<ul style="list-style-type: none"> • A suitable geo-economic situation of the country • sustainable growing economy and agriculture • good skills for cultivation and processing health-giving qualities • suitable temperate climate, suitable soil, dry atmosphere • good skills for canning table olives from Soviet times • turn away from animal fats in favor of vegetable alternatives 	<ul style="list-style-type: none"> • Due to the occupation of 20 % Azerbaijani territory weak investment attractiveness from foreign investors • purchasing of pressing oil equipment from abroad • lack of equipment for collecting olives • hand picking olives and as result crop shortage • high prices for olive oil in comparison with sunflower and corn oil and as consequence low consumer preference at the domestic market • limited numbers of olive production plants
Opportunity	Threat
<ul style="list-style-type: none"> • A suitable geographical market and expanding of export to Georgia, Kazakhstan, EU, Russian Federation, Iran • manufacturing of olive cosmetics (soap, creams, masks and etc.) • implementing of state oil policy • improving supply-chain • expanding the international trade geography • strong agricultural policy • development of oleotourism • to be able to increase domestic consumption conducting of advertising campaigns • conducting workshops for local farmers 	<ul style="list-style-type: none"> • A growing market of Georgia • domination of direct investments in the oil and gas industry • strong positioning of sunflower and corn oil in the consumer's mind • low motivation of local farmers to conduct olive business and lack of interest to cultivate olives • inability to compete with foreign brands and weak competition among local producers

4. CONCLUSION

Olives are a new culture, it is important to popularize it since it is very much in demand in almost all countries. The government is trying to build the new oil policy in the country. In 1995 the EU decided to wage a generic pan-European campaign with the aim to promote the use of olive oil. (Brassington, Pettitt, 2005, pp.55-56). It is necessary to learn the best practice of EU in Azerbaijan too. Such policy will encourage producers to create own-label products, compete with foreign suppliers and thus undercut branded prices, make consumers more knowledgeable about healthy features and cooking possibilities of olive oil. In other words the olive industry needs firstly a state support and it can be achieved within the context of third and fourth Strategic Roadmaps (Strategic Road Map for the manufacture and processing of agricultural products in the Republic of Azerbaijan; Strategic Road Map for the manufacture of small and medium entrepreneurship-level consumer goods in the Republic of Azerbaijan) endorsed by the President of Azerbaijan Republic. Domestic entrepreneurs should develop a marketing plan on how to attract customers' attention and gain their preferences. So, equitable competition should be guaranteed. All parts of promotional mix – strong advertising, publicity, and public relations should be activated. Using these tools local manufactures of the private sector may identify new demographic or geographic markets and successfully use market development strategy. In this context, supply chain mechanism should be strongly activated. And the last thing, what I want to say... It is well known that the olive branch is a symbol of peace. Azerbaijan holds this branch to all neighbors, who want to benefit from economic collaboration.

ABSTRACT

The main purpose of the research is to establish the structure of small and medium-sized enterprises, to ensure the current financial sustainability, to make assessments in line with the results of that analysis and to develop proposals on it. The research was carried out on the basis of research methods such as scientific abstraction and systematic analysis, logical summarization, and statistical analysis. As a result of the research, it has been determined through research and analysis that one of the most important priorities of economic policy in the country is to ensure sustainable development in enterprises. Large-scale and multifaceted measures are being taken to ensure sustainable development in Azerbaijan. A number of proposals have been made, taking advantage of international experience in addressing the issues raised in this area and ensuring durability. The practical significance of the research is that, as a result of the research, the role of the enterprise's financial sustainability has been identified, its role in the economy has been disclosed. The results and recommendations formed as a result of the research can be used to manage businesses. Scientific novelty and originality of the research: the current state of financial sustainability management in small and medium-sized enterprises was analyzed; proposals were made on the basis of results; assessment of financial sustainability of small and medium-sized enterprises was conducted, proposals on results were submitted; Directions for improving financial sustainability of small and medium-sized enterprises have been identified, proposals have been put forward.

Keywords: *entrepreneurship, small and medium enterprises, strategic road map, sustainability*

1. INTRODUCTION

The development of small and medium-sized entrepreneurship in Azerbaijan is of particular importance in terms of diversifying the economy, raising competitiveness, ensuring employment, replenishing demand for consumer goods through local resources and ensuring economic development. Thus, in the developed countries, when considering the share of small and medium-sized entrepreneurship in GDP and employment, it can be concluded that transformation of the small and medium-sized entrepreneurship to the main driving factor in sustainable economic development in Azerbaijan is one of the main challenges ahead. As its name implies, small and medium-sized enterprises small and medium-sized entrepreneurship are more important than large-scale businesses in the economy. In particular, small and medium-sized entrepreneurship have indispensable opportunities in matters of Gross Domestic Product (GDP), increased employment, and also the budget's tax needs.

2. THE ESSENCE OF MANAGING FINANCIAL SUSTAINABILITY OF SMALL AND MEDIUM-SIZED ENTERPRISES

The strength and durability of the economy in each country is due to the development of small and medium businesses in that country. As a small and medium-sized business type of business, it is now very widespread in the world and is growing steadily. The widespread use of this type of activity is related to its many advantages. Thus, one of the most important roles of small and medium entrepreneurship in the economy is to create and strengthen competition.

These businesses help increase employment or create new jobs in the economy. In addition, small and medium-sized enterprises are more responsive to the needs of the population and can respond more quickly to market conjuncture changes. High development of small and medium enterprises also contributes to the distribution of production facilities among more subjects. It is no coincidence that state-funded funds are created to support the development of small and medium-sized businesses in each of the developed countries. The biggest role of small and medium-sized businesses in the economy is the protection of competition. It is possible to strengthen the competitive environment in the country by developing this sector. Another important contribution to this sector of the economy is the creation of new jobs. The power of the country's economy depends on the level of development of its fields, and even the power of each economic entity, enterprise and organization. The more dynamic and sustainable development of each venture, the stronger the field. If all spheres develop strongly, the country's economy will be stronger. Successful outcome of any enterprise depends on many factors. One of them is the enterprise's sustainable and sustainable management. Sustainable development is one of the most important conditions in the market. If the enterprise has no sustainable development, it can not continue to collapse in competition and market. If the enterprise is competitive and wants to work for perspective plans, that should ensure sustained development. To do this, you need to develop enough initial capital and turnover capital, sufficient professional staff potential, strategic plans, trends and perspectives in that area, and choose the right tactics, strategies. Implementation of these records constitutes the basis of the organization's sustainability and management as it is an integral element of the entity's existence. The importance of ensuring sustainability for businesses is crucial to its high level of management and maintenance. To ensure the sustainable development of small and medium businesses:

- The financial opportunities of entrepreneurs should be expanded. In other words, entrepreneurs working in this sector should have access to financial resources not only from the state, but also from private institutions. Entrepreneurs should be able to benefit from preferential loans at the expense of commercial banks.
- In order to support commercial banks' real sector, banks that support small and medium-sized businesses should be encouraged. That is, certain discounts can be made to banks that give more money to the real sector.
- It is possible to support this area not only with financial support, but also with special programs. For example, gender balance in the small and medium-sized businesses should be supported. This experience in world countries can be brought to our country. For example, small and medium-sized businesses, which are the head of women, can be stimulated by tax incentives.
- Small and medium-sized enterprises with export opportunities may be granted subsidies for export volumes. Thus, the more enterprises export the product, the more countries are allowed to enter the currency. Therefore, SMEs with high export capacities should be encouraged.

Small enterprises play an important role in filling the domestic market with commodities and services, the liquidation of monopoly and expansion of competition in all spheres, as well as the emergence of entrepreneurial creativity, the attraction of existing labor and aterial resources, and the comprehensive provision of the population's needs. At the same time, small enterprises have to go through the republic's market relations, improve market mechanisms, create direct economic relations between producers and consumers, and involve more labor force in the economic reform and technological restructuring, and finally increase the incomes and purchasing power of the population. are important. According to the macroeconomic parameters of the financial sustainability of enterprises, the criteria for classification of

enterprises in our country were approved by Decree 556 of 21 December 2018 of the Cabinet of Ministers of the Republic of Azerbaijan. Let's analyze those indicators in accordance with the goals and objectives of the research.

Table 1: Distribution of micro, small, medium and large entrepreneurship subjects

Types of Entrepreneurship Subjects	Average number of employees (person)	Annual income (ig) (thousand AZN)
Micro entrepreneur	1 – 10	$ig \leq 200$
Small entrepreneur	11 – 50	$200 < ig \leq 3\ 000$
Medium entrepreneurship	51 – 250	$3\ 000 < ig \leq 30\ 000$
Big businessman	251 and above	$30\ 000 < ig$

Source: The table was prepared by the author on the basis of www.economy.gov.az

According to the criteria, 1 percent of legal and physical entities registered in 2017 are large, 2 percent are medium and 97% are small entrepreneurs. It should be noted that small and medium-sized enterprises in the European Union are divided into 3 groups: micro, small and medium-sized companies. The number of employees is smaller than 10, annual turnover of 2 million euros, smaller companies with less than 50 employees, annual turnover of 10 million euros, medium size companies with less than 250 employees and annual business turnover of up to 50 million euros. Please be informed that providing financial support, cash repayment, tax breaks, etc. to make small and medium-sized enterprises more effective in the world. various types of incentive tools are used. Development of small and medium-sized enterprises in Azerbaijan is a serious issue. For this reason, from the macroeconomic policy, there is a need to take measures that address a number of issues, including clear objectives, from the perspective of the citizens of Azerbaijan, particularly entrepreneurs and related government officials. Therefore, the implementation of institutional changes that support the development of the small and medium-sized enterprises and the creation of favorable conditions for their development are of strategic importance. Under the Decree of the President of the Republic of Azerbaijan dated December 28, 2017, the Small and Medium Entrepreneurship Development Agency under the Ministry of Economy was established. In accordance with the socio-economic development strategy led by the President of the Republic of Azerbaijan, the measures to expand entrepreneurship and enhance its role in the economy, further improve the business and investment environment in our country systematically and consistently. The new economic conditions are being implemented in support of the private sector, the protection of entrepreneurs' rights and interests, and the development of this field is based on international experience, taking into account modern challenges. As a result of government support measures over the past period, the number of entrepreneurship entities has increased 4.3 times over the past 15 years, while the share of private sector in gross domestic product is 80 percent, while employment share is 75 percent. While preparing proposals in this area, progressive management practices in international practice in entrepreneurship development and regulation have been investigated. Thus, in a number of developed countries the implementation of investments, modern technologies, advanced management practices and state regulation mechanisms for the development of entrepreneurship, especially Small and Medium Entrepreneurship stimulation of production of high quality, competitive and exportable products, information, legal and economic consulting services to entrepreneurship subjects and establishing appropriate institutions to assist in the establishment of effective cooperation with their governmental organizations, local and foreign partners. Establishment of the Small and Medium Entrepreneurship Development Agency, which will play a special role in the development of the private sector in Azerbaijan, is another manifestation of the constant attention and care of

the head of state to the development of the private sector, especially small and medium enterprises. The state program for small and medium entrepreneurship, covering the years 2016-2020, should be developed and implemented; entrepreneurship subjects in the legislation should be classified based on their size, and the concept of micro-enterprises should be included in the legislation. At the same time, it is proposed to establish private credit bureaus. There is also a need to establish specialized banks with close involvement of the state. In addition, it is emphasized that the loans granted to small and medium-sized enterprises and the guarantee fund are created. It also says that there is a need to improve the legislative framework to develop the securities market and stimulate small and medium-sized enterprises access. Along with this, it is proposed to establish a normative legal framework regulating the trading of local securities in foreign stock markets and to apply the relevant trading system to ensure the access of the small and medium-sized enterprises to foreign financial markets. Finally, the Government emphasizes the importance of developing a system of privileges and normative acts to support small businesses, including the implementation of microfinance programs, franchising, factoring, leasing.

3. FACTORS AFFECTING THE FINANCIAL SUSTAINABILITY OF SMALL AND MEDIUM-SIZED ENTERPRISES AND THEIR ANALYSIS

Strategic vision for the development of small and medium-sized enterprises in Azerbaijan by 2020 is to further improve the business environment, facilitate the access of SMEs to financial resources and sales markets, and to increase competitiveness and increase their role in economic development through increased knowledge and skills. As a result of the successful implementation of the envisaged measures, the main objective is to achieve the share of small and medium-sized enterprises in GDP and employment by 15 and 20 per cent respectively, while the share of non-oil exports in the country is 10 per cent. The long-term view of Azerbaijan for the period up to 2025 is to further increase the competitiveness of the small and medium-sized enterprises, to ensure the daily supply of consumer goods mainly through small and medium-sized enterprises, and to significantly increase the share of small and medium-sized enterprises in GDP and employment.

Table 2: The amount of investment required by the measures to be taken on the strategic road map and the expected results

№	The name of the priority	Impact on Real GDP (million AZN) 2020	The employment (full-time employees 2020)	The investment (million AZN) 2020
1.	Establishment of centralized small and medium entrepreneurship agency	200	240	10
2.	Creation of special industrial zones and clusters for small and medium-sized enterprises	475	23330	630
3.	Termination of the activity in the field of settlement of bankruptcy issues	450	900	-
4.	Expansion of financial services for international trade operations of small and medium-sized businesses and direct foreign investment promotion	55	9800	3
5.	Creation of foreign associations on separate sectors	45	-	-
6.	Development of business incubators and startup projects, creation of model businesses	35	-	50

- Note 1. This table outlines priorities that only allow for more than 10 million manat or more than 100 jobs in real GDP in 2020. Other priorities have a supporting role in achieving the intended outcomes.
- Note 2. These figures have been given to create a clear idea of the impacts of priorities. During the implementation of the measures, it is necessary to conduct comprehensive analyzes and clarify the figures for each priority.

The business environment in Azerbaijan has been further improved and the country has achieved a high score on some indicators of the World Bank's Doing Business 2017 (eg business start, property registration). With the creation of e-government portal in line with international experience, public services have been expanded. Innovation framework for small and medium-sized enterprises has been improved through both infrastructure (eg industrial parks, technology parks and business incubators) and financial support (creation of a special fund for information and communication technology (ICT) sector). Development of small and medium enterprises is one of the most important modern economies. Each country, regardless of its level of economic development, wants the small and medium-sized enterprises to have an active share of the economic growth in terms of modern requirements. The main burden in this direction is undoubtedly the state and its support for the development of this area. It is known that state support is a measure that is implemented through a certain mechanism. In each country, this support mechanism has its own peculiarities and development trends. The article considers the support mechanism which is characteristic for Azerbaijan, and specific development models are put forward. The necessity of state support mechanism Formation of state support requires a certain mechanism for the development of small and medium-sized enterprises as a long-term economic program in terms of economic evaluation. The functioning of this mechanism should be systematic. In some countries, state support to small and medium-sized enterprises can not be assessed unambiguously, as the state support mechanism should be able to respond to changing market conjuncture and its impact capacities should become asymmetrical for all sectors of the country's economy. While characterizing the state support mechanism for small and medium-sized enterprises in Azerbaijan, it should be noted that the main direction is the program-targeted measures. It should be borne in mind that small and medium-sized enterprises stimulation and diversification policies, which demonstrate a weak position in the formation of key macroeconomic indicators in the national economy, are mainly covered by programmatic events. In this aspect it is necessary to emphasize that the state support in our republic is a correct choice from the point of view of strategic choice. Improving the state support mechanism for small and medium-sized enterprises, in particular, is one of the most complicated issues to consider innovative factors in this process. In our opinion, the need for state support for small and medium-sized enterprises in Azerbaijan should not be assessed by time. It is important to differentiate the main directions of state support to small and medium-sized enterprises in Azerbaijan. These include:

- Providing state support to those who want to engage in new entrepreneurship (small and medium-sized). Especially in the direction of expansion and stimulation of family business (within the framework of the ABAD Program).
- Stimulation of existing small and medium entrepreneurship subjects. Supporting areas that provide them with discounts (tax, customs, price regulation, subsidies and subsidies), and stimulating steps.
- Support for newly elected small and medium-sized enterprises in selecting their activities. Applying certain concessions on various sectors of economy (agriculture, light industry, tourism, trade, hotel-restaurant, etc.), specification of main directions in small and medium-sized enterprises activities. This will allow SMEs to evaluate their potential capacities and identify the progressive aspects of their field of activity.

- Considering the development of other sectors of the economy and their accountability for small and medium-sized enterprises. While such programs are not directly focused on the activities of small and medium-sized enterprises, it also creates conditions for their development and provides opportunities;
- Implement state support measures to support innovation activities;
- Collaboration between small and medium-sized enterprises subjects, including supportive measures for implementing measures to expand corporate co-operation between small and medium-sized enterprises, small and medium-sized enterprises and government agencies.

They have concluded that shortcomings in the taxation mechanism in the development of small and medium-sized enterprises will lead to problems. These include:

- The weakness of the taxation system for tax liabilities of small and medium-sized enterprises, which is higher than in terms of number;
- small and medium-sized enterprises faster than non-formal economy relative to large entrepreneurs;
- Increasing administration costs;
- Faster tax burden on small and medium-sized enterprises, etc.

According to the tax legislation operating in our country, the majority of small and medium-sized enterprises used a simplified tax system, and their turnover was chosen as the key criterion. However, world practice gives grounds to say that it is not a simplified tax, but rather a "presumptive" hypothetical taxation system (the main characteristic of this tax method is that the tax base is not for the taxpayer, but for the field of activity and its character). It is important to take into account the following in order to undertake a number of measures aimed at solving these problems, and to further improve the taxation mechanism. Recommended:

- Establish separate committees dealing with the economic problems of small and medium-sized enterprises, clarify the criteria arising from international practice (including tax rates, tax burden, tax administration);
- Identify small and medium-sized enterprises identification criteria; - In the course of tax policy, the stimulating function should be considered as basic and the structure of tax incurred should be analyzed;
- Establish a separate monitoring and control system to ensure the rights and protection of small and medium-sized enterprises, etc. In order to support entrepreneurship in the Tax Code in 2019

The changes are mainly based on the simplified tax rate of two per cent in the entire territory of the country, retail sales and catering, non-cash payments in the retail trade and catering areas, suspension of cash outflow from the bank account and VAT deposit account during administrative complaint. During these changes, the support for entrepreneurship in micro and small businesses is particularly important, mainly due to the fact that starting from 2019 the fixed capital depreciation rates will be applied to fixed assets of micro and small business entities; Small businesses will be subject to additional tax breaks if they carry a transparent balloon; Small and Medium Entrepreneurship cluster companies will be exempt from profits, land and property tax for a period of seven years from the date they are registered in the Small and Medium Entrepreneurship Register; Imported equipment, technological equipment and facilities for production and processing by the companies included in the Small and Medium Entrepreneurship cluster will be exempt from VAT for 7 years; The part of entrepreneurial subjects, who are members of the Small and Medium Entrepreneurship cluster, is directed to capital expenditures - 7 years will be exempt from income tax; The proposed breakthroughs for micro-entrepreneurship subjects include tax exemption of 75% of profits and profits earned on

entrepreneurial activity. Individual entrepreneurs and legal entities subject to micro-entrepreneurship are exempt from property tax. Subjects of micro and small entrepreneurship who have obtained the Startup Certificate from the date of receipt of the relevant certificate will be exempt from income tax and income tax for a period of three years.

4. INTERNATIONAL EXPERIENCE IN ENSURING THE STABILITY OF SMALL AND MEDIUM-SIZED ENTERPRISES

Small and Medium Enterprise is one of the leading economies in many developed and emerging economies. There is no single practice in the world practice regarding the classification and indicators of small and medium-sized businesses in the legislation. However, the single classification within the European Union is valid. Thus, enterprises whose annual turnover does not exceed 10 million euros and employees with a number of employees are 10-49, small enterprises, whose annual turnover does not exceed 50 million euros and the number of employees is 50-249. In large countries such as the United States and China, small enterprise enterprises are enterprises with 100 or 1000 people or fewer employees. According to the classification of Turkey, the number of enterprises with annual turnover of 5 million liras and the number of employees not exceeding 50 and annual turnover of 25 million liras and the number of employees with 50-150 employees are considered as small and medium enterprises. Small and medium-sized enterprises also play an important role in the economic activity within the country. First of all, it should be noted that according to the number of Small and Medium Entrepreneurship per 1,000 people, Eastern Europe countries such as Estonia and the Czech Republic take first place. In these countries, the number of Small and Medium Entrepreneurship per thousand people is 71 and 88, respectively. The high development of small and medium enterprises in these countries is also closely linked to the privatization policy implemented during transition to a market economy. As the small-scale privatization policy carried out in these countries is mainly carried out on public catering services and small-scale enterprises, as well as the highest possible participation of the population, the number of Small and Medium Entrepreneurship is quite high Italy and Malta are ahead of the European countries due to their gross domestic product. Here, 80% and 77% of the additional value of the Small and Medium Entrepreneurship subjects. In addition, in many European countries this figure is also higher than 50% of GDP. By contrast, for Russia it is less than a quarter of GDP. This is due to the weakness of the small and medium-sized business sector. Additionally, about 50% of the Czech Republic, Estonia, Italy, Malta and Portugal are employed by such enterprises. In France, Slovakia and Finland, this figure is smaller, which is due to the fact that the number of Small and Medium Entrepreneurship enterprises is less than that of other countries. The main areas of small and medium-sized businesses are also different across countries. Thus, wholesale and retail trade services play a leading role in the EU's role in the GDP among small and medium-sized enterprises. About 22% of GDP is provided by this area of activity. Accordingly, this sector has the largest share in small and medium-sized employment. Overall, 26% of small and medium-sized enterprises are provided by businesses. Other important areas are also service areas. Construction, housing and food services as well as administrative services make up 23% and 30% of the value added and employment respectively. Interestingly, the processing industry is ranked second among the economic activities of small and medium-sized businesses. Given the dependence of this area on large scale capital investments and economy of scale, small and medium-sized businesses are likely to overcome these issues. Small and Medium Entrepreneurship in Turkey is also the key point of the economy. 99.9% of businesses, 76% of employment, 53% of total wage, 53.3% of total added value and 53.7% of total investments in material goods are provided by small and medium-sized enterprises. The most active small and medium-sized enterprise in Turkey is retail and wholesale trade, as well as Transport and Warehouse and Processing Industry.

The commercialization of commerce, both the empiricity of the manufacturing industry and the high level of technology, mean that Small and Medium Entrepreneurship contribution to employment and the ability to create high value. In addition, the share of Small and Medium Entrepreneurship in foreign economic activity is noticeably wider. Thus, 68% of Turkey's total exports in 2016 were provided by small and medium-sized businesses. 32% of imports fell to these companies. In the experience of foreign countries, many measures are being taken to promote Small and Medium Entrepreneurship activities. The most important is fiscal and financial incentives. Thus, measures to reduce the number of taxes imposed on Small and Medium Entrepreneurship and the introduction of a simplified single tax rate in some countries create favorable conditions for the activities of these entities. In addition, increasing credit opportunities, especially in European countries, providing state-guaranteed loans, expanding venture capital and creating business-angels are financially supported by Small and Medium Entrepreneurship. Providing information support to other stimulants, including the creation of business incubators and economic clusters to strengthen the relationships of small and medium-sized enterprises with large entrepreneurship, and expanding export opportunities with support for small businesses' export activities. Compared with international experience, small and medium-sized enterprises in Azerbaijan are relatively new and are not yet fully developed. Although the majority of enterprises operating in the country are small and medium-sized businesses (92%), this sector's gross domestic product (GDP) and share of employment are very limited. Thus, the share of goods and services generated by small and medium-sized enterprises in GDP is only 3%, and their share in employment is only 8%. For comparison, it should be noted that the share of small entrepreneurship in employment in Georgia is 43% and in Ukraine 58%. Most small entrepreneurship entities in the country are Baku (56.7%), the second and third largest regions of these enterprises are Aran (12.7%) and Absheron (7%) economic regions. As regards economic activities, most enterprises are engaged in trade and transport services (32%), transport and storage (10.3%), and 17.3% in the agricultural sector. Small and medium enterprises have an indispensable role in ensuring employment in the country. This sector is also one of the main anti-crisis methods of the states. Because the bankruptcy of large enterprises during the crisis deepens the crisis in the country's economy. However, such risks are even lower in small and medium-sized enterprises. Experts believe that if large companies determine the level of scientific and technical progress and production potential in the country, small and medium-sized enterprises will provide socio-economic stability and development of the country. Most of these businesses form a balance in the economy. From the aforementioned, it can be concluded that the development of small and medium-sized businesses in Azerbaijan is still not fully satisfactory compared with world practice, which shows its influence in the market. They also point to the fact that the development of small and medium-sized businesses in the country still needs to be settled and more progressive measures should be taken. Even though important steps have already been taken in this direction, it would be expedient to apply additional incentive mechanisms throughout the country, taking advantage of international experience.

Figure following on the next page

Figure 1: The share of small and medium business enterprises in export

Source: The table was prepared by the author on the basis of <http://www.kreditbusiness.ru>

It is no coincidence that state-funded funds are created to support the development of small and medium-sized businesses in each of the developed countries. In these countries, 99% of existing enterprises are small and medium enterprises. Their share in employment is 50-70%. The share of production in the GDP is 50-60 percent. The biggest role of small and medium-sized businesses in the economy is the protection of competition. It is possible to strengthen the competitive environment in the country by developing this sector. Another important contribution to this sector of the economy is the creation of new jobs. They can produce more production and product diversity with less investment. Also, it is possible to create job opportunities with less investment costs. They can adapt to the changes and variations in demand more easily. Small and medium enterprises have an indispensable role in ensuring employment in the country. This sector is also one of the main anti-crisis methods of the states. Because the bankruptcy of large enterprises during the crisis deepens the crisis in the country's economy. However, such risks are even lower in small and medium-sized enterprises. Experts believe that if large companies determine the level of scientific and technical progress and production potential in the country, small and medium-sized enterprises will provide socio-economic stability and development of the country. Most of these businesses form a balance in the economy.

5. CONCLUSION

Development of small and medium-sized businesses in our country is reflected as one of the main goals in the 2020 Development Outlook Concept. Significant steps are taken by the state in the development and support of this sector. The announcement of 2014 as the "Year of Industry" by the country's president was accompanied by the ongoing work in this area and the implementation of serious measures to open new businesses. Nevertheless, while the share of small and medium businesses in developed countries is higher than 50 percent in developed countries, the share of small and medium-sized enterprises in both exports and in Azerbaijan is relatively low. Experts link this with Azerbaijan as an oil country. Therefore, the share of oil in GDP is quite high. Given the fact that more oil companies operate in the oil sector, the share of large-scale enterprises in GDP is higher. The total amount of loans allocated to entrepreneurs by the National Entrepreneurship Support Fund is shown in the scheme below. Most banks are not interested in granting long-term loans to entrepreneurs, although they are encouraged by providing preferential loans to small and medium-sized businesses in our country. This is due to the fact that the amount of business loans is large and that they are transferred to the long-term. This is even more risky for banks than consumer loans. The percentage of business loans issued by banks is also quite high. Last year, interest rates of business loans in the country were at least 11 percent. That is why entrepreneurship subjects suffer from lack of funds and can not establish business. Owners, who receive cash, have a higher interest rate and are reluctant to repay the loan. Given the seriousness of the issue, President Ilham Aliyev called on banks to support the real sector at a meeting of the Cabinet of Ministers last year. "The advantage should be given to the real sector, not consumer loans. The main activity of the banking sector should be directed to creation of new enterprises, opening of jobs. What amount of funds are allocated by Azerbaijani banks, in which projects, in which regions or in Baku? This should be the case. I, the public, should see that the banking sector does not just pocket its own pockets, but also actively works for the development of the country ". According to the data, interest rates of business loans will be one-digit in next years. This will give impetus to the development of small and medium enterprises. There are also banks in the country aimed at stimulating small and medium entrepreneurship.

Rzayeva.Shahla@mail.ru*

ABSTRACT

This work indicates that social protection is a system of social and legal measures which provides all the citizens with a certain standard of living and is aimed at supporting individual groups. The improvement of social welfare of low-income population is always in the focus of the state. Recently important steps have been taken for improving the living standard of the population that need a special social protection, and in the field of their active integration into society. Attraction people of this category to numerous social programs has successfully been realized. A lot of work has been done for improving social and living conditions and the social payments allocated to this category people were regularly increased from year to year. It was noted that self-employment measures have particular importance in strengthening the socially sensitive part of the population, social protection of low-income families and increasing living standards, passing from traditional "passive" policy measures to "active" employment policies. As a result of the measures envisaged in the Strategic Roadmap on the sectors of the economy, the share of informal employment in the economy will be reduced, foreign investment in the non-oil sector and exports in the non-oil sector will be increased, additional workplaces in production and tourism sector will be created, and small and medium-sized businesses will grow. Specifically, it encourages women and the youth for social-public programs in rural areas and businessmen to participate in entrepreneurship training programs in vocational education institutions, increases dynamics of salaries for years and expands employment opportunities in non-agricultural areas, causes the timely implementation of the Strategic Roadmap to contribute to the implementation of the targets set.

Keywords: *Labor pensions, Social assistance, Self-employment measures, Social protection, Unemployment insurance*

1. INTRODUCTION

Restructuring the current social protection system in line with the market economy environment, as well as implementing reforms in the pension system based on the international norms and experience of the developed countries has been identified as one of the strategic direction of social policy. At that time, it was decided to start the development of the pension system according to the requirements of new circumstances after the creation of the solid economic basis for the changes and selection of an appropriate demographic time. And, meanwhile, previous solidarity and public security system have to be remained in place, though this task was very challenging. Those directions that have been wisely determined by the nationwide leader of the Azerbaijani people, Heydar Aliyev, made drastic measures aimed at improvement of living conditions and pension provision of the population, accompanied with annual increase in pension and benefit payments, which led to serious changes in this field.

2. THE MAIN DIRECTIONS OF SOCIAL PROTECTION SYSTEM

Social protection is a measure system of economic, social and legal advocacy for all citizens, providing a certain standard of living and specific support for individual groups. The state social protection system of the population implements measures to ensure the access to life and the level of living, employment and normal living conditions. Social security is a system of social benefits satisfying the material needs of the individual and his family in a broader sense (Figure

1). In that sense, the social security system coincides with the actual fact and personality rights. In a narrow sense, it is the state's policy to provide social security, in a particularly difficult situation, to ensure, at least, the decent living conditions of populations that can't live without help through administrative way. Social protection is one of the important functions of the state to ensure the basic social rights of the state on the basis of international and national norms. The laws of a democratic state include the right to employment, performance-based remuneration, recreation, old-age benefits, sickness benefits, unemployment benefits, benefits for loss of breadwinner, childcare benefits, education and health benefits, social security for cultural life, right to housing. The right to social protection is based on organizational and financial-economic frameworks. The legal basis establishes socially-oriented legislation on the specific areas; organizational governance involves the existence of a social bloc at existing levels and at appropriate institutions; mobilization of financial and economic sources of social protection. Here taxes paid to the state budget and contributions to relevant social funds plays an important role. The state in this or other form implements a special initiative in the sphere of social protection: charity activities, social expenditures of enterprises, firms and individuals can be cited as an example. Social assistance systems are divided into general and category-based help systems. There are difficulties in determining the wealth of people in some countries, which comes from the inefficient taxation of those countries. There is no effort to facilitate the establishment of general social assistance systems in these countries, but rather to provide categories of social assistance to groups of persons who are unable to conceal their income. There are tendencies to follow. The basic principle is that citizens living in the country are provided with social protection systems that can benefit from social benefits irrespective of their nationality. The three main features of the social welfare system in Western Europe are: 1) the existence of an official poverty line, (2) the status of individuals with incomes below the poverty line, and (3) an attempt to eliminate the difference between the poverty line and the actual income. This system can also be called a "Secured minimum income" (SMI) system. In the former post-Soviet countries, assistance schemes vary from SMI to a number of aspects. It is not enough for the amount of revenue to be lower than the poverty line for social assistance, and other criteria should be taken as a basis. Factors such as the family's ability to earn money, the loss of family head, the disabled, and the elderly can play a key role here. Social assistance is presumed to be a temporary measure and is primarily natural. The social welfare system does not aim to fulfill the gap between the limits of poverty and the actual income.

Figure following on the next page

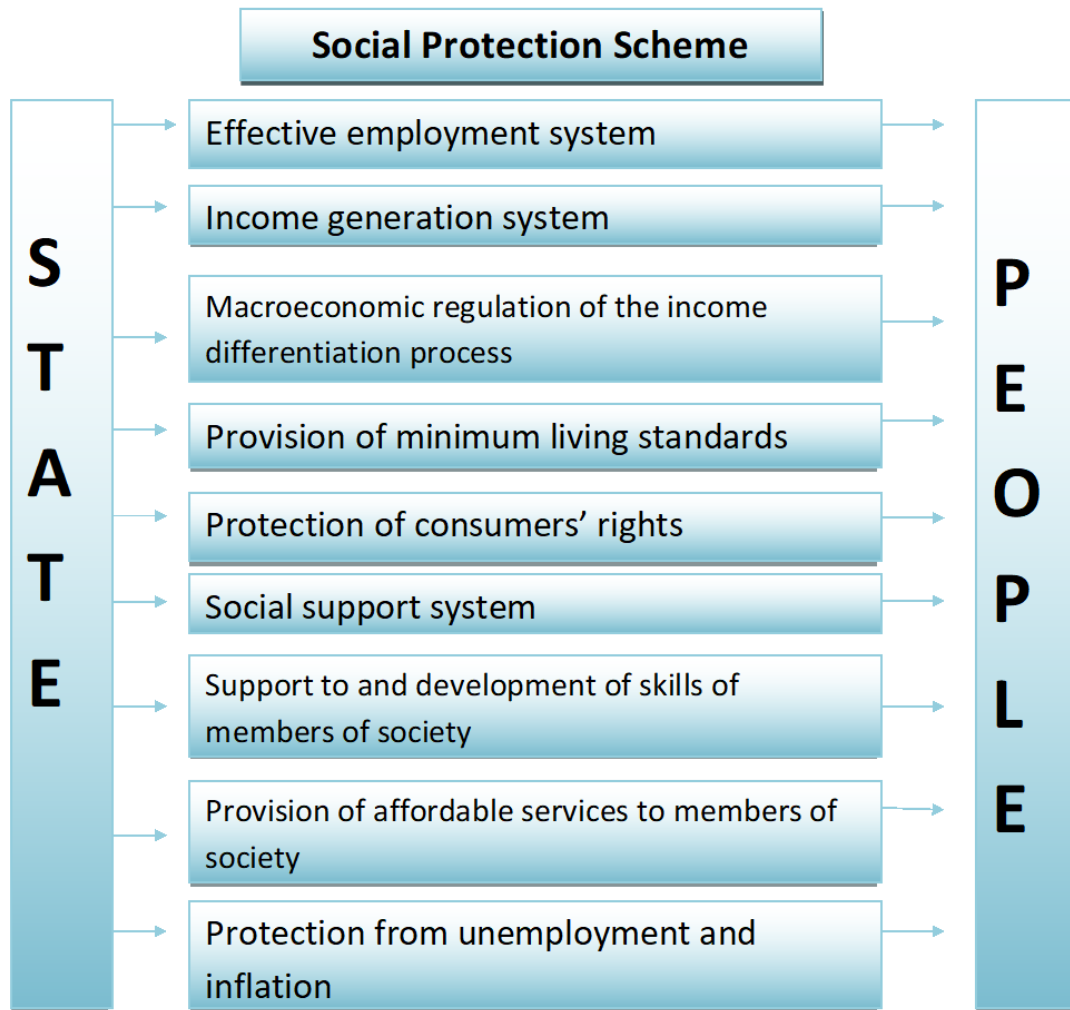

Figure 1: *Great Economic Encyclopedia (Samadzada, 2012, p.537)*

They used a “Revenue Amount Check” (RAC) system to get out of the situation with social assistance. None of the characteristics inherent to the SMI system is in the RAC system. Firstly, the actual information about the poverty line is not officially announced. Secondly, the fact that the amount of income is below the poverty line is not a sufficient condition for achieving social benefits. The third is that social assistance services do not take the necessary measures to cover the gap between the poverty line and the actual income (Mikayilova, 2006, p. 34). As we have noted, the main objective of the social assistance system is to improve the co-ordination of this assistance. It can be achieved in two ways. The first way is to switch from SMI to RAC. The second system is theoretically to ensure that the social assistance is accurate. The other way is to capture the RAC system, but in this case the address of the assistance needs to be improved. In order to reduce the number of those who are able to get social assistance, their income needs to be estimated. Social assistance should be the last tool that should be provided to those persons who are beyond the control of the social security system. For this purpose, poverty indicators such as the number of children in the family, age of the head of the family, and unemployment should be investigated and should not allow those who have important economic transfers to move. When determining the targeted referral of social assistance, the following can be avoided.

- excessive assistance, as in some cases the payments to the poor may exceed the amount required to reach the poverty line;
- entry falt. Payments can be paid to people who are not poor, so that they do not need social assistance.

Another important issue of addressing social assistance is the degree to which the displacement pattern is found between the level of social assistance and earnings. Frequency of decline in social assistance in most Western European countries reaches 100 per cent. But in post-soviet countries, this problem is deepened by two factors:

- the slightest difference between the minimum wage and the poverty line that causes the person to start looking for a job does not allow to increase family income to the extent that they are less likely to fall below the 100% threshold of social assistance;
- in most countries, the payment of several types of assistance is suspended after a certain amount of revenue is obtained.

The targeted social assistance problem occurs due to error of high interest rates in the above-mentioned systems. The main issue here is identifying poors, namely the exact definition of the amount of income. This is a consequence of the fact that the majority of cash revenues are derived from illegal activities in the shadow sector, and these revenues are often hidden from taxpayers. Observations show that about 10-12 percent of the population may be 10 percent lower or lower than the guaranteed minimum revenue. Those who do not need social assistance within these individuals can also receive benefits. It is not difficult to identify the poor in typically poor population groups. In other families where poverty is superior, the situation is different. For example, it is difficult to determine who is entitled to the right to receive social assistance in rural areas composed of multi-child families. Because in most of these families the number of children is 4, 5 and more, and one of the family heads does not work. Social assistance should be given to a person who has the right to receive this assistance without being dependent on his / her family background. Only in an exceptional case, social assistance can be viewed as a kind of assistance to families.

2.1. Pension and Social Insurance System in the Republic of Azerbaijan

At present, pensions in Azerbaijan are governed by the laws of the Republic of Azerbaijan "On Pension Provision of Citizens", "On Labor Penalty" and "On Retirement of Military Servants". These laws regulate the retirement benefits of the country's citizens when they are aging, fully or partially, and their family heads (Aliyev F., Aliyev T., 2011, p.231). In order to improve the system of pension provision in the "Concept of Reforming the Pension System in the Republic of Azerbaijan in 2014-2020" and to strengthen the financial sustainability of the system starting from 2017, the implementation of relevant measures has been started, Social Protection Fund has taken steps to identify the obligation of the state budget, and the basic part of the labor pensions, known as the basic public obligation, has been abolished, and the amount of newly established pensions are calculated on the basis of the retirement pension fund and the system has been created to allow it to be identified. Improvement of the structure of the insurance premium, the payment of compulsory state social insurance premiums to the minimum wage (ownership of agricultural land, individual entrepreneurship and labor activity) the implementation of some of the key issues in 2019 will be considered as the implementation of the norms. According to Article 29.1 of the Law of the Republic of Azerbaijan "On Labor Pensions", the insurance part of the labor pension and the penalty capital registered in the insurance part of the individual account shall be paid once a year for the relevant executive officer of the average monthly nominal wage is indexed in accordance with the decision of the relevant executive body in accordance with the annual rate of increase determined by the authoritative body. According to information provided by the Ministry of Economy of the Republic of Azerbaijan, average monthly nominal wage in 2018 is projected to increase by 5.7%. After the amendment to the legislation, the base and insurance part of the penalty was considered an integral part of insurance, but only those amendments that were determined by the legislation were distinguished.

The size of the pensions' costs depends on a number of factors - the country's physical condition, health, age and living standards, and their accumulated insurance coverage, average monthly pension, salary wage in the country, requirements of relevant legislation and so on. depends on. By taking these parameters into account, the costs of paying pensions are set at certain levels. A number of changes made in the legislation also contributed to the growth of the total cost, which necessitates the proper forecasting of the costs of pensions in terms of providing social protection to pensioners (Indexation of Labor Pensions, 2017). The size of the pensions' costs depends on a number of factors - the country's demographic condition, health, age and living standards, and their accumulated insurance coverage, average monthly pension, salary in the country, requirements of relevant legislation and so on. depends on. By taking these parameters into account, the costs of paying pensions are set at certain levels. A number of changes made in the legislation also contributed to the growth of the total cost, which necessitates the proper forecasting of the costs of pensions in terms of providing social protection to pensioners. According to the Law of the Republic of Azerbaijan "On the minimum subsistence minimum for the year 2020", it is envisaged that the minimum subsistence level for pensioners will be 149.0 in 2019, which is the average of the average pension amounting to 241.0 manat is less than the monthly pension amount.(Article 1, 2018) It is projected that the average monthly pension will be 92.0 manat or 61.7% higher than the pensioner's living minimum, or 161.7%. It should be noted that according to the official Internet website of the Federal State Statistics Service of the Russian Federation, this ratio is 153.3% in Russia in 2016 and 160.0% in 2017, according to the Internet website of the Statistics Committee of the Republic of Kazakhstan this proportion is 238.0% in 2017, 180.6% in Ukraine at 01.01.2018 and at the beginning of 2017, 103.9%. in Georgia. The Fiscal Affairs Department of the International Monetary Fund, based on a 2011 research paper titled "Call for State Pension Reforms in Emerging Economies," compared to 14.7% in Italy in 2010, 13.9% in Austria, 13.3%, in France, 12.7% in Portugal, 10.6% in Finland and Germany, 10.0% in Japan, and in 2030, respectively , 12.8%, 14.8%, 13.4%, 13.4%, 12.7%, 11.7% and 9.8% respectively. The proportion of pension payment according to GDP ratio in 2010 was 17.7 percent in Ukraine, 11.3 percent in Poland, 10.6 percent in Hungary, 9.3 percent in Estonia, 9.1 percent in Brazil, and 8.1 percent in Russia, and relatively these indicators will be intended 19,4%, 9,2%, 7,6%, 6,8%, 10,4% və 11,2% in 2030. The decrease is forecasted in EU countries like: Poland, Hungary and Estonia, as well as the increase is forecasted in Ukraine, Brazil and Russia. According to statistical data at the beginning of 2018, the admissibility factor affecting the specific weight of labor pensions in GDP, in other words, increased the share of 65 and older population in the total number of retirees Continued. Thus, this figure was 44.2% at the beginning of 2015, 46.0% at the beginning of 2016, 47.2% at the beginning of 2017 and 49.2 % at the beginning of 2018. The number of population by age group was 597.5 thousand in 01.01.2016, 620.3 thousand in 01.01.2017 and 648.2 thousand people for 01.01.2018. In other words, the increase in the degree of proportion has led to the increase in the population of the age group of 65 and over. Increase in the proportion of coefficients means, on the one hand, that the retirement of labor is higher than the elderly population and on the other hand, the number of pensioners who do not participate in GDP formation. The relative ratio represents the aggregate weight of the aged 65 and over in the general number of pensioners and acts as a factor affecting the ratio of retirement costs to GDP and the fiscal sustainability of the pension system. The decline of this ratio, in other words, the increase in the share of retirees in the total number of retirees without the retirement age is due to less labor activity and lower levels of participation in GDP volumes, as a minimum, means retirement of Citizens who get (CSSIF). According to the information provided by the Fund, the average monthly pension is expected to be at the level of 226.8 manat at the end of 2018, and in 2019 it is forecasted at 241.0 manats. Thus, the average monthly pension rate will increase by 8.7% compared to 2017 at the end of the current year, and it will

increase 6.3% in 2019. Replacement rate is the ratio of average monthly pension to the average monthly salary of both the 1970-1990 and the 1990-2010, both in countries with developed and emerging economies, and this factor played a key role in developing countries during the 1970-1990 period and in emerging economies in the 1990-2010 period. The average monthly salary rate is higher than the average monthly wage, with the fact that the paid (CSSIF) for a certain period of time is gradually insufficient to meet the pensions, can only weaken the fiscal stability of the system. The pointed ratio was 38.0% in 2015, 38.9% in 2016 and 39.5% in 2017. It is forecasted that this ratio will be 40.6% in 2018 and 37.6% in 2019. The decline in the substitution rate in the backdrop of the increase in pensions is due to an over-monthly average pension rate of 6.3% in average monthly salary growth of 14.9% in 2019. The percentage of labor pensions paid by age and loss of family head still remains behind the weight of the world practice, indicating the specific weight of labor pensions, on the contrary, prevails over the world practice of weighting the increase in payments on social insurance or payment bases, the right of the citizen to pay for it means that they will receive a larger amount of retirement benefits. The number of pensioners working in recent years have had an upsurge in dynamics, while the number of non-working pensioners has diminished in dynamics, which means that the penalties received by pensioners, working with their salaries, it is advisable to do so. It is therefore more appropriate to distribute labor between the citizens as labor pensions and wages, with the fact that younger employees make appropriate payments in exchange for their salaries and wages. In contrary to maternity leave and childbirth benefits as well as childbirth, there was a decline in the number of births in the country, which affected to the amount of child birth, and the predictive rate was 84.9% in 2017. The payments were 70.0% for the childbirth. By 2017, the expectations for child care up to the age of 3 were fulfilled by 80.9%, while expenses for funeral were 91.1%. The level of compensation for Compulsory State Social Insurance Fee (CSSIF) depends on the level of wages of the insured, work experience and health status, birth and death rates in the country. Some of these factors are objective, based on probabilities and coincidences. Therefore, difficulties may arise in predicting the actual costs. Positive conclusions can be drawn to better predict costs, taking into account the previous experience and performance indicators, other relevant statistical factors, as well as the legislative changes on the factors affecting the development of allowances. Strategic Road Maps on key sectors of the economy, approved by the Presidential Decree No.1138 dated December 6, 2016, have special importance in ensuring the social protection of people from unemployment. The Strategic Roadmap on the National Economic Outlook of the Republic of Azerbaijan envisages the employment of more than 450,000 people by 2025. As the President of the Republic of Azerbaijan, Mr. Ilham Aliyev, noted that the current unemployment rate in our country is only 5% according to the implemented measures in the country. As a result of the implemented measures envisaged in the Strategic Road Map on the sectors of the economy, the share of informal employment in the economy will decrease, the foreign investments directed to the non-oil sector, the increase in exports on the non-oil sector, the development of small and medium-sized businesses will be achieved. Specifically, it encourages women's and youth's social life programs in rural areas and promotes entrepreneurs to train entrepreneurial education in vocational education institutions, increase in salaries for years, undertaking measures to improve employment opportunities in other areas, timely implementation of relevant measures and results of the analysis will create conditions for implementation of the Strategic Road Map (Strategic Roadmap for the National Economy Perspectives of the Republic of Azerbaijan, 2016). The creation of the insurance system from unemployment have been specially noted in the Convention No. 88 and the Recommendation 83 of the International Labor Organization, ratified by the Republic of Azerbaijan. Thus, according to Article 6 of the ILO Convention on Employment Service No 88, the employment of vulnerable segments it was emphasized that it cooperated with insurance agencies to discontinue unemployment for the purpose of carrying

out measures for improvement the situation of the unemployed. Recommendation № 83 of the Article 8 of the "Organization of Employment Service", provides co-operation with service providers for labor inspection and unemployment insurance and services dealing with unemployment. It should be noted that, in order to solve employment problems of population, at present, the relevant funds operate in 72 countries of the world. In addition, according to Article 19 of the Law of the Republic of Azerbaijan "On Unemployment Insurance", insurance payments for unemployment, professional training and additional education, organization of paid public works, labor compensation and labor exchanges, helping them to self-employment, with the insurers working together with the insured, to pay the wages of the employed, the employment of citizens who are in need of social protection and who have difficulty finding employment establishment of jobs and expedited businesses and the implementation of targeted programs, the realization of other active arrangements for the exercise of labor law insurance funds (Measures financed by the insurance assets, 2018). Unlike social insurance premiums, unemployment insurance premiums are not covered by all insurance fees. The Law of the Republic of Azerbaijan "On Unemployment Insurance" does not pay insurance premiums for itself because it does not have labor compensation fund, even though a natural person does not pay insurance premiums on the same person when they sign a labor contract with any person. In contrast, Article 8 of the Law of the Republic of Azerbaijan "On Social Insurance" states that it is the insured person who makes social insurance for himself or someone else (Participants of social insurance, 1997). Insurance premiums paid in accordance with the Article 21 of the Law of the Republic of Azerbaijan "On insurance against unemployment", according to the administrative provisions stipulated by the Code of the Republic of Azerbaijan on violation of the requirements of the Law administrative penalties imposed by the Ministry of Labor and Social Protection of Population of the Republic of Azerbaijan, grants, donations and grants provided under the Grant Law of the Republic of Azerbaijan, bank loans, and by the Ministry of Labor and Social Protection of Population of the Republic of Azerbaijan Other sources were also mentioned in the Fund's sources of insurance.

2.1.1. Determining the self-employment of the population as an active employment measure

According to statistical data, in the first 9 months of 2018, the State Employment Service of the Ministry of Labor and Social Protection received 1923 vocational training and additional education, 865 paid work, 32 fairs were held in 32 cities and regions and 2230 unemployed and job seekers are provided with jobs. Over 79.7 thousand young people were provided with advice on vocational and occupational orientation of employers and job placement counseling in accordance with the requirements of the labor market during the recruitment campaigns organized by the state employment agencies during the reporting period.(Employment, 2018)

The introduction of self-employment as a means of active employment in our country was initiated on the basis of the Decree No 194 of the President of the Republic of Azerbaijan dated April 7, 2016 "On Additional Measures to Ensure Population's Self-Determination". Self-employed measures include the strengthening of the socially sensitive part of the population, the strengthening of the social welfare of low-income families and the improvement of their living standards, the "passive" (provision of allowances and grants) to the "active" occupational policy measures (to ensure the employment of socially vulnerable groups of population in the labor market) is of particular importance. Therefore, the costs of self-employment activities are at the core of the Fund's largest expenditure. Thus, the total expenditure was 40.2% of all expenditures in the Fund's 2018 forecast and by 2019 this figure was 50.4%. By October 1, 2018, more than 7.3 thousand people were enrolled in the program training courses, with graduates of these courses finishing their business plans to acquire goods and services for successful small business The provision has been commenced. The normative-legal basis for the compilation and application of professional standards in the "Strategic Road Course on

Vocational Education and Training in the Republic of Azerbaijan", approved by the Decree of the President of the Republic of Azerbaijan dated December 6, 2016 the development, approval and promotion of proposals, identification of the highest quality labor market requirements - defining the knowledge and skills available to businesses and social workers together with its partners it is envisaged to develop professional standards for priority sectors (Priority 3.1., 2016. pp. 85-88). The Strategic Road Map envisages setting up public, private and international funding sources to ensure future development of the vocational education system. As the expected outcome and outcome indicator, vocational standards and training programs have been identified to increase the employment level of vocational education institutions and provide qualitative personnel training. As a result of the increase in labor productivity and employment opportunities, it is forecasted that the real GDP will have a direct impact on the amount of AZN 1 million

3. CONSULUSION

The concept envisages improving the insurance premium structure, improving the insurance norms by paying compulsory state social insurance premiums to the minimum wage (persons using agricultural land in their possession, individual entrepreneurship and labor activities) 2019 It is planned to implement measures in the year; It is envisaged that the tax authorities will control the timely and full payment of social insurance premiums and payments from 2019; Most retiree pensioners, who retired earlier in the past, have been able to cover approximately half of their length of service at 01.01.1992, as well as additions to the pension legislation It is possible to note that the liabilities of the state budget are much higher; The number of retirees working in recent years has had an upsurge in dynamics and the declining dynamics of non-working penetrators; Decrease in birth rates is due to the number of beneficiaries who receive social benefits depending on the amount of benefits and non-working capital by influencing the number of those receiving social benefits at the expense of the state budget, and the number of beneficiaries overcrowded; Here it is shown that unemployed and job seekers are involved in active employment measures and that they are not exploited financially by their current financial capabilities and considered as valid.

ABSTRACT

World is struggling with the upcoming threats of CO₂ emissions, that is why, in order to achieve global environmental sustainability in the greenhouse gas emissions, several countries in 1997 agreed on Kyoto protocol which imposes some obligations on developed nations in the reduction of greenhouse gas emissions. The growing trend of CO₂ emissions is not only the case for developed nations, indeed, in the last decade emerging economies are capturing large scale of emissions and becoming much more hazardous for global warming. Especially, in developing economies foreign direct investments are dominant in polluting industries. Economic growth and FDI from this perspective, are causing CO₂ emissions to augment, if governments and industries are willingness in the alleviation of pollution. Thus, in this paper we have studied the impacts of FDI and economic growth on the Environmental degradation, proxied by consumption based CO₂ emissions for Azerbaijan country case. For this purpose, co-integration techniques were employed to the time series data over the period of 1996-2013. Cointegration test concluded that there is a long-run co-movement among the variables. Estimation results show that FDI and economic growth have positive and statistically significant impact on CO₂ emissions in the long-run. The findings of the study can be used by policymakers in making adequate decisions in related environmental degradation-FDI-economic growth circumstances.

1. INTRODUCTION

Foreign Direct Investments (FDI) has remarkable positive impacts on economic growth and development in many nations in the last half-century. However, this progressive economic performance entailed some negative externalities. Environmental degradation is perceived among the most influenced. As a consequence of economic growth, increasing consumption of energy causes to greenhouse gas (CHG) emissions, which is one of the main actors in the global warming. According to the World Bank data (2018), Carbon-dioxide (CO₂) is considered the biggest pollutant being responsible for 68% of all greenhouse gas emissions in 2012.

Nations are struggling with the upcoming threats of CO₂ emissions, and in order to achieve global environmental sustainability in the greenhouse gas emissions, some countries in 1997 agreed on Kyoto protocol, which imposes some obligations on developed nations in the reduction of greenhouse gas emissions. The growing trend of CO₂ emissions is not only the threat for developed nations, indeed, in the last decade emerging economies are capturing large scale of emissions and becoming much more hazardous for global warming (Winkler et al., 2002). In this empirical study, we have analyzed the impacts of FDI and economic growth on CO₂ emissions for Azerbaijan country case, which is abundant by its oil and gas resources, and one of the fastest growing economies of last decade. The dominant source of this remarkable economic growth is its crude oil and gas extractions, that pumping foreign currency to the economy and attracting foreign investors. The average annual economic growth of the economy in the last 15 years is about 5% (World Bank data, 2018). In 2017, the share of fuel exports in the total merchandise exports was 90.1%, which indicates the strong dependency of economy from oil and gas revenues (WB data, 2018). After signing several contracts with 41 oil companies with 19 countries since 1994, and after the completion of construction Baku-Tbilisi-Ceyhan pipeline in 2005 Azerbaijan crude oil had wide access to world market. That is to say, during the period of 1996-2017, FDI increased from \$627 million to \$2.87 billion, and had its pick \$5.29 billion in 2012 (WB data, 2018). There were many studies devoted to the impacts of FDI and economic growth on CO₂ emissions for different countries, where the findings vary across countries. Nevertheless, to the best of our knowledge, it is the first individual study for Azerbaijan country case, which examines the effect of FDI on CO₂ emissions. In order to fill this gap, the aim of this research is to assess the influence of foreign direct investments and economic growth on CO₂ emissions, and to see the effectiveness and necessity of government's anti-pollution policies. The related empirical studies are reviewed in the section 2. In the section 3, we presented the methodology and data employed, with following its results in the section 4. The outcomes and policy recommendations are discussed in the section 5.

2. LITERATURE REVIEW

There is a broad range of studies conducted in the last two decades, which studied the nexus of environmental degradation, FDI and income (GDP). The relationship mainly investigated for the group of countries and as well as for the individual country cases. In this section we reviewed some papers studied the CO₂ emissions-FDI nexus. China as one of the largest FDI recipient in the world, attracted remarkable amount of studies related to its environmental effects. Liu et al. (2017) analyzed the spatial environmental consequences of FDI in 112 Chinese cities employing Simultaneous Equations Model (SEM) for the period of 2002-2015, and found negative relationship between FDI and environmental pollution. Their study exerts that as more FDI flows to the Chinese economy, as less it degrades the environment. Another analogous paper by Huang et al. (2017) for the 30 Chinese provinces over the period of 2001-2012, demonstrating the significant negative effects of FDI and FDI to GDP ratio on pollution index. The study of Huang et al. (2017) used Spatial Durbin Model in order to look at the regional spillovers of FDI, where the coefficient of total effects of FDI on pollution index was found to be -0.20, suggesting that China's FDI inflows are environmentally friendly, especially, those FDI inflows which are flowed from the OECD member countries. However, there are some investigations (Ren et al, 2014 and Liu et al. 2018) argued about the positive relationship between China's FDI and environmental pollution. By employing GMM estimation model over the period of 2000 to 2010, Ren et al. (2014) found the FDI coefficient to be 0.24. Shahbaz et al. (2018) analyzed the nexus with more data sample of 62 years (1955-2016) for France, found significant positive relationship between FDI and carbon emissions with the coefficient of 0.08. Moreover, Bakhsh et al. (2017) also found significant positive relationship between FDI and CO₂ emissions for Pakistan, by employing SEM model for the period of 1980-2014.

Tang and Tan (2015) for Vietnam case, found that long-run, FDI has significant negative impact on CO₂ emissions with the –0.07 coefficient, although the short-run negative effect of FDI is statistically insignificant. Lau et al. (2014) investigated the relationship for the Malaysian case. The study exerts the long and short-run relationship between FDI and CO₂ emissions with employing cointegration approaches, where they have found significant and positive relationship between FDI and CO₂ emissions with the 0.07 coefficient. Gökmenoğlu and Taspınar (2016) displayed long and short-run positive effects of FDI on Turkey's case, with 0.03 significant positive coefficient. The country specific studies display varying results of FDI on environmental pollution, and it is interesting to look at the nexus on the country group level as well. Rafindadi et al. (2018) studied the environmental impacts of FDI for Gulf Cooperation Council (GCC) countries for 1990-2014, and surprisingly found significant negative relationship. They employed the Pooled Mean Group (PMG) methodology for six GCC countries, and suggesting that 1 percentage increase in FDI inflows to GCC countries will reduce CO₂ emissions by 16 percent. The relationship is also found significantly negative for the 30 OECD countries in the research of Paziienza (2015) for the period of 1981-2005, with the coefficient of –0.09. Income levels are considered in the investigation of Shahbaz et al. (2015), where 99 countries are split into three homogeneous low-middle-high income level groups, for the 1975-2012. In their research, FDI effects on income groups are changing, as in high-income countries, FDI inflows have negative impact on environmental pollution, which shows that foreign investors use good management practices and advanced technology, which alleviates the CO₂ emissions. The result is U-shaped for the middle-income level country groups, while it is positively correlated for the low-income level groups. When it comes to Latin American (LA) countries, the relationship shows significantly positive linkage in the recent research of Sapkota and Bastola (2017). By employing the data of 14 LA countries for the period of 1980-2010, they found 0.04 positive coefficient. The empirical studies are varying across the countries, and do not provide unilateral interpretation related to the environmental impacts of FDI. Although almost all studies recommend advanced technological implementation in reduction of the degradation effects of FDI, some studies (Paziienza, 2015 and Shahbaz et al. 2018) covering the developed countries, who were applying anti-pollution technologies for a long-time may display positive relationship. On the other hand, studies (Rafindadi et al. 2018; Tang and Tan, 2015; Lau et al. 2014) covering the countries which are weak in anti-pollution measures can show negative correlation.

3. DATA AND METHODOLOGY

3.1. Functional Specification and Data

The functional specification used in the current study can be described as follow:

$$\ln CO_{2t} = \beta_0 + \beta_1 \ln FDI_t + \beta_2 \ln GDP_t + \varepsilon_t \quad (1)$$

Where, all the elements of model are in logarithmic forms, and CO_{2,t} is consumption based Carbon-dioxide emissions in per capita terms, FDI_t is Foreign direct investment, net inflows (% of GDP), GDP_t – is Gross Domestic Product in per capita terms, and ε_t is an error term.

It's important to emphasize that the data in almost all sections of the science is difficult to collect for Azerbaijan. As, the data collection and its proper categorization was significantly weak in Soviet Union period. The availability to obtain the data before 1990s is mostly impossible. Furthermore, the engagement of Azerbaijan in war with Armenia in 1992-1994 years, and having changed government administration several times within these years, also

damaged the data collection process. That is, the majority of data created after the year 1994. For the reasons mentioned above (data availability and reliability), the current study uses time series data for the period of 1996-2013. CO₂ emissions are in million tons of carbon per year, GDP per capita in constant 2010 US\$, and FDI is FDI inflows as the share in GDP per capita terms. The data for CO₂ emissions are updated from Peters et al. (2011) and Hasanov et al. (2018). The data for GDP and FDI World Bank database (WB, 2018).

3.2. Econometric methodology

In empirical part first, we tested the variables for unit root, then for the common long-run trend (cointegration), and then estimated the long-run relationship among them. For unit root exercise we employed the Augmented Dickey Fuller (ADF, Dickey and Fuller, 1981) and Phillips-Perron (PP, Phillips and Perron, 1988) tests, while for testing the cointegration relationship the Engle-Granger (Engle and Granger, 1987), and Bounds Testing approach to cointegration (Pesaran et al, 2001) are utilized. The long-run relationship is estimated using two cointegration methods. First, the Bounds Testing Approach to Autoregressive Distributed Lagged (ARDL, Pesaran and Shin, 1999; Pesaran et al, 2001) model is used as a main tool, then the Fully Modified Ordinary Least Squares Method (FMOLS, Saikkonen, 1992 and Stock and Watson, 1993) is employed for the robustness check.

4. EMPIRICAL RESULTS AND DISCUSSION

First, the stationarity properties of the employed variables are tested using ADF and PP unit root tests and the results are given in Table 1.

Table 1: Unit root tests results

Variable	The ADF test			The PP test		
	Level	K	First difference	k	Level	First difference
<i>co₂</i>	-2.84*	0	-6.78***	0	-2.88*	-6.55***
<i>fdi</i>	-1.46	0	-3.32**	0	-1.46	-3.29**
<i>gdp</i>	-0.86	0	-2.67*	0	-0.86	-2.65*

*Notes: ADF and PP denote the Augmented Dickey-Fuller and Phillips-Perron tests respectively. Maximum lag order is set to two and optimal lag order (k) is selected based on Schwarz criterion in the ADF test; ***, ** and * indicate rejection of the null hypotheses at the 1%, 5% and 10% significance levels respectively; The critical values are taken from MacKinnon (1996) for the ADF and PP tests respectively.*

As can be seen from Table 1, all the variables are stationary at first difference, hence we can test them for the cointegration. The Bounds Test and Engle-Granger cointegration test results are provided at the right side of Table 2. Both cointegration tests concluded the existence of the long-run relationship among the variables. Therefore, the long-run relationship is estimated, where the estimation results are given at the left side of the Table 2. The residuals of the model are tested for Gauss-Markov conditions and all the results are in line with the requirements, the model also tested for misspecification and concluded that there is no misspecification problem¹.

Table following on the next page

¹ The results of these tests are not given here due to the space limitation, but are available from the authors upon request.

Table 2: Cointegration and Long-run estimation results

	ARDL	FMOLS	Cointegration Tests			
FDI	0.09 (0.00)	0.10 (0.00)	F-stat	9.12	EG tau-stat	-5.04 (0.01)
			Critical Values			
GDP	0.09 (0.00)	0.09 (0.00)	10%	3.70	EG z-stat	-22.47 (0.00)
			5%	4.43		
Constant	0.40 (0.08)	0.35 (0.04)	1%	6.27		

Notes: F-stat= F-statistics for Bounds Cointegration test based; Critical values=Narayan's (2005) critical values for Bounds test; EG tau-stat=Engle-Granger cointegration tests tau-statistics; EG z-stat=Engle-Granger cointegration tests z-statistics; p-values are in parenthesis.

As was mentioned in the methodology section, the main tool in empirical estimations is ARDL model, the results of which are given in the first column of Table 2. The results of FMOLS method, as a robustness check, are given in the second column of that table. As can be seen from the outcomes of both models are very close to each other either significance or magnitude wise. The coefficients have the expected signs, and are statistically significant. Since the variables are in logarithmic form, the coefficients can be interpreted as elasticities of variables. Based on the ARDL estimation results, we can say that the 1% increase in FDI and GDP results in 0.09% increase in CO₂ emissions. Based on the reviewed literature we can say that our finding of positive impact of FDI on carbon-dioxide emissions are in line with the conclusions of many studies in the case of developing countries. In terms of magnitude, our coefficient is close to the findings of Lau et al. (2014) and Shahbaz et al. (2018).

5. CONCLUSION

The impact of either local or international economic activities on environmental degradation is one of the hot topics of environmental economics since its direct influence on the climate change/global warming problem. One strand of the research devoted to the above-mentioned problem is the impact of foreign direct investment within a certain country on the CO₂ emissions level. In this regard, the current paper investigates the impact of foreign direct investment on CO₂ emissions in Azerbaijani case. The study uses consumption based CO₂ emissions, since it is a more proper proxy to measure the impact of international economic activities. For this purpose, ARDL and FMOLS cointegration techniques were employed over the period of 1996-2013. After testing variables for unit root, the results showed their stationarity at first differenced form. Hence, the variables can be tested for a common long-run trend. The Engle-Granger test and Bounds Testing methods were used to analyze the long-run relationships between the variables. The results indicated that there is a long-run co-movement among the variables. Results of the estimations revealed that FDI and GDP have statistically significant, positive impact on CO₂ emissions. This implies that 1% increase in FDI and GDP will increase CO₂ emissions by 0.09%. Our findings give us an opportunity to argue that FDI inflows to Azerbaijan are not so environmentally friendly. We also have found that increase in economic activity increases the CO₂ emissions, which shows the importance of anti-pollution measures. In this regard, we think that besides supporting foreign and domestic investors, policymakers should increase the technological requirements for both producers for decreasing the carbon emissions and its other negative externalities. In other words, the positive correlation of FDI and GDP with CO₂ emissions showing weak anti-pollution measures, which should be developed in order to have environmentally sustainable economic growth.

THE ROLE OF THE CORPORATE SOCIAL RESPONSIBILITY IN SUSTAINABLE DEVELOPMENT OF SMALL AND MEDIUM ENTERPRISES IN AZERBAIJAN

Shahla Gahramanova

Azerbaijan State University of Economics (UNEC), Azerbaijan
shahla.gahramanova@unec.edu.az; gahramanovas@gmail.com

ABSTRACT

Introduction and purpose of the study - The primary goal of this research work is to clarify and give a reasonable explanation to the role of corporate social responsibility (CSR) in sustainable development of small and medium-sized commercial organizations, particularly in post-soviet countries including Azerbaijan. As a central topic, it first discusses the concept of corporate social responsibility, its formation, development, transition to a new level, and then concentrates on the role of CSR for the companies, their sustainable development and establishing an effective dialogue with the overall environment. The author sets out the levels of responsibility of the business from the perspective of the CSR pyramid of Archie Carroll specifying the social responsibility as one of the most important responsibilities of businesses. The role of corporate social responsibility is underlined as an effective tool in gaining competitive advantage and establishing dialogue between the business organizations, community and governments.

Literature review - This research work is developed on the basis of published theoretical literature and articles of national and international researchers studying various aspects of CSR. Some field survey and first-hand information gathering has been conducted at this stage of the research. Used sources includes materials of scientific-practical conferences and business forums, expert analyses, documents of international organizations, as well as of business associations specialized also in scientific research.

Methodology - Methods include logical reasoning based on the analysis of scientific literature and of statistical data, analysis of CSR reports and data that is publicly available on the websites of different companies.

Practical and social implications - Conclusions and recommendations in this research work can be used by business organizations, particularly by SMEs who are interested in developing and practicing a consolidated CSR strategy. Furthermore, the content and the research materials of this study can be used for developing lectures/courses on CSR and Corporate Governance, Business Ethics, Strategic Management.

Keywords: *Business and society, SME, social reporting, CSR, sustainable development, CSR pyramid*

1. INTRODUCTION

The end of the XX century and the first two decades of the XXI century has been remembered by globally remarkable changes in the behaviour of business organizations in terms of their increased responsibility towards the society and the environment around. These developments have particularly been observed in developed countries such as the United States, Canada and developed countries of Europe and Asia. Under the auspices and by the initiative of influential organisations certain guidelines have been developed and standards established to regulate CSR activity of across the world. In our days requirement to social component of the activity of enterprises gain more and more importance regardless of their size, field of action, form of

ownership and organizational-legal form, geographical location, culture and national traditions of the country they operate in.

2. CONCEPT OF CORPORATE SOCIAL RESPONSIBILITY, ITS FORMATION, DEVELOPMENT AND TRANSITION TO A NEW LEVEL

Though the history of the concept of corporate social responsibility (CSR) in its modern meaning is not that far the way it had gone through is quite impressive. As we know, intensive discussions about the social responsibility of enterprise's started after the World War II and as a term CSR was coined by American scientist Howard Bowen in his book «Social Responsibilities of the Businessman» (1953) where he underlined that entrepreneurs carry out responsibility towards the environment where they function and had to contribute to social development. Years later, in 1991 Archie Carroll, an American scientist and the author of the CSR pyramid, supported the CSR concept of H. Bowen in his article "CSR: Evolution of the Term" and emphasised the significance of social responsibility in the sustainable development of businesses. During the last three decades CSR concept has been given a great attention both theoretically and empirically. Having gained theoretical recognition and approval by prominent academicians such as Archie Carroll, Kotler, Schwartz, Dou Jones and others CSR became an integral part of the sustainable businesses across the globe. Though CSR has been recognized by majority as an indicator of company's sustainability and ethicalness there are also approaches against this concept. For example, some scientists support the position of businessmen and entrepreneurs who consider that the solution of social issues and problems of society is the responsibility of the state agencies and businesses should not spend time and resources either than paying taxes and dues. This position was also supported by professor Milton Friedman, an American economist, winner of Nobel prize in economics who argued that "There is one and only one social responsibility of business - to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say, engages in open and free competition without deception or fraud." Accordingly, M. Friedman considered that responsibility of contribution to social development and the control over this activity should be undertaken by the state and other non - commercial organizations. Though supported by M. Friedman and other theorists in 1960s this position didn't gain neither popularity nor the support of the general public. The developments in XXI century and obvious benefits of being socially responsible made this approach totally unacceptable. However, thorough analyses of Friedman theory helps to understand the essence of the main idea behind his approach: open and free competition without deception or fraud is also a sign of respect to social responsibility and ethical principles. This approach is against businesses trying to hide their illegal or unethical activity behind the so called "social responsibility". When costs hidden behind the social responsibility are higher than the investment on CSR related projects it is more unethical than not having CSR activity at all. The developmental dynamics of CSR concept presented in the following table shows that this model, which appeared in the form of small scientific research in the 50s of the 20th century, has entered into a new stage of development in the 21st century and is regulated by the standards and principles of prestigious international organizations.

Table following on the next page

1950–1970	Initiatives (in the form of studies and research works) proposing establishment of mechanisms regulating the social responsibility of businesses	
1980-2000	Acceleration of globalization process, appeals for establishment of environmental and social reporting	
Since 2000	Promotion of sustainable development, promotion of GRI reporting system, Dow Jones Sustainability Indices (DJSI), SA 8000, ISO 26000, AAA1000 etc.	

Table 1: Dynamics of Evolution of CSR Concept

By the development of society, the character of requirements posed to businesses also changes. As stated by W. Shaw, professor of San Jose State University and author of the book “Business Ethics”, in our days “The list of corporate responsibilities goes beyond such negative injunctions such as “Don’t pollute,” “Don’t misrepresent products,” and “Don’t bribe.” Included also are affirmative duties like “See that your product or service makes a positive contribution to society,” “Improve the skills of your employees,” “Seek to hire the disabled,” “Give special consideration to the needs of historically disadvantaged groups,” “Contribute to the arts and education,” “Locate plants in economically depressed areas,” “Improve working conditions.”, etc. While examining the standards contained in the Table 1 we observe that these new requirements of modern society are reflected in the relevant global standards and regulations and it demonstrates transition of CSR to a new level of development.

3. CSR AS A FACTOR OF SUSTAINABLE DEVELOPMENT AND COMPETITIVE ADVANTAGE

Today, across the globe corporate social responsibility and ethical governance are perceived as the indicator and guarantee of the sustainable development and successful performance of a company. As we have noted above, requirements to the social responsibility of businesses becomes more serious regardless of the size and field of activity of businesses, their form of ownership, geographical location, culture and national traditions of the country they operate in. To prove it let’s review some advantages of being socially responsible. A socially responsible company:

- Can charge premium prices and gain brand loyalty because of their responsible approach towards environmental concerns;
- Can generate enduring relationships with suppliers and distributors thanks to trustworthiness demonstrated;
- Can attract talented workforce as their positive reputation makes it easier to recruit talent. High level of retention is one more strong factor of being ethical business which helps to reduce the costs of recruitment and retraining while increasing motivation and productivity;
- Can count on support of government in difficult times;
- A company is more likely to be welcomed into a foreign country when it has positive CSR reputation;
- Socially responsible companies are more likely to attract investors as strategic investors evaluate the business from different perspectives before making a decision on investment. To note that in recent years, the international ranking tables of the most successful companies are headed by the companies attaching a great respect to CSR. It can be seen from the Forbes list of World's Most Reputable Companies of 2018: The World’s most Reputable Companies such as Google, BMW Group, Microsoft, Bosch, The Walt Disney Company, CISCO and others lead the Forbes list of socially responsible companies.

3.1. The impact of CSR to the sustainable development of small and medium-sized enterprises in Azerbaijan

The concept of corporate social responsibility of enterprises, which covers compliance with the requirements for industrial safety and environmental protection, resource saving, provision of good quality products and services, ethical business conduct, investing in social welfare and community initiatives, ensuring decent and safe working conditions has been established in the theory and practice of CSR. However, small and medium sized enterprises cannot afford having the same level of CSR strategy and policy as the big companies do. Their CSR strategy may differ by its scope and components. In developed countries CSR policy has since long been recognized and CSR activities and well established non-financial reporting system is functioning while the situation in developing countries including post-soviet countries is different. The main problem of CSR policy in post-soviet countries is that majority of companies don't have in-depth understanding of social responsibility of businesses. Most of the national companies consider that their overall responsibility is limited to respecting and complying with the norms of legislation i.e. paying taxes, dues, providing related financial and tax reports about their commercial activity. However, the normative acts and legislation doesn't contend all the responsibilities, particularly social responsibilities of businesses. The international CSR regulating mechanisms developed during the last 25 years have not been totally integrated into the national legislation and here the enlightening and regulating role of the government and the non-governmental organizations are necessary to make businesses aware of their social responsibilities. The reason why CSR concept in post-soviet countries, including Azerbaijan, became actual only during the last 10 years (almost 20 years later than in developed countries) can be explained in the following way: 60 years long history of modern CSR concept shows that attention to the social responsibility of businesses increases in parallel to the economic development of a country or an entire region. This was the case in the US, in developed countries of Europe and Asia. As for Azerbaijan, there are number of political, economic and social reasons for belated attention to social responsibility of businesses. Among them are involvement of Azerbaijan in the Armenian-Azerbaijani Nagorno-Karabakh War in 1990s, struggle for the independence that the country gained after being part of the Soviet Union during 70 years, the difficult period of state-building in the conditions of the long-running transformation crisis of the 1990s, the lack of sustainable economic development, demographic crisis, and the poor social environment. Moreover, in order to achieve significant progress in CSR activity, there was a need for a new mechanism that would ensure the transfer of social responsibility from the state to the business. Though this model has not yet been fully developed up to date, yet significant progress is being observed in the field of CSR activity of Azerbaijani companies during the last 10 years. It was possible to achieve as a result of awareness-raising activities, both in national legislation and on public-sector commitment to the society. So, what is the role of the CSR for SMEs in Azerbaijan? - As mentioned earlier, the concept of corporate social responsibility is a relatively new phenomenon for Azerbaijani companies. CSR in Azerbaijan has become popular only since the end of the first decade of the XXI century though the manifestation of philanthropy was part of Azerbaijani entrepreneurs at all times in the form of charity which is considered the predecessor of CSR. Thanks to social contributions of the prominent Azerbaijani Maecenas such as Haji Zeynalabdin Tagiyev, Murtuza Mukhtarov, Aga Musa Nagiyev, Shamsi Asadullayev, Nabat khanum Ashurbeyli and others a significant progress has been made in early XX century in the areas of education, art, construction, science, medicine and some other spheres. To note that Nobel Brothers are also in the list of Maecenas who contributed to the well-being of the Azerbaijani society and are glorified among those who laid the foundation of responsible and ethical business in Azerbaijan. In modern Azerbaijan, the CSR activities try to follow the global trends, while this development comes mainly to the share of big business and does not really encompass small and medium-size businesses.

Azerbaijani SMEs as a rule, limit their CSR activity to a charity of a local scale, presenting it as the main form of their social responsibility. Studies have revealed a number of reasons why small and medium-sized businesses in Azerbaijan continue to abandon their commitment to sustainable social responsibility:

- Absence of required non-financial or social reports. While reading the non-financial reports of companies worldwide we can see components that are very useful for society, for environment, for employees and other stakeholders. Some of the activities doesn't require big resources - they require responsible planning and responsibly developed implementation mechanisms.
- Lots of expenses including income taxes SMEs have to pay to stay legally responsible and they don't have enough financial, material and physical resources to invest in long-term sustainable social projects. As a result, they have to limit their CSR activity to one-time local charity activity.
- Unawareness of the necessity and benefits of being CSR oriented.
- Absence of acknowledgment for the responsible CSR practices which may serve as a strong motivation encouraging enterprises to further develop in this direction. One positive step in this direction was the first Republic Contest on CSR projects organised in October 2018 by the National Confederation of Entrepreneurs of Azerbaijan together with Eurasia International Relations and Research Studies Public Union and the related state agencies.
- Non-active civil society. The role of active and enlightened society to influence businesses is great. Some globally recognized businesses became socially responsible after the call or boycott of the society. NIKE for example became one of the internationally recognised responsible and ethical company after customers boycotted its products because of the irresponsible exploitation of child labour in sweatshops in South East Asia. After having reconsidered its policy of using cheap labour force in bad working conditions the company improved and occupied its place in the list of companies respected for their CSR strategy. Influence of society made the British Petroleum be converted into Beyond Petroleum.

In line with these shortcomings it should be noted that global improvements in CSR activity of businesses and developed frameworks and initiatives are being reflected in the CSR activity in Azerbaijan. The list of measures taken include amendments to the related laws, issued normative acts, joining global social responsibility initiatives and developing related guidelines. The following regulating and recommendation mechanisms have been developed name a few:

- Azerbaijan Corporate Governance Standards developed by the Ministry of Economic Development in cooperation with International Finance Corporation (IFC)
- "The Code of Corporate Ethics" developed by the Ministry of Economic Development in cooperation with International Finance Corporation
- Reforms carried out by the Council on State Support to NGOs
- Establishment of the Agency for Development of Small and Medium-Sized Enterprises
- Activity of the State Agency for Sustainable development under the Ministry of Economics.

Thanks to the taken initiatives by government certain improvements are observed in the field of CSR activity, while (as mentioned above) this development comes to the share of big businesses such as oil companies, big industries, banks and mobile operators and does not really encompass small and medium-size businesses.

4. SUMMARY AND RECOMMENDATIONS ON THE FURTHER DEVELOPMENT OF CSR ACTIVITY OF SMEs IN AZERBAIJAN

The practise demonstrates that the most affordable way of the responsible self-assessment and ensuring the awareness of public about any activity goes through following the requirements,

recommendations and standards set on the given field. Therefore, the adoption of documents regulating corporate social responsibility in the country is a prerequisite for enhancing the social activities of enterprises. Accordingly, enterprises will strive to provide the public with evidence of their socially responsible activities. The first and main document that needs to be developed is standards on social reporting of enterprises and organizations functioning in the Republic of Azerbaijan. This document should be accompanied with methodological guidelines on implementation. The main advantage of adopting these standards will be encouraging companies to approach their SCR activity more responsibly. It will help to minimize the number of businesses having not made sustainable investment for social benefits and trying to appear as a socially responsible company by conducting a hastily organised charity event. Comprehensive preprinted reporting templates will help those who want to be active in CSR and to have their investments and activities more targeted and accurate but not having expertise in this field. Another important issue is providing expert support to organizations in developing and implementing their social responsibility practices. There are various national and international guidance on social, environmental and economic responsibilities such as GRI reporting system, Dow Jones Sustainability Indices (DJSI), SA 8000, ISO 26000, AAA1000 to name a few. However, preparing these reports will require providing expert support for companies. Experts may help companies in developing CSR strategy taking into consideration local conditions and the indicators of a company, surveying and identifying areas to be covered with CSR activity, identifying related indicators and then providing support to companies in drafting reports on the implemented activities. Without having expert support, a company, willing to be socially responsible and carry out related activities will fail in its endeavours and will again be forced to limit their focus on spontaneous charity events to prepare a CSR report. Special attention should be paid that the prepared CSR reports are developed according to the principles reflected in the related documents of reputable international organizations. Below is a short list of the most popular providers of sustainability reporting guidance:

- The GRI (The Global Reporting Initiative - GRI) Sustainability Reporting Guidelines enable companies and organizations to report their economic, environmental, social and governance performance. A sustainability report is a report published by a company or organization about the economic, environmental and social impacts caused by its everyday activities. Sustainability reporting can help organizations to measure, understand and communicate their economic, environmental, social and governance performance, and then set goals, and manage change more effectively. A sustainability report is the key platform for communicating sustainability performance and impacts – whether positive or negative. The Guide provides a list of specific indicators for reporting on the social, environmental and other related activities of an enterprise. One of the main advantages of GRI Sustainability reports is that it is for reporting by companies and organizations of all types, sizes and sectors worldwide. In 2018 companies from all sectors across the globe have published their sustainability reports according to the standards set by GRI's Sustainability Reporting Guidelines.)
- ISO 26000 standards for social responsibility provides guidance on how businesses and organizations can operate in a socially responsible way. This guidance helps organizations to act and report in an ethical and transparent way that contributes to the health and welfare of society. However, it should be noted that ISO 26000 is different from other ISO standards that are certified. It is a guideline regardless that of being called a standard.
- SA 8000 «Social Accountability» is an auditable certification standard developed according to the recommendations of International Labour Organization that encourages organizations to develop, maintain, and apply socially acceptable practices in the workplaces. SA 800 sets criteria for evaluation of several important aspects such as child labor, forced and compulsory labor, health and safety, freedom of association and right to collective

bargaining, discrimination, disciplinary practices, working conditions and hours, remuneration. All the listed aspects are very important to be respected and reported on by small and medium size enterprises.

- One of the most important reporting standards is AA1000 which covers the whole range of necessary information in the field of sustainability. Developed and then updated in 2018 the AA1000 Accountability Principles is applicable to organizations of all types and sizes and is primarily intended for organizations intending to develop an open, accountable and strategic approach to managing sustainability performance.

ABSTRACT

In this article the author considers reasons of the current trends in world development, the large-scale transformation of society based on the influence of scientific, technological and social growth, as well as their speed and interaction, which covers almost all spheres of human activity. Key factors and sources of economic growth change accordingly. Scientific knowledge and intellectual capital, which are the main sources of creating competitive advantages and sustainable development of socio-economic system are considered the most important. From the beginning of independence of the Republic of Azerbaijan to the present, the course of improving science and technology policy of state is consistently implemented aiming at further support for the stimulation of scientific and technological development and innovation activities of the republic. As a result of the policy implemented, a viable science and technology environment has been developed that generates new knowledge priority scientific and technical areas have been identified. In terms of the transformation of the market economy, it successfully solves the issues of macroeconomic stability, which is one of the most important factors of the transition from the export-raw model of economic development to an innovative economy, the key resource of which is human capital. In conclusion should be notes that it is necessary to create a unified national system of scientific and technical knowledge, which should ensure the development and effective use of national resources of scientific and technical information, their integration into the global information space and promote the creation of a market for information products and services. After applying this model of innovative research will develop infrastructure and mechanisms of scientific and technical knowledge. It will fund mainly by private sector and should create for introducing new technologies, production of innovative products, as well as strengthening the scientific potential of the country and improving human resources in the future.

Keywords: *assessment, expertise, innovative economy, scientific, social growth, technical knowledge*

1. INTRODOCTION

To ensure the sustainable development of the national economy, it is necessary to combine various instruments of state regulation in science, technology, and innovation. These tools should aim at creating favorable conditions for the development, transfer, and dissemination of knowledge, creation of innovations, competitive enterprises and high-tech industries, environmental management and the development of social well-being of society. Research institutes and education system play a key role in achieving these, which depends on dynamic economic growth and social development of society. For effective social development, establishing a developed system is important for mutual work, networks, and connecting stakeholders- government agencies, funds, companies, scientific organizations, universities through the developing common interests and strategic plans in joint innovation projects. Constructive activities and projects are carried out by recognizing the importance of such collaboration in Azerbaijan. This paper researches the first steps to be taken to achieve the goal.

In addition to this, the researcher recommends carrying research in the context of higher education institutions.

2. METHODS

2.1. Assessment of scientific activity

The assessment of scientific activity using the existing scientific potential is underway in higher education institutions of Azerbaijan. In this respect, the Cabinet of Ministers of the Republic of Azerbaijan approved the "Requirements for promoting the status of Higher Education Institutions as Research University" (Law of Azerbaijan Republic, p.1). The assessment of scientific activity is crucial for the execution of the relevant articles of the Decree. For the implementation of this process, Azerbaijani higher education institutions need to benefit from international experience. Evaluation system of research activities and scientific potential include the assessment of scientific activity is classified as determining the rankings of researchers, journals, universities, and countries:

2.1.1. Assessment of researcher's scientific activity

Individual assessment - the number of articles and citations for the assessment of the researcher's scientific activity, the age of the articles and so on. Several indicators are applied, for example, h-index, g-index, m-index, R-index, AR-index, and others. The *h*-index is an author-level metric to measure both the productivity and citation impact of the publications of a scientist or scholar. The index is based on the set of the scientist's most cited papers and the number of citations that they have received in other publications. The index can also be applied to the productivity and impact of a scholarly journal as well as a group of scientists, such as a department or university or country (link:H-index). The *h*-index is defined as the maximum value of *h* such that the given author/journal has published *h* papers that have each been cited at least *h* times (McDonald, Kim 2005). The index is designed to improve upon simpler measures such as the total number of citations or publications. The index works properly only for comparing scientists working in the same field; citation conventions differ widely among different fields. (Jones, T.; Huggett, S.; Kamalski, J. 2011, p. 36-38)

For instance, a researcher has a certain amount of articles, and for each *i* article there is a citation in *c* (*i*) number ($i = \overline{1, N}$):

$$\begin{aligned} 1 &\rightarrow c(1) \\ 2 &\rightarrow c(2) \\ &\dots \\ h &\rightarrow c(h) \\ h+1 &\rightarrow c(h+1) \\ &\dots \\ N &\rightarrow c(N) \end{aligned}$$

Articles are arranged in descending order according to the citations. That is, for arbitrary *i*

$$c(i) \geq c(i+1).$$

Then citations *c* (*i*) are compared with an ordinal number of the article, which is *i*. The largest number *i*, the satisfying condition of $c(i) \geq i$ is accepted *h*-index of a researcher.

$$h = \max \{ i \mid c(i) \geq i \}.$$

For instance, a researcher has 9 articles and 20, 15, 8, 7, 6, 5, 4, 2 and 2 are cited according to them. For this case $h=5$. Indeed, $c(1) = 30 \geq 1$, $c(2) = 20 \geq 2$, $c(3) = 10 \geq 3$, $c(4) = 8 \geq 4$, $c(5) = 6 \geq 5$, $c(6) = 4 \geq 6$. As a result, the largest number is 5.

Hirsch index

The row number of articles	1	2	3	4	5	6	7	8	9
The number of citations	30	20	10	8	6	4	3	2	2

Figure 1: Hirsch index

2.1.2. Index of journal assessment

Impact factor is a quantitative indicator of the importance of the journal. The **impact factor (IF)** or **journal impact factor (JIF)** of an academic journal is a measure reflecting the yearly average number of citations to recent articles published in that journal. It is frequently used as a proxy for the relative importance of a journal within its field; journals with higher impact factors are often deemed to be more important than those with lower ones (Alonso 2010, p.179). The impact factor was devised by Eugene Garfield, the founder of the Institute for Scientific Information. Impact factors are calculated yearly starting from 1975 for journals listed in the Journal Citation Reports (Link: Impact Factor). Immediacy Index - assesses the average number of times an article is cited. For example, Immediacy Index of journal F equals the ratio of number of citations (R) in 2014 to the number of articles (T) in the same year.

$$\text{Immediacy Index } (F_{2014}) = \frac{R}{T}$$

For example, if the number of articles published in journal F in 2014 is 100 and the number of citations is 12, then the immediacy index equals $12/100=0.12$

2.1.3. Assessment of organization

Proper, reliable and timely information that can be obtained through objective assessment, regular monitoring and strategic analysis of relevant market segments is required to implement the strategic priorities of the social and economic development of the Republic of Azerbaijan and carry out relevant activities for science, technology, and innovation policy of the state. At the same time, the information should be based on a system of indicators that allows characterizing the scientific, technological and innovative development of Azerbaijan within the implementation of the target socio-economic programs. Indicators should be taken into account for integral assessments by the players of the global market, which determine the country's rating according to one or another development factor and the rating, in turn, affects its reputation, self-identification, and the idea of its present and future. The ratings formed by a number of organizations, such as the Academic Rating of World Universities or the Shanghai Rating, the rating of world universities "Quacquarelli Symonds" and the World University Rating "Times Higher Education" (THE) have worldwide recognition in science and education areas. QS World University Rankings (QS-THES) is a joint project of the UK "TSL Education Ltd" and "Quacquarelli Symonds".

The following indicators are the basis in the "Top 200 World Universities" rating of The Times Higher Education Supplement newspaper, published in November 2004:

- The opinion of the academic community and researchers about the university
- Citation index of scientists' works
- The share of foreign students and teachers

From October 30th, 2009, Times Higher Education separated from QS, and started to collaborate with Thomson Reuters to create a yearly database of "World University Rankings." The magazine identifies a new assessment methodology for readers and editorial staff. Since that period the QS rating system has started a cooperation with the SCOPUS scientific base. At present, the project is being implemented to strengthen the position of the university in QS rankings at the Azerbaijan State Economic University (UNEC). In 2017, UNEC was classified among the top 5.5% of the "Best European and Central Asian Universities". UNEC, which ranks 5th among Azerbaijan's universities, scored 8 points, rose by two points and ranked third among the top-rated Azerbaijani universities last year. Among the specialized Azerbaijani universities, UNEC is in the first place. The current aim is to promote the university's position in this rating. ("QS regional rating for 2018 year" UNEC has been promoted 30 levels. 2017)

2.2. Expertise of scientific activity

Peer review- Activities to replace or supplement the traditional peer review by numerical methods, mainly bibliometrics. Peer review is an assessment process conducted directly by experts. They study the articles submitted for publication, applications for grants, the general level of individual scientists, research groups and institutions. Peer review can range from anonymous review of texts to the teamwork of international specialists (Akoyev 2014, p. 64). Bibliometric techniques are based on the statistical analysis of scientific communication, which in most disciplines (but not all) is conducted by publishing articles in journals. Existing databases (Clarivate Analytics, Thomson-Reuters ISI Web of Knowledge and Elsevier Scopus) contain information from the most reputable world-class scientific journals. Bibliometry is a large number of methods used to measure text and information. Through implementing the mathematical and statistical methods of scientific potential, books, periodicals, and others, bibliometry laws are used to evaluate printed materials. These laws are as follows:

1. Bradford's law of scattering – a law of collecting and disseminating information
2. Lotka's square law - studying the frequency of articles
3. Zipf law - reflects the dependence between the number of words in the text and the frequency of their processing.

In line with the context of this study, it is necessary to introduce Bradford's scattering law. Bradford's law of scattering has been used as an argument about how to build collections, how to select journals to be indexed in bibliographies, how to measure the coverage of bibliographies, how to solve practical problems related to information seeking and retrieval, and by Bradford himself as an argument for a new way to organize bibliographical work and scientific documentation. Any Bradford analysis involves three steps (Diodato, V. 1994, p.16-17):

1. Identify many or all items (usually articles) published in this field;
2. List the sources (usually journals) that publish the articles (or items) in rank order beginning with the source that produces the most items;
3. While retaining the order of the sources, divide this list into groups (or zones) so that the number of items produced by each group of sources is about the same. (Birger Horland, Jeppe Nicolaisen 2005).

2.3. Lotka's Law

Generally, Lotka's Law is an inverse square law that for every 100 authors contributing one article, 25 will contribute 2, 11 will contribute 3, and 6 will contribute 4 each. We see a general decrease in performance among a body of authors following $1:n^2$. This ratio shows that some produce much more than the average which seems agreeably true for all kinds of content creation. However, Lotka doesn't take impact into account, only production numbers. Furthermore, in 1974, Voos found that in Information Science, the ratio was currently $1:n^{3.5}$. (Voos 1974) Thus, we can say that Lotka's Law may not be constant in value, but in following inverse square (Turnbull, Don (1997)).

2.4. Zipf's Law

The most powerful, wide ranging law of bibliometrics is Zipf's Law. It essentially predicts the phenomenon that as we write, we use familiar words with high frequency. A distribution applied to word frequency in a text states that the n th ranking word will appear k/n times, where k is a constant for that text. For analysis, this can be applied by counting all of the words in a document (minus some words in a stop list - common words (the, therefore...)) with the most frequent occurrences representing the subject matter of the document. We could also use relative frequency (more often than expected) instead of absolute frequency to determine when a new word is entering a vocabulary. Zipf said his law is based on the main predictor of human behavior: striving to minimize effort. Therefore, Zipf's work applies to almost any field where human production is involved. We then have a constrained relationship between rank and frequency in natural language. Perhaps Zipf's Law can be applied to other scales of information as well. Wyllys suggests an approach by Benoit Mandelbrot is better at a more granular level. For costs in terms of words, letters that spell the words and spaces that separate them increase with the number of letters in a word, and (expanding outward again) by extension in a message. In other words Zipf's Law works at a micro (language) level as well.

3. DISCUSSION

3.1. Funding of scientific activity

For the evaluation of scientific activity, the volume of funding and human resources should be taken into account for expert research and evaluation. The main reason for the lack of funding for scientific activity is that different countries provide funding for those areas that have had a positive impact on the country's economy. For example, Turkey invests on agriculture, whereas South Korea mainly on scientific research experimental construction work. The second reason is that some of the departments on nature, technical and medical science (technical) have been formed that have profitable practices in their activities without funding. Research shows that the weight of scientific articles printed in journals in scientific research experimental construction work is stable and makes up 10%. Other 90% of the funds are spent on applied research and projects (Latur 1988, p. 288). The allocation of funds spent during the lifetime of EATC can also be classified by the readiness of technology on practical work. Figure 2 (Technology Rediness level 2018)

Figure following on the next page

Figure 2: Distributing Resource costs to R&D.

The numbers will be summed up by the technology TRL. In the Funders section, funds will be allocated to finance economy sectors. In the Performers section, the funds are distributed to the executors. Figure 2 shows that the most cost-effective phases follow after the fundamental research phase (after levels 1 and 2). It should be noted here that the phase of fundamental researches is the most risky stage, it is only state-funded, and for obtaining practical results some delays may occur. In Azerbaijan funding of scientific research works is carried out in two directions in accordance with the relevant legislation: State budget funds and self-financing (Law of Azerbaijan Republic, p.3,4). Funding for scientific research and activities in higher education institutions is allocated from the state budget for conducting fundamental researches, for experimental-design works on the basis of economic contracts is financed from the scientific and technical and social development funds of the institution. Based on the amendments made in the existing regulations, research activities are financed through grants, the same as in the other countries. As an integral part of the teaching process, research activities of the higher education institution will be carried out by means of the founder's funds, grants, funds from various sources and other legitimate sources. Figure 2 outlines expenditure on GDP for research and development over the decade.

Figure 3: Research and development expenditure (% of GDP)

(www.data.worldbank.org)

№	Country	2005	2015
1.	Azerbaijan	0.22	0.22
2.	Georgia	0.18	0.32
3.	Russian Federation	1.07	1.13
4.	Iran Islamic Rep.	0.64	-
5.	Turkey	0.59	-

Table 1: R&D expenditure (%) in border countries.

If we look at Table 1, we see that the neighbor country, the Russian Federation and Georgia, has increased its GDP share for research & development over the years. However, Iran and Turkey are preferring R & D financing in other areas, not in GDP. Due to the limited resources in the past 30 years, scientists and experts have vigorously discussed how to evaluate the results of scientific activities in order to optimize its financing (Zhilyakova E. V., Khrustalev E. Y. 2008. № 2.) In recent years, the degree of discussion has intensified significantly. It should be noted that, according to the legislation, Azerbaijani higher education institutions have to achieve at least 20 grants from local and international donors over the last five years in order to finance scientific activity. There is a need for international experience in this area.

4. CONCLUSION

Throughout this paper, factors possibly influencing the determination of evaluating science in social life of the country, were studied. To achieve results, it was necessary to find appropriate facts, applied by international practice. Due to space constraints, this section is focusing on the main results obtained from basic knowledge in this area. Enhancing the existing scientific potential is a prerequisite for evaluation and monitoring of scientific activity. The following activities are key to achieving this goal:

- Interaction of state authorities at various levels;
- Research and analysis of existing methods of scientometrics and tools for the formation of databases of electronic scientific and educational journals and evaluation of their impact factor, as well as the authors' rating;
- Development of normative-methodological and legal materials on the collection, digitization, cataloging and formation of a database of scientific journals of Azerbaijan;
- Determination of requirements for the presentation of electronic journals in databases, as well as the authors of scientific publications in the country that meet international requirements (in particular, the Web of Science);
- Definition of statistical indicators, which will be reflected in the reports on scientific publications of Azerbaijani authors and methods of their calculation.
- Formation of data of scientific journals published in Azerbaijan and providing online access to them, obtaining information about national citation guides.

Scientometrics Department has been established to investigate and implement these issues in higher education institutions of Azerbaijan. In order to achieve this soon, we need to consider the models used in international practice. The most commonly used is the Norwegian model. The 'Norwegian Model' attempts to comprehensively cover all the peer reviewed scholarly literatures in all areas of research—including the preferred formats and languages of scholarly publishing in the humanities—in one single weighted indicator which makes the research efforts comparable across departments and faculties within and between research institutions. In this model there are three main components:

- a) A complete representation in a national database of structured, verifiable and validated bibliographical records of the peer-reviewed scholarly literature in all areas of research;

- b) A publication indicator with a system of weights that makes field-specific publishing traditions comparable across fields in the measurement of ‘Publication points’ at the level of institutions;
- c) A performance-based funding model which reallocates a small proportion of the annual direct institutional funding according to the institutions’ shares in the total of Publication points (Gunnar Sivertsen, 2016).

All areas of research is equally and properly designed by Norwegian model. In Azerbaijan country implementation of typical mode need involve important researchers in each major area of research. The result of these applying this model will be simple, pragmatic and one single compromise—bibliometric indicator comparably and comprehensively cover all areas of research—in each individual field ideal and several separate representations of scholarly publishing standards.

PRIORITY DIRECTIONS OF FINANCING SOCIO-ECONOMIC DEVELOPMENT OF REGIONS IN AZERBAIJAN

Nusret Babayev

*Azerbaijan State Economic University, Azerbaijan
nusret.babayev@gmail.com*

ABSTRACT

The article outlines the essence of the state's regional policy and determines its main directions. Specifically, the criteria for determining the backward regions, which are of crucial importance in the formation of the regional policy of the state, have been substantiated. The article also substantiates the directions of financing the social and economic development of the regions. These justifications cover energy, transport and social development issues. The article outlines the factors that necessitate the state support to the development of the rural areas. The density of the population was noted as the main factor supporting the development of rural areas. Thus, in rural areas, due to low population density, both production and sales of products require large expenditures in comparison with urban areas.

Keywords: *Regional policy, spatial inequalities, financing rural development, state programs*

1. INTRODUCTION

Provision of regional development at the present stage of Azerbaijan's economic development is one of the most important priorities. Development of all regions of the country leads to overall development and increase of living standards of the population. Regional development policy is aimed at ensuring economic growth and sustainability of economic development. Based on the detection and elimination of structural problems in the country, state policy focuses on forming the necessary conditions for the development of regions and raising their competitiveness. The state's regional development policy, direct and indirect coordination of long-term economic decisions in order to address the challenges posed by regional development, in some cases, income, consumption, employment, investment and so on in regions can be seen as the conscious attempts of the state directed to control over the parameters. This policy is, first of all, related to the amount of public spending on the objectives of eliminating the differences between the regions on the development of regions and the level of socio-economic development. Thus, reaching any of the goals depends on decisions about the distribution of limited economic resources. This applies directly to one of the functions of finance. Second, regional development policy covers the impact of economic agents' decisions on the location of production and investment activities. So, the activity of any subject is related to the location. From this viewpoint, the state will have the opportunity to influence the selection of such a space. By Influencing the formation of income of farmers, the state affects their decisions regarding the location of production

2. METHODOLOGY

Space is an integral part of economic, social, ecological, political and cultural attitudes and processes, and their geographies define the conditions and forms of societal methods of how these processes can be developed (Markusen A. (1987) *Regions: The Economics and Politics of Territory*, Rowman and Allenheld, Totowa, NJ.). The unevenness or differentiation of the economic space has a significant impact on the state structure, the structure and efficiency of the economy, the intuitional changes and the tactics of socio-economic policy (p.41) (*Regional development: the experience of Russia and the European Union.* / A.G. Granberg, Moscow: ZAO "Izd-vo" Economics ", 2000, 435p.). Local and regional progress and material well-being depend on the continued growth of employment, income and productivity, which is an integral

part of economic development (STORPER M. (1997) *The Regional World. Territorial Development in a Global Economy*. Guilford, London.). From this point of view, the concept of "regional development" is related to the change in the number of population, employment, income and value-added regional productivity. It also means social development, which includes the health and well-being of the community, the quality and creativity of the environment (*Theories of Local Economic Development: Perspectives from Across the Disciplines/Edited by Richard D. Bingham and Robert Meir*. London: Sage Publications, pp. 319. C.27). In our view, the socio-economic development of the country is related to the socio-economic development of the regions and the elimination of differences between them. Regional development depends on geographical and demographic factors, specialization and productivity, physical and human capital, infrastructure and innovation. As the factors on the regions differ, their developmental levels also differ. This situation is widespread even in developed countries. For example, in Belgium the gross domestic product (GDP) per capita in the capital is 2 times more than in the province of Flanders, 2.8 times than in the province of Wallonia, and in the Netherlands this indicator in Antwerp is 1.8 times higher than the province of Eno (*Regional policy of the EU countries. IMEMO RAS, Moscow: 2009, 230 p. from. 14.*). Studies carried out in 1995-2007 by member states of the Organization for Economic Cooperation and Development (OECD) have shown that 32 percent of economic growth has been achieved by about 4 percent of the regions. The emergence of such a situation affects the geographical position of certain regions, their natural vulnerability levels, climates, and the quality of land, but in many cases market forces deepen regional inequality. The article uses an application-oriented approach to define areas of financing for regions. The main purpose of the regional economic (or socio-economic) policy is to express the compromise between economic efficiency and social justice, although it is expressed in different ways in different countries (A.G.Granberg. *Bases of regional economy*. Moscow: State University Higher School of Economics, 2003, 495 pp., P. 350). For example, in most OIC member countries, regional equilibrium (justice) and efficiency (growth and competitiveness) are based on regional policies. Examples of regional balances include the priority of the development of the backward regions in Denmark, the regional balance in Finland, the territorial integrity of France, and the equal living conditions in Norway (pp. 14) (*Regional Development Policies in OECD Countries*. Paris:OECD Publishing, 2010, 388 p.). The scale of the development of the regions has a significant impact. It is assumed that the rural area has a higher position in the distribution of economic resources than cities. In such a situation, the development of infrastructure for improving the competitiveness of vulnerable regions can be ensured by the allocation of economic resources to the benefit of vulnerable regions due to the state's funding. Thus, the region's competitiveness has a significant impact on the speed and value of material, financial and information flows in that region.

3. RESULTS

According to the socio-economic development of the forces, the role of the market in reducing regional inequalities is limited and this usually causes concentration of production in separate regions. Therefore, the state implements the redistribution of economic resources in favor of the regions with low development levels to reduce disproportions in the territorial structure of the national economy. In such circumstances, it is necessary to determine the criteria for the implementation of the resource allocation. For example, in the European Union, these criteria are the gross domestic product per capita, the unemployment rate and the rate of job creation, rural and agrarian regions (9. A. Cappelen, F. Castellacci, J. Fagerberg, B. Verspagen. *The Impact of Regional Support on Growth and Convergence in the European Union*. Eindhoven Centre for Innovation Studies, The Netherlands Working Paper 02.14, September 2002, 27 pp, p. 7.).

Thus, in the European Union, if the per capita Gross Domestic Product in the region is 75% of the average, this region is considered to be the backward. Also, the gross domestic product per capita and the share of agriculture in employment is one of the factors that are considered in determining the state support to the regions. From this point of view, it is possible to identify the regions in Azerbaijan that need to be supported. Although the gross domestic product is not calculated in the regions, the gross output per capita on key areas in the regions in 2012 varied from 5.1 per cent to 39.1 per cent of the country's average (Except for the Nakhchivan economic region, this figure is 95.8 percent in this region). As you can see from this criterion, all regions (except for the city of Baku only) are included in the category of regions that must be supported. Also, in 2012, 37.7 percent of the employed population accounted for agriculture, forestry and fishing, which is mainly covering the regions. In this regard, supporting the development of agriculture in the regions, as well as the development of non-agrarian spheres should be prioritized. At present, the Azerbaijani government has the necessary capacities to finance the development of the regions. Successful implementation of oil strategy has increased the volume of revenues in the country. An important part of these revenues remains at the disposal of the state. So in 2011, 50.1 percent of the remaining revenues in the country were aimed at saving and only 42.4 per cent of these resources were directed towards implementing investments across the country. Also, 62.0 percent of total savings in the country in 2011 were at the disposal of the state, of which only 44.3 percent were used. Over the recent years, the state's overfulfilment of the consolidated budget revenues has led to an increase in the assets of the State Oil Fund of Azerbaijan. Thus, the resources of this fund will be \$ 34.1 billion USD by the end of 2012, which is approximately half of the gross domestic product. Limitations of financial opportunities in the regions of Azerbaijan and poor development of institutional structures significantly increases the role of the state in regional development. Despite the implementation of two regional development programs in the country over the past 10 years: State Program on Socio-Economic Development of the Republic of Azerbaijan (2004-2008) and State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan in 2009-2013, the difference between Baku and other regions has not diminished significantly. Taking this into account, the Government of Azerbaijan has adopted the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018. In our view, the precise definition of regional development programs is crucial in terms of the effectiveness of the limited economic resources distribution. These goals are different in different countries. For example, the goal of a regional policy in the UK is to achieve a high and stable level of economic growth and employment across the country by providing full use of the existing potential of each region. In Poland, regional policies are aimed at supporting economic growth pole (large cities), in addition to stimulating the development of the backward regions, especially southern regions. In general, in the European Union, regional programs covering 2007-2013 include goals such as mergers, competitiveness, employment and foreign co-operation (Governing Regional Development Policy: The use of performance indicators. Paris: OECD Publishing, 2007, 198 p, p.34.). From this point of view, it is important to identify the objectives of regional development programs. The main objective of the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018" is the continuation of measures to develop non-oil sector, diversification of the economy, rapid development of regions, especially infrastructure and social services as well as further improvements. In our opinion, the main goal here is to accelerate the rapid development of the regions (including the development of the non-oil sector and the diversification of the economy). Nevertheless, the mentioned program would provide a high tempo of economic growth by identifying development poles in the country and directing resources to the development of these poles. To achieve the goal set out in the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018", it is

intended to achieve further improvement of the provision of infrastructure in the regions, including the provision of communal services to the population, accelerating the development of entrepreneurship in the direction of export-oriented and competitive products, increasing the employment rate of the population, especially the rural population, and the continuation of measures to reduce the poverty level. One of the most important tasks facing the government is to increase employment in the regions. Thus, by the end of 2012, the population in the country increased by 33.2 per cent compared to 1989 and 17.6 per cent in comparison to 1999, while the number of able-bodied population increased by 66.5 per cent and 43.4 per cent respectively. As a result, the share of those who are able to work in the total number of the population increased from 55.4 percent in 1989 to 56.8 percent in 1999, and to 69.2 percent in 2012. It should be noted that this figure reached its peak, 69.3 percent in 2011. As you can see, at present, the country has entered into the most aggressive period in terms of employment. In 2012, the share of Baku in the country's population was 23.0 percent, while its share in hired workers was 44.7 percent. Also, the latter figure increased by 1.8 percent compared to 2000. In 2012, the share of hired workers in the total number of the population was 30.7 percent in Baku, whereas in economically distant regions this figure was 11.4 percent. In particular, the rate of natural increase in rural areas in the country being relatively high, increases the importance of rural development and employment promotion. For this purpose, the following measures are envisaged in the field of employment in the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018:

- expansion of regional economic relations;
- Formation and development of a fair competition environment, ensuring compliance with labor legislation;
- directing a portion of revenues from oil exports to human capital development and applying advanced technology and innovations to the development of science-intensive industries;
- Creating a balance between the proposed workforce and the number of jobs available;
- Reduction of population migration through further development of social and communal infrastructure in rural areas;
- Increasing the level of employment of women and youth.

In general, the creation of new jobs in the country is one of the key factors that determine the economic policy of the state and it will depend on the measures taken to improve the competitiveness of the regions. One of the main directions of raising competitiveness of the regions is related to the development of infrastructure. One of the important areas in the development of the regions is the development of transport. Investments in transport infrastructure increase the region's internal and regional ties with other regions. This leads to the improvement of conditions for production, tourism and commerce, as well as the increase in competition and concentration across the country by reducing the time of transportation as well as the quality and price ratio of transportation services. The development of transport infrastructure in the country is also a necessary condition for the specialization of regions. It should be noted that the development of transport infrastructure has a direct, indirect, and derivative influence on the development of employment in the regions. Direct and indirect impacts are related to the creation and operation of transport infrastructure, whereas indirect impacts result from the impact of transport infrastructure on the region's competitiveness. As a result of the development of transport infrastructure, the time and cost savings, increased access to transport services, and reliability increase productivity in production. For example, the increase in the quality of motor roads can increase the vehicle lifetime and reduce its current operating costs. Also, increasing access to markets leads to increased productivity by creating new opportunities for business and raising competition. Thus, the development of transport infrastructure has a significant impact on employment and economic growth by increasing labor

productivity. The energy supply is crucial in the formation of competitiveness of the regions. Expansion of the electricity grid causes a reduction in system costs associated with investment projects in the regions. Over the past 2004-2013, 17 power plants with a total capacity of 2000 megawatt have been built in the regions, more than 10,000 kilometers of power lines and more than 1,500 substations have been constructed or reconstructed. During the mentioned period, 40,000 kilometers of gas lines were constructed or repaired in the field of natural gas supply, and the level of gas supply in residential houses reached 83.4 percent from 34 percent. At the same time, economic growth in the regions may require additional energy resources. One of the key priorities in the development of the regions is the financing of housing and communal services. So, in most regions of Azerbaijan, in housing and utilities sector, the current level is significantly below the established norms. For example, in 2012 the average per capita housing area in Azerbaijan was 13.1 m², whereas in Sweden this indicator was 52 m², in the UK 34.5 m² and in the US 96 m². Also, the proportion of housing commissioned in the country in 2012 was about 1.9 times less than in 1990. Also, if we accept the amortization period of a residential building for 50 years, then we come to a conclusion that the depreciable part of the country's housing stock is more than 2141.2 thousand square meters of housing put into use in 2012. As it is evident, increasing the housing construction is needed to improve the living conditions of the population in the country. Also, according to a survey conducted by the State Statistical Committee in 2010, an average household in the country consumed 2966.7 kWh of electricity in 2009. This figure was less by 907.6 kWh in Nagorno-Shirvan economic region, 772.4 kWh in Guba-Khachmaz economic region, 1040.8 kWh in Sheki-Zagatala economic region, 505.8 kWh in Ganja-Gazakh economic region, 412 kWh in Nakhchivan economic region and 756.8 kWh in Lankaran economic region. In the mentioned year, the average gas consumption per household was 2143.0 cubic meters, which was less by 619.9 cubic meters in the Nakhchivan economic region, 68.0 cubic meters in the Ganja-Kazakh economic region and 426.7 cubic meters in the Lankaran economic region m, and 345.2 cubic m in the Aran economic region. In 2012, 54.8 percent of households lived in urban areas, 45.2 percent in rural areas, while households with central heating systems account for 12.8 percent, households with network gas - 75.2 percent, the water pipe share of households was 78.8%. Also, one of the priorities is the implementation of measures to improve the population's housing coverage in conditions of population growth. In this area, the continuation of reforms in the housing and communal sector in the regions, supporting the development of the real estate market, provision of low-income citizens in need of housing in the regions, including young families, reconstruction and improvement of the water supply and sewerage system measures are planned to be implemented in 2014-2018. For example, within the project "Reconstruction of water supply and sewerage system of Lankaran city", it is planned to build ultrasonic cleaning plant based on a new technology with the output of 30,000 cubic meters per day. The project envisages construction of 15,000 cubic meters of water reservoir, pumping station, 200 km of various diameter distribution network, 180 km long sewerage network and 8 sewage pumping stations. In recent years, large-scale investments have been made in education in the regions, but this sector still remains a priority. In particular, the coverage of regions with pre-school institutions is low. For instance, in the Lankaran economic region, the level of provision for kindergartens is 15 per cent, in Nagorno-Shirvan economic region - 8.2 per cent and it is 23 per cent in Sheki-Zagatala economic region. Also, the calculations show that the number of seats in the regions is smaller than the numbers specified in the standard (AzDTN 2.6-1). From this point of view financing of construction of cultural facilities is one of the priority areas. It should be noted that, in addition to investment costs in the aforementioned areas, a substantial part of maintenance costs should be provided through the state budget. From this viewpoint, it is required to link the revenues of state budget with increasing costs. In 2012, 60.9 percent of the population in the economic regions of Azerbaijan (excluding Baku) was made up of rural population.

In this regard, the social well-being of a significant part of the population depends on the development of rural areas. As already mentioned, geographically, economic growth is mainly based on scalability and concentration in certain regions and cities. That is, the regions that can not mobilize enough opportunities to obtain employment and income are left behind. From this point of view, rural areas have a number of shortcomings. Thus, rural areas do not have a density which has a positive impact on the growth of the economy in a certain space. For example, according to the definition of the Organization for Economic Co-operation and Development (OECD), if less than 150 people fall per square meter, then such communities are considered as rural communities. If the share of the rural population exceeds 50 per cent in the region, then such region is mostly considered rural, if this share is less than 15 per cent then it is considered an urban region, and finally if it is between 15 and 50 percent, then such region is considered to be a middle-sized region...(OECD Rural Policy Reviews: Germany. Paris: OECD Publishing, 2007, 200 p, p.31.) In general, the American economist J.Makal has included the following factors limiting the development of rural areas (Magill, John (2003), "Rural Economic Development" in Sammis B. White, Richard D. Bingham and Edward W. Hill (eds.), Financing Economic Development in the 21st Century, M.E. Sharpe, Inc., New York, pp. 266-276.):

- Great distance to markets;
- Individual meetings of people living in rural areas (these meetings differ in comparison with towns);
- Limited access to capital (low competition among the rural lenders causes the capital price to be high);
- Limited scalability capabilities;
- Limited network of entrepreneurs;
- Deficiencies in information and business services;
- Restrictions on the relationships of rural economies with the rest of the economy;
- Lack of qualified personnel.

The above mentioned bring the state promotion of rural development to the fore. Also, agriculture is a key element of rural livelihood and is closely linked to other economic, environmental and social development forces in these regions. From this point of view, the development of agriculture affects the well-being of the rural population. In 2012, 37.7 percent of the employed population accounted for agricultural, fishing and forestry, whereas those employed were 38.4 percent of those living in rural areas. Also, about 59.1 percent of the working-age population living in rural areas operated in this area. In 2012, the economically active population in the country was 50.4 percent of the total population. Given these figures, estimates show that around 76 percent of the economically active population in rural areas are involved in agriculture, fishing and forestry. It should be noted that in the countries included in the Organization for Economic Cooperation and Development, only 10% of existing labor resources in rural areas are engaged in agriculture and forestry, and their support is needed (The New Rural Paradigm: Policies and Governance. Paris: OECD Publishing, 2006, 168 p, p.13.). At the same time, income per capita in agriculture is typically lower than in other sectors of the economy. So in 2012, an average of about 135 AZN added value was created per month for a person engaged in agriculture, fishing, and forestry, then we come to the conclusion that in rural areas income from employment is relatively small. From this point of view, the state is required to support rural areas as well as agriculture. The measures to support the development of the agricultural sector are multilateral. Thus, the development of the agricultural sector affects food security, raw material supply, and ecological status. Thus, in 2012, 55.1% of the country's land was used for agricultural purposes, and 29.9% of these land areas were irrigated lands. From this point of view, agriculture has the potential to reduce land quality and to seriously affect water pollution.

In such circumstances, policies for agricultural development should include environmental protection and biodiversity conservation. Also, since rural areas are at a distance from major markets, due to the low concentration in these places, infrastructure density and development levels are low, thus causing additional costs comparing to urban areas. Therefore, it is necessary to provide a state support to the development of rural areas, especially the agricultural sector. A modern approach to rural development envisages the implementation of large-scale investment projects, along with granting subsidies to the development of regions dominated by agriculture. These investments are made in order to create favorable conditions for living in the regions and to increase their competitiveness. This is related to the provision of necessary production and social infrastructure to rural areas. Also, the competitiveness of the agricultural sector depends largely on the development of the fields serving this area and staffing. In this regard, establishment of warehouses in the regions, agro-services serving agriculture, improving the quality of veterinary and phytosanitary services, seeds, fertilizers and pesticides, development of necessary sales channels, such as the organization of information and communication services for agricultural producers, are factors that determine the competitiveness of the agricultural sector. Development of agricultural products processing industry in regional centers and rural areas plays an important role in the provision of developing rural areas. There are great opportunities for the development of the food industry in the republic. Thus, in 2012, the volume of production of food products, including beverages, amounted to about 25 percent of the 1990 level and this decline was mainly due to a decrease in the production of export-oriented food products. Also, the complex processing of raw materials in the food industry is of crucial importance. Thus, in the processing of agricultural raw materials, products and production waste are also obtained along with the main product. For example, except for meat products, the waste of cut animals - hair, nails, horns, bones, gut, blood, etc. are also obtained in meat production. These waste products are used in various types of products (combinations, buttons, brushes, musical instruments etc.) and more than 40 medicines, animal feeds and so on. can be produced by using these wastes. The absence of waste recycling facilities reduces the efficiency of production. Therefore, the complex development programs for separate areas of food products should be developed in the republic, and this program should take into account the processing stages of agricultural raw materials. In general, the development of small and medium-sized businesses on the basis of administrative district centers is crucial for the creation of developmental poles in the country. Meanwhile, the specialization of agricultural products in separate regions, the creation of specialized warehouses, transportation economies and processing facilities can play an important role in the development of the regions. Along with the food industry, there are available opportunities for the development of light industry, mechanical engineering and metallurgy industry, building materials industry in the regions. It should be noted that the development of local raw materials based on the "State Program on socio-economic development of the regions of the Republic of Azerbaijan in 2014-2018" has been identified as a priority in this area. Nevertheless, it would be expedient to further define industry development opportunities within the framework of the mentioned program. In our view, it is required to conduct research in the following areas to identify industry development trends:

- available natural resources and their estimated quantities in the country;
- structure and volume of agricultural production;
- volume of future demand for certain consumer products;
- volume of import;
- successfully developing industries in countries with similar volume and structure of existing financial, labor and natural resources;
- possible interaction of the existing fields in the country with local and foreign related areas;

- opportunities for development based on vertical or horizontal integration of existing production;
- possible diversification of existing production;
- capacity to increase production volumes due to the scale of production.

It should be noted that there are limited opportunities for the development of many areas of industry at the expense of only domestic market. Only industrial products that are oriented to the domestic market ultimately lose capacity to scale-up and are not competitive in the long term. Therefore, it is possible to develop the country's industrial potential by creating relatively large industrial companies. At present, the creation of such industrial companies in the country is mainly possible with state participation and financial support. In such circumstances, certain actions can be taken in specializing in certain industries of separate regions in the country. In recent years, the black and non-ferrous metallurgy industry in the country has been primarily developed in the Ganja-Gazakh economic region. In our opinion, while the areas of food and light industries are mainly developed in line with their specialized agricultural products in the regions, it is advisable to develop industrial production based on raw materials and employment factors. The role of staff in achieving success in the above-mentioned direction is crucial. Therefore, the training of staff and raising their knowledge and skills in the country should be one of the main directions of government policy. In recent years, state funding of education in foreign countries, the development of vocational education and etc. steps are among the measures taken in this direction. Nevertheless, the development of separate regions should be clearly defined and the training of personnel in these areas should be financed.

4. CONCLUSIONS

Thus, direct and indirect financial support of the state is required in these areas. Determination of the role of the state in the financing of socio-economic development of the regions is also made based on the evaluation of the opportunity to participate in this development of the private sector. Thus, regional policy in Azerbaijan is aimed at raising competitiveness in the regions, creating new jobs and increasing social security. Measures in this direction cover both economic and social and environmental issues. Since 2004, regional development programs in Azerbaijan have led to an increase in the overall level of development of the regions, but did not substantially reduce the difference between Baku and other regions due to the level of income. Meanwhile, five-year regional development programs implemented since 2004 have played a crucial role in mobilizing financial resources and promoting regional development.

ABSTRACT

Pakistan is severely suffering from terrorism which have shaken its social fabric, shackled political system and frightened the public. This article provides an empirical investigation of the determinants of terrorism in Pakistan. Principally, the factors affecting terrorism was explored involving in terrorism adaptation by the peoples. The study was conducted in Faisalabad and Rahim Yar Khan and data thus obtained was subjected to logistic regression. Sociological studies using logistic regression models to analyze data in which the outcome variable has two discrete categories, classically referred to as a 'binary' outcome. Through standardized regression analysis, the factors contributing positively or negatively were identified to a change of state leading to potential terrorist activities. Results showed that education, age, radicalization, un-employment, extremism are the major factor affecting the terrorism. The anti-terrorism organization and Government efforts were found to be non-effective for eradication/stopping terrorism. The results revealed that geographic factors are also important to flourish the terrorist activities. Therefore, these identified potential factors should be taken into account in the prevention of terrorism activities in future.

Keywords: *Terrorism, Logistic Regression, Region, Anti-terrorism Organization*

1. INTRODUCTION

The base of the creation of the world is love and kindness. The loveable creatures and colors of world with enormous affection are created by ALLAH. Unluckily, people did not understand the purpose of this world and passing of days destruction have become the fashion. Today, Pakistan is facing severe terrorism problems. Terrorism has become the fashion of the day and a serious threat for the federation and public as well. Its roots have penetrated deeply into the external and internal boundaries of Pakistan. Although, it is a worldwide problem, but Pakistan has been affected terribly. Contribution of Pakistan in the war against terrorism has made the situation more violent (Khan, 2013). Pakistan involved as a front player in the international war of terrorism after 9/11. Pakistan does not only cover geopolitical position, it also becomes a nuclear power. There is large level of supposition that nuclear weapons could put into the hand of religious extremists. Pakistan has also become the central part of radical Islamic creed and its terrorist supporter. Elements of Islamic organization are attracted and central issue in Pakistan that the relations with United States and other dominant competitor created the fight of terrorism.

It is reported that warning is not important but terrorism posits a warning to the Pakistan security and international society and the main reasons are politic, social and economic issues. Jailing or killing terrorists, only the sign and not the sickness act as a part of terror war (Murphy and Malik, 2009). Crenshaw (1988) suggested principles of social cognition apply both to organizations and terrorists individually and concluded that “the actions of terrorists are based on a subjective interpretation of the world rather than objective reality. The foreign transit agencies experienced the destructive cost of terrorist acts like World Trade Center bombing. The phenomenon’s behind the generation of terrorists with respect of psychological dimension of terrorism also highlighted and it was also reported that there is a broad spectrum of terrorist groups and organizations (Post, 2001). Daniel (2002) believed that poverty was blamed for terrorism got repeated so frequently by so many that few people question that it was truth. Pine *et al.* (2005) reported that psychological factors not only contribute to the adoption of terrorism, but also decreased the mentality level of children and also responsible for terrorism activities. Steen *et al.* (2006) found that at national level confrontations of terrorism might have spillover results that could harm other countries. Asal *et al.* (2008) studied factors to pushing families to join Jihad. Keeping in view that such groups will pay off their families in case they expired like poverty, more sons, qualified but have no job, more religious, connection with militant, head of house especially whose sons were educated in Madrassahare are involved in terrorist’s activities. Irshad (2011) narrated that 9/11 incident created a strongest effect on universe in terms of organization and technologies and is responsible in developing and enlarging the terrorism activities. In this article, the factors such as social, emotional, behavioral, religious and economic were considered to appraise their relationship with terrorism in Pakistan and to describe the anti-terrorism organization and Government role in controlling and stopping the terrorism and special attention was focused on whether gender, education, age, geographically and social activities are related to terrorism and highlighted the most important factor which pushes the people in terrorism adaptation.

2. MATERIAL AND METHODS

The study was conducted in Faisalabad and Rahim-Yar-Khan area. A structured pre-defined questionnaire was developed and all the possible risk factors were included. A random sample of 300 respondents from two cities were selected through simple random sampling technique (150 from each city) using equal allocation sampling technique. Furthermore, the data was collected from different areas (residential, market and institutes). Different risk factors such as age, gender, regions, education and religiosity were considered. Most of the variables in this data set were binary in nature while some have more than two categories. When dealing with several competing models, the relative quality of each model must be considered. The quality of a model, as measured by its goodness of fit to the data, may be tested using either of two chi-square statistics as shown below, where O_{ij} = observed frequency and E_{ij} = expected frequency

$$\chi^2 = \sum \frac{(O_{ij} - E_{ij})^2}{E_{ij}}$$

Logistic regression is a type of regression analysis used for predicting the outcome of a categorical (a variable that can take on a limited number of categories) based on one or more predictor variables. Logistic regression could be bi- or multinomial. Binomial or binary logistic regression refers to the instance in which the observed outcome can have only two possible types (e.g., "dead" vs. "alive", "success" vs. "failure", or "yes" vs. "no"). Multinomial logistic regression refers to cases where the outcome can have three or more possible types (e.g., "better" vs. "no change" vs. "worse"). Generally, the outcome is coded as "0" and "1" in binary logistic regression as it leads to the most straightforward interpretation.

Logistic regression analysis studies the association between a categorical dependent variable and a set of independent (explanatory) variables. Logistic regression competes with discriminant analysis as a method for analyzing discrete response variables was used. In fact, the currently logistic regression is more versatile and suited for most situations than is discriminant analysis because it did not assume that the independent variables are normally distributed (Agresti, 1996).

3. RESULTS AND DISCUSSION

The variables selected for association estimation were education, gender, region with 11 important variables. The results regarding gender and response of a respondent are shown in Table 1. The respondent response showed that it did not depend upon his/her gender. Among all respondent, 34.0%, 63.0% and 3.0% revealed strong, moderate and religiosity level, respectively. Regarding personality, the gender and response of a respondent were independent. Does Islam support terrorism; gender and response of a respondent were again independent. Regarding age, the response of respondent was significant and 7.0% respondents revealed that under age 10 year, 51.3% revealed 16 year age, 40.3% respondents' response was under 30-year age. Gender and response of a respondent were independent and response did not depend upon gender. In response of terrorism made an impact on your community, 54.0% responses were great deal, 27.33% to some and 13.0% response was only a little impact. Government has done anything to prevent terrorism, 66.0% responses were yes and gender and response of a respondent were dependent. Regarding economy, 8.0% male response was poverty, 7.3% male response was unemployment and 24.0% say weak mind susceptible of brainwashing and gender response was independent. Regarding education, 34.3% respondents agreed, 11.7% were strongly agreed, 31.0% were disagree and 23.0% respondents disagreed strongly to question those people who interest in Islamic study are lead to terrorism. Children involvement response showed that 13.7% orphans, 10.7% sensitive, 35.0% poor and 40.7% respondents responses were mental disturb and get involved in terrorism activities. A 94.7% respondent response was yes that terrorism flourished wrong image about Islamic values and in response of how the terrorism can be reduced in Pakistan, 51.0% responses were revealed by spreading Islamic education, 18.0% making the justice system and 30.0% response were that by increasing educational level overall, the terrorism can be reduced. The responses related to educations of respondent are given in Table 2. The responses of respondent depend upon their education, 34.0% responses were strong, 58.0% moderate and 0% responses were weak religiosity level and education and response of a respondent were independent. In response of question, does Islam support terrorism, 89.3% respondent revealed that education and response of a respondent were dependent. Therefore, response of a respondent depends upon their education. Regarding age, 7.0% educated respondents revealed age under 10-year, 45.0% age under 16 year and 38.70% age under 30 years. A 54.0%, 27.3% and 13.0% respondent's response were great deal, to some extent and little, respectively in response of terrorism impact on community. In view of government counterterrorism activity, 64.3% educated respondents were satisfied. For poverty, unemployment, weak mind susceptible and brain washing, the responses were 14.3%, 13.3%, 61.0% and 3.33%, respectively and response were also dependent to education level. In response of question that Islamic study are lead to terrorism, 29.7%, 11.7% 27.7% and 23.0% respondent were agreed, strongly agree, disagree, and strongly disagree, respectively. Therefore, the responses were dependent to education level. A 13.7% educated respondents revealed that orphans, 9.0% sensitive, 30.3% poor, and 39.7% mentally disturb people are susceptible to terrorism and education and response of a respondent were independent and 94.7% respondents revealed that terrorism flourished wrong image about Islamic values. Regarding terrorism eradication, 48%, 18% and 26% responses revealed that it can be reduced by spreading Islamic education, making justice system and by increasing overall educational,

respectively. The results regarding region and response of a respondent are shown in Table 3 and it was found that the response of respondent did not depend upon their regions and 34.0% respondents showed strong, 63.0% moderate and 3.0% weak religiosity level. In response of question that do you feel personally that terrorism is an issue and response regarding region were found independent. An 89.3% respondent response was that Islam did not support terrorism. Regarding age, 7.0% respondent's revealed age under 10 year, 51.3% 16 year and 40.3% response were age under 30 year and region wise responses were independent. Regarding terrorism impact on community, 54.0% revealed a great deal, 27.3% to some extent and 13.0% response revealed only a little impact and 66.0% respondents were satisfied with Government to control terrorism. A 19.3% educated respondents revealed the terrorism reason is poverty, 16.3% unemployment and 61.0% weak mind susceptible of brainwashing and region and response of a respondent were independent. Among total respondent, 34.3% were agree, 11.7% strongly agree, 31.7% disagree and 23.0% were strongly disagree that Islamic study lead to terrorism. Among children involved in terrorism, 7.3% responses were orphans, 3.0% sensitive, 16.0% poor and 23.7% mentally disturb and region and response of a respondent were independent. A 94.7% respondent agreed that terrorism flourish wrong image about Islamic values and 51.3% revealed by spreading Islamic education, 18.0% making the justice system and 30.7% revealed that increasing educational level the terrorism can be reduced from the society.

3.1. Logistic Regression Analysis of respondents

The binary logistic regression was used because the dependent variable has two categories. To fit the logistic regression model 11 predictor variables were used. For this purpose, binary logistic regression was used because the dependent variable was of two categories. To explore the terrorism factors, the logistic regression model was fitted using 11 predictor variables e.g. the question does you feel that personally and terrorism is an issue, was taken as dependent variable with 11 questions. Associated probabilities in the Wald statistic provided an index of significance of each predictor in the model. The Wald statistic was distributed as chi-square distribution and finally, *P*-values were considered to evaluate the significance of the studied parameters. Results based on analysis revealed that the ages of people involved in terrorism were in the range of 10-30 years which were further divided into two categories; I) 10-16 year and II) 16-30 year which indicates that young people involved frequently in terrorism activities as compare to a person of age above than 30 which shows that the terrorism agencies de-tracked these young people emotionally. Secondly, it was observed that the uneducated people involved in terrorism more actively which indicated that uneducated people can easily be de-tracked and involved in these negative activities. The major factor behind these types of terrorism (young and uneducated people) and poverty, depression, hopeless and imbalance might be the main reason. Other factors which are also a cause of terrorism include Government efforts. It is observed that government efforts to stop terrorism have been failed totally. Furthermore, it is also observed that people having interest in Islamic study are easily motivated for terrorism on the name of Jihad by different terrorism organizations.

4. CONCLUSION

This study has concerned the public opinion of urban resident (institutes, general market and resident) of Rahim Yar Khan and Faisalabad in an effort to identify the significant factors that influence the terrorism. Further, people opinion about Government and counterterrorism organization were also taken into account. Data obtained analyzed using statistical techniques and provided critical interpretation based on the analysis. It is evident that education, age, radicalization, media, unemployment, mental disturbance and extremism are significant factors in adopting terrorism activity.

Furthermore, Jihad on the name of Islam is also a major factor. Moreover, the Government and anti-terrorism organizations are inefficient/non-serious to stop terrorism. Hence the government may choose to act in this direction by restricting the perceived factors responsible in terrorism spreading. The Government should also manage the Islamic institute according to Islamic values. There is also need to educate people and government should create job opportunities for young people which might be helpful in preventing terrorism.

ABSTRACT

Technological advances have caused dramatic increases in industrial productivity since the emergence of the Industrial Revolution. Although Industrial Revolution creates many new opportunities for companies, at the same time it causes many challenges arising from the ongoing automation and digitization of organizations. The latest changes, such as digitalization and robotics, have revolutionized the nature of work and created a demand for new set of skills to navigate the fourth industrial revolution i.e. Industry 4.0. However, the biggest challenge isn't technology; the focus is on the people. While digital technologies are rapidly becoming a commodity, success largely depends on companies and their employees. In order to face those challenges successfully, companies have to maintain a well qualified workforce. Hence, the purpose of this paper is to highlight the significance of human resource management in frame of Industry 4.0 revolution. The Industry 4.0 revolution has been driven by humans using creative minds to solve problems that were confronted. Moreover, Industry 4.0 is characterized by Cyber-physical systems (CPS), Internet of Things (IoT), Internet of Service (IoS), and Smart Factory and many more technologies that will require organizations with specific expertise. Therefore, the focus is on identifying competencies that are needed to fit well in Industry 4.0 revolution. The main theoretical contribution of this paper is a starting-point for further research of employee's competencies for Industry 4.0. In addition, the given preview of competence models will be useful for creating job descriptions that can ensure the survival of contemporary companies in the era of digitalization. According to identified relevance of competences, future research should focus on the development appropriate competence model and education system, which will fulfill the perceived gap in current practice.

Keywords: *Competence, Competence model, Competence development, Industry 4.0, Internet of Things*

1. INTRODUCTION

The industrial sector plays a crucial role in every economy, serving as a key driver of economic growth (e.g. job creation) and accounting for 75% of all exports and 80% of all innovations (Hofmann & Rüscher, 2017, pp 24). In the past, the industry was affected by technological change and innovation. These paradigms, called industrial revolutions were caused by mechanization (1st industrial revolution), use of electrical energy (2nd industrial revolution) and electronics and automation (3rd industrial revolution) (Lasi, et al., 2014). All these industrial revolutions did not influence only the production itself, but also the labor market and the educational system as well, which is the reason because some professions and jobs disappeared (Benešová & Tupa, 2017, pp. 2195). Due to the development of digitalization and robotics, we are facing the 4th Industrial revolution, i.e. industry 4.0 (Lasi, et al., 2014; De Man & Strandhagen, 2017). Originally initiated in Germany, Industry 4.0, the fourth industrial revolution, has attracted much attention in recent literature.

The fourth industrial revolution not only disturbs the sustainability of current industrial systems, but may also provide tremendous industrialization growth (Liao et al., 2017, pp. 3610). Consequently, human operators experience an increased complexity of their daily tasks; they are required to be highly flexible and to demonstrate adaptive capabilities in very dynamic working conditions (Longo et al., 2017, pp 144). In addition, some professions will be replaced. Moreover, only qualified and highly educated employees will be able to control new technologies. The main vision the following of Industry 4.0 is the emergence of “smart factories”, that will be connected to the production facilities Cyber-physical systems called CPS (Lee, et al., 2015, pp.18-20). Using of the Internet of Things, the Internet of Services and the Internet of People will make following connections: machine-machine, human-machine or human-human, and at the same time an enormous amount of data will be obtained (Benešová & Tupa, 2017, pp. 2196). Nowadays, companies face sustainability challenges, and technological advancements in digitalization and automation. However, the biggest challenge of industrial leaders isn't technology – the focus is on the people. Radical changes aren't always comfortable for the people who make it happen, so change management plays critical role. Also, IT skills are becoming a core capability for every industrial company, so enhancing skills and organizational structures will be required. Lack of skills or competencies in the company's workforce is also the biggest challenge. Some companies also indicate that external partnerships have a role to play, through the provision of technology or training, and a minority of companies (18%) expects to use M&A to acquire outside companies (Geissbauer, et al., 2016). Last but not least, customers require an increasing number of personalized products in variable volumes. This trend requires a radical change in the design and management of production systems (Cohen, et al., 2017, pp. 14962). In order to face those challenges successfully, companies have to maintain a well qualified workforce. Many manufacturing companies are not ready to manage big data due to the lack of smart analytic tools (Lee, Kao, & Yang, 2014, pp. 3), and they need to understand how they can employ technologies in new use cases to offer the greatest benefits to their customers (Lee, et al., 2015, pp. 19, Rübmann, et al., 2015, pp. 12). Although technological tools and their implementation is relevant, producers have to set priorities among their production processes and enhance their workforce's competencies. According to identified research issue, this paper aims to present the development of a competence model. First of all, it is important to reveal the key components and challenges of Industry 4.0 revolution, and to explore the effects, especially in the field of HRM and Human resources development. The focus is on social issues, including the future competencies, so the following research questions will be answered: What are general challenges companies will have to face in Industry 4.0? How do those challenges influence existing and future jobs as well as their related workflows? Which core competencies must employees possess in order to fulfill their current or future job? How can the competence model help a company to maintain a well qualified workforce?

2. INDUSTRY 4.0 EMERGENCE AND KEY COMPONENTS

The industrial environment discontinuously evolved over the centuries. As a matter of fact, discontinuities are identified by disruptive leaps in manufacturing processes resulting in remarkably higher productivity. As a consequence of these discontinuities, we have four industrial revolutions. According to Lukac (2015; referenced by Lu, 2017, p. 1), the first industrial revolution started at the end of the 18th century and is was represented by mechanical production plants based on water and steam power; the second started at the beginning of the 20th century with the symbol of mass labor production based on electrical energy; the third began in the 1970s with the characteristic of automatic production based on electronics and internet technology; and the fourth namely Industry 4.0, is ongoing, with the characteristics of cyber physical systems (CPS) production, based on heterogeneous data and knowledge integration (Lu, 2017, pp. 1).

The economic impact of this industrial revolution is supposed to be huge, as Industry 4.0 promises substantially increased operational effectiveness and the development of entirely new business models, services, and products (Mario, et al., 2015). The term Industry 4.0 was publicly introduced at the Hanover Trade Fair in 2011, presented as part of Germany's high tech strategy, which will enable to prepare and strengthen the industrial sector in order to deal with future production challenges (Hofmann & Rüsç, 2017, pp. 24). Industry 4.0 is currently a top issue for many companies, research centers, and universities, but a generally accepted definition does not exist. In the line with previous findings, scholars have tried to define Industry 4.0 from diverse perspectives. Henning (2013) define Industry 4.0 as "a new level of value chain organization and management across the lifecycle of products." As a matter of fact, the concept of Industry 4.0 depicts the increasing digitization of the entire value chain and the resulting interconnection of people, objects and systems through real time data exchange. Accordingly, the result of that interconnection, products, machines and processes are equipped with artificial intelligence and get enabled to adapt to spontaneous changes of the environment independently (Hecklau, et al., 2016, pp. 2). In order to contribute to this field of research, Hermann et al. (2016 referenced by Hofmann & Rüsç, 2017, pp. 24-25) identified four Industry 4.0 key components:

1. Cyber-physical systems (CPS) is a fusion of the physical and the virtual worlds. Shafiq et al. (2015, referenced by Lu, 2017, pp. 4) defines CPS as "the convergence of the physical and digital worlds by establishing global networks for business that incorporate their machinery, warehousing systems and production facilities".
2. Internet of things (IoT) represents the network architecture for a massive digitalization of various areas of life (Neugebauer, et al., 2016, pp. 3). It consists machines and equipment, networks, the cloud, and terminals, which can be used for offering specific and personalized products, and users are enable to customize products via web pages. After that, web servers transmit data to the industrial cloud and plants via wired or wireless networks. Based on the received data, the manufacturer will integrate design, and will optimize, manage, and monitor the production process in order to produce products efficiently (Lu, 2017, pp. 6).
3. Internet of services (IoS) enables "service vendors to offer their services via the internet. Services are offered and combined into value-added services by various suppliers; they are communicated to users as well as consumers and are accessed by them via various channels" (Buxmann, Hess, & Ruggaber, 2009, pp. 341).
4. Smart factory is defined as "a factory that context-aware assists people and machines in execution of their tasks. This is achieved by systems working in background, which are called Calm-systems and are used to accomplish the tasks based on information coming from physical and virtual world. The main difference between calm and other types of systems is the ability to communicate and interact with its environment" (Lucke, Constantinescu, & Westkämper, 2008, pp. 115).

To summarize, Industry 4.0 is a collective term for technologies and concepts of contemporary organization. Using the modular structured Smart Factories of Industry 4.0, CPS monitor physical processes, create a virtual copy of the physical world and make decentralized decisions. Also, over the IoT, CPS communicates and cooperates with each other and humans in real time. Via the IoS, both internal and cross organizational services are offered and utilized by participants of the value chain (Mario, et al., 2015).

3. CONTEMPORARY CHALLENGES

Based on previous review, Industry 4.0 is as a new paradigm of digitized and connected manufacturing, and it plays the important role in transforming established factories into smart and autonomous production (Arnold et al., 2016; Müller et al., 2018, pp. 1).

Generally, Industry 4.0 creates many new opportunities for companies, but at the same time several challenges arising from the ongoing automation and digitization (Hecklau et al., 2016, pp. 3). Currently, Industry 4.0 is a vision for the future, because it involves many aspects, and faces many types of difficulties and challenges, including technological challenges, economic challenges, social problems and political issues (Zhou et al., 2015, pp. 2150-2152).

3.1. Technological challenges

A digital connectivity implies sharing of data and opening up to a competitive market environment, resulting in transparent business ecosystems that are largely facilitated by online platforms. Accordingly, companies have to deal with two issues. First of all, a high level of transparency exposes companies to the risks of cyber-attacks and industrial spying, and the challenge of securing data rights and access. Second, companies that set platform standards may hamper established companies' unique selling propositions and finally drive them out of the market (Zhou et al., 2017). Other challenges refer to lack of global standards and data sharing protocols and poor existing data quality. In order to deal with these challenges, scholars advise companies to reflect and systematically innovate their current business models (Arnold et al., 2016; Brettel et al., 2014).

3.2. Economic challenges

In regard to an ongoing globalization process, companies have to deal with reduced time-to-market, shorter product lifecycles, and the need to cut costs in order to stay competitive. Moreover, markets have become increasingly volatile and heterogeneous (Hecklau, et al., 2016, pp. 3). Industry 4.0 is related to several challenges and takes place in a highly dynamic competitive environment. According to characteristics of Industry 4.0, it is inevitable that the latest industrial revolution reshapes industry boundaries, creates entirely new industries, and exposes established manufacturing companies to new competitive challenges (Müller, et al., 2018, pp. 7). Subsequently, the need for collaboration is more existent than before. Companies now have to enter strategic alliances with their suppliers or competitors to stay competitive. That further leads to the correlation of entire value chains, and as a consequence, increases the complexity of processes (Hecklau, et al., 2016, pp. 3-4) and financial constraints (Luthra & Mangla, 2018).

3.3. Political challenges

Political challenges refer to legal issues and problem of coordination and collaborations (Luthra & Mangla, 2018). Actually, governments need to support organizations with the development of new technologies as well as the integration of those technological tools in the existing environment. In addition, governments have to establish legal parameters for the usage of big data, because the most important concern is the protection of privacy, and data collection will be necessary while interacting with smart objects (Brühl, 2015 referenced by Hecklau, et al., 2016, pp. 3-4). Moreover, growing work flexibility further requires the establishment of regulations for work times and safety to protect employees (Hecklau, et al., 2016, pp. 3-4).

3.4. Social challenges

One of the most influencing challenges is social issues, including the demographic change, employee qualifications, digital skills and their acceptance of new technologies. In the survey in which respondents were asked what the biggest implementation challenge was in the context of Industry 4.0, their answer wasn't the right technology – it was a lack of digital culture and skills in their organization. Companies need to attract, retain, and train their employees who are comfortable working in a dynamic ecosystem environment. Companies' success with Industry 4.0 will depend on skills and knowledge of their employees and their biggest constraints may

be the ability to recruit the people needed to put digitization into place (Geissbauer et al., 2016). The current jobs in manufacturing are facing a high risk for being automated to a large extent, so the numbers of workers will decrease. The remaining manufacturing jobs will contain more knowledge work as well as more short-term and hard-to-plan tasks (Ganschar et al., 2013, referenced by Stock, & Seliger, 2016, pp. 539). The workers increasingly have to monitor the automated equipment, and the decision-making process need to be decentralized, because all employees should participate in engineering activities as part of the end-to-end engineering (Stock, & Seliger, 2016, pp. 539). Moreover, younger generations express contrary social values, such as the growing importance of a good work-life balance. That goes in line with the growing employee flexibility due to changes in organizations. However, boundaries need to be set up to restrict the continuous availability of employees, in order to constrain the influence of work life on their private life (Hecklau et al., 2016, pp. 3). Analysis of Industry 4.0's impact on German manufacturing indicates that the growth it stimulates will lead to a 6 percent increase in employment during the next ten years, and demand for employees in the mechanical-engineering sector may rise even more—by as much as 10 percent during the same period. However, a further replacement of simple tasks is expected, whereas tasks such as monitoring, collaboration, and training will still be required (Kiel et al., 2017, referenced by Müller et al., 2018, pp. 3). In the short term, the trend toward greater automation will displace some of the often low-skilled laborers who perform simple, repetitive tasks. At the same time, the growing use of software, connectivity, and analytics will increase the demand for employees with competencies in software development and IT technologies (Rüßmann et al., 2015, pp. 6). New job profiles with novel requirements for training and education are expected to emerge, mostly referring to decreasing importance of manual labor in contrast to IT-skills (Römer & Bruder, 2015, referenced by Müller et al., 2018, pp. 3). Additionally, processes are becoming more complex, which leads to an increase of jobs with higher qualifications and a loss in jobs requiring lower qualifications. Therefore, companies need to qualify their employees for more strategic, coordinating and creative tasks with higher responsibilities (Hecklau et al., 2016, pp. 3).

4. DEVELOPMENT OF COMPETENCE MODEL FOR INDUSTRY 4.0

As has been shown, Industry 4.0 is not just about machinery and equipment – people have to be also involved. For instance, there are some companies that have shelled out on remarkably expensive machinery that will remain untouched for months because they cannot find an employee able to operate these. Thus, buying machinery is the easy part, you should recruit the person(s) who'll be able to do something with it. Therefore, employees need to be qualified in order to approach this new technology concept, which is the reason because developing or sourcing employees' qualifications represents a major challenge and obstacle for manufacturers (Kiel et al., 2017; Müller et al., 2018). In the line with previous, this part focuses on indicating a set of competencies required for Industry 4.0. The first definition of competencies was delivered by McClelland, who defined a competency as “a personal trait or set of habits that leads to more effective or superior job performance” (Prifti et al., 2017, pp. 48). Kinkel et al. (2017, pp. 324) defines a competency as “the individual dispositional ability and readiness to act successfully and self-organized when facing novel, unstructured or complex situations or tasks and the ability to develop solutions for future situations”. According to Filipowicz (2011) the simplest possible understanding of a competency is interpreting it as a disposition within knowledge, skills and approaches that allow for executing professional tasks at a proper level. Such a notion of a competency means that it is expressed in the readiness for a specific sort of behavior. According to contemporary challenges, requirements for the qualifications and skills of employees will be higher than at present, because the companies will use new technologies and smart media.

The knowledge, qualification framework and staff training will be an essential part of Industry 4.0. Industry 4.0 will not only change the need for technology skills but will also causes a change in the education of workers (Hoppe, 2018). Consequently, the education system will be changed from Education 3.0 to Education 4.0. (Harkins, 2008) which will combine real and virtual world information. Virtual learning environments (VLEs) will be used for high transfer of developed knowledge and skills, and there will be the implementation of augmented reality in the real environment (Benešová & Tupa, 2017). Based on the analysis in various companies, it is possible to categorize competencies into four main groups – Professional, Managerial, Social and Personal competencies (Hecklau et al., 2016; Filipowicz, 2016).

Table 1: List of competencies (Filipowicz, 2016, referenced by Gudanowska, et al., 2018, pp. 68)

<i>Social competencies</i>	<i>Personal competencies</i>	<i>Managerial competencies</i>	<i>Professional competencies</i>
<ul style="list-style-type: none"> • building a relationship • sharing knowledge and experience • identification with the company • communication • customer orientation • teamwork/team collaboration • solving the conflict • cooperation within the company • exert influence 	<ul style="list-style-type: none"> • pursuit of results (entrepreneurship) • innovativeness and flexibility • analytical thinking • analytical thinking • self-reliance • decision-making • troubleshooting • thoroughness/reliability • professional development/ • readiness to learn • managing each other 	<ul style="list-style-type: none"> • building an efficient organization • team building • ability to delegate • motivating • strategic thinking • planning • leadership • project management • team management 	<ul style="list-style-type: none"> • administering/maintaining documentation • negotiating • orientation in business • procedures – knowledge and application • it skills • technical skills • professional knowledge • process management • knowledge of foreign languages

A competence model is a set of desired competencies for a certain task and may also include a description of single competencies as well as indicators to measure performance and outcome (Prifti et al., 2017). Respecting the relevance of Industry 4.0, and its challenges, future competencies were classified in four categories: adequate personal (e.g., willingness to learn), social/interpersonal (e.g., creative problem solving in social settings), action-related (e.g., ability to find practical solutions), and domain-related competencies (e.g., understanding network technologies as well as data analysis and processing) (Müller, J. M., Kiel, D., & Voigt, K. I. (2018).

4.1. Personal competencies

Personal competences consist the ability to learn, to develop an own attitude and ethic value system that a person may possess. In the context of Industry 4.0, employees have to face the fact that their present tasks no longer exist in the future. De facto, the employees' tasks keep on changing rapidly and there is a need to upkeep with the changes in the tasks. In addition, opportunities for a person's own development and the commitment to lifelong learning should be the responsibility of both the individual and the organization. Personal flexibility with respect to work time, work contents, workplaces and mindsets are prerequisites competencies for an agile production, to respond quickly to market need and environmental situations (Agolla, 2018, pp. 44).

However, rather than developing naive technology, devoutness as a critical attitude towards technological developments is a key asset for the future worker and organization in Industry 4.0 revolution (Erol, et al., 2016).

4.2. Social/interpersonal competencies

The significance of interpersonal competencies is based on a fact that organizations are social systems where interactions take place between different players. Therefore, allowing creative activities to be performed in distributed social settings, involving heterogeneous interdisciplinary and inter-organizational teams, require the ability to communicate complex problems in different languages as well (Agolla, 2018, pp. 44-45). Various authors underline social skills like collaboration (Richter, et al., 2015), teamwork (Richter, et al., 2015, Erol, et al., 2016) and compromising (Erol, et al., 2016), combined with emotional intelligence (Prifti et al., 2017). In addition, these skills also play an important aspect in project management (Grimheden & Törngren, 2014), maintaining customer relationships (Hoberg, 2015), customer orientation (Guo, 2015) and creating business networks (Hoberg, 2015). Therefore, managers must build or act as mediators that permit social processes such as mutual decision processes, which is not only within customary organizational borders but also for the whole network (Cabrilo, et al., 2014). Social media play a key role as supporting technology in the Smart Manufacturing and Industry 4.0 revolution (Agolla, 2018, pp. 45). Managers, engineers and workers now have to show literacy, skills, knowledge and abilities with different tastes of technical communication and support systems (Neeliah & Seetanah, 2016).

4.3. Action-related competencies

Action-related competencies can be understood as ‘the ability to take individual or socially constructed ideas to action’ that transforms dreams into reality in Industry 4.0 revolution (Agolla, 2018, pp. 45). Both managers and workers require strong analytical skills and ability to find domain-specific and practicable solutions without losing the overall goal, which are the key competencies. To accomplish this, therefore, managers must break down complex concepts into realistic work packages, to find and to assign appropriate people and teams. Managers are required to encourage taking new routes but also take into account the risk of failures. For workers and managers alike a strong interdisciplinary “out-of-the box” orientation is likely to facilitate solutions finding in complex environments (Erol, et al., 2016).

4.4. Domain-related competencies

These competences are referred to the ability to access and use domain knowledge for a job or a specific task (Lanza et al., 2015). A core element of Industry 4.0 revolution is the full digitalization of planning and the exploitation of data (Agolla, 2018, pp. 45-46), so the domain or analytical oriented competencies like IT and technology affinity, network administration, data security cloud architectures, programming, in-memory DBs are relevant for the implementation of necessary process. In this area all employees need to bring IT and technology affinity (Erol, et al., 2016; Hoberg, 2015; Hartmann & Bovenschulte, 2013), economics knowledge (Prifti et al., 2017), and be able to extract business value from the use of social media (Erol, et al., 2016; Hoberg, 2015). They should have knowledge in service orientation and product service offerings and change management (Hoberg, 2015), business process (Erol, et al., 2016). Also, knowledge of digital security, including data and network (Grega & Kornecki, 2015, Hoberg, 2015) knowledge about mobile technologies (Hoberg, 2015) and embedded systems and sensors (Grega & Kornecki, 2015) are requested. Besides knowing network technology and M2M communication (Erol, et al., 2016) it is important to possess knowledge of robotics and artificial intelligence (Hartmann & Bovenschulte, 2013). For all employees, big data and data analysis and interpretation (Prifti et al., 2017; Hoberg, 2015)

modelling and programming knowledge (Erol et al., 2016), knowledge about cloud computing and cloud architectures (Hoberg, 2015) will be of big importance.

5. CONCLUSION AND DIRECTION FOR FUTURE RESEARCH

Industry 4.0 enables a faster response to customer needs than is possible today. It improves the flexibility, speed, productivity, and quality of the production process, and it lays the foundation for the adoption of new business models, production processes, and other innovations. This paper provides a strong evidence of the important role human capital plays in Industry 4.0 revolution. In the era of digitalization, the success or failures of most organizations largely depend on how their human capital is managed, which is the reason because Industry 4.0 revolution provides a space where employees to machines interactions are the order of the day. Thus, the interfaces created become the connecting points between employees and machines. However, Industry 4.0 revolution requires creative and inventive employees, which are knowledgeable how to work in such environments. Developing a workforce to meet present and future market needs proposes the identification of required competencies. Competencies such as skills, abilities, knowledge, attitudes and motivations an individual needs to cope with job-related tasks and contemporary challenges. In the first part of this contribution, a comprehensive list of essential competencies for the work in a digitized and interconnected world was compiled. Even though every job has different requirements, the identified competencies are becoming progressively important and need to be addressed by human resource development. However, our literature review showed that research on Industry 4.0 competencies is rather limited. Most of the defined competencies are not new, so we should identify a specific combination of competencies for Industry 4.0. Moreover, current review does not show in which way employees should use their skills and current knowledge. If we consider today's economy and disciplines, there is a clear separation between the competencies that employees from different disciplines should bring. For instance, if we mention IT, everyone recalls a certain job profile and competencies in their mind that is completely different from the profile that one would recall if we mentioned IS or Engineering. The contribution of this paper is based on the fact that in the future the competencies sets that different disciplines should bring will be very similar and will differentiate only in some aspects of domain knowledge. As a consequence this should be a further point where research could offer teaching methods for interdisciplinary teaching. With our work we make an initial contribution that could be further expanded for other professions that require higher education. Further research in the area of Industry 4.0 competencies is required to study further aspects of competencies as well as define how the presented models could be applied in practice. Especially a definition of a competency profile for a certain job description, e.g. which competencies of the model should a programmer bring, could be a further interesting point for research and practice. Further research should focus on the development of specific job profiles, as well as on the integration of different job profiles. So, this paper has practical implications as well. The presented competencies models could be used in practice by companies and universities. Companies could use the model to define job profiles for the implementation of Industry 4.0. It is uncertain that one employee will not bring all the competencies included in the model, but by combining some of them depending on the position, different profiles can be described. Combination of real and virtual environment will cause the changes in education system and its transformation named Education 4.0. Regarding the social dimension of Industry 4.0, several benefits for employees are identified, such as human learning through intelligent assistance systems and human machine interfaces that lead to increased employee satisfaction in industrial workplaces. Additionally, Industry 4.0 will cause an increase or decrease of employee numbers in industry. As a result of these challenges, organizational implementation of Industry 4.0 requires purposeful transformation processes, often referred to as "digital transformation".

Actually, it requires new mindsets for handling challenges of digital transformation, as well as a common strategy for addressing employee qualification and acceptance of individual qualification methods. This will enhance the speed and agility of closing competence gaps with the help of the model.

ABSTRACT

In different countries the growth of the middle class is considered as the main force of political and economic changes in society. On the basis of world experience, we can say that in a democratic society the formation and development of the middle class is considered the basis of the state, but in the authoritarian regime it is considered the main source of threat to the state or government. Studies show that there are socio-economic and political changes in the formation of the middle class in developing countries. Representatives of this class also act as a driving force in addressing important issues, such as increasing employment, creating new business areas, improving infrastructure, creating an attractive environment for mobilizing new resources and ensuring sustainable and proportional economic development for the long term period. In the paper factors affecting the formation of the middle class in developing countries will be grouped and their impact levels will be determined. At the same time, comparative analysis of the current situation in this area will be carried out, the characteristic features of formation of this layer in developing countries will be summarized and appropriate proposals will be given.

Keywords: *middle class, employment, economic changes, developing countries, creating new business areas*

1. INTRODUCTION

The study extensively examines the boundaries and dynamics of the development of the middle class, its professional social composition, the structure of income and expenses.

2. CONCLUSION OF THE MEDIUM STABILIZATION

Despite the fact that the issue of the middle class is a subject of long-term academic research and approach from different perspectives, Aristotle, Marx and Weber's approach are accepted as theoretical basis of this field. The investigations show that Aristotle has a political attitude to the middle class. He noted that the middle class was selected from the rich and poorer

members of the political class as a more just and mighty ruling class.¹ While Karl Marks² designs production or capital owners as a middle class, Max Weber has approached mid-level representatives as a key marketer in the market. Weber referred to members of this class as "third-class" laborers, usually those who are away from the production process, as well as those engaged in individual entrepreneurship, professional professionals, civil servants and independent artisans. For Weber³, the source of income between the classes was different. Considering the earnings of wages and the earnings of capitalists, Weber perceives middle-class wages and, therefore, perceives middle-class workers as keeping the spiritual distance between poor and wealthy holders.⁴ Modern economics think that the choice of middle class owners is wider than both producers and consumers. Thus, in determining the middle class as the owners of this layer, it is more acceptable to consider objective (material-based approach and resource approach), subjective (based on people's involvement in the middle class) and a combination of these two approaches. The approach based on the level of material situation is characterized by a relatively high standard of living and consumption. The key criterion is the level of material situation and is formed on the basis of the following indicators:

- level of per capita income;
- availability of a certain set of expensive property (automobile, technically equipped housing);
- access to paid social services (education, health care);
- Ability to travel around the world (foreign trips for recreation).

The resource approach was put forward by modern English sociologist Anthony Giddens. In this approach, the "old middle class" and the "new middle class" distribution are given. Smaller entrepreneurs in the "old middle class", and the "new middle class" are usually hired workers with high salaries and average wages, engaged in intellectual work. The upper middle of the "new middle class" refers to the managers and highly qualified professionals. The lower part is for teachers, doctors, managers and so on. includes. The "old middle class" gradually decreases, the share of the "new middle class" increases. Thus, the size, type, and structure of the capital are based on the resource approach. This capital is the property of any person, household, class, etc. at his disposal. The subjective approach is based on personal-psychological characteristics of individuals. In this case, the middle class is determined by the people's own considerations. The combined approach is related to the complex application of the above two criteria for determining the middle class (self-determination, occupation, education, property and income characteristics). The investigations reveal that the problems of building a progressive social structure of the society in the recent years are in the focus of attention in the world. Economists still do not agree on a common middle class. Some refer to a class of about 50 percent of US median incomes. Note that there is no general definition of the middle class. One of the definitions given to the middle class is found in Heather Boushey's and American Progress Center's Adam Hersh's "Economic Growth" research case. Here is a summary of the "home-based family with a number of economic security", summarized as follows: "Occupational health insurance and high-paying job-holders, or having the ability to either study or send a child to a college or a new there must be a guarantee of starting work". In this regard, one of the main tasks of the states is to define the social structure and to increase the share of the middle class in society. Thus, according to the opinion of world economists, this special social group is an important social resource for the development of countries and regions.

⁴ Luce, Edward, Vincent Boland, Jo Johnson, Simon Kuper, and Andrew Ward, "Stuck in the Middle," *Financial Times*, 16 Dec. 200: 18

The British demographer and economist, Thomas Robert Malthus, also stressed the importance of forming and expanding the middle class to improve the country's socio-economic development and public welfare. In particular, he noted that "... the middle class in the society is favorable for the development of industry and all the abilities, but not all people can belong to the middle class. It should be noted that an appropriate methodology is used to define the social structure of the society (upper, middle, and lower) that there is a significant difference in the relative numbers obtained on the basis of these methodologies that it is possible to determine which social group the population belongs to, becomes. Based on this assessment, the causes of these problems, which prevent the development of problems in social groups and the development of a better level, can be explored and put forward in the view of removing them. Supporters of the widespread second approach note that the middle layer is indefinable. In the modern era, the middle class is referred to as the result of labor and professional skills, not as people in the past as in the past. In developed countries, the middle class fulfills the function of social stabilizers by organizing the basic social group of the population. Representatives of the middle class are more likely to support the existing state structure. In addition, the middle class plays an important role in other social processes. Thus, the middle class in the field of economic relations plays the role of an economic donor. They are also major producers, investors and large-scale taxpayers. In the field of culture, the middle class plays the role of a cultural integrator - this class protects and carries the wealth, norms, traditions and laws of society. The middle class is represented in the state apparatus or in the business sector as officers and managers. The self-regulation of civil society is based on the activity of middle-class representatives. Its function is called administrative-executive regulator.

3. APPLICATION METHODOLOGY OF MEDIUM STABILITY

The definition of the middle class and the division of the population into groups require further study of the cause of inequality. Finding the middle layer is divided into inequality components, individual groups of population and inter-group inequality. It is carried out in separate categories of the population in the region. Thus, if we are divided into different groups of m , Taylor's average logarithmic decomposition index can be illustrated as follows, if we express the specific weight of the j -group in the general population and its specific weight in consumption.

$$E(0) = \sum_{j=1}^m w_j E(0)_j + \sum_{j=1}^m w_j \ln \left(\frac{w_j}{v_j} \right),$$

Here is the average logarithmic displacement indicator for all individuals in the group $E(0)_j$. The first is the weighted average indicator for the subgroup collected. The first group characterizes the general inequality component of inner inequality. The second is the average logarithmic displacement indicator calculated on the average consumption of each group. Thus, the second group represents an inequality component of inequality. Distribution of income to identify inequality in individual groups, regions and income sources is divided into components. At the same time, distribution of revenue is divided into inter-group and intra-group components. The first component reflects inequality between people in different groups (education, specialty, gender, geographical characteristics), and the second is the interpersonal inequality in the same group. The general index of the division of inequality into components can be summarized as follows:

$$I = I_w + I_b = \sum_{j=1}^k v_j^\alpha * f_j^{1-\alpha} * GE(\alpha)_j + \frac{1}{\alpha^2 - \alpha} \left[\sum_{j=1}^k f_j * \left(\frac{y_n}{y} \right)^\alpha - 1 \right]$$

Where f_i is the specific weight of the j group in the total population ($j = 1, 2, \dots, k$);
 v_j - part of the group income;
 y_j - average income of j group.

Due to revenue source, the components are usually distributed on the basis of income.

This process is based on income rather than consumption. Each component of revenue is derived from the revenue source's concentration ratio in the total revenue at the same source. If there is a concentration coefficient for component k , then G_k^* is found by the following formula.

$$G_k^* = \frac{2}{\mu n^2} \sum_{i=1}^n \left(r_i - \frac{n+1}{2} \right) y_{k,i},$$

where the number of i - i components of an individual income, μ - average aggregate income, is the number of i households in the range of rigid income. Cini coefficient is the sum of the concentration coefficient with the following formula

$$P_k = S_k \frac{G_k^*}{G} \times 100\%$$

The above mentioned inequality factors show the total weight of source income. However, it is necessary to determine the limits of each source of income. In other words, how many percent of inequality varies if x revenue increases on income source. As can be seen from the above, the number of middle-aggregates is a difficult measure. Multiple statistical analysis should be used to identify the middle class as poverty. According to the sociological surveys conducted by the Pew Research Center, the distribution of population by layers has been grouped as follows.⁵

Distribution of revenue by revenue, US dollars	
Poor	<\$2
Lower-Middle	\$2 – \$10
Middle	\$10 – \$20
Upper-Middle	\$20 – \$50
High	>\$50

Table 1: Distribution of revenue by revenue, US dollars

4. MIDDLE CLASS IN DEVELOPED COUNTRIES

Recently, the factors of the middle class are differentiated depending on the level of development of countries. In developed countries, the level of the middle class, along with representatives of higher elite high-paying jobs, such as managers, lawyers, accountants and

⁵ Pew Research Center. 2016. "America's Shrinking Middle Class: A Close Look at Changes Within Metropolitan Areas." Washington, D.C. <http://www.pewsocialtrends.org/2016/05/11/americanshrinking-middle-class-a-close-look-at-changes-within-metropolitan-areas/>

scientists, includes many other social workers, sales agents, school and university teachers, doctors and government officials.

The classification of social groups in the UK, created more than 50 years ago in the course of the National Study of readership, became very widespread in the 20th century and is now widely used in national statistics and government reports. In 2001, this classification was slightly modified by the National Statistical Service of the United Kingdom. Both classifications are presented in Table 2. In general, all previous attempts to describe the middle class in both domestic and Western studies, as a rule, boiled down to identifying the middle class levels depending on income and status positions and in essence repeat the three-level model L. Warner⁶: upper middle class, middle middle class and lower middle class. Today, such a division is generally accepted in the world practice of middle class research.

Levels	Professions	
	Classification of the National Study Readership	Classification of the National Statistical Service of the United Kingdom
Upper middle class	Top managers, executives and professionals	Top professionals and top managers
Middle class	Middle managers, executives and professionals	Lower level managers and professionals
Lower middle class	Managers, Clerks, Lower Level Managers, Administrative Officers, and Professionals Skilled workers	Mid-Level Employees Small Business Owners and Self-Employed Lower Level Managers and Engineering Representatives
Skilled working class	Semi-skilled or unskilled workers	«Routine" profession
Working class	Working without a permanent job, low-level employees, retirees and other groups living on state social transfers	Unemployed for a long period of time
Poor	Working without a permanent job, low-level employees, retirees and other groups living on state social transfers	Unemployed for a long period of time

Table 2: The classification of social groups

Scientists have disagreements about confirming the criteria of the middle class. Some approaches include education levels and incomes, consumer standards, the presence of material or intellectual property and highly skilled work skills. Other approaches consider two options that characterize the structure of the middle class. Some sciences view the middle class as a fairly homogeneous type of education. At the same time, compared with the lower strata of society, the representative of the middle class has a higher income and favorable working conditions; but it has less favorable positions in these parameters, relative to the upper class. The second approach is widespread, emphasizing the heterogeneity of the middle class. For example, according to the modern British sociologist Anthony Giddens, there are two main

⁶ Warner L. What is Social Class in America. New York, NY: Irvington Publishers, 1949. JI. Warner identified only two levels of the middle class: upper and lower. Over time, his model was supplemented by another level - the middle.

categories in it. The first is the “old” middle class - small entrepreneurs. This category is characterized by the majority of the population.

The second category, the “new middle class”, consists of highly paid workers who usually participate in intellectual work. The top layer of the "new medium" includes managers and specialists from big business. As a rule, these people have higher education and are highly qualified specialists. Also includes teachers, doctors and artists. There is no clear boundary between these categories. In addition, there is a strong diffusion between them. Thus, the number of "old middle" classes (class of owners) is constantly decreasing, and the number of "new middle" layers, on the contrary, is increasing. At present, the majority of the middle class are not made up of those whose source of income is their own work and profession, as in the past, but people capable of owning personal property.

5. MIDDLE CLASS IN DEVELOPED COUNTRIES

Figure 1: The structure of social development and development of society

The social structure of developed countries schematically looks like an oval, resembling the shape of an egg (Fig. 1). In particular, compared with the low-income (poor) and high-income (rich), the proportion of the middle class is higher. Thus, currently about 65-75% of the population in developed countries belongs to the middle class. In developed countries, the middle class, as the main social group, performs a number of important social functions. This is clearly seen from the indicator of the distribution of the population into different strata based on per capita income. For comparison, the proportion of people with a daily value above \$ 50 was 46.9 percent in developed countries, while this figure was 8.9 percent in the world and 0.5 percent in Azerbaijan. While the average daily cost of less than \$ 2 is comparable to the situation in Azerbaijan with developed countries, the situation as a whole differs from \$ 2-10. From this it follows that in Azerbaijan the population is more numerous and prone to poverty, and belonging to the middle class. Thus, the current political system in developed countries allows the social structure of society to support the middle class and determine its position, unlike in the post-Soviet countries, including Azerbaijan, where this idea cannot yet be voiced.

Figure following on the next page

Figure 2: Population distribution in developed countries

The existing political system in developed countries protects and allows the middle class to determine its position in the social structure of society. It should be noted that the middle class plays a leading role in the process of social mobility, which, in turn, creates many real opportunities for improving the social status of the lower class and strengthens the existing social structure for protection against social disasters. The World Bank defines \$ 1.90 per day as the global poverty line. The Pew Research Center pushed this figure up to \$ 2 with information from Povcal Net and income surveys in Luxembourg and created a statistical basis for determining the level of stratification among the world's population by including three additional income levels. In this article, we use the same base to determine differences between levels of countries and conduct related research. Based on the above statistical base, the distribution of the population among developed countries can be clearly seen from the following table.

Table following on the next page

Table 3: Expenditures of the population of developed countries, in percent⁷

	high +50 dollars	medium to 20-50	low to medium 10-20	down 2-10	weak 2
Norway	77,2	20,2	1,5	0,6	0,6
Luxembourg	74	24,7	1,2	0,1	0
Switzerland	57,96	39,25	2,5	0,19	0,06
USA	55,7	31,9	7,4	3,4	1,6
Netherlands	68	29,4	2,3	0,3	0
Swedish	40,52	52,76	5,02	1,09	0,61
Germany	59,5	35,4	4,6	0,4	0,1
Danish	72,8	25,1	1,4	0,4	0,3
Ireland	36,2	49,5	11,5	2,4	0,6
Austria	44,88	47,8	5,39	1,31	0,62
Australia	50,1	42,5	5,9	1,1	0,5
Canada	56,4	36	6,2	1	0,3
Belgium	36,97	55,02	6,94	0,83	0,24
Finland	56,5	40,1	3,1	0,3	0,1
France	38,87	53,11	7,13	0,8	0,09
Big britain	42	42,3	12	2,6	1,1
Japan	22,67	60,32	12,98	3,68	0,35
Iceland	60,3	36,2	2,8	0,6	0,2
Italy	23,88	55,31	14,57	4,72	1,52
Spain	27,3	49,5	16,3	5,5	1,4
Israel	21,5	41	22,1	15	0,4
Portugal	8,07	42,5	36,12	12,57	0,74
The developed countries	46,9	41,4	8,6	2,7	0,5
World	8,9	15,5	16,2	43,8	15,6
Azerbaijan	0,5	6,1	30,7	62,1	0,6

As can be seen from the table, Norway is among the highest levels of development. In this case, 97.4 percent of the population exceeds the average-highest and highest share. In the next stage, Luxembourg, Switzerland, USA, Germany, Sweden and others. In addition to the stabilizing function, the middle class plays an important role in other social processes. In the field of economic relations, middle-class entities assume the role of economic donors and act as consumers, investors and taxpayers, as well as those who produce a significant part of the income of society. In the field of culture, the middle class is an integrator of culture. So the middle class is of exceptional importance for the preservation and dissemination of moral values, norms, traditions and laws. Also, the middle class provides human resources for government officials, as well as officials and managers of various levels in business. Self-regulation of civil society is also based on the activities of the middle class. In the third world countries, the figure that adequately reflects the social structure of society is the “pyramid” (Fig. 1): a group of high-class people, a group above the middle class, a large subclass. The relative minority of the middle class leads to the inability to perform the same functions as in developed countries. This can be considered as one of the causes of the socio-economic recession in developing countries. In each country there are similar and easily comparable criteria (education and lifestyle), as well as the individual characteristics of the middle class. For example, savings or the propensity to save in Western Europe and America, the widespread use

⁷ <https://chinapower.csis.org/china-middle-class/>

of credit, etc., belongs to the middle class. In developed countries, the middle class mainly consists of business people, intellectuals, civil servants, artists and skilled workers. Skilled workers work in the “lower middle” class, the “middle” class includes small entrepreneurs, civil servants and other officials, and the “upper middle” includes managers, officials, top managers, and people with hereditary wealth. The middle class also contributes to the scientific and technological development and affects among those who are involved in the fields of application of high technology. Thus, although “yesterday” the middle class was formed among the creators of new technologies, “today”, in the “post-industrial” period, has a high proportion among non-industrial workers. The middle position of this group leads to some contradictions. Thus, according to some left-wing sociologists, the middle class acts simultaneously as exploited and as exploiter: on the one hand, it is exploited by representatives of big business, on the other hand, joins the exploitation of labor rights.

6. MIDDLE CLASS IN AZERBAIJAN

The formation of the middle class in Azerbaijan in the past had a peculiar feature. The bulk of this class were not private owners, but numerous and heterogeneous groups of people — officials, workers, and students. Along with other countries that are part of the former Soviet Union, after World War II, Azerbaijan began the process of building industrialization. Since the 1960s, this has begun to manifest itself in an increase in the standard of living of the population. Thus, a significant part of the technical staff of the middle class and the creative intelligentsia, as well as a significant increase in the purchasing power of highly skilled workers led to the formation of middle-class populations. This class can be compared with the Western middle class in many characteristics (mainly in terms of education). An important characteristic is that these people have no meaningful property (not counting the house and the car). Unlike the Western middle class, the Soviet middle class was very sensitive. In the former Soviet republics, including Azerbaijan, the only form of awareness of this middle class is their sense of belonging to intellectuals. Here, with the beginning of market reforms, a group of people began to resemble the Western middle class.

Figure 3: Layer distribution by population expenditure in 2017

As can be seen from the figure, as in other countries, in Azerbaijan the number of people with an income of less than \$ 2 is relatively small. At the same time, comparing both the global

average and the indicators of the post-Soviet countries, a relatively small number of this group shows that the level of poverty in our country is not high.

However, the high proportion of those who have an income of 2-10 US dollars indicates that the population, on the one hand, is inclined towards the middle class, and on the other hand, it also has a large proportion of the population suffering from poverty. One of the main attacks on the formation and development of the middle class in Azerbaijan was the exposure to military aggression by Armenia from the first years of independence. Thus, as a result of the Armenian military invasions, some Azerbaijani lands were under occupation, and 15 percent of the country's population became refugees and internally displaced persons. In this situation, most of the population is faced with poverty. It should be noted that the level of poverty in Azerbaijan in Soviet times was quite high.⁸ Thus, in 1989, 33.6% of the population of Azerbaijan was considered poor, and this is 3 times higher than the average level of poverty in the Soviet Union⁹. In 1995, 68.1% of the population lived below the absolute poverty level. Since the beginning of the 2000s, Azerbaijan has achieved significant success in the fight against poverty.¹⁰ According to the World Bank, poverty reduction was made possible thanks to strong economic growth, wage increases and successful social protection measures. The resulting situation has led the mass of the Azerbaijani intelligentsia to the position of the lower class ("new poor") and divided the society. Subsequently, the economic recovery further strengthened the unification of the middle class. However, although this process is completely based on the concept of "middle class", the views of local scientists are rather contradictory regarding the existence of this class in Azerbaijan. A number of scientists deny the existence of a middle class not only in Azerbaijan, but even in the post-Soviet countries. But some speak of the peculiarity of the notion "middle class", which unites numerous groups of people, which differ little from each other. However, in the post-Soviet space there is still a belief that there is still a middle class. Some say that the middle class is in its early stages of formation and will soon exist in all post-Soviet countries. Scientists who know the existence of a middle class in Azerbaijan are distinguished by the following main features. Representatives of the middle class in Azerbaijan, as well as abroad, as a rule, are people with a high level of professional education. For most other criteria (income level, consumption patterns and lifestyle), this class of Azerbaijani society differs little from the lower class. A significant part of the middle class in Azerbaijan (about 40%) is the "old middle class", i.e. people engaged in entrepreneurship. As for the intelligentsia, they are mostly at a low level. Thus, the mentioned "new middle" class in the post-Soviet space is smaller than in developed countries. The middle class of Azerbaijan is characterized by high heterogeneity and even uncertainty according to very objective and subjective criteria. He knows the general interests of the middle class. Instead of serving as a stabilizer of society, the middle class is cautious against the official authorities and at the same time does not support the opposition. There are very few elite strata in the country, and the number of low-income or inclined to poverty citizens is very large. The division by income in developed countries resembles the "Egg" and "Pyramid" forms, but in developing countries, including Azerbaijan, it is different and resembles a "straw hat" (Fig. 2). At the same time, only a small part of the poor population belongs to the middle class. According to the results of a sociological survey of the Center for Strategic Studies (SRC) under the President of Azerbaijan, based on a certain methodology (availability: average monthly expenses of one person in the range of 94-470 manat; at least one of household assets, such as a country house or a car) 43.9% of the population can be considered the middle class. Analyzing representatives of the middle class in Azerbaijan, we observe the differential distribution of the indicator of education, which

⁸ <http://www.refugees-idps-committee.gov.az/az/pages/2.html>

¹⁰ Dünya Bankının məlumatları (Azərbaycan üzrə Memorandum, Yeni İpək yolu, İxrac yönümlü diversifikasiya, 2009, <https://www.adb.org/sites/default/files/linked-documents/cps-aze-2014-2018-pa-az.pdf>

is considered the most important criterion. Thus, only 30% of people considered to be middle class have a higher education.

If we evaluate according to predetermined criteria, then the middle class can be divided into two categories: upper middle class, lower middle class. The education indicator determines the volume of the upper middle class. This class covers 33 percent of the middle class in Azerbaijan. Another interesting point is that 66.9% of the average population in Azerbaijan has a secondary and specialized secondary education. Based on the criteria of education, 35% of the highly educated population cannot be classified as the middle class due to three reasons: 1) the principles of social justice in society or a low level of education are violated; 2) 35% of people do not have sufficient financial resources, even if they have a diploma. However, it should be borne in mind that the number of refugees and internally displaced persons in a country may exaggerate these figures. 3) According to the criterion of ownership, the middle class is 66.9 percent of the population, but they should be considered as a lower middle class. Since the probability of the activity of this group in the public life of society, the announcement of social challenges, the decisive role in general and national problems is estimated very low. In determining the classes of the middle class, it has been established that more and more people are qualified specialists (engineers, educators, doctors, scientists or programmers). Meanwhile, it draws to the attention that 20.5% of the middle class is in retirement age. This group of people is not dynamic, although it has certain property capabilities. This does not compromise social demands. One of the key points is that 9.7% of the population in the middle class identify themselves as unemployed. This group considers itself unemployed, although it has certain property. 13.7% of the incoming population who are in the middle class are between the ages of 16-29 years old, 16.9% - 30-40 years old, 29.6% - 41-50 years old, 24.9% - 51-60 years old, 11.1% - 61-70 years old and 3.7% - above 70 years. Based on the results of sociological polls of the SRC, it should be noted that the subjective opinion of the respondents that they belong to the middle class is consistent with our results. Since, 44.2% of the population includes itself in the average status by financial position, 45.8% by level of education and 33.3% by reputation of the profession. Apparently, the percentage of the population (43.9%) that the research group includes in the middle class corresponds to the share of respondents who consider themselves to be a class at the average level by financial status, by level of education and by reputation of their profession. This property sharply distinguishes the inner middle class from the West. In the West, social status criteria are very well coordinated: for example, income at the highest level, as a rule, is associated with the highest qualification. In contrast to the Soviet era, in modern conditions the middle class is distinguished by a certain heterogeneity in its composition. Often, scientists in post-Soviet countries distinguish two levels (even two subclasses) in the middle class — the “old middle” class (the Soviet middle class) and the “young middle class” (the middle class close to Western models). In contrast to the Soviet era, in modern conditions the middle class is distinguished by a certain heterogeneity in its composition. Often, scientists in post-Soviet countries distinguish two levels (even two subclasses) in the middle class — the “old middle” class (the Soviet middle class) and the “young middle class” (the middle class close to Western models). Individual subclasses have not only different external features, but also opposing ideas and values. Signal polarization is observed not only in the internal structure of the middle class, but also in its social geography. The middle class of capital cities has nothing to do with the surrounding class. Thus, the share of highly paid employees of medium and fixed capital is higher among entrepreneurs in the environment. Consumer standards are also very different: if in the capital more attention is paid to entertainment and comfortable living conditions, in the regions there is an indicator of the state of society, there is an expense for food and clothing.

Figure following on the next page

Figure 4: Population distribution by strata in Azerbaijan

The discrepancy between the living conditions and views of different groups of the Azerbaijani middle class leads to their mutual negation: intellectuals criticize businessmen, are “attacked” by metropolitan regions, and the “new weak” respect the “new rich”. With regard to the political views of representatives of the middle class of Azerbaijan, scientists note the absence of any stable and clear political problems. None of the political doctrines attract many of the middle class. Representatives of such a middle class associate their well-being not in any political regimes, but with their personal qualities and their activities. In many cases, the lack of desire for active participation in public life does not undermine the function of stabilizing this class.

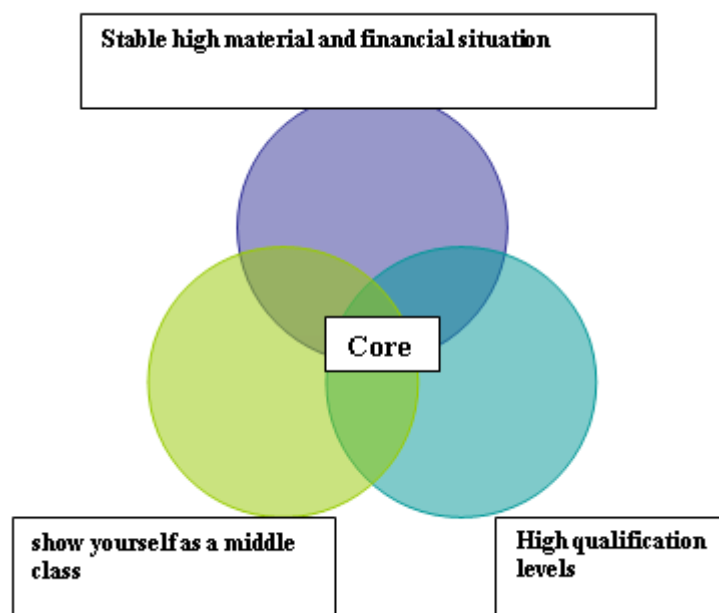

Figure 5: Identification of the middle class in view of income, professionalism and other characteristics

Thus, a relatively small “real” middle class (about 30% of the total population) and a large number of the average population (approximately 60%) in modern Azerbaijan have only a small part of the characteristics of the middle class. This situation can be described as a median indicator, reflecting at least one of the three functions of the average level.

7. CONCLUSION

In the future, apparently, there will be a combination of Western analogues in the post-Soviet space due to the spread of the proto-middle layers of the middle class to the “core”. At the beginning of the 21st century, there is a need for targeted state policy with the goal of “ripening” the middle class in the post-Soviet space, including in Azerbaijan.

ABSTRACT

This paper explores and analyzes the dynamics of firm growth and productivity, on the one hand, and the investments in innovation activity, on the other, as we distinguish between firms from Agricultural sector and Food processing sector. An attempt has been made to examine the relationship between the firms' growth and performance and the innovation activity of firms of different size and age. For this purpose we analyze 1) the change in the sales revenue and value added from firms' operations; 2) the significance of investments in innovation activities and real assets, the size and age of the firms as factors for higher growth and productivity. Our findings show that regardless the firm size there is a positive link between firms' growth, productivity and age and the amount of innovation investments for the food processing firms, and not for the firms in Agricultural sector. Innovation active firms in both sectors indicate better economic performance and create more value added. Considering firm size, we found that the investments in innovation activities and firms' age are significantly related for the small and large firms in the Agricultural sector and the small and medium firms in the Food processing sector. Large innovation active firms from the Food processing sector invest more in real assets, however in the Agricultural sector the small and medium-size innovative firms outstrip investments of the large firms. Food processing firms show higher ability to generate revenues, create more value added and perform larger investments. Investments in real assets are significantly linked with firms' innovation investments in both sectors.

Keywords: financial performance, firms' growth, innovation activity, investments, productivity

1. INTRODUCTION

Agricultural sector is a key sector in the Bulgarian economy. It is involved in rural development and employment, thus indirectly creating around 12-15% of the country's GDP, which is significant and important enough, and shows the potential to improve its performance in the future. In 2017 it accounted for 4.69% of the country's GDP at current prices.¹ Food processing industry is one of the manufacturing industries in Bulgaria, which in the year 2017 accounted for 24.33% of country's GDP. Both sectors have been the subject of discussions by many authors over the years, as they are a major driving force in a country's economy. Various relationships between them have been addressed in literature, including: age, growth and innovation; size and innovation; productivity and innovation; size and productivity; innovation, productivity and export by firms, and others. Studying the connection between innovation and growth of firms for the various age groups, Alexander Coad et al. (Coad, Al., Segarra, A. and Teruel, M., 2016, p. 387–400), found that investment in research and development (R&D) of young firms proved to be significantly riskier than R&D investments of older firms. The findings of Orkun Yildiz et al. (Yildiz Or., Bozkurt Ç., Kalkan Ad. and Ayci, Al., 2013, p. 590-599) also confirm that older age together with firm growth plays an important role in the

¹ <http://www.nsi.bg>

innovative performance of the firms. Czarnitzki and Delanote (Czarnitzki, D., Delanote, J., 2013, p. 1315–1340) believe that young innovative firms are developing faster and are therefore more effective, but García-Quevedo, J. et al. (García-Quevedo, J. et al., 2014, p. 1544-1556) claims that previous innovation experience is a major development factor, so young firms are more unstable and have to be more stubborn. Segarra, A. and Mercedes Teruel (Segarra, A. and Mercedes Teruel., 2014, p. 805–821) analyze the effect of investment in innovation on business growth. As an indicator of growth, they use two alternatives, according to the number of employees and sales volume. The authors conclude that a small number of firms in the survey have a rapid growth rate. The results reveal that investment in innovation has a positive impact on the likelihood that firms will become HGF (high-growth firms). Zoltan and Audretsch (Zoltan J. Acs and David B. Audretsch., 1987, pp. 567-574) believe that large firms tend to have a relative innovative advantage in sectors that are capital-intensive, highly skilled and produce differentiated goods. Gardiner, R. and Petr Hajek (Richard Gardiner, R., Hajek, P., 2016, p. 630-637) support the thesis that human capital is an important prerequisite for the investment activity of SMEs. Bianchini, St. et al. (Bianchini, St. et al., 2014) as well as Cainelli, G. et al. (Cainelli, G., Evangelista, R., Savona, M., 2006, p. 435–458) explore the connection between business growth and investment in innovation. Authors find that there is a dependency that has a positive impact on firms' economic performance. While Coad, Al. & Rekha Rao (Coad, Al., Rao, R., 2010, p. 127-145) found a different result - sales pace is poorly influenced by the investments made in innovation. Another important dependence that is widely studied in literature is productivity. Chronologically, productivity in industry is gradually overtaking that in the Agricultural sector. Early studies (Smith, A., 1937) show that productivity in Agriculture is growing faster than in the manufacturing sector. Over the years, the theory has been confirmed by the works of other authors (Jorgenson, D. W., Gollop, F. and Fraumeni, B., 1987; Lewis, P., Martin, W. and Savage, C., 1988, p. 48-53; Bernard, A. and Jones, Charles I., 1996a, p. 135-146). Over the last decades, however, industry has been found to have better growth rates than the agricultural sector. The foundations for this have been laid by Karl Marx and David Ricardo, followed by other authors (Hayami, Yujiro and Ruttan, Vernon W., 1985; Schultz, T. W., 1964). According to Will and Devashish (Martin, W., Devashish, M., 1999) the comparison of productivity growth between Agriculture and Industry is also important for research resource allocation policy. Halkos, G. Em. and Nickolaos G. Tzeremes (Halkos, G. Em., Tzeremes, N. G., 2007, p. 713-731) analyze the relationship between company size and productivity. They found that the size of firms has an indirect impact on their productivity. Acemoglu. D. et al. (Acemoglu. D. et al., 2017) has built a model to explore the relationship between innovation costs and productivity growth. The model is suitable for analyzing the dynamics of company entry into and exit from the market, production and R&D. Plane, P. and Marie-Ange Veganzones-Varoudakis (Plane, P., Veganzones-Varoudakis, M., 2018, p. 125-139) explore the relationships between innovation, productivity and export of firms. In their research, they conclude that R&D training is mutually supportive in the innovation process - R&D stimulates companies to train their staff, and in return training stimulates R&D. Huergo and Jaumandreu (Huergo, El., Jaumandreu, J., 2004, p. 541-559) find that innovation at some point leads to further productivity gain.

2. DATA AND METHODOLOGY OF THE RESEARCH

Firm productivity and growth is seen as an expression of net sales, value added and employment in the current period. For analysis purposes, we define productivity as net sales per 1 employee. The value added per employee is obtained by deducting the cost of raw materials, external service's costs and depreciation costs from net cash income. We measure firm growth as a change in net sales and the ability of firms to create value added. We determine the productivity and growth of firms as a function of their innovation activity, investment in real assets, size and

age (years of business activity of the firms). We investigate innovation activity by firms' investing in intangible assets.² In particular, we use the available data on intangible assets costs reflected in the firms' balance sheet. Accordingly, the firms that invest in intangible assets expenses we define as innovation active, and those who do not invest in innovation activities, as innovation inactive firms. In the analysis of the investment activity of the firms in real assets, we use the acquisition cost of tangible fixed assets as an indicator. In order to deepen our analysis, we track the investment activity of the innovation active and inactive firms. To that end, we distinguish two groups of firms on whether they are investing in the intangible assets. We determine the size of firms by the number of their employees, as defined in the Small and Medium-sized Enterprises Act (SME)³ - small with 10-49 employees, medium with 50-249 employees and large firms with over 250 employees.⁴ Regarding the age of firms, we define four categories as follows: 0-5 years, 6-10 years, 11-15 years and over 16 years. The database we are working with has 14193 firms, 7409 of which are from the Agricultural sector⁵ and 6784 from the Food Processing Sector⁶. This survey employs empirical data over the nine-year period 2007-2015. For the year 2015 the firms are 1401, 752 of which are from the Agricultural sector and 768 from the Food processing industries and for 2007 there are 1699 firms, 912 of which are from the Agricultural sector and 787 from the Food industries. Further in this article the presence of statistical dependence of the differences in the economic performance and the investment activity of the firms on their innovation activity is searched through variance analysis.

3. RESULTS

3.1. Innovation and investment activity

The number of firms that do not spend on investment in innovation activities exceeds the number of innovation active firms in both sectors (Figure 1). Innovation active firms account for only 35% for the entire sample. An exception is observed in medium and large firms from the Food processing industries, where the innovation active firms are 55% and 90%, respectively. Small firms are predominant in both sectors. Medium agricultural firms are six times less than medium size firms, while in the Food processing sector the difference is less than twofold. In the Agricultural sector the large firms are only 3, and they account for 0.4% of the total. While we have 33 processing firms in the sample and they account for 4.30%.

Figure 1: Distribution of firms according to their investments in intangible assets and size, 2015 (Source: created by the author)

² The data are collected from the firms' balance sheets and present information for both R&D and non-R&D investments, including investments in knowledge-based capital, such as software and databases, innovative property in terms of patents, designs, trademarks, etc.

³ The distribution of enterprises in this study is in accordance with the Law on Small and Medium-Sized Enterprises, Art. 3, para. 1-3 (promulgated SG No. 82/16 October 2009, as amended and supplemented)

⁴ In this study data from small, medium and large firms were used.

⁵ According to Nace Rev. 2 2008, Section A

⁶ According to Nace Rev. 2 2008, Section C, Divisions 10, 11 and 12

The costs of intangible assets incurred by the firms during the survey period show that small firms maintain a low level of innovation costs (Figures 2 and 3⁷). Steady growth is observed in the cost of small firms from the Food processing sector, while the cost of agricultural firms has shown a sharp but unsustainable rise (2011-2013).

Figure 2: Intangible assets cost in the Agricultural sector, 2007-2015 (Source: created by the author)

Figure 3: Intangible assets cost in the Food processing sector, 2007-2015 (Source: created by the author)

Strong impression is made by the significantly higher investment cost in innovation activities in the Food processing sector. In the Agricultural sector, from 2011 until the end of the survey period investments in innovation activity follow a decrease, while in the Food processing sector gradual increase was seen. Largest expenses for intangible assets were made by the firms in 2008 (BGN 128,80 thousand in the Agricultural sector) and 2015 (BGN 5277,27 thousand in the Food processing sector, more than 40 times over the ones in the Agricultural sector). In the analysis of the investment activity, there is a higher tendency of the large and the innovation active firms to invest in real assets. Of these, with the largest investment cost stand out the large firms from the Food processing sector. They invest 2.54 times more money in real assets, amounting to BGN 30 888.87 thousand, compared to the innovation inactive firms whose investment costs amount to BGN 12 143.67 thousand. At the end of the period, 2015, increased investment activity of the innovation active firms can be observed (Figures 4 and 5). Investments in real assets of the innovation active small and medium firms in the Food processing sector exceeded more than twice the investments made by innovation inactive firms.

Figure 4: Investments of innovation active firms in real assets, 2015 (Source: created by the author)

Figure 5: Investments of innovation inactive firms in real assets, 2015 (Source: created by the author)

An exception is made by large innovation active firms. In 2007, all large firms in the Agricultural sector were innovation active, while in 2015 their number decreased. However the size of the investment exceeded that of innovation inactive firms more than twice in 2015. The biggest difference in investment size is observed between the large food processing firms.

⁷ Values on the vertical axis in all Figures are displayed in BGN thousands (where applicable).

3.2. Productivity

In the firms' productivity analysis, we again see that innovation active firms have higher revenues and value added per employee compared to innovation inactive firms. Firms in Food processing sector are more productive than agricultural firms.

The firms' net sales dynamics is positive and shows a growth trend in both sectors (Figure 6).

Figure 6: Net sales per employee and value added per employee, 2007-2015 (Source: created by the author)

Until 2009, food processing firms showed higher revenues, but after 2010, agricultural firms increased their ability to earn revenue and steadily outpaced the productivity per employee of the Food processing sector firms. The value added dynamics of the firms in both sectors shows a similar upward trend until 2013, and then the value added volume realized by the agricultural firms decreased. For the 2007-2015 period, the value created by the food processing firms exceeds the value added produced by the firms in the Agricultural sector (excluding the period 2010 to 2012). We see that the evolution of value added by agricultural firms is characterized by greater dynamics. Differences in comparative productivity are observed in innovation inactive small firms in the Agricultural sector and the Food processing sector. The results show that the productivity of agricultural firms without innovation investments exceeds that of firms in the Food processing sector. There is a significant difference in the amount of investment in innovation activities by large firms in both sectors. The volume of investments made by food processing innovation active firms exceeds 4 times those made by agricultural firms on average.

3.3. Age

The analysis of the age structure of firms shows that firms operating over 16 years are prevailing (Figures 7 and 8). Such age is found for more than half of the firms in both sectors, with firms operating 16 years or more in the Agricultural sector, occupying a significantly higher share of 70%. The relative share of the same age-based firms in the Food processing sector is 58%.

Figure 7: Distribution of firms by age, Agricultural sector, 2015 г. (Source: created by the author)

Figure 8: Distribution of firms by age, Food processing sector, 2015 г. (Source: created by the author)

3.4. Comparative analysis of economic performance

The differences in the economic performance of the innovation active and inactive firms are studied with respect to the following variables:

- Net sales per 1 employee;
- Value added per 1 employee;
- Investments in real assets per 1 employee;
- Age of the firms;
- Average number of employees.

The descriptive statistics of the average values of the above-mentioned variables shows that innovation active firms generate higher net sales per employee and invest more funds in real assets per employee (Table 1).

Table 1: Descriptive statistics of productivity, investment activity and age of firms, depending on the availability of investments in intangible assets, 2015 (Source: created by the author)

2015 year	Agricultural sector		Food processing sector	
	Non innovative ⁸	Innovative ⁹	Non innovative	Innovative
Net sales per employee, BGN thousand**	177,76	201,62	306,96	416,76
Value added per employee, BGN thousand**	30,11	31,04	56,50	118,17
Investments in real assets per 1 employee, BGN thousand*	91,75	120,02	26,60	51,39
Age of the firms, years***	14,75	15,85	12,71	13,18
Average number of employees*	29,60	40,20	42,40	128,50

* differences are statistically significant at a level of significance $\alpha = 0.05$ for both sectors – Agricultural sector and Food processing sector

** differences are statistically significant at a level of significance $\alpha = 0.05$ for the Food processing sector only

*** differences are statistically significant at the level of significance $\alpha = 0,05$ for small and large firms in the Agricultural sector and for small and medium firms in the Food processing sector

The absolute values of the net sales and value added per one employee by the innovation active and inactive agricultural firms show differences, with higher values observed in the innovation active firms. The analysis of Food processing sector data is analogous and firms that have costs for intangible assets have higher net sales and value added. The study of the value added differences of innovation active and inactive firms shows that average values of the food processing firms exceeded the average values of the Agricultural sector firms. Analysis of investment in real assets shows a higher investment activity for Food processing sector firms. The cost of real assets for innovation active firms in the Agricultural sector is almost twice as high as that of innovation inactive firms, and in the Food processing sector innovation active firms are more than 7 times more than the innovation inactive. Differences are also observed when comparing the values in Table 1 for the two sectors – the net sales and value added per employee of food processing firms are higher, while agricultural firms show higher investment activity in real assets per employee and age. Net sales of innovation active firms are almost 4 times higher than those of innovation inactive firms. The difference in net sales per 1 employee is relatively small, only 1.5 times, due to large firms, which invests the most in innovation activities but their employment is larger and not productive enough. The same is true for the value added of the Food processing sector firms, the difference between the innovation active and inactive firms is over 6 times, and for value added per 1 employee – 2 times.

⁸ We use "Non innovative" for the firms that do not invest in innovation activities

⁹ We use "Innovative" for the firms that invest in innovation activities.

Higher employment is provided by innovation active firms. Compared by sectors, the number of employed in food processing firms significantly exceeds those in innovation active agricultural firms (over 3 times more). Additionally, on the basis of unweighted net sales and value added data for innovation active and inactive firms in Agricultural sector, we revealed the presence of significant differences (Table 2).

*Table 2. ANOVA of net sales and value added, firms from the Agricultural sector 2015
 (Source: created by the author)*

Groups		Count	Sum	Average	Variance
Net sales*	Non innovative	540	1431784	2651,452	23098556
	Innovative	212	861398	4063,198	32020219
Value added	Non innovative	540	217472	402,7259	5128546
	Innovative	212	122578	578,1981	2682578

* Differences are statistically significant at the level of significance $\alpha = 0.05$

Among the firms that spent on intangible assets in 2015, the number of food processing firms is greater by 73. In terms of relative values, the share of innovation active firms in the Food processing sector is 37.11% and exceeds the share of agricultural innovation active firms, which is 28.19%. The results of the survey show significant differences in the ability of innovation active firms to generate income from their activities. The average net sales for the Food processing sector is 5.26 times greater than that of the Agricultural sector. Although the innovation active firms in the Agricultural sector are only 28.19%, they have generated 1.5 times more net sales - 4063.20 BGN. Even more significant is the difference within the food processing firms - the net sales of the innovation active firms exceed 6 times the net sales of the firms that do not invest in innovation activities.

4. CONCLUSION

Firms in Agricultural sector and Food processing sector that recognize investments in innovation activities as an important factor for higher economic performance represent a low relative share of total number of surveyed firms. Only 35% of all firms undertake innovation investments. Taking into account cross-sectoral differences, we see that innovation active food processing firms hold a relative share of 20% of all and exceeds the 15% share of innovation active agricultural firms. Significant differences are revealed in economic performance and the number of employed in firms with higher innovation activity in both sectors. Innovation active firms have higher productivity and show greater ability to generate net sales and create value added. Concerning investment activity in real assets (machinery and equipment), the innovation active firms show better performance. The highest investment activity is indicated by the large innovation active firms and lowest innovation investments are made by the small inactive firms, both from Food processing sector. However, small agricultural firms manifested higher innovation activity than medium firms operating in the Food processing sector. Small firms in terms of number of employees, are predominant in both sectors, with a relative share of over 70%. Firms operating over 16 years are dominant in our sample. Comparing the two sectors, we found that food processing firms bear larger innovation investments, achieve higher economic performance, and create more value added per employee, however agricultural small and medium-sized firms make larger investments in real assets. Considering the firms regardless their size, we found that, the investments in innovation activities have statistically significant and positive link with economic performance only for the firms in Food processing sector. Differences in the economic performance of innovation active and inactive agricultural firms are significant only in relation to net sales unweighted per employee, and the added value

is insignificant. Investments in real assets and the number of employed are positively and significantly linked with firms' innovation investments in both sectors. Searching for significance link differentiating firms by size, we found out that firms' age and investments in innovation activity are found to be significantly related only for the small and large firms in the Agricultural sector and the small and medium firms in the Food processing sector.

ABSTRACT

The major aim of economic policy of any country is to provide economic growth. One of the important factors is the investments in fixed assets. The role of investment factor in economic growth is researched and results are shown in the article. The econometric analyze of main macroeconomic indicators – GDP in Azerbaijan, investments in fixed assets is the predmet of the article. So the mutual relations GDP in Azerbaijan and investments in fixed assets is researched and the dependence between them is researched by absolute and relative indicators. The econometric models of investment multiplier and accelerator which is reflected the quantity and quality regularity influence of investment to economic growth and the mutual of relations GDP and investment are established in the article. The run period and force of influence of current and previous invesments to the economic growth is estimated. In present conditions the importance of large scale investments are justified, the model of forecast investment is offered and the forecast fixed assets investments are estimated.

Keywords: *investment, economic growth, multiplier, accelerator, econometric model, forecast*

1. INTRODUCTION

One of the main problems in economics is the increase in the sources of economic growth of the national economy. So, in some countries, for many years, there is a high rate of economic growth, positive dynamics, and the low economic growth in other countries, which is one of the main reasons for economists to think. A number of assumptions have been made about reasons of decreasing rapid growth and economic growth by various economists. At that time various factors of successful development of the national economy are put forward. Discussed factors of economic growth often include investment. The impact of investment on economic growth is a matter of discussion. There are models expressing positive relations between investment and economic growth: the model of the Harrod and Domar (Domar, 1946), AK-model (Frankel, 1962). At the same time, there are models that express negative relations between investment and economic growth: fK-model (Matveenko, 1984, 2005). There are models outlining that there is no relation between long-term economic growth and investment: Solou-Svena (Solow, 1956). Empirical researches can't answer the question about the relations between investment volume and economic growth. Even data analysis allows you to say that the relations between investment volume and economic growth are not exact. For example, let's look at the economic development of some countries around the world. For example, some countries, for example, Singapore, Japan, Thailand, demonstrated high economic growth due to the high share of investment in GDP during the period 1950-2004. However, for example, countries such as Zambia and Iran have managed to reach the lowest economic growth rates,

despite the high investment volume. Nevertheless, for example, a country like Ecuador had a higher economic growth rate than low-volume investments. At the same time it should be noted that almost all countries, such as Rwanda, Uganda, "zero" economic growth or even some, such as low investment volumes (below 10% of GDP), Madagascar, Senegal, and Niger have shown a negative trend in GDP per capita. Mutual relationships between investment norms and economic growth have been empirically investigated by many economist scientists (Attanasio et al., 2000; Li, 2002; Aghion et al., 2009; Jones, 1995; Madson, 2002).

2. LITERATURE

The role of investment in economic growth and the cause-and-effect relationship between economic growth and investment has been the main subjects of macroeconomic literature (Abdelha fihh, 2013; Baharumshah & Thanoon, 2006; Chakraborty & Nunnenkamp, 2008; Lee & Chang, 2009; Li & Liu, 2005; Madsen, 2002; Mah, 2010; Qin, Cagas, Quising, & He, 2006; Zou, 2006). The main hypothesis on the impact of investment on the overall economic growth is that investment expansion has a positive impact on economic growth, and investment has many economic benefits. Many scientists have found that there is a positive relationship between investment and economic growth across countries (Borensztein, Gragario, & Lee, 1998; Hermes & Lensink, 2003; Li & Liu, 2005; Odedokun, 1997; Zou, 2006). It has been generally accepted that investment is the most important factor of economic growth both in developed and emerging economies (Shiau, Kilpatrick, & Matthews, 2002, Yu, 1998). Similarly, Anwar and Nguyen (2010) and Madsen (2002) reported the two-way cause-and-effect relationship between investments and economic growth based on the nature of the investment. The outcome was mainly that economic growth was conditioned by investments in machinery and equipment. At the same time, investment in non-residential construction and infrastructure is based on economic growth. Investment is the most important channel that affects the economic growth through the financial market (Li, 2006). Economic development is linked to institutions, social capital, labor force, real estate, income, wealth (Fagerberg et al., 2014). But economic development is not just an economic growth Sen (1999). According to Schumpeter (1961), economic development involves the transition to a new, innovative method of increasing the productivity of capitalized designs. Economists have come to the conclusion that the development of high quality institutions is the main factor of economic growth (Rodrik et al., 2004). Lipset (1959) confirm that the efficiency of socio-economic institutions determines economic development. Institutions are rules of play, existence mechanism, accepted standard, logic of economic development and behavior in society (Ostrom, 1986). Economic development can be viewed as both the floor and the result of economic growth. If economic growth is invested in economic development, it provides vulnerable resources that provide the basis for future economic growth (Amsden, 1997). Unfortunately, the growth of all and any growth is often an easy task to succeed, thanks to long-term goals and targets (Rubin, 1988). Indeed, many conceptual instruments of economist scholars, perhaps, can not solve many economic development issues (North, 1984). It affirms that the neo-classical economy is short-term and the optimal distribution of resources does not fit into a dynamic, long-term disposition that defines the process of economic development. It is assumed that eight years for the academic invention applied to the industry or 18 years for scholarship preparation (Mansfield, 1991).

3. INVESTMENT POLICY IN AZERBAIJAN

As a result of the country's natural resources acquired by Azerbaijan, the expansion of financial opportunities of our country and the measures taken to improve the investment condition led to a steady increase in investment. As it is known, the economy can be used better by using the production funds or replacing old funds with more productive ones and increasing their quantities.

There is no long-term development in the expense of existing obsolete fixed assets. Because their active part - machinery and equipment will wear out quickly, lose their competitiveness and therefore should be updated on average every 7-8 years. Thus, economic development depends on the degree of investment in fixed assets, which is an essential condition for renewal and expansion of production. As the Republic of Azerbaijan possesses strong natural-economic potential, it is attractive in terms of investment. At the same time, the attractive political, socio-economic environment and relatively cheap human resources created for entrepreneurship further enhance this attractiveness. The favorable investment climate created in Azerbaijan is not only a yearly increase in domestic and foreign investment, but also bring the new technologies, production and management methods used in the world economy, and so on. to our country. The main factors promoting investment in our country since 1994 are as follows:

- Ensuring political and economic stability
- Creating a favorable economic environment;
- Increase of the international reputation of the country (increase of credit rating, effective cooperation with international financial institutions);
- successes of the initial stage of privatization (qualitative improvement of economic indicators of privatized enterprises), etc.

The investment policy implemented in the country plays an important role in the economy, including the regions. This policy seeks to create the most favorable legal and institutional environment for attracting foreign and domestic investment. Banks and credit institutions also play an important role in lending entrepreneurial activity and creating favorable investment climate. The basis of Azerbaijan's banking system development strategy is the mobilization of free-of-charge financial resources, transforming them into the real sector in the form of investment and more effective distribution. For this purpose, the qualitative new development of the banking system, the application of modern banking technologies, the formation of a sound and stable legislative framework, and most importantly, their reliability and risk reduction, significant measures have been taken in the warmth. Investment opportunities and investments in the country are rapidly increasing. Rapid growth of investments in the economy of Azerbaijan is a logical result for a favorable environment for both domestic and foreign investment in our country. An exemplary legislative framework for foreign investment has been established guided by tasks and recommendations given in the field of attracting foreign investments to our country. From the documents adopted in this field, the laws "On Investment Activity" of January 13, 1995, "Investment Competition" of May 16, 1997, "Investment Funds", November 30, 1999, etc. it can be noted. Some of the steps taken to attract and protect foreign investment in our country are related to the approval of agreements on the promotion and mutual protection of investments between Azerbaijan and various countries. Such agreements were signed between Government of the Republic of Azerbaijan and Pakistan, Georgia, Germany, Kazakhstan, Ukraine, Kyrgyzstan, Poland, Austria, France, Iran, Austria and others. developed and developed countries. Significant changes have taken place in the structure of investments. In addition to the oil sector, investments in the non-oil sector across the country are a major stimulus for the development of the economy. Investments in the economy have increased dramatically over the decade than in the early 1990s. The most invested area is industrial field. Investments in this area constitute 70-80% of the total investment volume.

- divide the forming sources of internal investments into two groups:
- State sector (on the account of budget fund);

Private sector: At the expense of the population's own funds and funds of enterprises and organizations;

When only 20-25% of investments are realized through own funds (amortization and profit) in developed countries, like in other transition economies, 70% of capital investments in Azerbaijan are financed by firms. At the same time, the state-funded capital expenditures in our country are increasing with figures and relative numbers, as shown in the following figures. Over the past 10 years, the physical volume of state capital investments has increased 35 times, and now is the basis of dynamic development in the near future. In 2005-2017, investments in the country's economy have grown mainly due to domestic sources. Investment expenditures were mainly focused on the non-oil sector development goals. In addition to the budgetary funds, other funds have also played an important role in the growth of domestic investment. The volume of domestic investments financed by budget funds increased 1.3 times, and extra-budgetary funds increased by 55%. 35% of domestic investment in fixed capital was spent on budget funds. For comparison, in the corresponding period of 2005, the share of budget funds in the total amount of domestic investments was 35%. Decrease in investment in the oil sector has had a significant impact on the growth of foreign investment. This is primarily due to the fact that investments are mainly directed to the non-oil sector. The share of investment both in size and in total investment. The post-2005 period is characterized by an increase in investment in the non-oil sector. This is the final stage of investment in the oil sector, in other words, the pipeline's operation. The broad using of investments for the development of industry and all areas throughout the country is seen as a step in the country's economy not only for the oil industry but also for the development of the non-oil sector and the further improvement of the country's economy.

4. DATA

During research period 2000-2017, GDP increased 14,87 times and reached from 4718,1 million manats to 70135,1 million manats. This result has increased 5,60 times in comparison with 2005, 1,65 times in 2010, 1,19 times in 2014, 1,29 times in 2015, 1,16 times in 2016. In 2000-2017 GDP in industry has increased 16,53 times and reached from 1999,6 million manats to 28087,3 million manats. This result has increased 4,53 times in comparison with 2005, 1,28 times in 2010, 1,16 times in 2014, 1,57 times in 2015, 1,25 times in 2016. In 2000-2017 GDP of agriculture has increased 5,20 times and reached from 758,9 million manats to 3949,3 million manats. Current indicator has increased 3,47 times in comparison with 2005, 1,68 times in 2010, 1,26 times in 2014, 1,18 times in 2015, 1,17 times in 2016. During 2000-2017 GDP in construction area has increased 21,71 times and reached from 308 million manats to 6687,2 million manats. This result has increased 5,93 times in comparison with 2005, 1,94 times in 2010 and decreased 10% in comparison with 2014m, but again increased as 3% in 2015 and 5% in 2016. . In 2000-2017 GDP in transport and communication field has increased 10,36 times and reached from 567,1 million manats to 5875,5 million manats. This indicator has increased 6,41 times in comparison with 2005, 1,86 times in 2010, 1,58 times in 2014, 1,36 times in 2015, 1,14 times in 2016. During 2000-2017 in other fields GDP increased 18,66 times and reached from 1093,9 million manats to 20413,9 million manats. And this result has increased 9,31 times in comparison with 2005, 2,35 times in 2010, 1,27 times in 2014, 1,17 times in 2015, 1,12 times in 2016. Net taxes in 2000-2017 increased 17,59 times and reached from 291,2 million manats to 5121,9 million manats. This result has decreased 5,41 times in comparison with 2005, 1,78 times in 2010, 16% in 2014, but increased 5% in comparison with 2015, 3 % in 2016. The above mentioned processes occurred as investments. Thus, during 2000-2017 research time total investment has increased 18,01 times and reached from 967,8 million to 17430,3 million manats. This result increased 3,02 times in comparison with 2005, 1,76 times in 2010, but decreased 1% in comparison with 2014, and again increased 9% in 2015, 5% in 2016. Industrial investment has increased 15,83 times and reached from 670,1 million to 10610,1 million during 2000-2017.

And this result has increased 2,54 times in comparison with 2005, 2,48 times in 2010, 1,39 times in 2014, 1,25 times in 2015, 7% in 2016. During 2000-2017 investment in agricultural field has increased 95,05 times and reached from 6,5 million manats to 617,8 million manats. This result has increased 15,18 times in comparison with 2005, 1,43 times in 2010, 1,70 times in 2014, 1,74 times in 2015, 1,90 times in 2016. During same years the investment in construction field has increased as 807,65 times and reached from 3,4 million manats to 2746 million. This indicator has increased 59,57 times in comparison with 2005, 24,13 times in 2010, 1,24 times in 2014, 1,29 times in 2015, 1,22 times in 2016. For 2000-2017 investment in transport and communication field increased 21,81 times and reached from 89,4 million manats to 1949,6 million. This indicator has decreased 2,89 times in comparison with 2005, 27%, in 2010, 25%, in 2014, 23% in 2015 but increased 22% in 2016. During 2000-2017 GDP has increased as 7,59 times and reached from 198,4 million manats to 1506,8 million. This result decreased 1,81 times in comparison with 2005, 38% in 2010, 69% in 2014, 38% in 2015 but increased 40% in 2016.

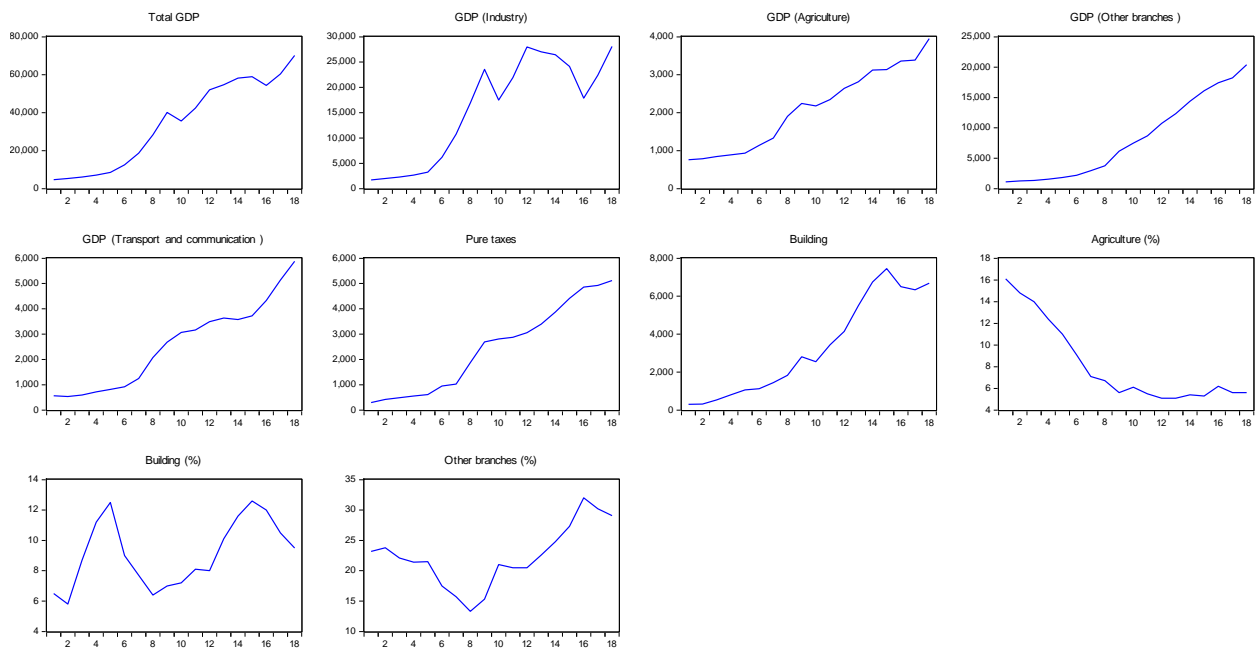

Figure 1: Dynamics of GDP of Azerbaijan

Figure following on the next page

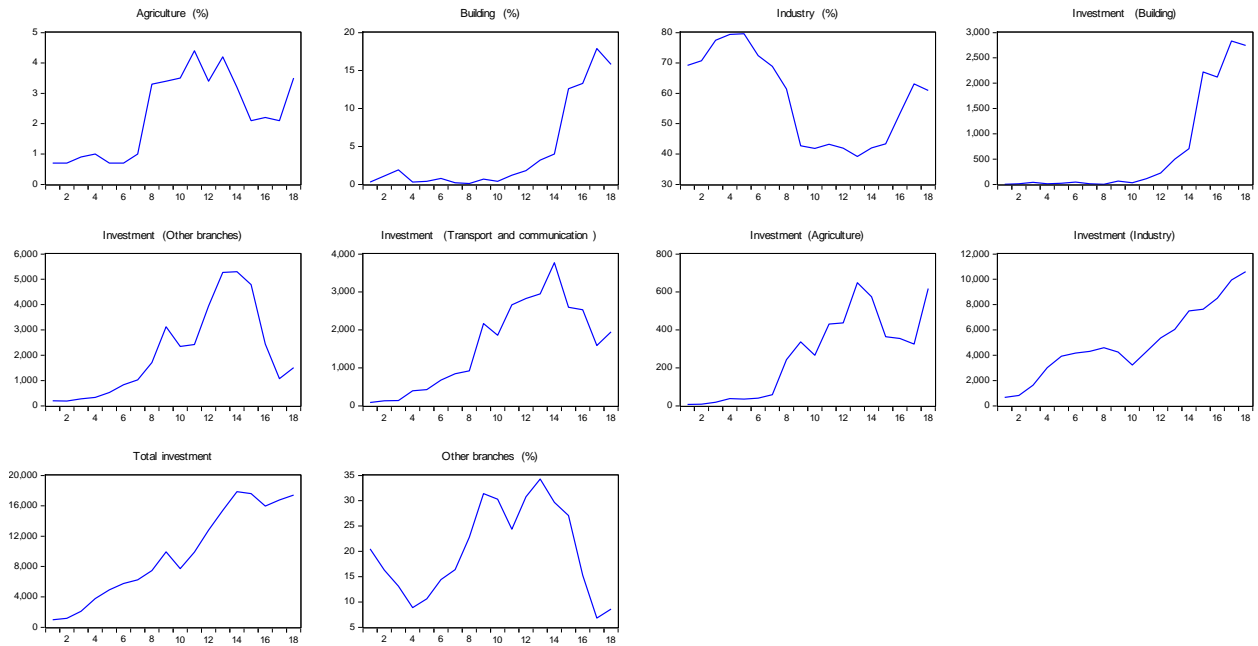

Figure 2: Dynamics of investments of Azerbaijan

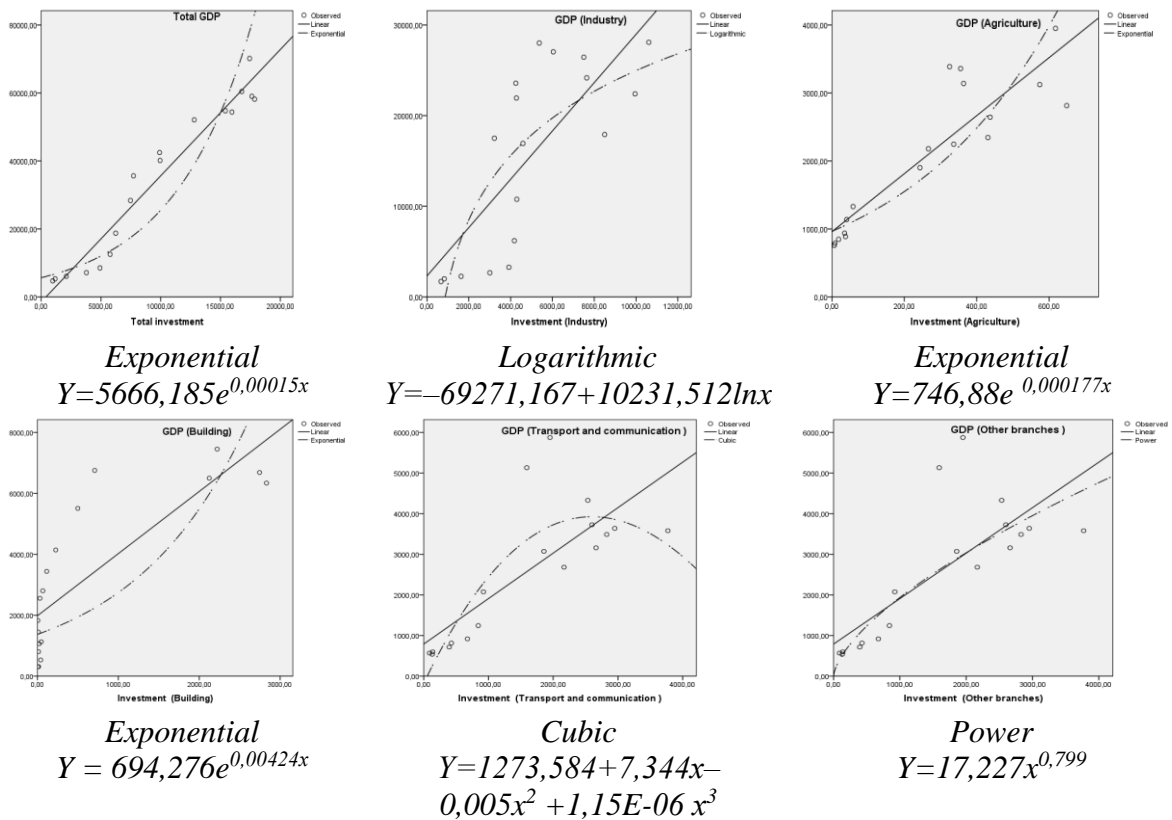

Figure 3: Models and graphs of GDP versus investment

Drafted models are mainly chosen in accordance with high level of R^2 and statistical importance of t-statistic coefficient. In this case for total dependence on investments of GDP in industry logarithmic, in agriculture and construction exponential, in transport and communication cube function, and in other fields power function have been chosen.

5. CONCLUSION

In the frame of state investment policy all forces should be directed to movement of new investments which assists maximum use of existing resources. Investment renewal acts as optimal strategy directed to obtaining low inflated economic development that observing development of new work places and increasing of purchasing power of population in the state. Although that, investment policy in modern world bases on self-financing of most part of capital investment, development of mechanisms and infrastructures of material-technical resources market, principles of agreement and returning system between participants of investment process, some kinds of complete programs needs support of government. For this purpose, investment policy should be built productively by straight support of government and realized in more sufficient from in future.

ABSTRACT

Azerbaijan as an oil-rich country faced a wide range of problems in the way of transformation to the capitalist system. Especially, weak institutional development, high level of “shadow economy” and high dependency from oil and gas exports created economic threats and weakened sustainability. In this research paper, we have tried to find an answer to the main research question: How can the innovation-based economy play a role to decrease import dependency and reinforce export in Azerbaijan? We have taken into consideration the official data (Azerbaijan State Statistical Committee) for the geographical structure and development dynamics of foreign trade during 1997-2017. Analyzing this data and taking into account the institutional structure of the economy of Azerbaijan, we have established a model that offers a framework to launch and develop an innovation-based economy in the long run. The main results of the analysis show that Azerbaijan in the period from 1997 to 2017 mainly was dependent on natural resources and increased the stickiness to imports in different sectors. High dependency on natural resources creates new threats in front of the sustainability of the country. Because of these factors, Azerbaijan requires to realize a transformation to the innovation economy. By introducing a significant import dependency as a factor, we have limited the reasons for economic security. The further research on other factors of economic security and investigations about building an innovation-based economy in Azerbaijan are significant.

Keywords: *sustainable development, innovation economy, economic security, and economic growth*

1. INTRODUCTION

This research paper investigates the role of innovation-driven economic system and its role to decrease import dependency and reinforce export in Azerbaijan. As a developing country, Azerbaijan faced many problems in the pathway of transition to the capitalist system. The main problem was and still remains as dependency on the export of natural resources and country imports technological and manufactured goods. These issues create a continuous threat in front of the national economy. The solution to the problems mentioned above needs a complex approach to orthodox macroeconomic policies. Several investigations were held by different authors in order to show the current situation of Azerbaijan economy and to identify the role of institutional reforms, export-led growth strategy and its impacts and innovation-based export policies. Ahmadov, I., Mammadov, J., Aslanli, K., Guliyev, F. (2016) investigated the new challenges and opportunities in front of Azerbaijan economy after the price shock since September 2014. The authors focusing on new macroeconomic conditions, existing monetary policies against oil price shocks, fiscal regulations and social policy perspectives. This research paper mainly focuses on the import dependency of Azerbaijan from technological and manufactured goods and innovation-driven export.

This paper is a policy recommendation to achieve long-term sustainable economic development in the context of foreign trade of Azerbaijan. Two main hypotheses were determined to explain these processes:

- Hypothesis 1: Export-oriented foreign trade policies are the base to achieve long-term sustainable economic development
- Hypothesis 2: Innovation is an important factor to accelerate export

The first hypothesis tries to explain the export-led growth model, which shows that the countries owning a developed export structure are more successful than resource-based economies and they are able to provide economic security in the long-run perspective. Growth in export as a result of technological diffusion and other economic factors stimulates trade among countries. The economic crisis that country faced since September 2014, after a decline in crude oil prices in global market enforces export-led growth strategy in the post-oil period of Azerbaijan. In order to explain the second hypothesis, the current position of Azerbaijan in the Global Innovation Index was presented for 2013-2017 years; the facts already presented in different investigations were introduced. To justify this hypothesis the paper is exploring the correlation between innovation-driven export and long-term sustainability.

2. LITERATURE REVIEW

The analysis in the different context of the relationship between foreign trade and sustainable development is actual. This research based on the results of two main sub-parts of trade policy – macroeconomic threats because of high dependency on import and positive effects of import on sustainable development in the practice. Previous investigations mentioned below are based on the data of different countries and are significant to present policy recommendations to the Azerbaijan economy. Zhang and Zou (1995) analyzed 53 developing countries in order to stress the relationship between economic development and the import of technology. According to this research, the process of economic development in developed countries is different compared to the process in developing economies. Productivity in developing countries mainly depended not only on innovations; also, it relies on technology transfers, import of machine and equipment from different countries. (Zhang and Zou, 1995) This investigation examines the influences of the share of technological investments in GDP to economic development. The main result is about the positive impacts of imported technology on sustainable development in all analyzed countries. Oskooee and Domac (1995), Awokuse (2007), Gerni (2008) and Qiang (2010) analyze the role of imports on the sustainable economic development of developing countries. The common hypothesis of these investigations is that there is a positive correlation between changes in the share of intermediate industries in the structure of import and sustainable economic development. Another group of researchers such as Musonda (2007), Olaniyi (2013) and Bilas (2015) indicate the role of export-oriented trade policies as a driver of sustainable economic growth. These investigations also stress the role of import substitution policies as a base for export-oriented trade policies in the long run. Agayev (2011) introduced analysis for 12 post-soviet countries, partly for Azerbaijan in order to test the relationship between export and sustainable economic development in these countries. The main conclusion of this research is that long-run dependency on one-industry results with the high level of export in this field, but cannot accelerate economic development. To achieve high and sustainable economic development countries like Azerbaijan need to adopt the economic system to the innovation-based export. Previous studies in the long-term economic sustainability of developing countries mainly were based on the level of innovation policies realized in these economies. American economist, Joseph Schumpeter (1942) mentioned the role of innovation in production and economic growth in the long-run perspective. Innovation process includes a Research & Development (R&D) activity that is able to improve production and export of

developing countries, particularly export of Azerbaijan. Shahin (2015) claims that it is difficult for countries to achieve sustainable growth without effective R&D activities. Studies in this field such as Frantzen D., (2000) Rachel G., Redding S., & Van Reenen J., (2001), Savrul, M. and Incekara, A. (2015), Cin, B.C., Kim, Y.J. & Vonortas, N.S. Small Bus Econ (2017) indicate that there is a positive relationship between expenditures on R&D and long-run economic development. Ahmadov (2016) analyzed new macroeconomic conditions of Azerbaijan after a rapid decline of crude oil prices in the world market since September 2014 and its significant effects on economic growth of Azerbaijan. The author claims the difficulty to establish a new development model in the short after high dependency on oil for several years. Ahmadov (2016) indicated a high level of risk under financial and macroeconomic pressures and the negative impacts of an unregulated economy, which was mentioned as “informal economy” on the realization of new institutional reforms to regulate the national economy. This is a barrier in front of administrative reforms and traditional ways of managing the crisis, such as a supply of money and credits are not effective. Ahmadov (2016) underlines the importance of implementation of institutional changes in order to overcome the results of the crisis in the Azerbaijan economy. Mammadov (2016) analyzed the new monetary policies of Azerbaijan government after oil shock in a global market. The author mentions that the depreciation of national currency (manat) has created a new perspective in front of the Azerbaijan economy to develop the structure and the level export and to achieve long-term sustainability. Mammadov (2016) stresses the role of foreign direct investment (FDI) to attract new capital to the different fields of the national economy and to decrease the cost of production. Aslanli (2016) investigated the role of fiscal policies in Azerbaijan after the decline in crude oil prices in order to regulate the crisis. The author mentions the impacts of high volatility of crude oil prices on the fiscal position of the government, which is not stable. Aslanli stresses a need for new financial regulation in order to achieve long-term sustainable development.

3. DATA AND METHODOLOGY

This study is aimed to investigate the role of innovation-based economy to decrease import dependency and reinforce export in the long-run perspective of Azerbaijan economy. Qualitative and quantitative research methods were used to achieve this goal. It includes different methods such as data collection and its analysis. Data collection and analysis: Data for foreign trade of Azerbaijan, data for the innovativeness of Azerbaijan economy, and their analysis are the main methods of data collection. Global Innovation Index data, The State Statistical Committee of Azerbaijan, other primary and secondary sources are to be utilized depending on the necessity.

4. INNOVATION-BASED ECONOMY TO DECREASE DEPENDENCY ON IMPORT AND ACCELERATE SUSTAINABLE DEVELOPMENT

4.1. Export-led growth model as a driver for long-term economic sustainability

4.1.1. Historical context of sustainable development and its importance for Azerbaijan

The significant multidisciplinary position of sustainable development concept stimulates researchers to investigate the role of this concept in different economic issues. Different reports and conventions introduced by several international organizations explained the role of the sustainable development concept in order to stress its importance. Starting with the Stockholm Conference in 1972, leading to Rio (Rio+20) Conference 2012, this process improved sustainable development phenomena and stimulated in a global context. One of these reports is “The Limits to Growth” introduced in 1992. Global economic structure introduced in this report still is significant for resource-based economies like Azerbaijan (Meadows, D., et. al., 1972). Sustainable development is a multilateral process and includes different economic factors, such as capital accumulation, trade, institutional development, ecological sustainability, political

factors and the distribution of income.

4.1.2. Analysis of participation of Azerbaijan in Global Trade

Azerbaijan is not a member of World Trade Organization (WTO) and this factor restricts the chances of country to participate in free trade. High dependency on natural resources and non-membership of WTO as the two main factors determines the position of Azerbaijan in Global Value Chain (GVC). Table 1 indicates the dynamics of foreign trade turnover of Azerbaijan during 2013-2017, according to the official data represented by State Statistical Committee of Azerbaijan.

Table 1: Dynamics of foreign trade turnover

Years	In million US dollars				Percentage change from previous year *)		
	Turnover	Imports	Exports	Balance	Turnover	Imports	Exports
2013 ²	43,554.1	10,712.5	32,841.6	22,129.1	102.7	109.1	100.7
2013	34,687.9	10,712.5	23,975.4	13,262.9	106.3	109.1	105.1
2014 ²	39,407.5	9,187.7	30,219.8	21,032.1	95.7	85.4	99.0
2014	31,016.3	9,187.7	21,828.6	12,640.9	94.1	85.4	98.0
2015 ²	25,809.0	9,216.7	16,592.3	7,375.6	99.9	99.5	100.1
2015	21,945.8	9,216.7	12,729.1	3,512.4	104.3	99.5	106.3

2017	22,593.6	8,782.0	13,811.6	5,029.6	80.0	83.9	77.6

1) Data of the State Customs Committee

2) Statistical data - taking into account volume and estimated statistical value of factual exported crude oil and natural gas crossed country border but not made official in the customs committee in the reporting period.

*) Indices for 2010-2017 were calculated by taking into account price factor.

Source: State Statistical Committee of Azerbaijan, <https://www.stat.gov.az/source/trade/>

4.1.3. Potential application of Export-led growth model in Azerbaijan

In the context of recent global economic recessions, many national economies design foreign trade strategies in order to achieve sustainable development. In one hand, these strategies are aimed to prevent the economic security threats and on the other hand, they are playing an accelerator role for sustainable economic development. Because of the wide application of export-led growth models since 1970s, the significance of import substitution policies was decreased. Seyidoglu (2015) stresses that the positive effects of export growth in the development of production are accepted as a hypothesis for export-led growth. The case of Germany, Finland, Japan, South Korea, China, Malaysia, Thailand, Taiwan and Singapore are the most successful experiences in this regard. Developed export policies realizing the distribution of resources accelerate economic development. In the export-led growth model increase in export is accepted as one of the main determinants of development. (Hausman, R., Hwang, & Rodrick, D., 2007) There two main sides of connection between export and economic development: growth in export and economic growth. There is a positive correlation between these two sides. Previous investigations show that enhancement in export plays a role of accelerator for production in different fields of economy.

As a result of our research, after export-led growth model can be applied for Azerbaijan economy in order to achieve long-term sustainable economic development. This process and its possible outcomes can be explained as below:

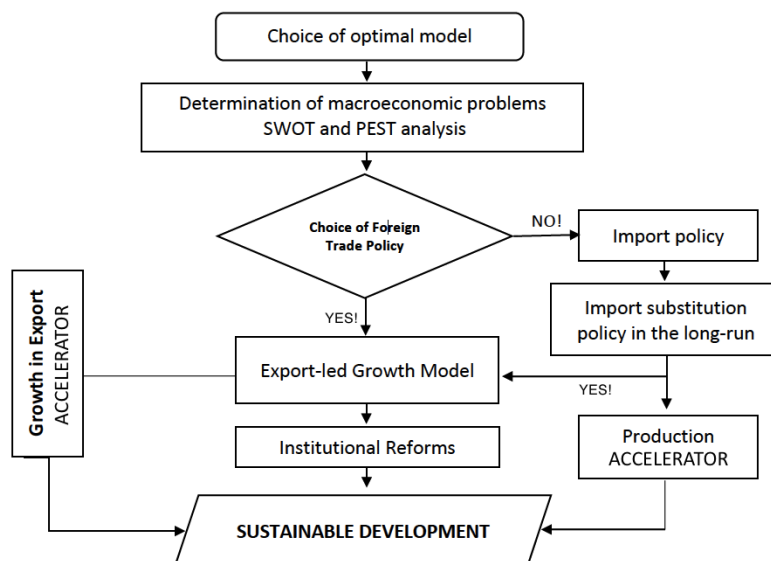

Figure 1: Application of the export-led growth model and its macroeconomic outcomes.

Source: created by the authors based on the application of export-led growth model in different countries.

Weak institutional development, high level of “shadow economy” can be a barrier in front of the realization of different economic reforms in order to gain long-run sustainable economic development in Azerbaijan. As a theoretical result of our research, realization of export-led growth model’s algorithm can be introduced as:

Figure 2: Algorithm of the application of export-led growth model in Azerbaijan

Source: created by the authors based on the application of export-led growth model in different countries.

4.2. Innovation is an important factor to accelerate the export of Azerbaijan

One of the main goals of this research paper is to discover the role of export-oriented industrialization in the economic development of Azerbaijan. The significant impacts of innovation-based production on the diversification and acceleration of export is analyzed in this part. The importance of diversification of exports was mentioned above. According to the structural models of development, the countries should realize the transformation from primary products to manufacture (Chenery, 1979, Syrquin, 1989).

Prebisch – Singer Hypothesis (PSH) stresses vertical export diversification, which is able to improve the conditions of developing countries in global trade. This Hypthesis indicates that the relative price of traditional goods has a declining trend compared to the manufactured products. (Cuddington J.T., Ludema R., Jayasuroa S.A., 2002)

4.2.1. Azerbaijan in Global Innovation Index (2013-2017)

Table 2 presents the position of Azerbaijan in the Global Innovation Index between 2013 and 2017. During these years, Azerbaijan realized progress in positions, but this is not sufficient to establish innovation-based economy to have long-run sustainability. Establishment Azerbaijan National Innovation System (ANIS) is able to overcome these issues and to develop innovation capacity of the country and to face long-run sustainability.

Table 2: Azerbaijan in Global Innovation Index (2013-2017)

Year	Position	Innovation Index
2017	82	30.58
2016	85	29.64
2015	93	30.10
2014	101	29.60
2013	105	28.99

Source: Global Innovation Index reports (2013-2017)

4.2.2. Main factors to make a transformation to the innovation-based export in Azerbaijan

In order to make a transformation to the innovation-based economic system Azerbaijan should enhance its capacity in innovation; invest in Research & Development (R&D), to apply new institutional reforms. The reforms mentioned below can be an accelerator of sustainability of Azerbaijan economy in the long-run perspective:

- To identify the field that innovation policies will be implemented;
- Determination of planning in the innovation system, an organization of infrastructure and resources and identification the role of different state institutions in order to manage the system;
- Development and application of Research & Development (R&D) and Science & Technology (S&T) policies;
- Creation of demand for technology in the country in order to stimulate the supply of technology;
- Organization of knowledge and technology transfers;
- Establishment of industrial centers in different regions of the country and the transfer of R&D activities through these regions;
- Determination of research universities and the establishment of “shared vision” with public and private research universities to increase the level of R&D activities;

5. CONCLUSION

This research paper indicates an overview of the current structure of the Azerbaijan economy, focusing on foreign trade conditions and innovativeness. Starting with the analysis of participation of Azerbaijan in Global Trade the paper explains high import dependency in technological and manufactured goods. The paper offers a model for Export-led growth model as a driver for long-term economic sustainability and stresses the main outcome of this model as weak institutional development, high level of “shadow economy” can be a barrier in front of the realization of different economic reforms in order to gain long-run sustainable economic

development. The algorithm of the export-led growth model was introduced to show the importance of innovations in the long-run perspective of the national economy. Explanation of the second hypothesis introduced the data that showed the position of Azerbaijan in the Global Innovation Index to point out the weakness of Azerbaijan Innovation System. This is a very strong argument for why Azerbaijan should make a transformation to the innovation-driven economy and make institutional reforms. The reforms such as development and application of R&D and S&T policies, an organization of knowledge and technology transfers, creation of industrial centers in different regions, transfer of R&D activities through these regions were introduced as a policy recommendation to strengthen the sustainability of Azerbaijan economy in the long-run perspective. The main outcomes of this research can be of significance for theory-based policymaking by the national government. The results of the research could also serve as an important framework for further investigations in future models of the Azerbaijan economy in order to achieve long-term sustainable development.

CONTENT COMMUNICATION IN BUILDING BRAND IMAGE VIA SOCIAL MEDIA - CASE STUDY

Beata Tarczydło

*AGH University of Science and Technology, Faculty of Management, Poland
beata.tarczydlo@poczta.fm*

ABSTRACT

The aim of this article was to determine the place and significance of the content communication in building the right brand image using social media. The following thesis was taken into consideration: in the days of IT development the decisive role in building the right brand image on the Internet is played by methodical publishing of attractive and useful content as a manifestation of content marketing of the brand. Starting from the definition, the instrumentarium and the strategy of applying the content communication, the following concepts were described: the brand image and fundamentals of its building. The theoretical deliberations were supported by the results of the author's own research based on the study case method. In the consequence, the comprehensive application of the varied forms of content communication via social media for the Rimmel brand was presented in this article. It is to help to enhance the unique image of the examined brand, to contribute to build its community and to bring measurable results in such a competitive branch as the cosmetics is.

Keywords: *content communication, brand image, content communications using social media, case study*

1. INTRODUCTION

In marketing activities for brands, increasingly subtle strategies and techniques are sought. This quest results from conditionalities such as information noise, over-satiety with traditional persuasive advertising, over-abundance of stimuli; the need to attract attention and distinguish itself from the competition; technical and technological advancement; or a dynamic development of web functionalities. At the time of information society, over-abundance of information hampers the operations of both the entrepreneurs (due to e.g. information noise), and the target audience (flood of useless information, intrusive promotion). Moreover, hypermedial (Kitchen, Proctor, 2015, pp. 34–42; Mazurek, Tkaczyk, 2016, pp. 181–242) environment and the attacks by means of communications in a variety of forms targeted at the recipients by all the media – press, radio, television, Internet, mobile networks – necessitates imposition of some limits on delivery of burdensome information and prioritisation of the one which is functional and useful. This article aims at defining the position and role of the content communication in creation of a proper brand image on the Internet. The considerations are structured around the following thesis: in the era of development of information technologies, an important role in creation of a proper brand image in the web is played by methodical publication of attractive and useful content as a reflection of content communication for a brand with a specified and desired image. Theoretical considerations are enriched by results of own research conducted by means of the case study method. In particular, the answers to the following questions are sought: have any forms of content marketing communication been undertaken for the studied brand, and if yes, in what form? How were they responded to by the stakeholders? Which brand image features have been strengthened? What results have been achieved? How did it influence the Internet brand communities? What are the implications in the cosmetics industry? It is therefore necessary to present some basic theoretical issues.

2. THE ESSENCE OF CONTENT MARKETING COMMUNICATION IN SOCIAL MEDIA

Social media (Chaffey, Smith, 2017, pp. 224–230; Stawarz-Garcia, 2017, pp. 93–119) are a specific type of aggregation platforms enabling integrated marketing communication and other functionalities on the Internet. The notion relates to all Internet media and mobile technologies which provide a means of multi-level communication with others. The communication tools for creating and sharing diverse resources are provided by social portals such as Facebook, YouTube, Twitter, Pinterest, Google+, Instagram, and many more. Communication via social media (Bonek, Smaga, 2013, pp. 24–30; Scott, 2015; Singh, Duhan, 2016, pp. 62–88; Stępowski, 2016, pp. 20–102; Stawarz-Garcia, 2017, pp. 89–136; Wyrwicz, 2017, pp. 43–53; Ekhlasi, Moghadam, Adibi, 2018, pp. 61–168; Lieb, Szymanski, 2018, pp. 125–142; Mazurek, 2018, pp. 365–382) encompasses inter alia: funpages content, competitions, blogs, videoblogs, Internet fora, discussion lists, etc. For example, a content marketing agency informs of the following types of services it offers (www.they.pl): content on the website (information about the company and its offer, products and services description, news, expert how-to articles, commentaries and opinions published in the site); articles, promotional publications (promotional articles for publication in thematic services, information notes for industrial services, press information); blogs (articles in blogs, commentaries in blogs, responses to users' commentaries, photos and graphics in blogs); guides, reports (PDF publications: short periodic reports, guides, instructions, and comprehensive reports); infographics (Stopka, 2017, pp. 29–36), maps, charts (infographics which enable finding a compromise between an attractive form and content, statistics in the form of charts, maps, and other graphic visualisations); videos (short advertising films, instructional films such as "how to assemble a table", advisory films on "how to fill in a traffic incident report form), and many other, depending on the needs and inventiveness.

3. PRESENT DAY BRAND AND FOUNDATIONS FOR ITS DEVELOPMENT ON THE INTERNET

Present day brands constitute a specific type of conglomerates. They mark a variety of market entities (persons, cities and towns, organisations, products, etc.) and their building involves methodological marketing activities. An important phenomena in brand management (Keller, 2013, pp. 563–654) is its personification, i.e. attaching human features to it, by which "they can communicate" (Jefferson, Tanton, 2013) with stakeholders (Kotler, Kartajaya, Setiawan, 2017, pp. 119–128), and even in some sense "interact with them". Brand personality helps to achieve distinctiveness even in a crowded market, assists in building relations with partners, and facilitates the process by which the brand is more easily remembered. Personified brands play an important role in the stakeholders' lives (Dahlen, Lange, Smith, 2010, pp. 236–272; Rowles, 2014): they not only offer products, but provide an opportunity to identify oneself with them and – due to the Internet profiles – to participate actively in the life of their community. Present day brands have an impact on actions undertaken by the stakeholders, create various values, and the marketing activities performed for the purpose of their building generate experience, as well as provide a chance for participation in a variety of endeavours under their emblem. In turn the brand image (Arnhold, 2010, pp. 37–39) is a composition of opinions, judgements, and perceptions attached to it. In brand management, the important role in the current market conditions is played by methodical shaping of their distinctive image (Tarczydło, 2013, pp. 16–20). In practice it means that a brand should rise connotations with a list of unique features which generate specific value (Kotler, Kartajaya, Setiawan, 2017, pp. 161–176) to the stakeholders. Since the brand image is a result of an individual's sensory experience in contact with a brand, its owner should aim at enhancing the features related to the identity, lifestyle, and personality of the client/stakeholder.

Methodical shaping of brand image constitutes an overall set of proceedings, and therefore a long-term process, which requires undertaking of specific measures and implementing of a consistent strategy of operation. Contemporary pro-image activities comprise extensive communication channels, in particular the Internet, in which the social media proliferate. The brands present on the web not only offer the opportunity to form mutual relations, as they usually have a specific personality, but seem to be fully interested in clients-Internet users, their views, remarks, opinions, and even feelings. This facilitates the process of generation of common values, development of cooperation, and loyalty building. The cyclical procedure (Tarczydło, 2013, pp. 167–169) of integrated activities for proper brand image should include a body of activities addressed to the stakeholder's mind, soul, and body, which relates to a holistic (Kotler, Kartajaya, Setiawan, 2017, pp. 41–42) treatment of a human being (= reacts on all levels at the same time, i.e. the mental, physical, and spiritual). The conclusions derived from literature studies have been subjected here to critical review in the context of economic practice.

4. EXAMPLES OF USE OF CONTENT COMMUNICATION FOR RIMMEL BRAND

For the purposes of this study, a case study has been conducted for the Rimmel brand from the point of view of its communications policy. The answers to the following questions were sought: are there any forms of content marketing communication published on the Internet for the studied brand, and if yes, what are their types; what role do they play in the process of building of a proper image for the Rimmel brand; who performs these processes; what are the results of these actions. Rimmel (O Rimmel, 2019, www) is a brand with a history spanning almost two centuries. The brand owner has changed several times, but since 1996 it has been part of Coty, Inc. The cosmetics bearing the brand in question are available for sale in approx. 40 countries worldwide. Since 2001, the Rimmel brand has been represented by the supermodel Kate Moss (Collins, 2009, p. 249), who has been using the cosmetics since her teenage years. The Rimmel brand offer comprises numerous make-up cosmetics: a variety of mascaras, powders, foundations, blushes, eyeshadows, lipsticks, glitters, lip colours, and nail coats. This study has been specifically focussed on the use of inbound marketing for the studied brand.

Table following on the next page

*Table 1: Selected examples of content communication on the web for the Rimmel brand
 (Source: own elaboration on the basis of conducted case study)*

Communication media and forms on the Internet	Examples of applications
Website of the brand and its information resources group	The website of Rimmel London Polska – http://pl.rimmellondon.com – contains information structured into groups. Primary bookmarks in the heading are as follows: products, get the look and hot news. The second layer has been divided into: Where to buy?, My Rimmel, and Rimmel in Social Media. Finally, under the “About us” bookmark interesting content can be found: about the brand, terms and conditions, privacy policy, and contact details. The products on offer have been grouped into the following categories: face, eyes, lips, and nails. It is interesting to note the statement in the bottom right side of the site: “Rimmel London against animal testing. Find out more”.
Information on products, industry services	For example: on Rimmel eyeshadows, Metallic Cream Shadow with a possibility to be reviewed by the interested users who can get involved in a discussion forum – including the opportunity to propose the topic for discussion – http://wizaz.pl/kosmetyki/produkt.php?produkt=4165 – a unique combination of pigment and mother-of-pearl ensures exceptional gloss in 8 brilliant opal shades. Light, creamy consistency allows for make-up to be applied with fingertips. The shades can be mixed to obtain a unique effect. Cosmetics – opinions and reviews – Cosmeticopedia – Stylistka.pl – kosmetyki.stylistka.pl – a service for women presenting advice on fashion, beauty, stylisation, cosmetics, most recent collections, fashion haircuts.
Press information	high value content for media professionals, for example: http://www.o-m.pl/informacje_prasowe/103/rimmel-roz poczyna-wspolprace-z-os3.html Rimmel starts cooperation with OS3. OS3 Agency has been selected in the tender process to present the Rimmel Polska brand in social media. OS3 will be responsible for comprehensive presentation of Rimmel Polska in Facebook. The Agency will take care for graphic creations, photos, and – in cooperation with the make-up expert Andrzej Sawicki – coordination and performance of photo sessions. Communications strategy provides for the use of inter alia applications. Rimmel is a brand dedicated to young, modern, brave, and active women. The brand is part of Coty, Inc., prepared by Angelika Rusiecka.
Promotional publications	http://www.rossnet.pl/Produkt/Rimmel-Wake-Me-Up-podklad-do-twarzy-1szt-pelna-oferta,114350,promocja14 , special offer for the Rimmel primer which prepares the skin for a brighter, more radiant complexion, giving it a perfect look, acts immediately to eliminate the signs of tiredness, contains peptides and moisturising vitamin complex.
Blogs	official Rimmel brand blog – Five o’blog – http://blog.rimmel.info – conducted by two young women: Ola and Marta, who comment on the most recent make-up trends, novelties from the fashion world, most up to date news about celebrities (including Kate Moss, who is the face of the Rimmel brand), and actualities from the capitals in Europe and overseas. Other blogs: http://www.zeberka.pl/art/kate-moss-w-najnowszej-kampanii -marki-rimmel-29812 Blog focussed on cosmetics, cosmetics reviews, skin care, etc. sparklesbeauty.blogspot.com/ Agnieszka Grzelak - Beauty Blog Make-up, advice, etc.blog.grzelak-makeup.com/
Guides	http://poradnik.kobieta.gazeta.pl/szukaj/poradnik/rimmel , minimalist style with a rock edge – such a description can be provided for the spring edition of the Rimmel brand make-up presented by the brand ambassador Kate Moss.
Forum	for example http://wizaz.pl/forum/showthread.php?t=777111 , new foundation Rimmel Lasting Finish 25 HR, Rimmel brand loves to face new challenges and achieve ambitious goals. This time the ambition has been set really high, as the brand has decided to improve its best-selling product to a new level of perfection.
Comments and opinions	http://rimmel.nowekosmetyki.pl/ , Rimmel Match Perfection podklad, blodka, I have a 010 Light Porcelain colour – ideal for pale skin tone like mine. And at last I have found a perfect light foundation for summer. Its consistency is just right – light and liquid. I tap it in delicately with my fingertips and it merges with my skin really well for an even natural skin tone. And what is best – even after the whole day I haven’t noticed any darkening on my face. The foundation provides an even skin colour and smartly reduces dark circles under my eyes. However, it does not manage to mask larger skin imperfections and unfortunately it is necessary to use a corrector. After about 5 hour the face begins to shine in oily parts, but it is still a good result for a cosmetic which is not designed for matte finish. An attractive and comfortable packaging with a pump and the efficiency top up the satisfaction. I will definitely use the cosmetic this summer :)
Video	video materials for example: http://www.gazeta.tv/Wideo/10,132445,15440938,receznja_podkladu_matujacego_do_twarzy.html , a vlogger tests new product by Rimmel – a mattifying foundation from the Stay Matte range. http://kobieta.spryciarze.pl/zobacz/jak-zrobic-makijaz-jesienny-od-podstaw , how to create an autumn make-up from the start.
Brand profiles in social media	Rimmel Poland has its profiles run on: Facebook (https://www.facebook.com/rimmellondonPL/), Instagram (https://www.instagram.com/rimmellondonpl/), Pinterest (https://pl.pinterest.com/pin/541628292679513092/ ; https://pl.pinterest.com/pin/459015387002790332/), and YouTube (https://www.youtube.com/user/RimmelLondonPL). The research carried out has shown that the brand under study uses content adapted to the users’ expectations in their social media. This includes in particular educational content: articles, e-learning sessions, news feed information, comparative infographics and process-illustrating infographics; entertaining content: tests, quizzes, competitions, sponsored videos, and apps; inspiring content: user opinions and blogger posts; and convincing content: user reviews and product rankings. The brand is not oriented at a single way of distributing content, the activities are carried out through multiple channels. It runs its own websites which are regularly updated with new, valuable material added. Content is also published by bloggers, influencers, and Internet users. A person interested in beauty products has a good chance of coming across the distributed content. The content is presented in a clear manner and the ease of finding it is not surprising, considering the proper layout of the pages and appropriate positioning of the online resources. Valuable content published in the social media channels should be assessed highly, as well. The largest number of users follow the brand’s Facebook page. With the increase in the popularity of Instagram and Pinterest, relevant activities are undertaken for the Rimmel brand. In the era of the growing role of video production, the brand also has a YouTube channel including numerous content-related videos, particularly tutorials. Moreover, it collaborates with bloggers and influencers – currently, mainly as part of their social campaign fighting against beauty cyberbullying, and on a regular basis, in the process of testing new products.
Newsletter	Interested Internet users can log in and receive information on Rimmel new offers and events sent to a provided e-mail address http://pl.rimmellondon.com/uzytikonik/newsletter

Table 1 presents in a synthetic way the examples of a variety of forms of content communication for the analysed brand. It can be observed that the activities are used on an extensive scale and in a methodical way. The conducted case study shows that content communication for the brand under study enables the provision of high value content to stakeholders, and consequently allows for a penetration of the brand into their life, presentation of solid information, education, stirring emotions, involvement of target audience on the conscious and subconscious level, creation of positive experience, and generation of mutually beneficial effects. Creation of the brand website and its profiles in popular social media produces numerous benefits, such as triggering of a low cost whisper marketing, building of a community which surrounds the brand and the products, an opportunity for communication in real time with users and other stakeholders; an opportunity to share opinions, films, photos, etc.; a possibility for demographic analysis of the community (gender, age, place of residence, etc.); building of strong relations with Internet users; an opportunity to create any kind of application, campaign or competition; to raise conscience on important company events; to encourage involvement in a variety of endeavours, such as designing of own varieties of branded products; an opportunity to exert influence over the brand image. The structure and content of the created sites for the given brand in the selected social media, as well as the forms of communication of high value content with the Internet users' involvement deserve to be commended. Another question relates to the opportunities for building of a proper image for the Rimmel brand. With respect to the problem of creating the proper image for the analysed brand, it is dedicated to young (both in terms of age and spirit), modern, brave, and active women (*O Rimmel*, 2019, www).

*Table2: Creating desired brand image for the Rimmel brand by means of high value content
 (Source: own elaboration on the basis of conducted case study)*

Enhanced features of the Rimmel brand image	Information on selected forms of content marketing communication
Unique, international but with British origins	brand information service, materials from photo sessions
User friendly (simple to use, universal, accessible),	communicating information which is interesting for the fans; thematic blogs; instruction videos; brand profiles in social media adapted to users' needs
Responsible, fair	many social responsibility projects
Creative, innovative (encouraging to experiment with make-up and freely express oneself)	integrating communication activities; constantly maintaining interest by means of novel projects and undertakings, new topics, new items on offer, as well as increasingly perfect modes of informing.
Inspiring, modern (trend setting)	proposing topics for discussion, keeping pace with cosmetics market development, trend setting, product innovations, an extensive offer and innovative forms of communication, including integrated inbound marketing activities

Information presented in Table 2 confirms the thesis that the content marketing communication activities play an important role in the process of creation of the appropriate image for the Rimmel brand. The owner of the Rimmel brand, Coty, declares that beauty should always bring joy and happiness, never sadness. According to them, the freedom to express oneself is key when it comes to beauty that is to be highlighted using the cosmetics of the brand under analysis. They emphasise that everyone, both women and men, boys and girls, have always used make-up to be able to express themselves. Rimmel wants to inspire people to experiment with make-up and show their most authentic selves this way. The role of the personified brand, going beyond the function of the products offered by it, is to broaden the definition of beauty and

inspire others to approach their image in an authentic manner, as it is their beauty that makes them unique. It also aims to fight against limited definitions of beauty, as well as shaming, judging, and criticising others based on their looks. Nowadays, such behaviour takes on the form of beauty cyberbullying. In order to investigate the scale of the problem and find out why the phenomenon occurs and how it impacts those affected, Coty commissioned a comprehensive study to be carried out in 10 different countries. Interviews with 11,000 young women aged 16 to 25 were held as part of the study. It turned out that in 2017 alone, as many as 115 million images were deleted from social media because of beauty cyberbullying. This is why the brand has partnered with non-governmental organisations: the Cybersmile Foundation on a global level, and in Poland, with the Empowering Children Foundation, which runs a Helpline for Children and Teenagers. The primary objective is to spread awareness and fight the phenomenon of beauty cyberbullying through the "I Will Not Be Deleted" social marketing campaign. The activities are additionally motivated by the information that one in four women have been victims of beauty cyberbullying. Moreover, it turned out that only 57% of all those bullied told anyone about what happened. Research shows that it is a huge problem and many people are unable to deal with it. It is never okay to hide behind the screen and criticise others for the way they look or express themselves. By highlighting this global issue, Rimmel wants to encourage people to fearlessly explore their own beauty and declares that it will keep fighting for everyone's right to express themselves online. Influencers, celebrities, and cyberbullying victims were involved in the campaign. According to globally successful model and actress Cara Delevingne, cyberbullying related to beauty choices has an impact on the victim on many levels: the personal, mental, and social levels alike. The celebrity believes that it is terrible that people make decisions concerning the way they look in anticipation or fear of being criticised. She emphasises that she identifies with the RIMMEL brand and looks forward to working on the campaign that raises this growing problem. Consistently enhancing its image as a socially responsible brand, Rimmel's owner believes that it is their duty to help create a safer and more positive online environment. A place where both women and men can fearlessly share their make-up and looks with others. With this in mind and with the good of people at heart, Rimmel strives to spread awareness of the phenomenon under discussion and create a safe space for self-expression and individual beauty.

5. CONCLUSION

In the light of the above considerations, it is justified to support the thesis that in the era of development of information technologies, an important role in creation of a proper brand image on the web is played by methodical publication of attractive and useful content as a reflection of content communication for brand. It is based on the strong belief that clients' trust and loyalty is best earned by providing them with relevant, reliable, high value information which contributes to creation of a unique brand image. Ensuring the provision of high quality information to the existing and potential clients motivates pro-consumer activities which are profitable from the company's perspective. Information is understood here as the intellectual capital having real value and translating into human life. Its dissemination in the marketing communication process triggers tangible results – attracting user's attention, newsletter subscription, completion of the contact form, participation in the contests, or eventually making the purchase and its repetition (loyalty). By means of high value content, the brand solves human problems and provides answers to important questions, and consequently begins to play an important role in the consumer's life. Quite often, education and change of habits and behaviour of the society is of crucial importance. Additionally, it is important to keep up with progress which for example indicates the greatest popularity of webcasts (i.e. production and transmission of presentations containing an abundance of videos, sound and text) and e-videos published on the product-related services.

In view of the conducted analysis it is justified to state that in the current market conditions, including the intensive Internet use, among other for the purpose of communication, the content marketing communication for the brand appears to be an effective tool for exerting influence upon the stakeholders; a tool which produces image-oriented results, generates value, and influences sales. The Rimmel brand promotes the joy of self-expression without limits. Thanks to dedicated content marketing communication in social media for the residents of 19 countries (9 European countries and 10 on other continents), the brand image is enhanced through the so-called "London Look", which encourages self-expression in an original and bold manner. The London Look should always be trendy, always authentic, close and accessible. Sometimes, it is rebellious, sometimes elegant, but the most important thing is to be yourself. The Rimmel brand primarily inspires people to play with make-up and colours. Thanks to its broad range of high-quality cosmetics, everyone can transform their looks as easily and quickly as they can run from one London Underground station to another, the way people move down the busy streets of London from Soho to Piccadilly Circus or from Portobello to Notting Hill. Since 1829, Rimmel has helped people express themselves without telling them what they should look like – providing them with beauty products intended to let them discover that. Content communication campaigns constitute a up-to-date and highly effective form of marketing activities for brands. They stir strong emotional reactions and influence stakeholders' behaviour. The performed analysis and research clearly indicate that high value content which is inspiring, stimulating, educative or entertaining distinguishes the brand and creates its unique image. The analysed content communication campaigns triggered immense interest of both the clients and the Internet users and industry experts. They can serve as a model to be followed by marketers who consider the use of an increasingly popular content. Communications related to the brand – due to the overt or subtle communication – influence the stakeholders in a multi-layer manner and strengthen the desired brand image. The campaigns are welcome and raise considerable interest on the Internet, which is reflected in numerous views or in comments. The high value content stays in the target audience memory and heart, is remembered for longer, is conducive for building of brand uniqueness, and enhances its authenticity. The communicated content clearly creates new stakeholders' experience related to the personified brand. Using content in communication for brand allows for avoiding pressure, giving freedom, providing entertainment, involving stakeholders in active dialogue, which facilitates their engagement in the digital era. Content stirs imagination, raises emotions, influences the conscience and subconscious of the audience, and supports relation building. Effective activities for personified brands which are interacted with by the stakeholders are determined by appropriate content marketing communication. Properly generated content – related to the brand, attracting the recipient's attention, in the form which is adapted to the expectations of the audience and the communication channels which they use, including the social media – seems to determine the process of brand image building and success in the digital era. The conducted research provide the basis for the conclusion that the content marketing communication plays an important role in the present day brand management – a phenomenon that clearly appears to be increasing.

HOW DOES LABOR MIGRATION AFFECT THE ECONOMIES OF RECIPIENT COUNTRIES?

Terane Shirvanova

*Azerbaijan State University of Economics (UNEC), Azerbaijan
teraneshirvanova@gmail.com*

ABSTRACT

Modern social reality can not be imagined without the migration of the population. Leading world development states, applying a selective approach and clearly defining priorities, seek to use international migration as a significant factor in the development of national human capital, the economy and the entire social sphere. A striking example is the United States, where science, high technology, medicine, etc., develop with the help of highly qualified immigrants, and low-skilled labor from abroad provides small and medium-sized businesses with cheap hands. Such countries as Canada, Australia, New Zealand, Israel, England, and Germany do not stand aside. However, migration cannot be viewed as a process with only positive effects. In fact, migration is a kind of social "catalyst". If the state has systemic problems in governance, anti-corruption activities, there is an increase in inter-ethnic tensions, crime, shadow economy, illegal employment, drug trafficking, etc. With the growth of labor migration, foreign labor resources began to have a greater influence on the socio-economic and political development of the host countries, including the development of the labor market, individual industries, and the smoothing of demographic imbalances. Unfortunately, the assessment of the impact of labor immigration on economic development is complicated by a number of factors: the widespread illegal employment, the shortcomings of the migration statistics system, and the dependence of the effect on the scale and duration of use of foreign labor. It should also be noted that the consequences of attracting highly skilled labor are different, in some cases drastically, from the immigration of low-skilled workers. Nevertheless, the analysis of the most significant local and foreign scientific research allowed us to form a typology of the positive and negative consequences of the use of foreign labor resources for the economies of the receiving migrant countries.

Keywords: *demographic imbalances, human capital, international migration, labor immigration, positive and negative consequences for the economy*

1. INTRODUCTION

The problem of migration, its impact on receiving and sending societies has recently become extremely relevant. And above all, this is due to the extraordinary increase in the influx of refugees into Europe, but not only. Cross-border migrations, and above all labor, have increased in all regions of the world, and in some regions of the Asian continent the growth rates of labor migration are particularly high. Obviously, we can state large-scale transformations both in the migration process in general and in labor migration in particular. Labor migration, regardless of the stage of development of migration processes, to one degree or another is their motivating and driving factor. It is hard to imagine that the majority of economic migrants, going to another country, rely only on state support in this country. Of course, dependent motives are present in modern migration mobility, but they are by no means dominant. Even in terms of assessing the scale of labor migration, 65% of the total number of cross-border migrants is more than an impressive share. But much more important is its place and role as a phenomenon that affects, in fact, all migration flows: family, educational, and humanitarian. What is labor migration in modern conditions and how does it affect the sustainable development of recipient countries of the labor force? These and other issues are covered in article.

2. POZITIVE AND NEGATIVE EFFECTS OF LABOR MIGRATION ON RECIPIENT COUNTRIES

Such factors as globalization of trade, development of transport and communication technologies, as well as demographic dynamics also act as incentives for migration flows. Migration can have both positive and negative effects on recipient countries. If migration flows are managed through well-thought-out policies, then international and internal migration can make a significant contribution to sustainable development, the UN Commission on Sustainable Development points out. With the help of migration policy, one can build social and political ties, help migrants improve knowledge and experience, provide sources of capital, investment and knowledge transfer. However, poor management of migration flows, insufficient opportunities for migrants to use previously acquired knowledge and skills, the presence of barriers to sending remittances to the country of origin lead to the fact that migration can potentially contribute to chronic labor market imbalances, tax imbalances and significant income inequality. Migration is a kind of social “catalyst”. If the state has systemic problems in governance, anti-corruption activities, there is an increase in inter-ethnic tensions, crime, shadow economy, illegal employment, drug trafficking, etc. With the growth of labor migration, foreign labor resources began to have a greater influence on the socio-economic and political development of the host countries, including the development of the labor market, individual industries, and the smoothing of demographic imbalances.

Table following on the next page

Table 1: Implications of the use of foreign labor resources for the country of entry of labor migrants (https://www.ictsd.org/sites/default/files/review/mosty_february_issue_-_2018.pdf)

Positive effects	Negative consequences
Consequences for the labor market	
Mitigate labor shortages.	Dumping in the labor market, leading to lower wages for local workers
Migrant employment in the household contributes to the employment of women.	Rising unemployment among the local population and the marginalization of less skilled workers.
Increasing employment in small business and entrepreneurship.	Criminalization of individual sectors of the labor market.
Providing employment in unskilled jobs.	
Employment of migrants in “non-prestigious” sectors of the economy contributes to the vertical mobility of local workers.	
Implications for human capital development	
Improving the quality of the workforce through the selection of young and skilled workers (in the segment of highly skilled labor).	Given the prevalence of low-skilled labor and the availability of substitute trends, the overall level of national human capital is reduced.
	Increased poverty (in case of declassification of a migrant due to job loss).
Implications for economic growth for the production of goods and services	
The emergence of a resource for regional shifts in the economy due to the possibilities for migrants to settle in certain regions.	Blocking the possibility of introducing labor-saving technologies.
Reducing labor costs and total costs associated with this.	Reduced efficiency and productivity due to the use of cheaper labor caused problems with the introduction of new equipment and technology.
Stimulation of additional employment, the formation of additional jobs and the development of infrastructure caused by the demand of foreign workers for goods and services.	The concentration of migrant workers is not in industries and regions experiencing the need for additional labor, but where you can count on quick earnings.
In the case of immigration of highly skilled labor, growth of innovative activity, increase in labor productivity is possible.	
Increasing the competitiveness of local goods and services by reducing costs.	
The growth of direct investment (including foreign), due to the availability of cheap labor.	
The development of the transport sector, both public and private transport.	
Implications for the financial sector and the formation state budget	
Increase in the collection of taxes from migrants' wages, receipts of obligatory payments (state fees, advance payments, etc.) and contributions to social funds.	Increased spending on social assistance for unemployed migrants.
Increase in payments for the use of housing and utilities by migrants.	The growth of government spending on migration policy.
Savings on education costs.	Additional impact of migrants on the social sphere and infrastructure.
Slowing inflation due to a higher propensity to save from foreign workers.	Capital losses associated with the transfer of part of wages by migrants abroad.
	Additional negative pressure on the national currency.
Implications for foreign economic activity	
Growth in the number of joint ventures with economic entities of the importing country of labor resources.	
Increase in commodity turnover between the exporting country and the laboring country.	

Let us dwell in more detail on the blocks presented in the table.

2.1. Implications for the development of the labor market and human capital

Labor immigration primarily affects the labor market of the host state. As already noted, this impact has both positive and negative consequences. First, the import of labor resources helps to alleviate the problem of labor shortages. Most of the developed countries have now entered a period of decline in the total number of working-age population caused by a decline in the birth rate. To solve this problem, by and large, only in two ways: a sharp increase in labor productivity and the promotion of labor immigration. The first option is the most favorable, but it requires time and technological development. The second option offers prompt satisfaction of the resulting deficit, especially for small and medium businesses. Secondly, the employment of migrant workers in the household contributes to the employment of women. The labor niches of carers, nannies, and housekeepers in developed countries turned into migrant ones in a short time. However, the ability to use cheap hired foreign labor for many women is a factor that stimulates their access to work. Third, employment in small business and entrepreneurship is increasing. This effect is observed as when attracting low-skilled labor, and highly skilled. As a rule, small business is highly dependent on the magnitude of costs, especially at the stage of creation and development. Foreign labor resources make it possible to obtain the necessary labor in case of their shortage, as well as to reduce their cost. This effect is also observed when using illegal migrants, especially in countries with high social guarantees in the labor market. Reducing costs is the cause of the spread of illegal employment in Russia, because brings incomparably greater benefits to employers, compared with legal employment. The study showed that the hiring of one illegal migrant, the economic effect is not less than 220 thousand rubles. savings per year. These calculations explain the main reason for the spread of illegal employment, especially in the small, as well as the so-called "migrant" or "diaspora" business. It should be noted that illegal migration leads to a number of negative socio-economic and political problems and can lead to various risks. In this regard, from the position of state administration of labor immigration, a deep assessment of all possible consequences for the formulation of a strategy regarding the scale of attracting cheap labor from abroad is necessary. Fourth, labor migration provides employment in unskilled jobs. Significant changes in the social structure of developed countries have had a major impact on the labor market. For a growing middle class, jobs with unskilled labor are not prestigious in both economic and socio-psychological aspects. In this regard, the influx of low-skilled migrants provides non-prestigious areas of the desired workers, although, as already noted, carries a number of social and political risks. Fifth, the employment of migrants in "non-prestigious" sectors of the economy contributes to the vertical mobility of local workers, encouraging them to improve their skills and find more prestigious and well-paid jobs. In a situation where local workers do not have the ability or desire to upgrade their skills and find employment in higher paying jobs, the probability of unemployment or their relocation from this region is very high. Labor migration has a number of negative consequences for the labor market of recipient countries. First of all it concerns unemployment and the level of wages. From the position of state management of migration processes, it is necessary to conduct continuous monitoring of the dynamics of unemployment and the level of remuneration in order to promptly respond to negative trends that may worsen with increasing migration flows. Another negative effect for the host state is the criminalization of certain sectors of the labor market. In addition to tax evasion, criminalization, as a rule, reduces the overall level of competition in the segment / industry, which leads to a slowdown in growth and technological development. We should not forget about the complex of possible negative socio-political consequences of this phenomenon. Labor migrants, entering a new society, become part of the aggregate national human capital of the host state.

Depending on the level of qualification and education, age and health, the incoming labor flow can both increase the level of development of national capital and reduce it. In the post-industrial economy based on the knowledge and technologies of the 5th and 6th ways, human capital becomes a strategic resource, critical for sustainable development, national competitiveness, growth of the population's well-being. The developed countries of the West, being attractive to labor migrants, are trying to improve the quality of the labor force by selecting young and skilled workers. Currently, there is global competition at the intra-industry, inter-industry, inter-regional and inter-country levels. For example, the United States uses not only labor, but also educational channels to saturate growth points with highly qualified personnel. The IT sphere is annually filled with the best specialists from India, China, South Korea, Russia, etc. With the prevalence of low-skilled labor, the overall level of national human capital is reduced. As a negative one, it is necessary to consider a situation where, along with the entry of low-skilled workers, there is a significant departure of highly qualified personnel from the country. With this trend of substitution, the reduction in the level of human capital is the most significant. It should also be noted that low wages in the segment of cheap labor can lead to an even greater decline in the human capital of migrants, due to the poverty of the latter. In such cases, the foreign worker has to save on food, medical care, advanced training, etc. The gradual erosion of the human capital of labor migrants leads not only to the deepening of poverty, but also to a decrease in their contribution to the economy, both through labor activity and through the consumption of goods and services.

2.2. Consequences for economic growth, for the production of goods and services

The increase in external labor immigration leads to an increase in the contribution of migrants to the gross domestic product of receiving countries. Migrants increase the total population of working age, come with a certain level of education, skills and competences, contribute to the development of the human capital of recipient countries. At the same time, in the case of the immigration of highly skilled labor, an increase in innovative activity is possible, which leads to an increase in labor productivity. For example, the migration of highly skilled labor in the United States contributes to increasing the amount of research and innovation, as well as increasing technological progress. Another positive effect of labor emigration is the ability to use its resource for regional shifts in the economy through the resettlement of migrants. The state, through indirect management based on the creation of growth points, needs to direct the flow to those regions where there is a need for labor. Unfortunately, this effect is very difficult to use in the case of low-skilled labor. An important positive effect of attracting foreign workers is to reduce the cost of labor and the total costs associated with its use. As already noted, this effect is observed when using legal as well as illegal migration. Reducing costs leads, firstly, to an increase in the profitability of the organization. Secondly, the growth of direct investments (including foreign ones) is stimulated, due to the availability of cheap labor. The experience of China shows that cheap labor, combined with transparent business conditions and guarantees of private property, ensures a steady flow of foreign money into production and, as a result, GDP growth. Thirdly, in the conditions of internal and external market competition, cheaper labor increases the competitiveness of an organization, facilitates the entry of goods and services into new markets. We should not forget about the stimulation of additional employment, the formation of additional jobs and the development of infrastructure caused by the demand of foreign workers for goods and services. In this context, the increase in the share of wages of migrants, which they use for domestic consumption, is a very positive effect. Also a favorable effect will be the accumulation of migrants' money in bank accounts, since The bank deposit tool allows you to invest these funds in the economy of the host state. The growing scale of labor immigration leads to an increase in the demand for transportation services, including the development of public and private transportation.

There is an additional impetus to the opening of new transport routes, an increase in the number of flights, and a fleet of vehicles. All this leads to an increase in the profitability of transport companies due to the “economies of scale”. For recipient countries of labor migrants there are several negative consequences for economic growth and the development of production and services. First of all, it is necessary to note the negative impact on the introduction of labor-saving technologies. The reason for this is the fact that entrepreneurs and enterprises in conditions of the influx of a large amount of cheap labor lose incentives to develop and put into operation resource-saving equipment. This negative effect leads to the appearance of another: labor productivity is reduced due to problems caused by the use of cheaper labor with the introduction of new equipment. The lack of productivity growth leads to a “freezing” of wages. The growth of the welfare of both the migrant and the local worker stops. This affects the processes of consumption and accumulation of funds by these social groups. It should also be noted that the resulting effect of cheap labor can improve the competitiveness of the organization, but it can only take place in the short-term dynamics. In the future, the postponement of modernization will lead to a sharp lag behind competitors who will re-equip. The next important negative effect that is clearly seen in the example of Russia is the concentration of labor migrants not in industries and regions that need additional labor, but where you can count on quick and not always legal earnings. The overseas practice of managing migration flows shows that migration can and should be managed. Countries such as China, Israel, Sweden, Greece, etc., use the management of migration flows (not limited to purely labor) to stimulate regional development. For modern Russia, regional development is not only a matter of economics, but also an important factor in geopolitical security and political stability. The negative trends in population reproduction in Siberia and the Far East, complicated by the “western drift” in migration of the population, threaten to depopulate vast territories. Colossal internal Russian differentiation in the standard of living leads to migration, including highly skilled workers from the subjects of the Russian Federation, to the Moscow region. This undermines the economic, demographic, scientific, managerial potential of the Russian territories.

2.3. Consequences for the financial sphere and the state budget

Labor migrants have an impact on both the budget of the host state and the entire financial sector. Entering the labor market, a foreign worker becomes an object of taxation. Also, certain taxes and fees are usually paid by the employer who uses migrant labor. With an increase in the migration flow, the collection of taxes on migrants' wages, receipts of obligatory payments (state fees, advance payments, etc.) and contributions to social funds increase. At the same time, the higher the qualifications of migrants, the higher the cash receipts in the budget of the receiving state. Naturally, in this context it is necessary to talk only about the legal component. Factors affecting the financial effects of labor migration primarily depend on certain characteristics of the immigrants themselves, such as age and causes of migration. An OECD study showed that young unskilled labor migrants start paying taxes and fees more than the state spends on them, only after reaching the age of 40–45 years. Another positive consequence is the increase in payments for the use of housing and utilities by migrants. This effect depends on the magnitude of the flow and the development of the infrastructure and the rental housing market. As a rule, the increasing flow of migrant workers stimulates the construction of hostels, apartment buildings. At the same time, the compact placement of migrants, the formation of ethnic ghettos can reduce the cost of real estate in these areas, which will reduce the income to the treasury from real estate tax, if it is calculated from its actual cost. An important positive effect is the hidden savings of the state budget of the host state on the costs associated with obtaining education, medical care, and support through social programs. Another positive consequence is the slowdown in inflation due to a higher propensity to save from foreign

workers and remittances abroad. In fact, both savings and remittances from the country allow reducing the money supply in circulation, which should have a positive effect on the level of inflation. The situation with the exchange rate of the national currency in the host country of the migrant is a bit different. If he makes a money transfer to his homeland in the currency of the country of his residence, then the national currency exchange rate must be strengthened. The effect is the greater, the greater the money supply is transferred abroad. The opposite situation may occur if the migrant transfers money in the currency of third countries. For example, working in Russia and receiving wages in rubles, a foreign worker buys US dollars and makes a transfer. This increases the demand for foreign currency, which may put some pressure on the Russian ruble rate. Along with the positive effects of the use of foreign labor on the financial system of the host state, there are a number of costs. First, it is necessary to note the additional impact of migrants on the social sphere and infrastructure. This problem is particularly acute in the conditions of the crisis and the decline in demand for labor. During such a period, social assistance costs for unemployed migrants and return assistance are increased. As already noted, the relatively low cost of foreign labor is provided, including the almost complete lack of social guarantees for labor migrants from both the employer and the state. Such savings at the micro level can result in increased social spending at the macro level, which will have to be included in the expenditure side of the state budget. Secondly, an increase in immigration flows leads to an increase in government spending on migration policy. First of all, the costs are associated with the creation of infrastructure for the legalization and adaptation of migrants. Permissive and controlling functions of public authorities will require an increase in costs, following an increase in the number of foreign workers. Thirdly, although most experts believe that a migrant worker in value terms makes a greater contribution to the economy of a receiving state than sends remittances, in a pure form, "remittances" are a leakage of capital abroad. It is almost impossible to influence the total amount of remittances, since they are one of the main goals of labor migration, and additional taxation of this financial flow can only lead to the emergence of gray cash flow schemes.

2.4. Consequences for foreign economic activity

The existence of close migration links between the donor state and the recipient state cannot affect the external economic interaction of the two countries. First of all, we should talk about the increase in the volume of mutual trade and the increase in the number of joint trading enterprises. The impact of migration on bilateral trade is primarily due to three reasons. First, immigrants are well aware of traditions, laws, speak the language, are familiar with the business practices of both the donor country and the recipient country. Accordingly, their presence helps to bridge the information gap between sellers and buyers on both sides, thereby facilitating the realization of trading opportunities and the establishment of strong bonds based on trust. Secondly, immigrant networks can enforce contract execution through certain informal sanctions, which are used in the case of weak institutional rules and reduce trade costs. And thirdly, immigrants directly or indirectly promote the goods of their homeland, form demand and distribution for them.

3. REACTION OF NATIONAL IMMIGRATION SYSTEMS

National immigration regulation systems were formed as institutions for the prevention and resolution of conflicts arising from the influx of foreigners into host countries. Their activity was primarily determined by the country's needs in attracting foreigners, expanding or limiting admission in a specific period of its history. It is possible to conditionally distinguish at least three periods in the post-war history of immigration flows due to their imbalances and conflicts:

- settlement immigration;
- the period of "economic" migration;

- the post-crisis transition to selective methods of receiving the foreign labor.

Increased international competition, multiplied by technological shifts, changes in the structure of employment, the system of labor relations - all of these factors radically change the balance of supply and demand in the international labor market of migrants. The principles of selective selection of specific groups of specialists and low-skilled categories of workers and the need to counter the expansion of illegal migration, and, if possible, reduce the scope of its use, are prevailing. Until recently, national immigration systems did relatively well with their usual tasks of selecting and eliminating standard categories of foreigners. However, the transition to a new stage of socio-economic development reduces the capacity of labor markets, their interest in large contingents, even skilled labor. The influx of unclaimed labor migrants instead of the expected economic effect leads to an increase in social tension. This aggravates the internal problems of many national labor markets (unemployment, segmentation, redundancy of education, lack of demanded specialists, etc.). It is clear that cross-border migration cannot be stopped, it can only be limited and regulated. For this purpose, the methods of "rejecting" migration, redirecting migrant flows to other destinations or to other regions, seem to be the most effective. But this is quite a complicated and expensive event. It is becoming increasingly clear that the economic crisis, a sharp drop in economic growth rates, the uncertainty of the situation on labor markets and the growing imbalance of job creation with the need for them in new age cohorts are having an increasing influence on the transformation of immigration policies of host countries. In the EU, there is a struggle between opposing trends: the unification and standardization of migration policy with the diversification of national approaches in the field of migration regulation. This was particularly evident in the aggravation of contradictions in measures to overcome the migration crisis of 2015–2016. Obviously, the EU member states do not make much effort to encourage migration, and this applies even to those countries where there is a shortage of personnel. According to the Eurofund, active labor market policies make a rather modest contribution to facilitating geographical mobility within the EU. The reason lies in serious structural barriers - linguistic, cultural and in the difficulty of recognizing foreign qualifications. In addition, the share of unemployed among labor migrants from third countries in Europe is significantly higher than among the local working-age population. Moreover, this proportion is maintained even with a decrease in the level of registered unemployment.

4. CONCLUSION

Migration regulation is an extremely complex and delicate process due to the high degree of conflicting interests of the parties involved and a high degree of politicization (both in defining goals and objectives and methods for achieving them). This applies to both measures to reduce the influx of new immigrants (Great Britain), and the problems of integration (EU countries) and the presence of illegal migrants (US). The criteria for determining the real and future demand for foreign labor force are constantly changing; the importance of the filters used (quotas, scoring systems, lists of deficient professions, the level of remuneration, etc.) increases; the role of regulatory instruments (permit systems and control systems of employers and other sponsors, programs for irregular migrants) is increasing; the problem of the adaptation of foreigners and the inclusion of immigrants in host societies (integration agreements) is being updated; There is growing attention to the state of public opinion, the level of tension and conflict in relations between the local and visiting population, and shifts in electoral behavior. Reported processes affect both the countries of origin and potential migrants, increasing competition for decent jobs, obtaining relevant education and training. At the same time, a reduction in demand, given the unchanged economic situation in the countries of origin, is unlikely to have a significant effect on reducing the supply of foreign labor in the international labor market.

And this cannot but lead to the growth of irregular and illegal migration with all its consequences. It is precisely due to the peculiarities of historical and cultural experience, the presence of unequal economic and natural resources, but with more or less similar immigration policy objectives, various configurations of migration management tools are formed and effective in the proposed conditions and ready for transformation when new goals and objectives arise. In general, today, the regulation of migration flows is increasingly taking the form of restricting the flow of unwanted migrants through the introduction of additional filters: high requirements for professional qualifications, income levels, education and language skills, age restrictions, but also measures to attract the desired labor migrants. The considered positive and negative consequences of the impact of the import of labor on the economy of the receiving state mainly indicate the systematic nature of labor migration and its complexity for scientific analysis. Certain positive effects in the short term can give an impetus to negative trends in the long-term, which dictates the need for state management of migration processes, whose task will be to maximize positive effects and minimize costs. The peculiarities of such migration policy are, firstly, the complexity and timeliness of obtaining reliable statistical information. Secondly, the need to create a system of indicators for comprehensive monitoring of the impact of foreign labor on various aspects of the economic and social development of the state.

ABSTRACT

According to the European Environment Agency (EEA), global demand for energy and natural resources is expected to increase, and climate change impacts will intensify. The only viable option is to move to a low-carbon, clean, safe, affordable and renewable energy circular economy. Circular economy is thus among the main contemporary political objectives in Europe, and sustainability and reflection on the life cycle are increasingly the center of attention. According to the Circular Economy (EC) model, with regard to energy production, sustainable development must be guided by principles of reduction, reuse and recycling of materials and waste, with the combustion process as the penultimate option, followed by landfill. The current paradigm of extraction, production and use of natural resources do not converge with a future vision. The planet has a finite capacity of resources that it is able to provide, just as is finite its capacity to deal with the consequences of the use of these resources. Solutions that seek synergies between resources and waste, the use of resources and the consequences that result with a minimal environmental impact, have been sought. Biomass recovery technologies are pointed as a solution that aims to reversing part of the problem. This document approaches the problems associated with resource extraction, elucidating how waste (in this case, forest biomass) can be converted into energy and the resulting by-products can be returned to nature with a positive impact, closing the cycle. These new biomass recovery technology can enable the creation of new companies and job creation.

Keywords: *biomass, closed product cycle, production of energy*

1. INTRODUCTION

Human development depends on natural resources, largely due to energy needs. According to the European Environment Agency, it is expected that global demand for energy and natural resources will increase and the impacts of climate change will intensify. With energy production accounting for two-thirds of total greenhouse gas (GHG) emissions and 80% of CO₂ emissions, promoting sustainable development and combating climate change become integral aspects of planning, analysis and formulation of energy policies (International Energy Agency, n.d.). Moving towards sustainable development should promote resource use efficiency and the integration of waste into natural cycles for the benefit of nature and the economy. In 2010, about 65 billion tons of raw materials entered the economic system and are expected to reach

82 billion tons by 2020. This abusive consumption exposes companies and countries to risks related to the volatility of resources prices and supply disruptions (“Economia Circular - O que é a Economia Circular?,” n.d.). However, not only the drawing out of resources raises concern, the production of waste also has a strong negative impact. The Earth is not only limited in the supply of resources, but also in the absorptive capacity of the generated waste, much due to the synthesis of substances that are not generated in nature. Thus, the global trend of waste/biomass valorization for energy production has gained prominence, with the concept of "Waste for Energy" (WTE), widely promoted as a form of sustainable development (Ferreira, Monteiro, Brito, & Vilarinho, 2017). In Portugal, 4.891 thousand tons of solid urban waste (RSU) were produced in 2016, 3% more than in 2015. This trend of growth over the years does not converge with that which is the Community and national strategy for waste adding that the recovery of waste remains stagnant - that year, 29% of MSW collected were deposited in landfills, 22% were incinerated in waste energy recovery centers, 2% were sent for organic recovery and 11 % were recycled (APA, 2016). This situation becomes more sensitive in view of the fact that this type of waste represents only 10% of all waste generated. In addition, in 2017, devastating forest fires swept the northern and central regions of Portugal with a great loss of life, burning a total area of 442.418 hectares. The dimension of these events has made the Portuguese internal administration unprepared, emphasizing the need to implement of preventive measures of territory management and planning (Silva & Eus, 2019). Therefore, it is essential to reinforce the use of biomass as a source of energy since cohesion and valorization of the national territory undergo by the use of this endogenous, abundant and accessible resource, which uses efficient and mature technologies. Which has advantages over other sources of renewable energy because it is subject to storage and transportation is less dependent on location and climate, is the only non-intermittent renewable source in energy production, as well as valuing waste that, on the other hand would become polluted. The processes of thermochemical conversion of biomass, as in the case of combustion, have accompanied humanity throughout its development. However, their exploitation remains undervalued in the face of the benefits that could result. The advantages of using these processes for the production of energy go through the valorization of endogenous energy resources, which in turn would lead to a decrease in imports of fossil fuels and consequent improvement the stability of trade balance. Job creation is inherent in investing in these technologies, and because it is a renewable source of energy, greenhouse gas emissions will be reduced. In addition, as technologies promoting waste recovery, the environmental and economic impacts associated with waste management would be reduced, which would lead the country to meet the European targets for waste, GHG emissions and the share renewable energy production. The European Commission has approved under the EU rules on State aid a Portuguese scheme to support biomass energy installations located in close proximity to forest areas considered to be 'critical' in terms of fire risk. Thus, this article presents a study of the resulting energy potential of enhancement of forest biomass of northern Portugal, more specifically in PROF Douro region. Where it is analyzed the economic and environmental viability of the implementation of a biomass power plant that uses the technology of combustion for electricity production.

2. LITERATURE REVIEW

2.1. Circular Economy

According to the European Commission (European Commission, 2014), the implementation of measures to increase the efficient use of resources can lead to substantial gains:

1. cost savings, for European industry in the order of 630 billion €/year;
2. the boost in economic growth, with a 3,9% increase in GDP, creating new markets and adding value to materials;

3. and a reduction of 17 to 24% in natural resource extraction by 2030. Re-injection of resources into the production process and reduction of waste and dependence on uncertain sources of supply are a direct way to improve resilience and competitiveness, contributing to more sustainable growth.

Thus, the transition to a circular economic model will bring Europe up to the challenges of resource pressure and increased supply insecurity (European Commission, 2014). It should also be noted that some measures for the transition to the EC require investment to be feasible. Public and development banks should provide resources that signal priorities to markets, such as innovations and new forms of business for CE, so that the economic mechanisms support the better allocation of resources, overcoming obstacles and market failures, giving scale initiatives, raising the level of discussions to recognize good practices and encouraging entrepreneurship in new business (Abu-Ghunmi, Abu-Ghunmi, Kayal, & Bino, 2016). There should be measures to facilitate investment in circular solutions, such as the dissemination of product information to private investors via non-financial reporting, especially in long-term financing; create new risk-reducing financial instruments such as the proposal for a specific fund in the European Investment Bank or the use of public-private partnerships to enable JI projects; eliminate negative subsidies and exchange part of the tax on labor (such as income tax) for a tax on pollution and use of resources (there is a proposal under discussion on European environmental tax reform in this regard); restrict current waste funding by European funds to those preferential solutions (selective collection, recycling, etc.), and no longer subsidize landfills; and provide specific credit lines to develop new markets for secondary materials with higher quality and reliability (Abu-Ghunmi et al., 2016; Faivre, Fritz, Freitas, de Boissezon, & Vandewoestijne, 2017; Wolfram & Frantzeskaki, 2016).

2.2. Forest resource

There is a high energy potential of forest biomass in Portugal, and it is imperative to instigate its energy recovery to reduce the amount of fuel associated with fires, external dependence on fossil fuels, greenhouse gas emissions and promote job creation. In 2017, biomass met 5,40% of the needs of the Portuguese energy sector, with a total output of 2,8 TWh. Although the contribution of this source has been increasing, it is far away from other sources of renewable energy such as wind and hydro-electric energy, with contributions of 23,10% and 14,20%, respectively (APREN, 2017). Being even more below that which is the national potential. According to the 5th National Forest Inventory (ICNF – Instituto da Conservação da Natureza e das Florestas, 2010), in the northern region of Portugal, forest assume the largest land occupation with 1 358 079 hectares, or 64% of this territory. The most representative species are pine tree (45%), followed by eucalyptus (22%), oak (16%), chestnut (5%) and cork oak (2%). From the Northern region of Portugal, the Regional Planning Plans (PROF) of Alto Minho, Baixo Minho, Tâmega, Porto Metropolitan Area and Entre Douro and Vouga, Barroso and Padrela, Northeast and Douro (Figure 1a). These are defined by the Basic Law of National Forestry Policy (Law No. 33/96), and are a key element in the Portuguese Forestry Planning System, developing the guidelines recommended at the level of national forest planning and legislation and translating them, on action programs, or on specific forestry and land use standards (UTAD, 2006). The Douro PROF area is located in the south of the region of Trás-os-Montes and Alto Douro and north of Beira Alta, partially covering four districts: Bragança, Vila Real, Viseu and Guarda. Administratively, the 410.897 hectares considered are distributed in 19 municipalities, encompassing a total of 301 parishes (Figure 1b). The soil occupation is distributed with 39,4% of agricultural space, 30,6% correspond to non-wooded forest areas and 28,2% correspond to wooded forest areas (UTAD, 2006).

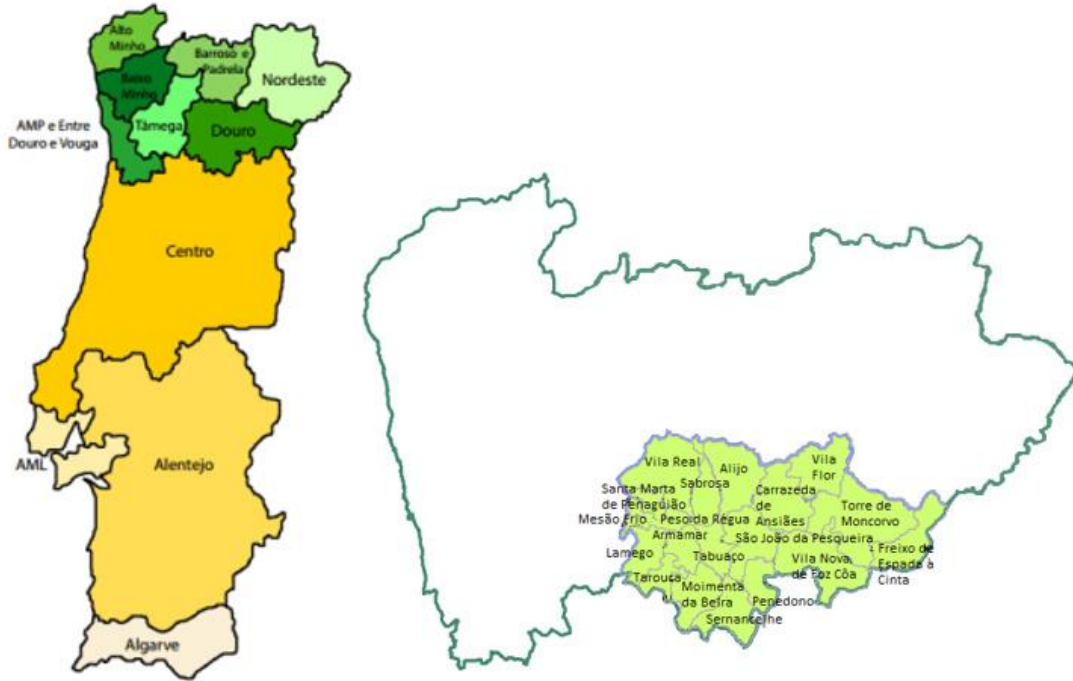

Figure 1: Scheme of the PROF regions of the North of Portugal and counties that make up the PROF Douro

Regarding the feasibility of the energy utilization of forest biomass, the existing quantity and the annual average additions, are good indicators of the potential of implementation of plants for their valorization. The PROF region of the Douro presents as soil occupancy characteristics: 39,4% of agricultural space, 30,6% of non-wooded forest spaces and 28,2% of wooded forest areas (Figure 2). The most representative species are pine (71,5%) and oak (10,1%) (UTAD, 2006). With regard to existing biomass and annual average increases (AAI) of biomass, there are 52,9 ton/ha of biomass in this region and the average annual increases are 3,4 tons/ha (ICNF – Instituto da Conservação da Natureza e das Florestas, 2010). That is, 128.287 tons of forest biomass available every year.

Figure 2: Characteristics of soil occupation of the PROF region

3. BIOMASS AND CONVERSION PROCESSES

Biomass can be converted into energy and/or biofuels by biochemical conversion processes or by thermochemical conversion processes. The first involves catalysts and biological organisms for the production of energy; already the second involves heat and chemical catalysts. Biochemical conversion is less expensive and more environmentally friendly than thermochemical conversion, however, given its low yield and high process time the thermochemical conversion is more widespread (Tripathi, Sahu, & Ganesan, 2016). The products resulting from the conversion of the biomass are directly related to the applied technology, so your choice must be careful in order to obtain the maximum quantity of product with the desired characteristics, at the lowest cost, with the maximum process efficiency and with the less environmental impact. Examples of thermochemical conversion of biomass into energy are combustion, pyrolysis and gasification. In this article, the combustion process will be the subject of analysis. Combustion can be defined as the complete oxidation of the fuel, involving a number of highly complex physical and chemical aspects. In this process, the chemical energy contained in the biomass is converted into heat, mechanical energy or electricity through devices such as ovens, boilers, steam turbines, etc. Combustion technologies play an important role in the production of energy from biomass, which is the main technological route for bioenergy, responsible for more than 90% of the global contribution of bioenergy. However, for a greater implementation of biomass combustion, the technology should be optimized to meet raw material costs, increase fuel flexibility, and have lower emissions and greater efficiency (Jaap, 2008). In Portugal, the combustion of biomass in small domestic applications such as heating and food preparation is frequent, however it is not well documented (Ferreira et al., 2017).

4. METHODOLOGY

This study analyzes the economic and environmental viability of the implementation of a forest biomass energy recovery power plant using the combustion technology in a specific region of the North, the PROF Douro. The production of electricity is examined, based on technical-economic data presented in the literature, as shown in Figure 3.

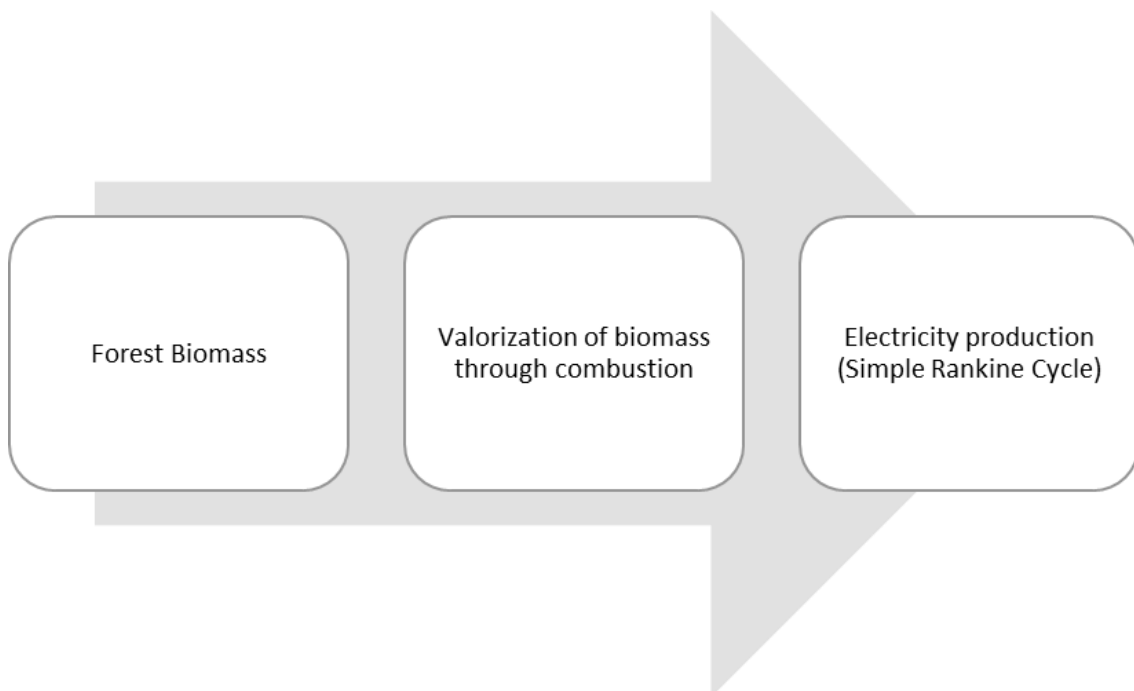

Figure 3: Scheme of the study scenario

4.1. Considerations

For reasons of sustainability and inherent difficulties to the transport and collection of biomass, it was considered that the forest resource available for conversion is 50% of its totality (CBE, 2004), that is, 64.144 tons/year. Considering the LCV of forest biomass equal to 15.6 GJ/ton (reference value for calorific value presented in Order No. 17313/2008 (Ministério da Economia e da Inovação, 2008)), it is inferred that there is an energy potential of 277.956 MWh/year. It was also considered a constant availability of biomass throughout the year, during the period of operation of the plant. For this type of thermoelectric power plant, it was considered that the electricity production is based on the operation of a simple Rankine cycle with a thermal efficiency of 35%. It was also considered an efficiency of 85% for the boiler (Borges, 2009). Table 1 summarizes the input data applied in the calculations.

Table 1: Technical-economic characteristics of the scenarios under analysis

Dados técnico-económicos dos cenários analisados	Reference	
Location	PROF do Douro	
Plant availability	8.000 hours/year	(Borges, 2009)
Biomass potential	64.144 ton/year	(ICNF – Instituto da Conservação da Natureza e das Florestas, 2010)
Potential of biomass energy	277.956 MW/year	
Biomass cost	41-76 €/ton	(Enersilva, 2011)
Revenues for electricity selling	107 €/MWh	(Ministério da Economia e do Emprego, 2013)
η_{th}	85%	(Borges, 2009)
η_{el}	35%	(Borges, 2009)
Power Plant capacity	10 MW	
Reference cost of the plant (€/MWeI)	3.000.000	(Relvas et al., 2015)
Production costs (€/MWh)	13.33	(Relvas et al., 2015)
Operational costs (€/h)	133	(Relvas et al., 2015)
Project lifetime	20 years	
O&M costs	5% of the total investment	
Discount Rate	10%	

5. ECONOMIC VIABILITY

In order to analyze the economic viability of the power plant, the economic indicators PBP (Payback Period), NPV (Net Present Value) and IRR (Internal Rate of Return) were analyzed to examine the profitability of this type of projects. Payback Period gives an indication of the number of years that the user recovers the invested capital. However, it does not take into account the updating of amounts and considers the existence of a gross benefit (revenues minus expenses), constant. This indicator can be translated by the expression:

$$\text{Payback Period} = \frac{\text{Investment costs}}{\text{Revenues}} \quad (1)$$

The NPV indicates the surplus generated after the investment. The user values the capital at a rate of $a\%$ and at the end of the project lifetime (n) recovers the invested capital (I) and generates surplus (when the value of the NPV is greater than zero), or only pays the invested (when the NPV value is equal to zero) (Borges & Moreira, 2009).

$$NPV = -I + (R - C) \left[\frac{(1+a)^n - 1}{a \times (1+a)^n} \right] \quad (2)$$

where I refers to the invested capital (10^3€), R revenue (10^3€), C to operating costs or charges (10^3€), a represents the discount rate ($0 < a < 1$) and n is the number of years of project life.

The IRR corresponds to the project update rate for which the NPV value is equal to zero. This indicator allows determining the rate that the investor obtains, on average, in each year, on the capital that remains invested in the project, while the initial investment is recovered progressively.

$$-I + (R - C) \left[\frac{(1+a)^n - 1}{a \times (1+a)^n} \right] = 0 \quad (3)$$

The sale of electricity produced to the grid was taken as revenue, taking as reference the value of 107 €/MWh (value calculated according to Decree-Law no. 35/2013 (Ministério da Economia e do Emprego, 2013). The investment refers to the cost of the equipment and its installation, whose values are presented in Table 1. Annual operating and maintenance costs were taken as 5% of the total investment value. Costs of biomass include costs of production, collection and transport and range from 41-76 €/ton, so we consider the average value of 58,5 €/ton. The life time of the equipment was considered to be 20 years. Finally, the value of 10% for the discount rate was considered.

6. ENVIRONMENTAL VIABILITY

In order to determine the savings generated by the plant's implementation of biomass in terms of CO_{2e} emissions, the potential of electric power generation by the thermoelectric plant was compared to the same amount of energy produced if coal, oil or natural gas were used. In Order n° 17313/2008 (Ministério da Economia e da Inovação, 2008), the lower calorific value (LCV) and emission factors (FE) are established for the analyzed fuels. Table 2 shows the values used in the calculations.

Table 2: Calorific values and emission factors of the analyzed fuels

Fuel	LCV (GJ/ton)	FE (kgCO _{2e} /GJ)
Wood biomass	13,8-15,6	0,0
Bituminous coal	25,8	94,5
Crude oil	42,3	73,3
Natural Gas	45,1	64,1

7. RESULTS

7.1. Economic viability

Table 3 presents the results obtained in the study of economic viability of the thermoelectric power plant, according to the considerations taken.

Table 2: Results obtained in the economic analysis

Investment (€)	Total operation costs (€/year)	Revenues (€/year)	Payback (years)	NPV (€)	IRR (%)
30.000.000	2.565.213	8.560.000	5	21.036.999	17

According to the results, the implementation of a 10 MW biomass thermoelectric power plant requires an investment of 30.000.000 €, with a return on capital invested in just over 5 years. By valuing the capital at a rate of 10%, after the 20-year life of the project. In addition to recovering the initial investment, is generated a surplus of around € 21.036.999. The capital investment is valued at a rate of 17%, that is, the rate of return of the investment is higher than

the discount rate. According to the World Bank Group (International Finance Corporation, 2017), the project is feasible: the payback period is less than 10 years, the NPV is positive and the internal rate of return is higher than the discount rate.

7.2. Environmental viability

The implementation of biomass power plants leads to a number of environmental and social benefits such as the reduction of forest fires, increasing the share of renewable energy production and promoting rural development and job creation. In quantitative terms, biomass combustion plant has a potential for electricity production of 80.000 MWh/year, equivalent to 18.461 tons of CO_{2e} avoided if the fuel used to produce this energy was natural gas.

8. CONCLUSIONS

The current pattern of production and consumption raises questions about the availability of limited resources and the volatility of commodity prices, undermining their supply. The growing awareness that the economy depends on the ecosphere and that the Earth is finite and so economic growth has limits, has motivated the development of more sustainable solutions. Thus, biomass energy valorization has increasingly been considered as an integrated strategy of bioeconomy and sustainable circularity, which preserves the biological balance of ecosystems, which does not compete with the food chain, nor does it potentiate the extraction of raw materials, understanding waste as resources. In addition, the by-products generated can be returned to nature, with environmental benefits, closing the cycle. In the present work, the potential of electric energy production of the forest biomass of the Douro region using the combustion process was analyzed. The production scenario was considered and the economic and environmental feasibility study was carried out. From the economic analysis the project was viable with a surplus value generated of 21.036.999 €, an internal rate of return of 17% and a return period of 5 years. From this, it is concluded that this kind of project has economic significance for the region. Indeed, economic data show that the creation of businesses for the production of electricity from forest biomass could be a reality, thus enabling the region's economic development and job creation. The economic gain is not, however, restricted to the creation of wealth based on the creation of electric power companies, but also on the creation of satellite companies, from the by-products originated from the electricity production industry. Also with regard to the reduction of greenhouse gas emissions, the implementation of this type of plant has a potential of 18.461 tons of CO_{2e} avoided if the fuel used for the production of electricity was natural gas. Although this evaluation is generic, since several considerations have been taken, which may differ from reality, it is an indication of the potential of this type of use. Biomass is thus a renewable energy source with a great potential for the production of electric energy and can become a strategic sector in Portugal or in any other country with forest resources at least identical and whose energy market is based largely on imported fuels.

ABSTRACT

Resources and capabilities are considered to be key sources of competitive advantage of a company, but only if they are not possessed by the competition. In order for competitive advantage to be sustainable, it is important that firms invest in continual improvement, i.e. in the education of their staff, modern technology and innovations. Modern business takes place in constantly unpredictable and uncertain conditions, and it is therefore necessary that a company has people ready to adjust to new business climate, and also new technologies to keep up with the competition. New business conditions have made the boundaries between people and information thinner, so many firms opt for entering international markets. Entering the international market represents a huge economic challenge because it requires certain skills and knowledge from the management and the employees. In the forming of export economic strategies, the country decides on the way of realizing its strategic goals with the highest success. The Republic of Croatia has faced some highly demanding political and economic processes and events in the past few years. Fast development of modern technologies and globalization has created conditions for internationalization of businesses in Croatia. Economic success of a country depends on the compatibility of development goals of the country with the goals of the economic strategies. When choosing the strategy for entering international market, companies have to conduct different researches related to the demand for their product or services, and the research on the culture, language and customs of the country where they wish to operate. The empirical research was conducted with the experts in charge with the activities related to the internationalization of companies. Based on the sample of five firms, the conclusion can be made on what strategies Croatian firms choose for entering the international market, and whether they come across any obstacles along the way, and if they do, what the most common obstacles are.

Keywords: *competitive advantage, internationalization of firms, strategies for entering the international market, resource theory*

1. INTRODUCTION

Competitive advantage can be established only in relation to the competitors, based on which we can differentiate successful from unsuccessful firms. It can be said that a firm has competitive advantage when it is able to create more economic value than its competitors (Barney, 2008). The basis of competitive advantage are invisible resources, and this is because invisible resources are specific to the firm that owns them, and because those resources are difficult to imitate (Wong, Kair, 2010). Fast development of modern technology and globalization has contributed to the internationalization of business activities. Firms that have access to new knowledge, information and technologies possess advantage in relation to other firms. Modern business implies dynamic environment, i.e. constant uncertainty and unpredictability. Therefore, internationalization is a crucial activity, because if a firm relies only on the domestic market, it might not survive (Törnroos, Halinen, Medlin, 2017). Chang, Wilkinson, Mellaahi (2007) state that globalization and internationalization have provided

multi-national firms presence on the growing markets via lower entrance barriers and lesser regulations, but also via trade liberalization. It is important to point out that, with the business internationalization, firms actually protect the activities from the international competitors and also enable expansion into international markets (Rialp, Urbano, Vaillant, 2005). Resources that are valuable and cannot be imitated can provide the firm with competitive advantage, along with the knowledge and skills the competitors cannot easily acquire. The role of small and medium-size firms on the growing markets is evident in big profit from the export. Also, those firms are also prone to undertake risky activities to show their knowledge and technologies make them capable of doing business on the international markets (Javalgi, Todd, 2011). Autio and Acs (2010) point out that long-term competitiveness is connected with the knowledge and tendency for innovations, and faster internationalization than the competitors. Tolstoy and Agndal (2010) think that technological innovations can positively influence the export, and so technological abilities can contribute to the realization of competitive advantage. Besides knowledge and innovations, technology is emphasised as the way of creating competitive advantage. Owning modern technology enables firms to expand on international markets and it also brings competitive advantage. Crick and Jones (2000) have concluded that internationalization is influenced by technological intensity of a firm through specific characteristics of the products and the environment where the firm operates.

2. BUSINESS INTERNATIONALIZATION

Internationalization has become inevitable, ever since it started to evolve in the 1970s, when strong market liberalization was set in motion and when technology reached the level which enabled firms to expand their businesses outside the borders of their country. It is important to note that through internationalization, a firm can realize lower production costs and economies of scope (Jenkins, 2013). Every company that wishes to develop has to think globally, i.e. the main motive of the internationalization is the creation of new value for the company (Daniels, Radebaugh, Sullivan, 2009). There are many reasons why firms opt for internationalization, for example, the wish to access new buyers is one of them, along with the wish to reduce the costs. Another motive of internationalization is the advantage a firm can create if operating on a new market before its competitors (Thompson, Strickland, Gamble, 2006). A factor influencing the decision on internationalization is the risk dispersion. With the dispersion of business, firms can protect themselves from negative changes in the prices of raw materials in one country, in the way that they transfer their production where it is most cost-effective. Dispersion relates also to the customer dispersion, i.e. with the internationalization, a firm stops being dependant on domestic consumers only (Koslow, Scarlett, 1999). Korsakiene and Baranauskiene (2011) state that success of the internationalization depends on motivational factors and the factors that disrupt the process. The motives that lead small and medium-size companies towards internationalization can depend on different sectors, the size of the company, their former experience in international operations etc. Likewise, they think that firms are motivated by different factors depending on the level of internationalization. Firms that have high level of internationalization mostly combine both motives. If a company wants a good internationalization strategy, its management has to: evaluate the export potential, consult with the key employees in the firm regarding the export potential, decide what market is acceptable and, in the end, form and implement the strategy (Daniels, Radebaugh, Sullivan, 2009). It can be concluded that first, it is necessary to perform evaluation of whether there is a market for the product or a service that the firm offers, and then make other evaluations. If there is not enough demand on the domestic market, or if the firm wants to reach high levels of the growth, then entering international markets is inevitable. In order to survive on the international market, a firm has to possess resources for maintaining competitive advantage. While making the decision on the internationalization, it is important to know what a “multidimensionality of

distance” is, and it relates to the level of knowledge about the new market which depends on the proximity in relation to the country of domicile (Aharoni, Brock, 2010). Political systems that have stable and predictable rules increase the possibility of direct foreign investments, i.e. the risk of internationalization (Gelbuda, Meyer, Delios, 2008). The risks can be divided into: intercultural, currency, commercial risks and the risks of the country. Intercultural risk relates to different language barriers and the differences in the life style, culture and the customs. Depending on the culture, customers have different wishes and needs, and different way of conducting business. Currency risk appears due to international transactions in different currencies. Taking into account the connections among the international economies, it can be concluded that inflation in one country can influence the currencies. Commercial risk arises if the firm brings poor decisions regarding the prices or the time of entering a market. The country risk, also known as the political risk, relates to poor effects or unprofitable business in case of unfavourable events in political and economic environment of the country (Cavusgil, Knight, Riesenberger, 2014). Many firms think that outer and inner obstacles for internationalization are too great. Therefore, some firms prepare well in order to avoid potential barriers, and some think demand on the domestic market is sufficient and do not consider expanding their business. The process of internationalization can be expensive and long-lasting, so it is important that firms are flexible, but also innovative to prepare as good as possible for the demands of the international market (Roy, Sekhar, Vyas, 2016). The existence of the obstacles makes entering the market for new firms difficult, while for the existing firms, it enables creation of economic profit. Pihno and Martins (2010) think that firms can, but do not have to, encounter certain obstacles, depending on the industry, but it is crucial to alleviate the influence of the potential barriers. While making the decision on the internationalization, a firm definitely has to consider the possible barriers and how to avoid them or minimize their impact. Škrtić and Mikić (2009) state that most common obstacles of internalization on an internal level: high internationalization costs, the price of the product or the service, employees who are insufficiently educated on the business activities on the international market and the quality or certain specifications of the product or the service. According to Leonido (2004), it is necessary to reduce the obstacles, especially in the initial phase of the development of business on the foreign markets, because preventive removal of the obstacles can influence international business.

3. RESOURCES AND CAPABILITIES OF INTERNATIONAL FIRMS

In the 1990s, the so-called Resource-Based View of the Firm – RBV was developed that explains the relations between the resources a firm possesses and the competitive advantage. In order for a firm to gain value, the resources have to be rare, difficult to imitate and hard to replace (Husnah, Aisjah, Djumahir, 2013). Penrose (1959) defined resources as physical means that a firm buys, rents or produces for its own needs, and she put the emphasis on the unique character of the firm that creates heterogeneity and not homogeneity of the production parts that are potentially put at disposal from the resources. The core of the resource theory is based on the fact that a firm can achieve competitive advantage if it owns unique and specific resources, skills and knowledge, and the technology their competitors cannot have or cannot imitate (Tipurić, 2014). In order for a firm to be able to defend itself from its competitors, it has to use the resources it possesses efficiently, but also develop new ones.

Figure 1: From resources to rents (Enders, 2012, p 13)

There are different divisions of resources: Grant (2013) divides them into tangible and intangible; Barney (1991) categorized them into physical (machines, buildings), human (knowledge, experience of the employees, their dedication and loyalty), organizational (organizational culture, informal processes) and financial (debts, capital); Hafeez, Zhang and Malek (2002) suggest the division into physical, intellectual and cultural asset; Dess, Lumpkin and Eisner (2008) divide resources into 1) tangible – financial, physical and technological, 2) intangible – human, innovations and creativity, reputation and 3) organizational capabilities. According to Tipurić (1999), resources (tangible and intangible) are at the bottom of the pyramid, while capabilities are less visible and tangible than resources and they can be divided into simple and dynamic (they are used for modification of the simple capabilities). On the top, there are the key competences that have the most strategic significance, i.e. that, in relation to the resources and the capabilities, create most value. Key competences signify a sort of knowledge acquired with organizational learning inside a company, and especially about how to coordinate different production knowledge, harmonize the basic technologies, organize the work and deliver the values to the market. They are the capabilities of consolidation of the production technologies and skills into the competences that enable certain business areas quick adjustment to the changeable environment (Hamel, Prahalad, 1990).

3.1. The VRIN and VRIO framework in forming the strategy of an international firm

In 1991, for the first time, Jay B. Barney presented a more concrete and comprehensive framework for identifying necessary characteristics of the resources with the aim of creating competitive advantage, better known as the VRIO model. The VRIN framework is based on the resource theory that implies that constant competitive advantage will exist only if the competitors are not able to copy, i.e. imitate the advantages of the firm (Barney, 1991). Researches have revealed that a firm with more valuable and rare resources has a constant level of competitive advantage and better performances, and the reason for this is the interconnectedness which exists between the rare and valuable resources, which can directly or indirectly influence competitive advantage (Talaja, 2012). The value and rarity are considered understandable, while the uniqueness and non-substitutability require a more detailed explanation. Regarding the uniqueness, the emphasis is put on those factors which can prevent competitors to imitate accumulated resources of the leaders (Barney, 1991). Grant (1991) stressed four characteristics important as the guidelines for competitive advantage: durability, lack of transparency, transferability and limited possibility of replicating. Durability represents the period in which a resource becomes outdated in relation to the resources of other competitors. Due to the advancements in technology, it is emphasised that the resources that are intangible are a better, i.e. a more long-lasting source of competitive advantage. On the other hand, it can be noticed that physical resources become outdated more quickly. If transparency does not exist, other firms imitate competitive advantages with more difficulty. Barney (2002) suggested replacing the VRIN framework with the VRIO framework. Barney and Clark (2007) state that competitive advantage can be realized through resources in the way that: the resources already owned by the firm are protected, there is continual work on improving and advancing the resources and efforts are made to build new resources. The goal of international companies is to focus on the development of unique resources and basic competencies that have the VRIN or the VRIO characteristics, in order to perform as better as possible. In this way, a firm can accentuate competitive advantage in the area where it dominates and eliminate competitive disadvantages in some unprofitable areas (Buntak, Droždek, Kovačić, 2013).

3.2. Sources of competitive advantage on the international market

When a firm is able to achieve a better position in industry than the competition, it can be said that it has created competitive advantage. If the changes are negated, regarding the uncertainty of the environment, competitive inferiority can occur, so it is necessary to expand the operations to the international market, i.e. introduce internationalization activities if the firm wants to have competitive advantage (Tošović-Stevanović, 2009). In order for a firm to differentiate itself from others on the international market, it is important to define the strategy that will enable competitive advantage. Also, it is crucial that the strategy supports innovations, changes and constant improvements. Technology and its advancement play an important role in creating and sustaining competitive advantage. It relates to all the processes based on which a firm transforms the work, the capital, the materials and the information into products or services. Also, technological changes can lead to strategic changes in economy, i.e. the advantage of a firm depends on them. Innovations are also one of the sources of competitive advantage considered crucial for surviving on the international market. With innovations, companies can more easily fight for their survival (Savić, Pavlović, 2014). They imply the use of new knowledge if they want to offer new products and services. Barney (2002) points out that organizational resources have developed from different legal, political and cultural traditions and they are characterized by specific administrative heritage from different countries. It can be concluded that firms which operate on the international market have to own modern technology and invest in innovations because in that way, they alleviate the contest with the competition, invest in the knowledge of the employees so they can possess new information and so make conducting business easier.

4. THE ANALYSIS AND THE INTERPRETATION OF THE RESEARCH

The results of the research are based on the answers acquired by the deep interviews. The respondents that represented the firms have been at their key functions for a longer period of time. The sample comprised of five managers. At the beginning of the interviews, the respondents were guaranteed that certain data about the firms would stay confidential. The interviews were recorded with the sound recorder, so the elements of the conversations were electronically documented. The length of the interview depended on the time the respondents had at their disposal. The shortest lasted 40 minutes, and the longest 65 minutes. To protect the anonymity of the employees, the firms were coded with Y1, Y2...Y5. The responses to the questions are presented below. The first firm (Y1) primarily deals with retail and wholesale, and with jewellery manufacturing. The biggest initiator of their expansion and development is the creativity in designing jewellery and the way they place and position themselves on the market. About ten years ago, jewellery as an idea for an international brand was unthinkable, while today, Y1 firm is the synonym for that jewellery. The firm employs over sixty people directly and more than three hundred indirectly, through the suppliers, and develops the production in Croatia, while at the same time placing the domestic product on international fairs and markets. The basic business of the second firm (Y2) is information and telecommunication. In cooperation with the global partners, they deliver information, telecommunication, network and safety solutions for small, medium-sized and large companies on the Croatian and the neighbouring markets. Y2 has direct contracts with the leading ICT producers which enables the firm to gain insight into newest information on all the products and technological solutions. The biggest partners (principals) of Y2 are DellEMC, Bosch, Mitel, 2N, Cisco, CheckPoint, SonicWall, VMware, Patton and Microsoft. Y2 has used government subsidies for small and medium-sized entrepreneurs. The third firm (Y3) is a software development company with international experience in programming and designing websites and mobile applications. The main registered business of Y3 is computer programming. Today, the organization has more than seventy programmers and over three hundred external associates that cover almost all

software technologies. It is directed solely towards foreign markets and foreign clients and operates actively in twenty countries worldwide. They have positioned themselves on the Croatian market as the firm that introduces innovations into their internal processes and in that way adjusts to the demands of their clients. The fourth company (Y4) is a family firm that, for the last 25 years, deals with the buying, selling and processing logs into the elements for parquet floors and planks. Due to their long-term tradition and flexibility evident in the small number of employees and efficiency, the company operates profitably on the Croatian and the surrounding markets. The fifth company (Y5) deals with the production of lime and stone aggregates. This business falls into the category of the base industry of mineral raw materials processing and as such is under the influence of the costs of energy necessary for the production. The company owns high quality raw materials and a high level of energy efficiency is achieved due to the investments in the production drive and the use of alternative fuels in the process. Table 1 gives the overview of the key items of the interviews that will be later explained in detail.

Table 1: The overview of the key items of the interviews

COMPANY	Y1	Y2	Y3	Y4	Y5
KEY RESOURCES AND CAPABILITIES	Creativity of the employees Care about consumer satisfaction	Quality staff	Personalized client approach Employees with specific knowledge	Staff	Employees with experience Quality of the natural resource
STRATEGY FOR ENTERING THE INTERNATIONAL MARKET	Export 2 franchises	Direct foreign investment	Export	Export	Export
BARRIERS	Not proficient in the language	Legal and tax	Lack of the insurance instruments of the payment Non-transparent legal framework	Bureaucracy connected with delivery	Administrative Customs
USE OF GOVERNMENT SUBSIDY	Do not use	Use	Use	Do not use	Use

As the greatest resources, i.e. capabilities, the CEO of Y1 highlights the creativity and the possibility for placing i.e. positioning on the market and the care for their customers satisfaction, and in that, continual work on enhancing the quality of the product. Likewise, great efforts are made to invest in innovations that Y1 introduces onto the jewellery market, in Croatia and abroad. As the source of competitive advantage, one can highlight the employees with an exceptional creativity and a well-researched market regarding the preferences of the consumers. The CEO of the second firm, Y2, points out that high quality staff is of crucial importance for the survival of the company and highlights that the company invests considerable resources in education and training of their employees, which has made it competitive on the current market for many years. The sources of competitive advantage lie in the relations with the partners that Y2 has been nurturing for years. High quality staff is also the key resource for Y4. The employees of the company excel in high proficiency in the specific line of work, but they also point out that they constantly invest in their education to keep up with the competition. The CEO of Y4 thinks that education of their employees is the key component, because in that way,

they acquire new knowledge and receive new information. The firm invests in the relations between the clients and the suppliers with which they operate from the very beginnings and they are a part of the heritage that characterizes this company. As the sources of the competitive advantage, the CEO points out the long-term quality of the product, competitive prices, avoiding financing by debt, paying suppliers on time and good relationship with the clients. A healthy relationship with the clients is especially highlighted, because the CEO thinks that it is important to notice their wishes, i.e. preferences. He also deems the trust inside the firm as very important. It enables better motivation, which then leads to better business, so, it can be concluded that the trust among the employees is one of the sources of competitive advantage. The CEO of Y3, in charge of international cooperation, points out that their business is primarily based on specific knowledge of the staff they cooperate with regarding the type of the business. Special attention is given to the personalized and unique approach to every client individually. For Y5, the CEO points out employees as the most important resource. Through the decades of work, they have gained the Know-How important for successful business in these trying market conditions. Besides the employees, she highlights the importance of the natural resources – mineral raw material calcium carbonate is of very good quality and suitable for further industrial processing. Also, she points out the production facilities that today enable them efficient work and profitable production due to the long-term investments in them. The sources of competitive advantage are definitely the employees, regarding their knowledge, and the experience which is especially appreciated and they think it is what differentiates them from the competition. They also see the source of competitive advantage in the efficient production (regarding the costs), and primarily in the quality of the product for which they point out it is traditionally recognized by the buyers. Regarding the strategy for entering the international market, Y2 places its products via a distributor and wholesale channels, and via franchises (two of them for now). The CEO states that the primary plan of their business activities was to expand outside Croatia, the reason being too small a market. Because of that, already at the beginning of their business activities, they developed wholesale locations in Europe, and after the first phase of the wholesale network, they began opening retail locations, first in Croatia, then in Slovenia, Austria, Slovakia etc. Y3, Y4 and Y5 also use export as the strategy for entering international markets, while Y2 has used the strategy of direct foreign investment. The CEO of Y3 points out that they encounter issues and foreign clients demands on a daily basis, and these demands are often more complex and challenging than those of the domestic clients. IT industry abroad is more complex than in Croatia, clients ask for more and expect better results in shorter time. Y3 operates on 20 markets abroad. Y4 was compelled to move a part of their business onto other markets because in Croatia there was no sufficient demand for logs. The CEO says that the other reason is that for the companies abroad, it is much cheaper to buy imported wood. Likewise, with exporting into other countries, better price is achieved than in Croatia, for example, due to greater purchasing power (e.g. in Austria). Y5 has chosen export as the strategy for entering the international market. Because of some of the characteristics of the product (high transporting costs in relation to the price of the product), they are present on the regional market: Bosnia and Herzegovina, Montenegro, Slovenia, Hungary, Albania and Kosovo. The export is characterized by the small starting investments and complete control of the production, and the CEO points out that the risk of export is smaller than in all the other strategies. The export is mostly achieved directly through their buyers without the mediators/distributors, since the deliveries are performed in the manner of Full truck, delivered to the buyer's storage. The CEO of Y2 points out that internationalization happened by networking as one of the most essential features of today's technological and entrepreneurial world. Y2 has succeeded in starting business in the Middle East that has been operating relatively successfully for two years providing ICT services. The strategy of the direct foreign investment has been used, because it was estimated that it holds certain competitive advantage not easily imitated and the

competition on that market is not strong. Regarding the barriers, the CEO says that bureaucracy is the main obstacle they have come across in Croatia and points out that abroad, conducting business is much easier and simpler than in Croatia, as well as placing the product or opening a branch office, a firm etc. She states that one of the obstacles is the language, but as the market has become global, so the majority of the employees in the firms have become proficient in at least one of the world languages. The CEO of Y2 also lists bureaucracy as one of the basic obstacle the firm encountered when it was opening the branch office in the foreign country, but also the long-lasting processes of approving documentation have not been crucial for the progress of the society. The main barrier for the CEO of Y3 is the lack of appropriate instruments for ensuring the payment and the non-transparent legal and regulatory framework in the exporting countries. Great financial investments in the development of the business on the twenty markets are also great obstacles. They require large amounts of the working capital that have to be invested in the very preparation and the carrying out the business travels. Moreover, one of the barriers they have encountered is choosing and recruiting the employees and partners that know how to recognize diversity of the cultures and can and know how to adjust to the business systems in different parts of the world. Y4's CEO states that the obstacles during the transport and at the customs have existed ever since the beginning. The bureaucracy has been very challenging at deliveries and with the entire shipping. It is highlighted that, with the accession to the EU, the conditions have changed, so now, minimum documentation is needed, which has alleviated the business greatly. The CEO of Y5 says that the obstacles connected with the administrative and customs area, since it is necessary to go through the export formalities, have a shipping agent, your own employees with the customs licences so they could perform export customs clearance "at home" etc. Besides the fact that the interviewed firms come mostly from different industries, there are connections among them in their international business. As the most important resource, i.e. the source of competitive advantage, the companies mostly underline the staff. The employees are considered a valuable resource that can contribute to a good and successful business. Most firms invest in education and additional training of their employees. Building the career is considered another key element, as well as adding more activities employees can participate in after the working hours. The trust among the employees is also highlighted as one of the key sources of competitive advantage. One of the firms points out choosing and hiring employees as the obstacle because they think that it is exceptionally important for their employees to have a well-developed sense of cultural diversity and the capability of adjusting to different business systems. The interviewed companies have mostly used the export strategy for entering the international market (Y1, Y3, Y4, Y5). Besides the export, they have used the franchise (Y1), and the direct investment strategy (Y2) in the United Arab Emirates. Furthermore, the firms mostly agree that the greatest obstacle to the internationalization is of legal nature. They state some of the issues during the internationalization, like not knowing the language (Y1), which can lead to false or incomplete information, the non-transparent legal framework (Y3) in the countries they export to, the bureaucracy (Y4), etc. One of the firms highlights the administrative and customs barriers in conducting business on the markets outside the EU (Y5), like the obligation to have employees with the shipping licence, etc. Two out of the five interviewed companies do not use government support, although they know they are entitled to (Y4, Y5). The firms opt for international business mostly because there is not enough demand on the Croatian market, or they have already made the decision because of the unfavourable entrepreneurial climate in Croatia. The respondents mostly think that conducting business on the foreign markets is inevitable if a firm wants to grow, but, also, the emphasis there is put on the importance of the innovations and the care for the wishes and the preferences of the consumers.

5. RESEARCH LIMITATIONS

The limitations of this research come primarily from the definition of the sample. The interviews were conducted on a small number of the experts that have taken part in the internationalization of the Croatian firms, so it is difficult to draw a general conclusion on the internationalization of the Croatian companies. Moreover, the conclusion could not be complete, since some of the information gained with the interviews are secret, so not all information could be presented, which definitely influences the understanding of, for example, competitive advantage of a firm. In order for the findings to have more significance, more firms should be included, coming from different sectors and industries.

6. CONCLUSION

Modern business conditions have led to the situation where companies have to direct their activities towards the internationalization as soon as possible if they want to achieve growth. Modern technologies and the availability of information have certainly accelerated the internationalization of the Croatian companies. The decision on entering the international market requires much preparation. First of all, it is necessary to investigate whether there is demand for certain product or service on the international market and then consult with the employees within the firm. Also, it is important to have employees that can easily adjust to the business activities on the international market. After a firm has made the decision, it has to determine the way of entering the international market. The strategies for getting into the international market are: export, franchise, strategic alliances and direct foreign investments, and they differ depending on the level of control and the risk, and depending on the obligations. In order for firms to be successful in internationalization activities, it is important to have resources and capabilities that differentiate them from the competition, i.e. based on which they can achieve competitive advantage. The presupposition of the resource theory is that a company should own unique and specific resources, as well as technology and knowledge if it wants to outdo the competition. The goal of every company that operates internationally should be the development of key resources that should be valuable, rare, that cannot be imitated or substituted. Also, it is important to assure that the resources are heterogeneous, i.e. different from the resources that competitive firms possess. They also should be immobile, i.e. competitive firms should not be able to easily imitate or acquire them. The empirical part of the research was conducted via the method of the deep interview. The findings show how important it is to operate internationally if a firm wants to grow and achieve a long-term survival. It is crucial to hire people who have specific knowledge and can easily adjust to the new environment and rules. The use of modern technology facilitates the process of adjustment to the business on the international market and ensures competitive advantage.

TRANSFORMATION OF THE WORLD MONETARY SYSTEM FROM THE GOLD STANDARD TO THE CRYPTOCURRENCY?

Inara Rzayeva

Azerbaijan State University of Economics (UNEC), Azerbaijan
inara_rzayeva@unec.edu.az

ABSTRACT

The world monetary system is a mechanism that links the economies of individual countries into a global economy. Therefore, any violations arising in the functioning of the global monetary system lead to significant problems in the development of the economy of separate countries and the world economy as a whole. Historically, the world monetary system passed through four stages in its development. The first world monetary system was the gold standard system. The existence of the gold standard prevented inflation and ensured the equilibrium of balance of payments of states. The next stage was the period of the Genoa currency system. During this period, only some currencies including the British pound sterling and the US dollar began to be considered as gold equivalents. The Bretton woods monetary system was adopted in 1944, which consolidated the leading role of the United States and its currency in the world monetary system, due to the post-war economic power of this country. Under this system, only the US dollar was pegged to gold and exchanged for gold at the request of central banks of other countries. The Jamaican currency system replaced the Bretton woods monetary system in 1971. According to the new system, the rate of the currency of each country began to change according to changes in supply and demand in the foreign exchange market. The modern monetary system is based on the functioning of two currencies, the US dollar and the Euro. Unfortunately, exchange rate fluctuations of these leading currencies negatively affect the economies of other countries. Some experts consider cryptocurrency as the global currency of the future global monetary system. The current situation in the global economy confirms that the world monetary system will inevitably be transformed and this process will be long, ambiguous and possibly not predictable.

Keywords: *Balance of payments, Currency, Cryptocurrency, Global Economy, Financial crisis, Special Drawing Rights, World Monetary System*

1. INTRODUCTION

Turbulence in the global currency and financial markets, the decline of the economic growth in many countries of the world has intensified the contradictions and instability of the development of the world monetary system. Currently global economy is characterized by the dominant role of the US dollar in the Global Monetary System. The US dollar simultaneously performs the functions of both national and world currency. Due to the dual function of the dollar benefits are received by the issuing country, others the states are in the conditions of currency dependence.

2. HISTORICAL STAGES OF DEVELOPMENT OF THE WORLD MONETARY SYSTEM

Historically, the world monetary system went through four stages in its development, and each transition from one system to another was justified by a specific economic and political situation in the world. The first world monetary system was the gold standard system (from 1867 to the 20s of the 20th century), a characteristic feature of which was the adoption of a regime of fix exchange rates. The existence of the gold standard prevented inflation and ensured the equilibrium of balance of payments of states. The next stage was the period of the gold exchange standard (Genoa currency system).

During this period, only some currencies (about 30) including the British pound sterling and the US dollar began to be considered as gold equivalents. The Great Depression (1929-1933) had a negative impact on the world monetary system, in which almost all currencies refused to convert into gold. During this period, gold was considered only as a reserve and payments instrument. Due to the existing economic and political situation in the world, at the end of the Second World War, the question of the formation of a new monetary system was raised again. The Bretton woods monetary system was adopted in 1944, which consolidated the leading role of the United States and its currency in the world monetary system, due to the post-war economic power of this country. Under this system, only the US dollar was pegged to gold and exchanged for gold at the request of central banks of other countries. Actually, the Bretton woods system retained the basic principle of the gold standard: the parity between gold and paper money, and the principle of a fixed exchange rate. In 1971 the Bretton woods system collapsed. The main reasons for the crisis of this system were the unstable and contradictory development of the world economy as a whole, the instability of the balance of payments (the deficit of the balance of payments in some countries and the positive balance of payments in other countries). The growing economic power of the Western European countries and Japan, the decrease in the US gold reserves, the Vietnam War, and the energy crises during this period also contributed to undermining the fundamentals of the Bretton woods monetary system. As a result of the collapse of the Bretton woods monetary system, fixed exchange rates were replaced by floating, which increased the economic and financial crises in the world. The Jamaican currency system replaced the Bretton woods monetary system. According to the new system, the rate of the currency of each country began to change according to changes in supply and demand in the foreign exchange market. In the process of transition to a new monetary system, experts assumed that a floating exchange rate would reduce inflation in a number of countries, and countries would be able to manage their monetary policy. Unfortunately, the forecasts did not come true, the economies of most developing countries weakened even more, and capital outflows and inflation rates increased.

3. CURRENT SITUATION IN THE WORLD MONETARY SYSTEM AND PROBLEMS OF ITS DEVELOPMENT

In the context of changes in the globalizing world economy and the global financial and economic crisis (2007-2011), the basic principles of the Jamaica monetary system have ceased to correspond to new trends in the global economy and the actual system is in deep crisis. The modern monetary system is based on the functioning of two currencies, the US dollar and the Euro. Unfortunately, exchange rate fluctuations of these leading currencies negatively affect the economies of other countries. The dollar is extremely volatile (Fig. 1), which undermines its function as a measure of value in the global economy.

Figure following on the next page

Figure 1: Graph of the dynamics of the euro against the dollar in the Forex market

Currently, the US dollar maintains a leading position in the modern monetary system and in the short and medium period, the dollar will dominate in the reserves of countries. According to the Bank of International Settlements, this currency is the main currency when making currency exchange transactions on an international scale. According to economists, the main strength of the dollar is due to the fact that all oil contracts in the world are made only in dollars. According to the World Bank's forecast, by 2025 the dollar will lose its dominant position and now in the global economy there is one of the most important questions: what currency, or maybe a group of currencies, will replace the dollar? According to experts, the new global monetary system should be based on the principle of multi-currency. None of the currencies in the world today can have monopoly domination. If earlier the global monetary system was mainly determined by the USA, Great Britain, Germany, Japan and France, today increased role of China, India, Russia. Especially the role of the Yuan becomes significant in the construction of a new world monetary system. In November 2015, the Executive Board of the International Monetary Fund completed a five-year review of the basket of currencies constituting Special Drawing Rights (SDR). In result the Board decided that from October 1, 2016, the Yuan will be included in the SDR basket as the fifth currency, because this currency meets all IMF requirements.

Table 1: Weight of currencies in the SDR basket (Press Release: IMF Executive Board Completes the 2015 Review of SDR Valuation)

Period	Dollar USA	EUR	GBP	YPY	Yuan
2011-2015	41,9%	37,4%	11,3%	9,4%	-
2016-2020	41,7%	30,9%	8,1%	8,3%	10,9%

Figure following on the next page

Figure 2: Currency Composition of World FX (IMF, 2017)

Constant fluctuations of the dollar and the euro lead to the formation of regional currencies. For example, “Amero” is a unit regional currency that was planned to be introduced into the territory of the United States, Canada and Mexico. “Afro” is a unit regional currency project developed in West Africa. AKU is an Asian unit currency that is planned to operate in Japan, China, South Korea and the ASEAN countries. The Arab Monetary Fund seeks to use the “Arab dinar” as the collective regional currency of the Arab states. It is predicted that the multicurrency system will replace the current monetary system, which is associated with the rapid growth of developing countries, including the BRICS countries. China has signed an agreement on swap lines with the United Arab Emirates, Japan, South Korea, Malaysia, and Turkey since 2011, thereby expanding the scope of influence of the Yuan. Iran pursues a policy of using national currency in trade relations with partner countries. The transfer of large commodity transactions to national currencies may reduce the dependence of the world economy on the dollar. It is assumed that the multicurrency reserve system will be formed on the basis of two or three currencies (playing the role of reserve at the world level), plus several regional currencies. The “Currency wars” have a negative impact on the world monetary system. The “currency war” refers to the actions of national governments and central banks to artificially lower the exchange rate of the national currency in order to protect their own market from imported goods and create conditions for increasing exports of their own products. Frequent currency crises adversely affect the modern world monetary system. The abolition of currency restrictions within the framework of the Jamaican monetary system has contributed to the growth of international capital mobility, which has become the driving force of currency crises. The main causes of financial crises are:

- the use of currency as an independent asset for investment;
- the predominance of the role of the financial sector in the formation of the public revenues;
- widespread fictitious financial capital;
- acceleration of capital transfer from one foreign exchange market to another;
- limited state regulation of financial markets due to the high degree of integration of various countries into the global economy.

Thus, the global economy is actively seeking solutions to the problems of the monetary and financial system. Unfortunately, the international reserve asset SDR during its existence did not become world money in framework world monetary system.

But experts believe that it is necessary to expand the range of the use of SDRs for mutual settlements between the IMF member countries. The active use of SDR mechanisms can be an alternative to the US dollar as the main currency in the international financial arena. Recently the idea of using precious metals as world currencies has become actual, due to decline purchasing power of the dollar, euro and yen. However, there are several reasons that prevent the use of gold as world money. First, precious metals have the high intrinsic value. This is explained by the fact that it is necessary to spend a part of GDP on the extraction of precious metals. Secondly, the complicated technology of settlements in metals. In order for financial calculations to be made in gold, it must be in cash. Some experts consider cryptocurrency as the global currency of the future world monetary system. Cryptocurrencies have become popular as a result of the rapid development of information technology and the Internet and its circulation does not provide any guarantees. Bitcoin, one of the leading virtual currencies, designed for online payments. Based on the data of Cryptocurrency market capitalizations, the exchange rate of this currency in electronic trading amounted to 15 thousand dollars in December 2017. The cost of cryptocurrency has reached 20 thousand, and again a sharp decline in prices to 13 thousand in January 2018 (Fig. 3),

Bitcoin Charts

Figure 3: Dynamics of growth in Bitcoin prices (coinmarket.com)

As can be seen from Figure 2. Bitcoin has a spasmodic growth dynamics, which causes heated discussions of experts about its prospects. Some economists believe that the cryptocurrency can recover the principles of the "gold standard" on a global scale, if will be strict state regulation conditions and concerted action of banks. Some states have already begun to actively use electronic money in the economy. For example, Sweden and Norway have announced a complete rejection in the future of the use of cash in circulation. In the UK, Denmark, the Netherlands and Japan began to actively use cryptocurrency. Currently, there is no single strategy for the development of cryptocurrency in the world, but it is important that the competitive development of various electronic money systems should be under the obligatory control of financial regulators. Cryptocurrency can occupy a niche in which their use will be most effective in countries with a developed economy and a stable monetary system. In developing countries with a infant and unstable monetary system, tight controls are needed in the implementation of cryptocurrency. The number of implemented systems should be limited and, if possible, unified.

4. CONCLUSION

As a result of the analysis, we can conclude that in the modern global economy, the US dollar or the currencies of any other countries are not able to perform all the functions of the world currency. Currently, the most acceptable form of functioning of the world monetary system is a multi-currency standard, because are increasing economic role some group developing countries in the global economy (China, India, Brazil). At present, reforming of the IMF and the whole monetary system has been necessary. Thus, the issue of transition to the new monetary system has become very urgent and requires lengthy negotiations between the countries of the world. The current situation in the world economy confirms that the world monetary system will inevitably be transformed and this process will be long, ambiguous and possibly not predictable. Thus, to build a new financial architecture, it is necessary to do the following transformations:

1. To strengthen the global financial system by creating global financial centers and a variety of reserve currencies;
2. To increase the legitimacy of existing financial institutions;
3. To maintain the free choice of exchange rate regime based on liberalism and on interstate regulation.

DEVELOPMENT AND INTERNATIONALIZATION OF SMES IN POST-SOVIET COUNTRIES: SUGGESTIONS FOR FUTURE PERSPECTIVES

Ganira Ibrahimova

*ISE Lecturer at Azerbaijan State University of Economics (UNEC), Azerbaijan
ibr.ganira@gmail.com*

ABSTRACT

The principal objective of this paper is to analysis of current SME situation in the Post-Soviet Countries, state policy, supporting programs, financial support, finding similarities and differences in post communistic legislative features, institutions, economic systems, understanding positive and negative sides of these differences and their affect on SME activity. The paper analyses a situation of one-way integration mode and information flow and outlines an existing gap in SMEs management approach. In order to succeed on international markets, it is needed to build up a network of awareness and information exchange between major actors such as SMEs, public and business support institutions, academia and other players. The article relates the key attributes of factors directly connected to SMEs and integration as well as concentrates on how SME could benefit from a closer regional economic integration through information exchange.

Keywords: *internationalization, value chain, SMEs, information exchange, integration, Azerbaijan, Georgia, CESD report, non-oil sector*

1. INTRODUCTION

For a long time, the role of small and medium-sized businesses was underestimated and it was believed that after these firms undergo the necessary stages of development they will eventually become large companies. But with time it became clear that this point of view is not correct all the time, and some companies remain same size even after passing all stages of development. The first wave of interest in the small and medium business sector was observed in the United States and Great Britain in the 1980s, when one of the studies proved that large corporations have higher costs, they are not quite inclined to innovate behavior, and the probability of their bankruptcy could lead to extremely negative consequences for society, and, they react more slowly to changes in the economy (Manahan, 2010). Gradually the researches, focused on small and medium-sized businesses appeared, they studied SME's role in creating jobs, solving social problems, increasing economic growth and competitiveness. It turned out that this sector is better suited to development in times of crisis, so in Germany, France, the United States and other developed countries, support for small and medium-sized businesses became important - firms in this sector have turned into a kind of indicator of the state economic situation: they are more sensitive to changes in economic infrastructure, falling or rising rates of profit in the economy and they are more adaptable to current changes (Laricheva, Strelkova, 2006). In addition, small and medium-sized enterprises are more dynamic in developing of new products and capturing new economic niches. Active innovative policy is one of their main features: for example, in the US, the number of innovations per worker implemented in the SME sector is twice higher than same indicator in large companies [Manahan, 2010]. Besides, small and medium enterprises are characterized by increased profitability and more efficient use of available resources, since their managers are personally interested in minimizing costs and increasing profits (Bessonov, 2013).

2. INTERNATIONALIZATION

2.1. Internationalization happens in big and small companies

In the modern world, internationalization has become an important development trend for small and medium-sized enterprises. For a long time, large corporations were seen as the main players on the world stage, but today no company can be isolated from the process of globalization and international competition. Because of development of technologies and the expansion of international economic relations, small firms have the opportunity to implement the strategy of internationalization - to start operations abroad and expand their activities beyond the national market. The interest of the leaders of small and medium-sized businesses is connected with the enormous opportunities that internationalization can bring, but they have to overcome significant obstacles in the process of its implementation. One such difficulty is defined as "liability of foreignness" (Zaheer, 1995). It is the costs of doing business abroad, which are faced by firms entering the new market, but are not relevant for local firms. For example, the costs of transportation and coordination of operations with foreign partners, the costs associated with ignorance of the cultural characteristics of this country, the foreign language and the local business environment, as well as the costs that firms may face from their national environment, including restrictions on the sale of certain types goods (Zaheer, 1995). Of course, these problems arise for large companies too, but for small and medium-sized businesses any additional costs are extremely high. Leaders of small and medium-sized businesses are interested in obtaining maximum profit, but at the same time they are forced to pay taxes, carry organizational and production costs, etc. In this regard, all additional costs that may arise in accordance with internationalization decision should be carefully analyzed and taken into account. Another entry barrier is the available resource; knowledge and experience of small and medium-sized businesses are often not enough to actively develop operations in the new foreign market. This problem is called the "vulnerability of newness / smallness" (Stinchcombe, 2012). This means that starting a business abroad, a company faces the same problems as "start-ups": they need to look for the necessary resources, build relationships with all stakeholders and prove their legitimacy (Barringer, Greening, 1998). Faced with an increased level of risk in a new environment and role (Delios, Henisz, 2000), small and medium-sized businesses are looking for ways to avoid or minimize it. But due to the limited resources available, their probability of internationalization remains much lower compared to large firms (Hollenstein, 2005). This helps us to understand why some theoretical approaches developed for large companies do not "work" when it comes to small and medium-sized businesses (Chen, Hambrick, 1995). The main differences were classified according to several criteria that characterize the company's management process (goals, leadership, decision-making, employees, planning, formalization of processes, financial resources and a typical internationalization strategy) and are described separately for small, medium and large businesses in Table 1. In small and medium-sized businesses, key position belongs to a founder, who is also the manager of the company, while in large companies professional managers are involved (Westhead, Usbasaran, Wright, 2001). Regarding to this, the process of decision-making in small and medium-sized businesses differs significantly from similar processes in large companies, since the manager makes decisions independently (sometimes with the participation of specialists holding key positions). This makes it possible to solve problems more quickly, but also puts the firm in greater dependence on one person (or team of managers) and his subjective assessment of current trends [Bloodgood, Sapienza, Almeida, 1996]. In larger companies, the decision-making process takes much longer and depends on the existing organizational hierarchy. On the one hand, this makes them less flexible, but, on the other hand, allows them to make more "rational" decisions. Basically, all the processes related to internationalization happens in very different way in large companies and in small and medium ones.

Table 1: Internationalization strategy in big and small companies

Criteria	Small business	Medium business	Large business
Goals	Determined by market trends, often intuitively	The market makes adjustments, changes are selective	Domination in the market, goals are systematically revised
Management	Founder, Authoritarian Management	Founder / manager and specialists in key positions	Professional management, organizational hierarchy
Decision making	Founder	Founder / manager and specialists in key positions	Organizational Hierarchy Chain
Staff	Personal relations, high degree of involvement	Cooperation relations, some degree of involvement	Strict hierarchy of relations, low degree of involvement
Planning	Irregular and short term	Short term and irregular long term	Long term
Formalization	Informal processes	Some processes are formal	Formal structure and processes
Financial resources	Personal funds/Bank	Personal funds/Bank	Different sources (banks, stocks)
Internationalization Strategy	Export	Export	Export and FDI

2.2. Concept of Internationalization

The beginning of internationalization process is the general decision to become involved in foreign markets. The motivation can come from both the company itself and from outside. In order for the internationalization decision to be positive, however, internal basics must also be fulfilled within the company, which makes successful international activities possible in the first place. These include the appropriate commitment of management as well as the availability of the necessary internationalization skills and competitive advantages that can be used abroad. There could be various reasons why companies are interested in international operations: the goals of internationalization can be resource-oriented (access to raw materials, suitably trained workers, capital or other resources), efficiency-oriented (use of cost-cutting potential through relocation of production abroad) or strategically motivated (expansion competencies to increase competitiveness) (Dunning and Lundan 2008). In other words, they can seek for additional profits, they want access new information, they look for potential partners or they want to maintain and strengthen their competitive advantage. Thus, we can define internationalization as a process of developing company international operations with a purpose to obtain some certain benefits. The main motive for export, however, lies in the development of new markets for their own products and services. Export is one of the main strategies for the internationalization of small and medium-sized firms (Reynolds, 1997). But the choice of internationalization strategy for small and medium-sized businesses usually stops at exports, because due to the limited resources (for example, financial, human), they do not have the opportunity to make direct foreign investments that large companies can afford (Zahra, Neubaum, Huse, 1997). This causes particular attention of researchers to small and medium-sized firms and their international activities, since these differences can influence both the prerequisites and the result of their internationalization. That's why internationalization is a crucial strategy for SMEs who want to survive and succeed in the contemporary world. And here are some advantages of internationalization:

1. When entering the international markets, SMEs increase their client base, as the result of available expansion to new markets. This leads to increased revenues and the opportunity to reinvest for further growth.
2. Internationalization allows SMEs to have access to all the resources needed at a lower price and to the resources that are not enough in the home region.

3. Internationalization makes it possible to achieve the economies of scale, especially if the production volumes of the company were limited in the domestic market, because of its saturation or intense competition
4. Internationalization helps to improve productivity and reduce the production costs, due to the fact that company can take the advantage of differences in currency exchange rates, tariffs, prices, etc
5. Internationalization allows SMEs to distribute their risks among different countries and reduce the dependence on domestic markets. more chances to survive and develop.

2.3. SME internationalization in post-soviet countries

2.3.1. Azerbaijan, Georgia and Czech Republic cases

Considering the peculiarities of the SME internationalization, it is necessary to clarify what exactly is meant by the "small and medium-sized enterprises" term. In theory, there is still no single approach to quantitative and qualitative definition of small and medium-sized enterprises. Each country has its own legislation to define which exactly companies could be referred as small and medium ones. In Azerbaijan Republic, In accordance with the "Large, Medium and Small Business Criteria", approved by the Cabinet of Ministers of the Republic of Azerbaijan dated June 5, 2015, small entrepreneurs have the average number of employees in the total number of employees up to 25 and annual revenues up to 200,000 manat. (Cabinet of Ministers of the Republic of Azerbaijan, 2015). It should be noted that such quantitative criteria are not characteristic for all countries. Table 1.1 presents the main criteria for classifying subjects to the small and medium business sector in Azerbaijan, Georgia and the EU countries (as defined by the Commission of the European Union).

Table 2: Criteria for classifying subjects as small and medium-sized businesses in different countries

Country/Companies	Small companies		Medium companies	
	Amount of employees	Income	Amount of employees	Income
Azerbaijan	< 25	< 100 000 euro	25-125	< 600 000 euro
Georgia	< 20	< 166 000 euro	20-100	< 500 000 euro
EU	< 50	< 10 mln euro	50-250	< 50 mln euro

2.4. SME in Azerbaijan context

The problem of internationalization of small and medium-sized businesses is especially urgent for countries in transition such as Azerbaijan; today Azerbaijan faces a large-scale task of modernization and diversification of the economy in order to reduce dependence on the export of natural resources, which is more than 90%. One of its solutions can be the development of international activity of small and medium-sized enterprises, as they have a significant and unrealized growth potential. However, the level of involvement of Azerbaijan's and other transitive countries' small and medium-sized businesses in international activities remains still low, which necessitates a more intensive study of this phenomena. Nowadays development of Small and Medium Enterprises in Azerbaijan became a crucial issue to solve in the terms of

employment, diversification and import substitution via producing domestic goods using local resources and avoiding import dependency. All these macroeconomic indicators providing sustainable economic growth, and that is why government tries to create favorable conditions for the growth of non-oil tradable sectors, which is economy diversification. The possibilities of such diversification could lay in the creation and stimulation of favorable environment for entrepreneurship. Relying on oil and gas prices that are falling down and difficult to predict is quite risky for national economy, as well as downturn in Azerbaijan economy depicts the fact that dependency on oil and gas sector should be reduced and eliminated in shortest time (CESD report on SME development in Azerbaijan, 2017) If not, then we could not avoid its negative effects, such as deficit in balance of payment and undiversified exports. Besides, the oil and gas sector is capital-intensive, so it has little effect on job creation or employment; while, the non-oil sector might contribute into employment rates (Macroeconomics, Mankew). Micro and small- and medium-sized enterprises in Azerbaijan have been divided into two main groups: individual entrepreneurs (one owner without forming a legal entity) and small and medium enterprises (many employers, legal entities). All individual entrepreneurs are officially commenced as small enterprises and registered as legal entities accordingly to two indicators: number of employees and annual turnover (International Finance Corporation, 2009). Azerbaijan Republic Cabinet of Ministers has defined the “criteria of SMEs” on the 5th of June, 2015, but new order with some changes was approved in June 2016, and it is currently valid. The new order assists to simplify SMEs defining criteria, in accordance with new order, as shown in Table 1, classification is defined by the size of the enterprise, average number of employees and annual turnover but not by the sector in which it works (president.az, 2016).

Table 3: Criteria of SMEs determination in Azerbaijan

<i>Entrepreneurship Category in terms of size</i>	<i>Average Number of Employees (Definition 1)</i>	<i>Average Number of Employee (Definition 2) For Tax Purposes only</i>	<i>Annual Revenue</i>
Small	< 25 employees	Self employed	< 200 000 AZN
Medium	25-125 employees	Hired labor	200 000 - 1 250 000 AZN
Large	> 125 employees	Hired labor	< 1 250 000 AZN

Source: AR Cabinet of Minister’s order 29th June, 2016.

2.5. Statistical review

Considering the data given by the Ministry of Economy of Azerbaijan for 2016 year, the amount of entrepreneurship units in all areas of the economy was 792,764. In compare with 2015, the amount of entrepreneurship enlarged by 77,179. If review their geography, 36.1% of all SME's were registered in Baku while 63.9% in other cities of Azerbaijan. Besides, we should take into account the fact that SME activity in Azerbaijan have been divided into 2 groups. These groups are those who are creating legal entities and those who are working individually without creating the entity. Furthermore, the number of individuals who are working without generating a legal entity is 685,406. Let's see statistical data given to both of these categories of entrepreneurs.

Figure following on the next page

Figure 1: Individual enterprises amount

Source: The Republic of Azerbaijan Ministry of Economy, 2017

Figure 2: Small enterprises amount

Source: The Republic of Azerbaijan Ministry of Economy, 2017

Regarding the orientation of SME in Azerbaijan, proportion of SMEs busy in non-oil sector is approximately 5.8% of value added, 0.7% in total gross profit, 6.5% in annual average employees. Geography of SME's in Azerbaijan is also diversified - they are mostly located in Baku city (approx. 60%). The reason is big size, high urbanization level and of course developed infrastructure of the capital.

Figure 3: Geography of SME in Azerbaijan

Source: The State Statistical Committee of the Republic of Azerbaijan, 2017

Figure 4: Structure of SME's subjects

Source: The State Statistical Committee of the Republic of Azerbaijan, 2017

We can see clearly in the figure above that, the most of the SME's are engaged within the trade and retail trade sector and they made almost half of whole SME's share in Azerbaijan. Possible reason is that production sector in Azerbaijan has been developed worse, than consumption one. And another cause for the unequal development of the SME in different sectors could be the existence of monopolies, but in retail trade sector level of monopolization is low and the initial capital requirement is small, therefore there is a big chance for SME's to orientate themselves without any barriers from the monopolies. (CESD Report on Azerbaijan SME 2017). Due to the Economy Diversification strategy of Azerbaijan Republic other sectors than oil and gas must be improved, therefore SME sector is one of the important ones supported by the government via special state programs and funds. However, the differences between value added of SME's in European countries is much higher (more than 50%) than in Azerbaijan (only 4%). The diagram below is showing us that Azerbaijan is mostly engaged with the oil manufacturing and making international transactions on oil more than on products of any other sector.

Figure 5: Business demography indicators

Source: The State Statistical Committee of the Azerbaijan Republic, 2017

Depicted low level of development of the small and medium business sector in Azerbaijan shows that internationalization capacities of local SMEs are also a bit limited. This problem occurs not only in Azerbaijan, but also in Georgia, Kazakhstan, Russia, Turkmenistan, Romania, and other post-soviet countries, that are unfamiliar with business culture because of their communist past. Most of these countries as well as many emerging economies, are going through a period of major changes, many of which are related to transformations taking place in the institutional environment. The institutional environment is unique for each country. It creates "rules of the game" (North, 1990), which affect the development of business and the behavior of firms, regulating their interaction and defining the context for making managerial decisions. Thus, firms are dependent on the national institutional environment in which they were "born" and are developing at the present time, and this dependence is especially characteristic of small firms, because due to the limited resources they do not have the opportunity to change it. It is believed that in the emerging economies, the institutional environment plays a special role in terms of the speed and dynamism of the changes that occur in it, which may have unpredictable consequences for business (Yamakawa, 2008). It is important to define the impact of the national institutional environment on the development of the internationalization of small and medium-sized businesses and what exactly institutional factors play a decisive role in this process. In particular, there is no understanding of the specifics of the national institutional environment that surrounds small and medium-sized businesses, and those factors that may prove crucial in making management decisions about internationalization. Thus, a more in-depth study of the influence of the national institutional environment on the internationalization of Azerbaijan, Georgia and other post-soviet CIS countries SMEs is also very important.

2.6. Barriers of SME development and internationalization in Azerbaijan

Because of the post-communist political background, private sector as well as the business culture in Azerbaijan is quite new concept. Azerbaijan has been independent after Soviet Union collapse in 1991 as well as Georgia and other post soviet countries. And since that moment all of these countries are trying to develop their own model of sustainable economic growth. Challenges and solutions in all of these countries are globally similar but locally quite different from country to country. In Azerbaijan this model was mostly oil oriented because of the natural resources abundance. This model worked very well in the stage of capital accumulation, but now state policy has changed towards economy diversification and development of non-oil sectors, and SME sector development is one of the state strategy priorities. Although, local SMEs are facing different barriers for growth and development because this sector is still infant in Azerbaijan. In accordance with Islamic Cooperation for the Development of the Private Sector (ICD), the main barriers for Azerbaijan SME development are tax rates, access to finance, and corruption. Access to finance is one of the most important issues in SME development, and survey data of ICD indicates that number of people reporting it as a major barriers in Azerbaijan is 9% higher than the world average, at 16% (Islamic Corporation for the Development of the Private Sector, 2012). The same survey depicts tax rates that are over 20% as another barrier to entry for SMEs in Azerbaijan.

Table following on the next page

Table 4: Taxes in Azerbaijan

Azerbaijan Taxes	Last	Previous	Highest	Lowest	Unit
Corporate Tax Rate	20.00	20.00	25.00	20.00	percent
Personal Income Tax Rate	25.00	25.00	35.00	25.00	percent
Sales Tax Rate	18.00	18.00	18.00	18.00	percent
Social Security Rate	25.00	25.00	25.00	25.00	percent
Social Security Rate For Companies	22.00	22.00	22.00	22.00	percent
Social Security Rate For Employees	3.00	3.00	3.00	3.00	percent

Source: Ministry of taxes of Azerbaijan Republic

Figure 6: Azerbaijan tax rate

Source: tradingeconomics.com and Ministry of taxes of Azerbaijan Republic

Unequal distribution of SMEs all over the country also impact to SME situation in the country. Due to the fact that they are mostly located in the capital and Absheron area, they do not expand to other regions of the country and that is why infrastructure of these regions stays underdeveloped and population of these regions are moving to Baku and forcing over urbanization process there. According to the statistics of Ministry of Economy, published in 2017, Baku accounted for nearly 57% of overall enterprises in Azerbaijan (Ministry of Economy of the Republic of Azerbaijan, 2017). See Figure 3. Regarding to the World Bank data in 2017, Azerbaijan is in the 65th place for its overall business environment within the 189 target countries. However, Azerbaijan takes good place among the 189 countries in “overall doing business environment” index.

Figure following on the next page

Figure 7: WB Doing business 2017 ratings

Source: World Bank, doing business database 2017

2.7. Access to finance

Obviously, one of the most crucial factors boosting SME activity is financial support. Azerbaijan SMEs have a limited access to commercial banks loans. The reason is that offered interest rates are very high, approximately 30%, and most of them are short term loans, often unbearable for SMEs. The situation has changed slightly since February 2018, when Azerbaijan state bodies have applied insurance for such kind of loans. This decree under the President of Azerbaijan Republic states that in the case of business failure the government obliges to pay 70% of the loan, and that measure is supposed to impact business activity of the country in the positive key. If regard to official data, provided by EBRD "Business Environment and Enterprise Performance survey" in 2014, more than 45% of all small and medium enterprises in Azerbaijan, are discouraged to take loans, and main reason of this fact was high interest rate. More than 50% of enterprises cited this reason, second popular reason was complex procedures, then approval expectance and all other issues to follow. (EBRD, 2014). The World Bank report also mentions that the top three barriers to start SME in Azerbaijan are: difficulty in finding needed funding, large initial investment and difficulty in finding proper business partners. The most common regulatory constraints were constantly changing taxation and bankruptcy legislation. Financing sources of SME's in Azerbaijan are nor in a wide range. Eastern Partnership (EaP) Comparable analysis of countries shows that, the majority of enterprises in Azerbaijan (more than 50%) are funded by entrepreneurs' own resources and generally, the trend continues throughout the life of the enterprises. Only 25% of Azerbaijan entrepreneurs use loan from commercial banks and alternate loan options such as international financial institutions and public financing schemes are not existing. East Survey Index (2012), also shows that number of SMEs taking a loans from international donors or international financial institutions are close to zero. All of these show us that SMEs access to finance is not diversified. The reason could be low level of Azerbaijani entrepreneurs financial literacy. In this circumstances Azerbaijan's micro-finance institutions became important source of SMEs financing. World Bank Report (2015), estimates that in 2013 Azerbaijan micro-finance institutions have financed approximately 400,000 of local SMEs.

Figure following on the next page

Figure 8: primary financial resources for SMEs

Source: East Invest Survey, 2012

2.8. Other barriers

2.8.1. Limited access to markets

Lack of the knowledge about markets awareness hinders SMEs' ability to expand their borders into local and international markets. Majority of SMEs in Azerbaijan don't have necessary knowledge about market requirements, they mostly making profits for the short term. With a plan to integrate into World Trade Organization and /or to European Union (EU) markets, Azerbaijan SMEs must meet international standards and market requirements.

2.8.2. Baku exchange market

Extremely low level of financial markets is development and access is another huge constraint for SMEs innovation and growth. According to the Central Bank of Azerbaijan (CBAR) and Financial Market Supervisory Authority (FIMSA), stock operations volume in Azerbaijan makes only 1% share in GDP and that pushes back SME growth and development (president.az, 2016).

2.8.3. Legal barriers

The registration process is simpler for individual entrepreneurs than for legal entities and for that reason all the expenses such as registration fees, license and permits are at a lower price for individual entrepreneurs. Taxation process and tax inspection is also different in SME's and individual enterprises, second ones are less often checked by the inspection services, due to the fact that state bodies do not have a list of all registered individual entrepreneurs. However, legal entities must register in relevant ministries and agencies, therefore, they are checked by these government structures on regular basis. The simplicity of the procedures in case of entrepreneurship activities termination be also improved.

Besides, all these inspections and procedures should be enhanced in the conditions of absolutely transparency and certainty.

2.8.4. Poor business skills

In Azerbaijan, the correlation between educational system and labor market is still low. There is a gap between the needs of the local work market and adequate qualifications of existing work force, and that makes the school-to-work transition difficult. Lack of properly skilled employees and a workforce misfit to the local and national market. (CESD Report SME of Azerbaijan, 2017)

Figure 9: SWAT Analysis of SME sector in Azerbaijan

<p>Strengths</p> <ul style="list-style-type: none"> • Comparatively good infrastructure and service provision level (BEEPS) • Extensive e-government system • Government programs for SME support and promotion (ASAN, ABAD, NTFS etc) • Easy procedures for starting a business • Low price of energy 	<p>Weaknesses</p> <ul style="list-style-type: none"> • Limited access to bank finance • Low level of competitiveness • Low level of innovation and R&D • Lack of coordination between state programs supporting SME • Lack of public and private business consultants • Lack of structured institutional set-up • Low level of business skills • Low capacity for export and internationalization
<p>Opportunities</p> <ul style="list-style-type: none"> • Strategic Road Maps appliance • Non-oil export program development • SME Involvement into public procurement and infrastructure projects • Development of human capital • Rising the awareness of citizens • Creating favorable business climate • Creating exchange market mechanism • WTO membership 	<p>Threats</p> <ul style="list-style-type: none"> • Foreign impact factors • Weak banking sector • Devaluation of manat • Poor competitiveness • Oil dependence • Lack of innovation agencies • Territorial conflict • Lack of infrastructure in rural areas • Absence of stock culture

2.9. Institutional support of SME's in Azerbaijan

With a purpose to boost SME sector development in Azerbaijan, state bodies have adopted a number of legislative acts such as the Law on Entrepreneurship, the Law on State Support for Small Business, the Law on State Registration and State Registry of Legal Entities, etc. At the same time, company registration processes are simplifying via e-government services. The institutional support for SMEs has also been developed after the creation of Department of Entrepreneurial Development Policy under the Minister of Economy and Industry. This department is responsible both for the development and also for the implementation of SME policy in Azerbaijan. At the same time, there are several agencies like the Baku Business Training Centre, ABAD, the National Fund for Entrepreneurship Support and AZPROMO. Unfortunately, co-ordination between this agencies and departments are still not very effective, so the platform, merging this bodies together with SME could provide higher efficiency of such cooperation. Actually, there was no any defined SME strategy or program until 2016, when “Strategic Road Map on Production of Consumer Goods at Small and Medium Enterprises in the Republic of Azerbaijan,” was approved by the Decree of the President of the Republic of Azerbaijan, dated December 6, 2016. This Road Map has been developed as part of the country-wide measures to ensure competitiveness, inclusiveness and sustainability in the country's economy. At the same time, some progress in improving of business climate in Azerbaijan was done: termination of entrepreneurship inspections for two years, reducing the licenses and permits amounts for entrepreneurial activity, reducing the amounts of fees, simplified procedures for issuing permits, establishment of an electronic portal in this area, application of "one window" system (the time for the registration of new enterprises has decreased from 53 days to 3-7 days and the number of procedures from 13 to 5), minimizing the number of required

documents and procedures during import-export operations, and so on. As can be seen from the actions mentioned above, several initiatives have been enacted to fill the gap in SME support and legislative frameworks in Azerbaijan, some improvements still need to be made (CESD Report SME of Azerbaijan, 2017). Recently, the in According to “Starting a Business” indicators of the World Bank’s Doing Business 2017 report Azerbaijan was ranked 5th based on its registration procedure for new companies simplicity. (WB 2017) According to data in this report, starting a business in Azerbaijan requires 2 procedures, takes 3 days, and costs 1.3% of income per capita for men and women. Registration for individual entrepreneurs is free of charge and it takes three days for companies to register. Entrepreneurs can easily do their registration in the State Agency for Public Service and Social Innovation’s public service (ASAN Service Centers). And if they need to get any information about permits and licenses, there is a state website www.icazeler.gov.az. with all needed info. Besides, there are organizations as Baku Business Training Centre (BBTC) and its seven regional office, The National Fund for Entrepreneurship support, the Export and Investment Promotion Foundation. These organizations provide defined range of services and implement various trainings like start-up trainings. BBTC has well-developed online training facilities and approximately 25% of users of online training services are women. Same progress could be observed with the launch of several informative websites such as www.biznesinfo.az and www.b2b.az. But according to the OECD survey despite the progress supporting services, almost 79% of SMEs in 2015 were not aware of any services provided by government or other organizations to support SME's (OECD/European Union/EBRD/ETF,2015). Regarding to SME innovation policy, Ministry of Communication and High Technologies of Azerbaijan has established the State Fund for Development of Information Technology - ICT Fund In 2012. This fund formed from budget, supports innovative ICT projects in several ways; it distributes concessional loans through banks with a maximum 5% interest rates. Loans can be small (from 10,000 AZN to 50,000 for up to three years), medium (from 50,000 AZN to 500,000 for up to five years) or large (from 500,000 AZN to 5,000,000 for up to ten years). It also provides venture capital for development projects, technologies, equipment and software. The ICT Fund also awards grants, mainly to SMEs, for development of software products and innovative infrastructure projects. Although the maximum potential size of grants which are awarded by the ICT Fund is 300,000 AZN, but fund gave grants only 10,000 AZN to 12,000 AZN to 30 companies. National Fund for Entrepreneurship Support (NFES) of the Republic of Azerbaijan provides entrepreneurs with preferential loans, including an allocation of loans under favorable terms from the state budget. In 2016, 2,402 (97%) of investment projects financed on favorable conditions were small scaled loans (22,887.8 thousand AZN), 34 (1.4%) were medium scaled loans (8,890.3 thousand AZN) and 41 (1.7%) of them were large-scaled loans (157,652 thousand AZN) (NFES, 2016). NFES has already provided loans to 12,500 enterprises, average of \$47,000 USD per each. Most of these loans were addressed to agricultural production. (Ministry of Economy of the Republic of Azerbaijan, 2016). "Azerbaijan Investment Company" (AIC) supports the development of non oil sectors, through substantial capital investments. The AIC's share package ensure that venture capital (entrepreneurship capital) is at least \$1 million USD. The AIC's portfolio is multidimensional and combines various industries, such as heavy industry, agriculture, logistics, sub-stocks and food processing. National Fund for Entrepreneurship Support and the ASAN service have partnered to together to solve such issues as limited credit resources of commercial banks, high interest rates as well as lack of skilled and qualified staff through the development of the "ABAD" Centre and Support Services. The ABAD service has targeted to the problems related to finance, infrastructure and skilled workforce. Regarding to interview held with ABAD's director and vice director, ABAD Centre main goals are implementation of projects to support family businesses, small and medium-sized businesses, and establishing a fund for financing these projects.

ABAD is and creating conditions for SME to use modern technological equipment for production of farm products as well as they assist in transportation and sales of produced goods. They also provide trainings so entrepreneurs might use production equipment, provide technical support for these equipment, and information on the most advanced technological innovations used in agriculture. And of course, ABAD provides Monitoring and evaluation of these projects. The areas in which ABAD mostly focused on are agriculture and crafts. Recently there are 215 family businesses involved into ABAD and 715 are waiting for the approval. Among them there are 12 SME's run by handicapped people and 58% of total business owners involved in ABAD are women. The mechanism of project launching in ABAD is quite simple. After on-line registration of business within two months ABAD officials check current status of the business and then provide special trainings to rise the labor qualification. After that entrepreneurs are passing exams and getting certificates that gave them right to produce under the ABAD brand. Special equipment is brought and placed right at SME premises, kind of Hi-Tech container with all needed equipment inside for full production process. And after the products are ready ABAD assist SME's to transport it and sell. They have their own ABAD shops and besides contract with one of the biggest market chains in Azerbaijan - Bravo (interview with ABAD director and vice director Rufat Elchiyev and Ulvi Badalov). AZPROMO is the leading agency which is responsible for the promotion of international trade opportunities for local businesses, including SMEs. AZPROMO was established by the Ministry of Economy with an annual budget of approximately 1 million EUR and offers all services free of charge. AZPROMO allocates funds for SMEs to participate in international sales fairs and help them to proceed import and export operations. In 2015, AZPROMO established the Exporter Club, whose main function is to support manufacturers in exporting Azerbaijani products to foreign markets. However, according to those SMEs surveyed by the OECD in 2015, most of them were aware of these government programs for encouraging companies to export. State Service for Agricultural Projects and Credit Management under the Ministry of Agriculture of the Republic of Azerbaijan: Using loans provided by the State Service at a rate of 2% annually, authorized banks can allocate loans to entrepreneurs and farmers on preferential terms, without applying an additional interest rate of more than 5 percent. As a result, participating SMEs are able to receive interest rates of 7% or lower in local currency. State Fund for Development of Information Technology under the Ministry of Communications and Information Technologies of the Republic of Azerbaijan: The Fund is financing start-ups with high technology, with a total allocation of up to 300,000 AZN

2.10. SME in Georgia context

Within the last ten years, Georgia has carried out radical and comprehensive economic reforms, which have affected onto a micro and macro levels of country's economy. The main goal of those reforms was the creation of favorable business climate in the country both for Foreign Direct Investment sector, as well as for Small and Medium Enterprises sector. This was achieved via wide economy liberalization, including war with corruption and reduction of taxes. Two main documents supporting this economic policy are - "Socio-Economic Development Strategy of Georgia – Georgia 2020" (2014) and Governmental Program "For a Strong, Democratic and United Georgia" (2014) . The importance of the strong private sector is underlined in both of these documents. The results of such policy making are quite impressive - Georgia have been recognized as the top improver country by the WB/IFC Doing Business (2015) and one of the best places for doing business in the post-Soviet space. However, SME sector contribution to GDP is still not high enough.

3. STATISTIC OVERVIEW

Definition of a Small and Medium Enterprises in Georgia differs from one institution to another, and that makes analysis and compilation of SMEs statistics in Georgia quite complicated task. Georgia National Statistics Office classifies enterprises as small- or medium-sized if the number of employees does not exceed 100 and the average annual turnover is up to 1.5 million GEL. Small business status also might be granted with a purpose of taxation to individuals, whose gross income from different economic activities does not exceed 100,000 GEL during a calendar year. So, there are two official definitions of SMEs, one of them has been set by the Law on Georgian National Investment Agency and another definition has been set by the Tax Code of Georgia. The Tax Code divides all SMEs to micro and small enterprises owned and/or operated as self-employed enterprises.

Table 5: Criteria of SMEs determination in Georgia

Size/Criteria	Employment		Turnover	
	Definition 1	Definition 2 *tax purposes only	Definition 1	Definition 2*tax purposes only
Micro		Self employed (no hired labor)		<30 000 GEL
Small	<20 employees	Self employed (no hired labor)	<500 000 GEL	<100 000 GEL
Medium	<100 employees		<1 500 000 GEL	

Source: Law of Georgia No. 519 of 12 June 2012, on the Georgian National Investment Agency; Tax Code of Georgia

Today, SMEs make a significant contribution to Georgia's economy, making up 94,1% of enterprises, 42,7% of employment and 20,6% of value added in 2013 (OECD/European Union/EBRD/ETF, 2015). Their main advantage is that SMEs are more flexible and adapt quickly to changing conditions of the market economy. If discussing SME activity sectors, in 2006-2014, overall business turnover increased by 3.4- fold and number of employees increased from 361.000 to 592 147. The largest share in total turnover by economic activities (in 2017) was in trade (34%), manufacturing (22%) real estate activities (20%), while the volume of output was highest in manufacturing (31.5%) followed by trade (17.1%) construction (15.7%) and transport and communication (13.8%).

Figure 10: Georgia SME activity sectors

Source: European Investment Bank, 2017

There are several factors that makes doing business in Georgia much easier than it was before.

First of all we need to mention tax policy reforms, number of taxes and tax rates were significantly deducted and right now Georgia has very liberal tax jurisdiction in the region. In accordance with Forbes' Tax Misery and Reform Index 2009 Georgia had the 4th lowest tax burden country globally after Qatar, Hong Kong. and UAE. Currently, Georgia has 6 flat taxes compared with the 21 existing there in 2004. Small businesses have been taxed either 3% or 5% of their taxable income. Micro businesses are exempted from income tax. Reforms in the customs policy also very simplified and reduced foreign trade costs because import tariffs were eliminated for approximately 85% of all traded products. Custom taxes exist only on several kinds of agricultural and construction products. Besides, Georgia is not applying non-tariff barriers which are import and export quotas, and number of licenses and permits also was reduced approximately by 90%. And this simplifies Georgian Business Internationalization a lot. (Source: Law on the Georgian National Investment Agency 4 and Tax Code of Georgia)

3.1. Institutional Support

Ministry of Economy and Sustainable Development in Georgia has established the Entrepreneurship Development Agency (Enterprise Georgia) and the Innovation and Technology Agency (GITA) in February 2014 in order to promote SMEs emergence, development and growth of their competitiveness via innovative approaches. Enterprise Georgia is providing SME aid programs, like supporting start-ups; facilitating modern entrepreneurial culture; supporting diversification of export of goods and services, etc. Nad GITA is a main coordinator in the process of creating innovative ecosystem, stimulating R&D and modern technologies and supporting innovative start-ups and their competitiveness growth. Besides, Georgia has Institutions working with SME sector, like Georgian Chamber of Commerce and Industry, Georgian Employers' Association and Georgian Small and Medium enterprises Association. (SME Development Strategy of Georgia 2016-2020)

ABSTRACT

Forests are an important part of the environment, but they are also a source of economic benefits. The society puts great demands on forests as an important environmental element. This create strong pressure from the public for comprehensive fulfilment of all, wood production and non- wood production functions. However, sufficient sources of funding need to be found to ensure their realization. There is a large-scale of policy tools to support sustainable forest management, like technical assistance, outreach education, financial incentives, and regulations. Among these policies and programs, financial incentives, particularly tax incentives, hold a significant position. The paper presents the possibilities of application tax allowances as an additional source of funding for the ecosystem services. In the example of Slovak Republic, the main advantages and disadvantages of applying the analysed forest policy tool are approached. Application of the tax exemption from forest land tax on certain types of forest stands increases the resources available for forest enterprises. Then they can be used for financing the forest ecosystem services.

Keywords: *financial instruments, forest ecosystem services, forest land tax, support*

1. INTRODUCTION

Forests are a significant part of the environment; they are also a source of economic benefits. They fulfil important ecological, economic and social functions. They are a source of wood, which is currently the most important source of renewable energy. The use of the forest and its functions changed during the development of human society. Forestry has been influenced by the demand for wood production for a long time. Accordance with both the EU and the SR strategy, in relation to forestry, one of the basic objectives is to promote a functionally integrated use of forest functions in its entirety. The importance of securing all forest functions is also declared by the EU in its new forestry strategy: A new EU Forest Strategy: for forests and the forest-based sector. It is a policy framework that coordinates and ensures coherence of forest-related policies and allows synergies with other sectors that influence forest management. According to this strategy, the objective of the forestry by 2020 should be to improve the balance between the different functions of the forest, to ensure the provision of ecosystem services, and to create the conditions for forestry to become a competitive and viable contributor of bioeconomy. Forests and their functions should be understood as a natural wealth and must be preserved and, if possible, improved by appropriate management. However, the society must take care to ensure a socially acceptable rate of profit for forest landowners, given the fact, that the owner provides important services for the arrangement of the adequate forest structure.

As a significant problem limiting the effective application of a multifunctional forestry system, there is often a discrepancy between the social order and its economic cover. While a social order for wood production is a market-driven economy, the social order for the use of other functions (especially non-market character) is not economically sufficiently secured even in unambiguous cases of orders such as protection forests and forests of special designation. To cover the social order for the use of non-market functions, the system of subsidies, compensation for damages, tax exemption, (Čaboun et al., 2010). Payment for ecosystem services schemes (PES), where the providers of environmental services receive payments for the adoption of land uses and practices that support those services, are relatively recent. There is strong interest in PES schemes, because of their potential to mobilize new resources for conservation and achieve development outcomes. This interest has increased with recent discussions under the United Nations Framework Convention on Climate Change on a mechanism for Reduced Emissions from Deforestation and Forest Degradation (Tacconi, et al., 2011). Payments for ecosystem services have received much praise and are increasingly perceived as a promising tool to ensure the protection of global ecosystems as well as being able to help alleviate poverty in areas rich in ecosystem services. Given current trends, the scale of payments is likely to grow, creating new circumstances within which ecosystem services will be managed (Kronenberg, Hubacek, 2013). The goal of the paper is to analyse possibilities of financing forest ecosystem services (FES) using economic public policy instrument – tax allowance. The result is identification of advantages and disadvantages of using the analysed tool.

2. MATERIAL AND METHODS

Document analysis was used to analyse the current situation in FES support in Slovakia. We analysed public policy documents as legislation and strategic documents and have made an overview of existing financial instruments. According to Papanek (1978), multifunctional forestry (or functionally integrated forestry) can be defined as an optimal combination of the various forest functions (commercial, protective and special purposes) into the harmonious system of its management. It has five characters (Konopka, Konopka, 2003):

1. In determining the forest management objectives, consideration is given to all the functions of the forest that result from natural conditions and from the interest of society (the principle of universality of forest functions) in given local conditions.
2. All forest functions are expressed and measured both in technical units and in monetary indicators, and are thus considered together, regardless of whether they earn income or only merit through the fulfilment of these forest functions (the principle of equivalence of forest functions).
3. Seek and explore different ways to use forest functions and explore their economic impact on the provision of benefits, costs, labour, mechanisms, investments, etc. (the forest function analysis principle).
4. The option of exploiting the functions of the forest is the one that gives the best results to the smallest victims, thus requiring and harmonizing each other's forest functions in optimal proportions (the principle of optimizing forest functions).
5. Integration of forest functions is reflected in forest management plans and forestry so that a functionally integrated forest management is a practical fulfilment of the theoretical concept of forest management in optimal proportions (the principle of implementing forest functions).

There is no formal market environment for many of the functions that forests provide to community. There is no uniform system of payment for services, such as recreational and health care, water, shelter, anti-erosion or carbon sequestration.

State interventions in the form of support mechanisms are therefore necessary (Hyde, et al., 1987, Sterbova, Salka, Sarvasova, 2018) The range of economic instruments potentially usable to support the development of non-woodproduction forest functions is relatively broad. The problem of their wide-ranging application within the EU is currently an absence of coherent forest policy at this level. Forestry is an area where policy-making and initiatives are left at national level. The EU is aware of the risks and shortcomings of the current situation in this area and therefore calls on the Member States to consider the principles and objectives set out in the current European strategy when drawing up and implementing their action plans and national forest programs. A new EU Forest Strategy: for forests and the forest-based sector (COM (2013) 0659) was agreed in September 2013. It represents the basic conceptual framework that should be taken into account in the formulation of national policies and strategies. It is based on fundamental principles such as: Sustainable forest management and the multifunctional role of forests, delivering multiple goods and services in a balanced way and ensuring forest protection, resource efficiency and the EU's global responsibility for forestry. Part of the document is the definition of economic instruments that should be used within national policies to support the achievement of the targets. Command and control is the traditional instrument applied to regulate behaviour in a certain direction, for instance through the regulations in the New Forest Act or the restrictions on activities in the forest management plans, restrictions on access and land use in order to reach conservation objectives in National Parks and Nature Reserves or on non-conserved land to preserve a certain level of biodiversity. The challenge for command and control regulation is the high level of information needed about private land owners along with costs of administration to ensure that policy instruments are efficient. Compared with command and control measures, economic incentives have the potential to deliver more cost-efficient implementation of enhancement or protection of ecosystem services. The reason for this is a higher flexibility under economic incentives for the land owners to determine the intensity and type of activity that is optimal given the taxes, charges or conditional contracts (Zandersen et al., 2012). The challenge for developing countries and transitional economies is to identify and adopt instruments that integrate environmental and economic policy and that are parsimonious in their use of scarce development and management resources; instruments that allow differential response by economic units and adjust flexibly to changing circumstances. The search for instruments of environmental management in developing countries and transitional economies is a search for instruments of sustainable development. Economic instruments meet most of these conditions and are uniquely suited for the integration of environmental and economic policy and can be designed to advance sustainable development (Panaiotov, 1994).

Figure following on the next page

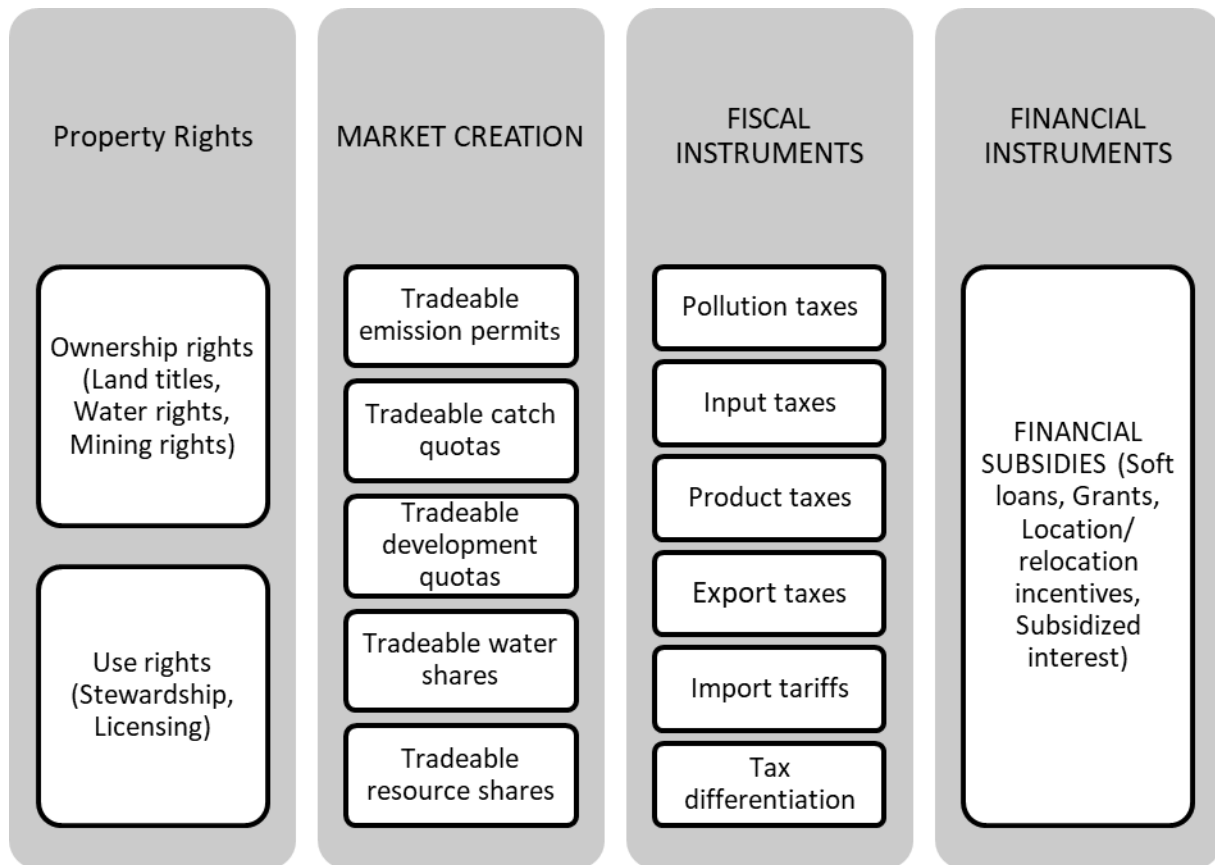

Figure 1: Economic Instruments (Panaiotov, 1994)

2.1. Forest Land Tax

Land Tax is a part of real estate tax. It is governed by Act No. 582/2004 Coll., on local taxes and on local fee for communal waste and small construction waste as amended. Real estate tax comprises land, buildings and flats (apartments). This tax is paid annually by the owner of the real estate. Paid tax amount does not reflect real estate market value, but its size in square meters and related tax rate (mostly depending on use and location). Local self-government has in the field of real estate property powers of tax office. Municipal authorities are allowed to increase or decrease the annual tax rates depending on land location, nature and purpose of the land or number of floors in the case of buildings; however, they cannot exceed certain limits. Tax declaration concerning new real estate property must be submitted to tax administrator up to 31st January following year when new property had been acquired (or in a case of any change - changed in use e.g. form residential to commercial, change in size etc.). If there are no changes in real estate ownership subject does not need to submit real estate tax declaration in the following years. Real estate property will be taxed according to previous tax declaration. Calculation of payable tax amount is responsibility of local self-government. Real estate owner is informed about this sum in letter, stating also possible form of payment (bank voucher, bank account number, cash at local self-government cash desk, time for payment etc.). As a rule, a tax liability is payable within 15 days after a tax assessment became valid. • If the taxpayer finds out that the data in a filed tax return based on which the tax liability is calculated is incorrect, then he is obliged to file an amended tax return no later than four years after the end of the year in which the obligation to file a tax return or a partial tax return arose. As a rule, the land's registered owner pays the land tax. In certain cases, it is paid by the land manager or the lessee. The tax base is the value of the forest land determined as the value stated in the municipality's general binding regulation or on the basis of a surveyor's report composed according to special regulations (Act No. 382/2004 Coll. on Experts, Interpreters and

Translators and on amendments and supplements to certain acts as amended and the Decree of the Ministry of Justice no. 492/2004 laying down the general value of the enterprise). The basic annual tax rate on forest land is 0.25% of the tax base. The municipality may decrease or increase this tax rate (the minimum may be zero, maximum decuple of the base rate, by other land types only 5-fold).

3. RESULTS

Directly Act no. 528/2004 on local taxes and charges, as amended, defines only forest land on which commercial forests are located (stands listed in the forest management plan as production forests) as the tax subject. Their main purpose is the production of wood and other forest products along with ensuring other (non-productive) functions. In addition to the production function, other forest functions usually play non dominant roles, but their importance does not go beyond the main function. Unlike production forests, protective forests and special purpose forests perform primarily other than an economic function. Their purpose is to meet the specific needs of the community, such as recreational function, water protection or hunting function, and so on. Protective forests are being declared on extraordinarily unfavourable sites, in high mountainous locations, in the zone of dwarf pine for securing soil protection and others. The main purpose of farming in these landscapes is never the production of woody raw materials, but always ensuring the permanent fulfilment of the protective function. The Act directly exempts another group of forest land from tax. These are, in particular, land owned by the state, municipalities, and other state and public administration institutions (schools, hospitals...). The potential tax savings are approximated by an example of a University Forest Enterprise. University Forest Enterprise (VŠLP) is a specialized organisational part of the Technical University in Zvolen. The VŠLP covers variable natural conditions in the attitude range of 250 to 1 250 m a. s. l. At relatively small area there are different communities of fauna and flora (from thermophile communities, through the communities of nutrient sites to the elements of the mountain flora). The forest communities are integrated into 5 vegetation altitude zones (from oak to fir-beech). VŠLP manages the forests of the area 9 535,97 ha. This area is comprised of state forests (9 065 ha), forests of the TU (only 27 ha) and the rest is rented from private owners. 78% from the total area are incorporated into forests of several specifications, 13% are protection forests and only 9% are commercial. The diversity of ecological conditions of forest communities managed by VŠLP is a good base for compilation and evaluation model for tax relief analysis as a tool to support non-forest production functions. Table 1 approaches the estimated level of tax liability of VŠLP according to individual cadastral territories and forestry units. The tax rate between 2015 and 2017 was not changed in the analysed areas, nor was there a change in the value of the land (determined by the ROG or the expert opinion). Expected tax liability (without tax exemption) represents in the company € 45,746.59. In the case of economic forests, the company does not pay the tax because of the low tax level, which does not reach the established minimum rate of tax in one municipality. Thus, the company earns an average of € 4.80 per hectare per year in the form of a reduction in financial costs for taxes and levies. The undisputed advantage of such support is also the administrative difficulty, where it is sufficient to obtain a relief from presenting the current Forest Management Plan.

Table following on the next page

Table 1: Calculation of potential tax liability (own results)

CADASTRAL TERRITORY	FOREST ENTITY	M ² - CT	EUR/M ²	RATE	EUR/TOTALLY	TAX

4. CONCLUSION

Although the tax land rates are not very high they are significant burden for forest land managers. The forest land owners are obliged to pay taxes even though they have not gained any profit for 30 – 50 years. This kind of support is considered as payment for ecosystem services and helps to overcome market failure. If such support did not exist, forest managers would try to get their increased costs or reduced yields into market prices, especially in wood prices, and thus distort the market. This PES is a state payment (instead of consumers - citizens of the Slovak Republic) directly for non-productive functions of forests, the value of which is according to the economic groups of forest types listed in Annex no. 1 of the Forest Act. The consumer - the citizen of the Slovak Republic - should pay for these non-productive functions of forests. The condition for payment of such compensation is the fulfilment of the prescribed criteria for the crops with cleaned or planted or pasture-grown plantings in close proximity (KICKO, 2017). Provided support for non-productive functions of forests will simultaneously be an incentive payment that encourages the forest manager to ensure that forest measures are taken to adapt forest vegetation created by natural or artificial restoration to climate change. Slovak Republic, as a member of the EU, promote the implementation of a functionally integrated use of forests. Obstruction of this goal is conditioned by sufficient support for forest owners and users, especially provided by the state. There is a whole range of tools, such as subsidies, damages, tax breaks, and so on. Tax measures appear to be an appropriate tool to support the delivery of ecosystem services. In particular, general measures at the level of the law that can be used by each taxpayer once the conditions are met. Analysed forest tax allowances can be included in this category. The advantage is their transparency and the assumption of long-term functioning. However, this support system is inadequate, which is also confirmed by its hectare value. It is therefore important to look for other tools that will remove this shortcoming.

A CONCEPTUAL MODEL FOR SMART CITY EVALUATION: ATTRIBUTES AND RULES

Peter Farago

Széchenyi István University, Hungary
farago.peter@sze.hu

ABSTRACT

The evolution of the ‘smart city’ concept among scholars has been remarkable over the last decades. While the diversity of related descriptive notions (digital, knowledge, intelligent, creative, livable or ubiquitous city) remains, academic papers in steadily growing numbers scrutinize ‘smart cities’ from various aspects (knowledge management, ICT infrastructure or urban planning). This paper aims at establishing a conceptual model to determine cities’ position on the path to becoming a ‘smart city.’ May we expect that a city with an established high-tech digital library, however, lacking an intelligent public transportation system will reach the level beyond which academics will affix the ‘smart city’ tag? What happens if some contributing components improve while others remain at their previous levels or even diminish over time? We constituted a knowledge-based model comprising of smart city attributes and rules, taking into account their effect, to be prepared to answer questions like these. First, we defined all the relevant and independent attributes that build up the ‘smart city’ from the smallest factors, grouped by the three main deterministic dimensions: technology, institutions, and people, as conceptualized by academics (Nam & Pardo, 2011). Second, in commencing research, we shall define probability levels for these attributes, representing what extent they contribute to their governing factor. We shall use four linguistic variables to describe these fuzzy values. In the final step, we shall implement a deductive reasoning model to facilitate conclusions on the likelihood of reaching the goal: the smart city. We shall also demonstrate the results of the model by investigating actual scenarios from the world of our time. The comprehensive set of substantial and organized contributing factors previously studied by numerous academics, the adequately defined rules, and the deductive reasoning underpin the trustworthiness of our conceptual model.

Keywords: *Smart cities, expert system, components, attributes*

1. INTRODUCTION

The evolution of the ‘smart city’ concept among scholars has been remarkable over the last decades. While the diversity of related descriptive notions (digital, knowledge, intelligent, creative, livable or ubiquitous city) remains, academic papers in steadily growing numbers scrutinize ‘smart cities’ from various aspects (knowledge management, ICT infrastructure or urban planning). Some authors argue that the smart city characterizes a city capable of sustaining social, environmental, economic, and cultural progress. However, scholars agree that one of the components of smartness is related to technology. Furthermore, definitions of the smart city pay particular attention to critical infrastructures and to their principal aim to provide better services to citizens. Besides, it seems clear that the combination, interconnection, and integration of systems and infrastructures are threshold characteristics for a city to be called smart (Gil-Garcia, Pardo, & Nam, 2015). The smart city is an environment where sensors, data, and connections harmonized rules, gives citizens and other actors the possibility of developing applications and solutions able to improve the life of the city (Murgante & Borruso, 2013). Kourtit and Nijkamp argue that “smart cities are based on a promising mix of human capital (e.g., skilled labor force), infrastructural capital (e.g., high-tech communication facilities), social capital (e.g., intense and open network linkages) and entrepreneurial capital (e.g., creative and risk-taking business activities)” (Kourtit & Nijkamp, 2012).

This paper aims at establishing a conceptual model to determine cities' position on the path to becoming a 'smart city.' Ruhlandt concludes that In particular, further research should explore the links between the components of smart city governance and the expected results, that remain mostly vague. Potential insights must be tested for their causal links. With confirmatory statistical research, the few components and subcomponents that demonstrate prevailing similitudes with their generated insights can be further explored. (Ruhlandt, 2018)

2. APPROACH AND METHODS

Expert systems are based on artificial intelligence and are made up of rules and attributes. Facts and heuristics are the knowledge incorporated inside an expert system. The facts are the information body, and the heuristics are methodological indications and good guessing rules that together characterize the decision-making of experts in the field. The method of backward-chaining identifies the needed attributes as subgoals and other rules are examined to conclude values for this subgoal. The results are passed forward, and conclusions are drawn about the primary goal (OXMAN & GERO, 1987). In the first step of our conceptualization, we have identified the most important attributes and aligned them in a goal chaining tree where these attributes have been identified as sub-goals. Scholars have identified numerous factors that make up the smart city concept. These factors or attributes all contribute to some extent to building the smart city. The value of these subgoals is determined by their subordinates that, on the lowest level can be defined by domain experts. We are following the concept of Nam and Pardo who argue that three major dimensions provide the fundamentals of the smart city concept, namely the human, the institutional and the technological dimension (Nam & Pardo, 2011). After completing a comprehensive literature review in these fields, we have identified the essential attributes and their subordinates that can be comprehended as goals.

3. TENTATIVE SOLUTION

Scholars have identified the main focus of researches to be on six principal axes of 'smartness' including economy, mobility, environment, people, living and governance (Murgante & Borruso, 2013). In this model, the economy is characterized by employment, the innovative enterprises, universities and research institutes, and infrastructures. Mobility comprises of the public transportation network, park and ride, green travel means, limited traffic areas, cycle paths, bike and car sharing. As for the environment, air quality, the separate collection of waste, the green spaces in the city and quality of water are held crucial. In smart cities, people appreciate education, a high proportion of women working and holding positions within the administration, political participation, voluntary associations, and lively cultural events. For citizens, smart living means culture and welfare, childcare facilities and community libraries, cinemas and hospitals, immigrants and social integration, all with a low criminality rate. The smartness of governance is measured by services no only related to e-government, the but the widespread of green cars, the proportion of recycled waste, energy saving, and adoption of environmental policies for city planning and development. Other authors disseminate differently when they highlight connectivity, mobility, energy grid and water management, urban planning, public safety, environmental sensors, traffic and navigation (William Altman, Intelligence Analyst, CB Insights). Also, the smart city may be subdivided into the land, a geographical area, and the technologies, incorporating all high-quality infrastructures, services, and governance processes. Those above extended with the citizens the people to which all the smart initiatives are addressed and who should gain benefits from the smart city and the local government, that manages the city with the legislation granted by the citizens for choice and decisions about the public space (Renata Paola Dameri, 2012).

3.1. Human dimension

The human factor as part of the smart city concept has been attracting the most attention from researchers in the fields of human relations, cooperation, and knowledge management recently. In this paper, we have identified ‘creativity and knowledge’ and ‘smart communities’ as the most relevant governing attribute that contributes directly to the human dimension. As the initiators and the beneficiaries of initiatives are people, in this sense they must be in the center of smart cities (Battarra, Gargiulo, Pappalardo, Boiano, & Oliva, 2016). In the early stages of research on digital and intelligent cities the technological factor was believed to transform and improve cities automatically, but now it is clear that progressive cities must put people and human capital to the first place (Hollands, 2008).

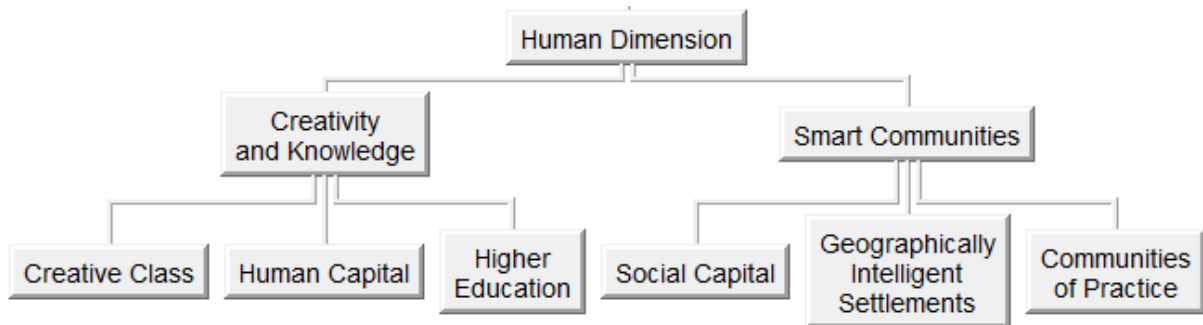

Figure 1: Attributes of the Human dimension (author's elaboration)

3.1.1. Creativity and Knowledge

Most politicians and analysts agree that competition, knowledge, and technology are the primary source of economic growth in the 21st century. Nevertheless, according to Richard Florida, none of these three factors are fundamental drivers of growth: economic growth is ultimately driven by human creativity, and because creativity flourishes best in an urban environment, it is a vibrant city that will be the ultimate driving force for future economic development. Mostly, the majority of writers in the creative city discourse emphasize the social and human dimensions of the city, as much as the technological emphasis at the heart of the smart city. The creativity scheme of Richard Florida is widely represented by the three ‘t’-s of economic development: tolerance, technology, and talent. Florida extends the concept of creativity more generally to the cultural industries. This so-called ‘creative class’ includes authors, innovators, scientists, engineers, consultants, media professionals, authors, architects, designers, musicians, and artists, in short: people who earn their money by creative thinking, design, and production (Florida, 2012). The knowledge and potential of learning found in people are usually described as human or intellectual capital. Research confirms that smart city and intellectual capital views are highly compatible. In order to study smart city from management studies, systematic adoption of intellectual capital approach might be very helpful (Renata P. Dameri & Ricciardi, 2015). The attribute ‘human capital’ in this conceptual paper focuses on the knowledge, especially tacit that citizens possess and use in their everyday life for the good of the whole city. Evidence also suggests that smart cities grow mainly through the attraction of young people from closer regions and not from more considerable distances like neighboring countries. Therefore, smart cities drain talent from areas without competitive higher-education (Winters, 2011). This fact stresses the importance of quality higher education as a critical attribute in the human dimension.

3.1.2. Smart Communities

Social capital is the relationship between individuals, organizations, networks, and systems. Communities in smart cities form networks and cooperate by a set of standards, rules, values, and expectations which link community members and bridge the divisions that exist in civil society (Halpern, 1999). The combination of the potential of geo-location and social networking with real-time communication enables people to spatially disintegrate their virtual networks and then share real experiences in the virtual world and vice versa. In these hybrid spaces, people can share their successive locations and movements with members of their network through various types of technological solutions and track them in return. They can also increase their geo-communication capacities and enhance common knowledge gained from geographical content generated by friends (Roche, Nabian, Kloeckl, & Ratti, 2013). The importance of communities of practice in the evolution of digital (smart) cities needs to be highlighted at the same time. In the organization of CoP stakeholders from different fields work together to develop a concept that may later turn into strategy and finalize in realization. These organizations are particularly successful because the knowledge is integrated, networked, virtualized and highly-distributed.

3.2. Institutional dimension

Smart governance is the characteristic most needed at the time, in the sense that coordination structures are needed to create synergies (Battarra et al., 2016). The domination of neo-liberal urban spaces is widely recognized worldwide (and indeed accepted), and urban governance in most Western cities has changed subtly from management to business, and towns are shaped increasingly by big business or enterprises. There is also a growing link among urban development driven by business, technology, and the changing role and function of urban governance in the smart city. Smart projects must be linked to a specific initiative, such as: providing quality e-services, achieving results that people see as desirable and building public confidence to use technologies to create public value. (Renata Paola Dameri, 2012)

Figure 2: Attributes of the Institutional dimension (author's elaboration)

3.2.1. Smart governance

Smart governance requires local governments to adopt a set of principles to manage and guide the growth of cities and what principles should be applied to internal and external relations between stakeholders. Conventionally, local government has been concerned with how to manage institutions. However, smart governance also seeks to harness the enthusiasm and capacities of residents, rather than to combine their interests following their representatives' capabilities, to represent them directly and precisely. Therefore, the focus of smart governance is on participatory organizational arrangements and democratic institutions (Anttiroiko, Valkama, & Bailey, 2014). Also, the quality of life local governments provide citizens is of great importance that may be characterized through the urban environment (environmental degradation), cost of living, cost of housing, and commuting issues (traffic congestion), school

quality, cultural amenities, and public safety. (Salvesen, 2003) Lower education and healthcare are also of great importance. Smart governance must enable citizens appropriate access to healthcare data for better quality of care, early disease detection, and prevention (Dirks, Gurdgiev, & Keeling, 2010). A further critical factor is the transport and mobility in smart cities. Since local governments maintain the central transport infrastructures (i.e., roads and public transportation systems), it is their primary task to continually improve and thus satisfy citizens and accomplish goals set in strategies developed under partnership and stakeholder involvement programs. The measures, smart authorities carry out may also include real-time traffic data service provided based on data acquired from vehicle counts and other sensors or the deployment of electric vehicle charging stations. Many scholars emphasize the importance of smart partnership (Johnston, 2010), (Lowndes & Squires, 2012). In order to help the decision-makers understand what happens in the communities from the viewpoint of the partners and share decisions with them, participative organizational arrangements can involve conversations between smart city authorities and their local communities. This method can be used to create room for innovation that is socially creative by helping community leaders to emerge, build trust, negotiate services and promote their achievement through collaborative arrangements.

3.2.2. Urban planning and sustainability

Environmental sustainability plays a major role in smart cities. In an environment where resources are scarce, and cities base their development on natural resources and tourism, their use must ensure that the natural heritage is safe and renewable (Caragliu, del Bo, & Nijkamp, 2011). In this sense, urban planning must take sustainability as an inevitable aspect. Another commonly applied tool through the urban planning cycle is ‘impact mapping’ that is used to monitor the impacts of local government measures carried out. The series of expected impacts subdivided into the impact domains of different field (e.g., mobility, citizen engagement, socio-economic deployment) that list multiple indicators by which the different dimensions of the impact might be measured. It is possible to elaborate on the expected impacts, to enable comparisons between cities and sectors, as well as underpinning the replication of successful smart city technologies by this method (Evans, 2017). Through urban regeneration partnerships, people in the impacted area may be involved in the planning phase. The notion of ‘ecological integrity’ has become a common approach in the field of sustainable management. It is used to measure the ecological condition of an environment (Andreasen, O’Neill, Noss, & Slosser, 2001). Despite this variety of approaches, there is no multimetric integrated index to measure the degree of environmental change and state of urban environmental integrity. The networked communities, virtual organizations, and managed learning environments together develop ecological integrity. (Tazin Shathy & Reza, 2016)

3.3. Technology dimension

Some researchers conceptualize smart cities by explicitly emphasizing the use of intelligent computing and communication technologies. We believe that ICT is a fundamental dimension of the smart city concept and primarily serves as a means to enable or catalyze processes.

Figure 3: Attributes of the Technology dimension (author’s elaboration)

3.3.1. Intelligent communication technologies

The use of networked infrastructures for economic and political efficiency and social, cultural and urban development is one of the critical features that emerge in the smart city literature. While this involves the use of a wide variety of infrastructures, including transport, business, housing and a range of public and private services (including leisure and lifestyle services), ICTs are the main focus of the smart city concept and support all these networks (Hollands, 2008). Technology is the specific dimension that allows the creation of specific cognitive frameworks combining geographic information and communication technologies in order to improve the quality of knowledge, communication and social infrastructure for city planning and management (Murgante & Borruso, 2013).

3.3.2. Intelligent Data Management

Intelligent data management is the enabling technology for citizens, authorities, and services to be ubiquitous in the smart city. Cloud and fog computing both provide end-users with storage, apps, and data. However, the proximity to end users and greater geographical distribution of fog computing is increasing. Edge computing is a method by removing some part, data or service from one or more central node, to another logical extreme of the Internet, connection with physical worlds or end-users, in order to optimize applications or cloud computing systems (Garcia Lopez et al., 2015).

3.3.3. Intelligent Applications

Smartphones are today embedded in an enormous range of sensors and informatics and media. By capturing the physical world data and making the mobile device more context-aware, they reduce the difference between the virtual world and the real world. The exciting part of mobile sensing is that in a given environment these intelligent sensors are always mobile and are attached to an entity like the end user. The universal character of mobile phones provides broad sensing applicability in the city and thus fulfills the first requirement for smart city applications. The majority of mobile applications are accessible by established app dissemination channels like app stores/markets, which currently exist. Moreover, most smartphone platforms are open and programmable, providing a very low entry barrier for developers from third parties (Balakrishna, 2012). The distinction between 'here' and 'there' and between 'present,' 'past' and 'future' is blurred in the combination of geographical information systems (GIS) and telecommunication networks that provide real-time access to the information on these systems, and for place-based or context-aware social networking. The key feature of smart cities is to eliminate the distance between people and different locations. Also, space-enabled society and smart cities share a lot, and both of them benefit from spatial data infrastructures (SDI) that enable platforms for improved access, space data and services sharing and integration (Roche et al., 2013). Another fundamental part of intelligent applications includes the smart cards that are capable of storing encrypted information and run multiple secure apps in the appropriate hardware environment. For security and data protection reasons local governments insist on the most secure technology available, and unfortunately, this criterium impedes the widespread simultaneously. The smart card features enable the technology to serve as a means of mostly secure identification when the citizen accesses public services.

4. DISCUSSION AND CONCLUSION

Although the attributes discussed before are interconnected and by some extent related, we chose them primarily because they are easy to identify and disseminate and assess their development levels. This line is also the explanation of why the list of attributes is not comprehensive: some factors are so deeply co-related that their representation is neglectable.

Our concept complies with other fundamental smart city models like the triple helix (Leydesdorff & Deakin, 2011), the SMART (Ben Letaifa, 2015), the conjuncture of four forces (Angelidou, 2015) or the report smart cities ranking (Giffinger et al., 2007). The smart city-enabling factors are all present but aligned or grouped by a different logic. Scholars distinguish three main classes of intellectual capital: the human, the organizational (or structural) and relational (or social) capital (Bontis, 1998). Following the approach above, we represented them individually under their governing dimensions. This research shall commence by establishing the rules (if...then relationships) between the governing and child-element attributes. The goal-chaining tree shall be constituted from different disciplines and by taking into account experts' advice. Further studies shall be reviewed on the actual implementation of the smart city strategies (e.g., Brorström, Argento, Grossi, Thomasson, & Almqvist, 2018).

ABSTRACT

The first part of the study presents the contextual and conceptual novelty elements concerning human resources on which this human resource management approach relies. The conceptual novelty element is represented by the comprehensive approach of human resource management (MRU), focused on the relationships of the organization with internal and external human stakeholders, not limiting to the traditional approach, managers subordinates. The second part of the paper makes a selection of methods and techniques used in human resource management, grouped on the 14 activities specific to MRU. This ensures a coherent and effective methodological basis for human resource managers and specialists, in agreement with the challenges of the current period of transition to knowledge-based economy. The last part of the study indicates the methods and the techniques recommended to be used in particular during the eight stages of human resource reengineering.

Keywords: *career development, innovation, human resources, new methods*

1. INTRODUCTION

Successful individual company activity in many ways depends on effective human resource management. In the modern world, the role of human resources and their management is becoming increasingly important. The ability to correctly select qualified, meeting all the stated requirements of staff for their organization is quite a challenge. In this regard, the issue of personnel appraisal becomes even more relevant. There is a need for the availability of objective information, the state and prospects of staff development. What does the notion of “personnel appraisal” mean? Evaluation of personnel — a system of methods for measuring the value of the main human resource. In the economic sense, is characterized by the efficiency of the resource in terms of the objective function (optimality criterion). Thanks to its use, the best use of available resources (labor, production, natural, etc.) is achieved. The objectives of staff evaluation:

1. Administrative goals are based on decision-making by the organization’s leadership (promotion or demotion, transfer to another job, etc.) based on the results of staff performance evaluations.
2. The information goal is that all employees, including a guide, have the opportunity to obtain reliable information about the activities of the organization. Open access to information gives you the opportunity to build your own activities, taking into account its improvement, and managers are given the opportunity to make the right decisions.
3. The motivational goal is that human work should be assessed objectively. Motivation plays a big role if an employee sees that his assessment of his work meets his expectations, in the future his efforts and motivation will only increase. Tasks of personnel assessment: organization; feedback organization; staff quality of their work;

Methodological approach in relation to personnel management means the use of certain methods of knowledge and methods of activity aimed at achieving management objectives. General methodological approaches should be defined:

- Consistency;
- Accounting for the long-term perspective of the organization;
- Equal opportunity;
- Integration and team cohesion;
- Employee participation in decision making;
- Team leadership;
- reliance on the professional core of personnel potential;
- Horizontal collaboration;
- Compliance with the balance of accounting managers and staff;
- Legal and social cooperation with the professional committee and the public. Principles of formation of personnel policy:
- Science, the use of all modern scientific developments in this area, which could provide maximum and social effect;
- Complexity, which should cover all areas of personnel activities;
- Systematic, that is, taking into account the interdependence and the relationship of the individual components of this work; the need to take into account both the economic and social effects of both the positive and negative effects of an event on the final result;
- Efficiency, any costs for activities in this area should be returned through the results of operations.

Human resource management as the most important component of management activity is based on the not always declared idea of a person's place in the management of an enterprise. Among the most important principles of personnel management in enterprises and organizations should be mentioned:

- ensuring the interrelation of personnel management functions with the goals and objectives of the enterprise;
- compliance of the personnel management system in the formed structure of the enterprise or organization;
- use of developments and experience in personnel management of advanced domestic and foreign industrial enterprises and corporations.

The personnel management system should contribute to the advancement of the most intelligent and effective workers on the career ladder and in no way contribute to the excessive complexity (and even contradictory) of their official duties. Every employee of an industrial enterprise should be able to clearly compare career aspirations with the achieved results of their production activities. It is believed that among the main tasks of human resource management is the timely development of sound decisions that determine the requirements for the company's personnel potential, i.e. to what labor resources and in what quantity are necessary to achieve the goals set by the owners of the enterprise. The classic tasks of human resource management traditionally are:

1. Resource Planning - Develop a plan for meeting future human resource needs. This process consists of three main stages: assessment of available resources, assessment of future needs for them, development of a program to meet the identified needs.
2. Recruitment - is to create the necessary reserve of candidates for all positions and specialties, from which the organization selects the most suitable employees for it. This stage is largely determined by the results of the first.

3. Selection - evaluation of candidates and the selection of the best from the reserve created during the recruitment. This stage involves the collection of information to determine whether a candidate is eligible for the vacant position for which he is applying.
4. Career guidance and adaptation of employees to the requirements of the company and its divisions, the development of employees' understanding of what the organization expects from it and what kind of work it receives deserved evaluation.
5. Training (and development of training programs) labor skills required for effective work performance.
6. Determination of wages and other remuneration or compensation - the creation of methods for calculating wages and other payments (bonuses, sick pay, maternity leave, etc.).
7. Evaluation of labor activity - the formation of methodologies for evaluating labor activity and bringing it to the employee.
8. Management training, career management - development of programs aimed at developing the skills and improving the efficiency of managerial personnel.
9. Enhance, downgrade, transfer, dismissal - the choice of methods for moving employees to positions with greater or lesser responsibility, developing their professional experience through their work in other positions or areas, as well as procedures for terminating the employment contract.
10. Training and professional development of employees of the organization, career planning, staff motivation [15, 18].

In the light of the ever-growing requirements for the functionality of personnel management facilities, modern personnel systems should meet the requirements of a wide variety of users. Since the personnel system must be integrated, it is quite natural that each task to be solved is linked to the system. In this case, tasks are usually combined through a set of criteria, which can be used as knowledge, skills and requirements, which are determined for a specific position and correlated with employees.

2. CHAPTER 2

The origins of human resources management lie in the second half of the XIX century and are associated with the development of personnel management. The development of these disciplines contributed to the activities of the movement for the improvement of working conditions of industrial workers. For a relatively considerable period of existence of HRM, the most effective methods have been formed, which are successfully used in foreign and Russian organizations. HRM methods are divided into 3 main groups:

- Administrative
- Economic
- Socio-psychological

Consider these groups separately. The group of administrative management methods is characterized by a centralized impact on personnel. These methods involve behavioral motives: responsibility, discipline, a sense of duty, the desire to follow corporate culture and loyalty to the company. Administrative management methods, in turn, are divided into 3 types:

- methods of organizational impact regulated by the regulatory documentation within the framework of this enterprise: recommendations, instructions, labor regulation, etc. ;
- organizational stabilization methods - these include federal laws and other regulatory acts with the status of state, including standards;
- disciplinary methods - the deterrent effect of negative incentives: penalties, fines, threats of dismissal; administrative methods regulated by operational management documents: orders, orders.

- Administrative methods include career advancement of employees within the company. The opportunity for career growth strongly binds the employee and the employer. The company provides the employee with the conditions for development, to achieve results. The employee has the motivation to work more efficiently, responsibly, constantly develop, undergo training. Due to the implementation of the practice of career growth within the company, both parties win - both the employer and the employee. Motivating the employee that good work is encouraged not only by bonuses, but also by promotion, the employee will try to act with greater observance of the rules and standards. [7,24]

This is certainly very good for the employer, who, in turn, in response to the employee gives him the promotion he deserves. Thus, the company maintains a hierarchy of levels, while preserving valuable frames. This method perfectly develops trust relationships between hierarchical levels in an organization, and, moreover, people who take a leadership position know the organization very well from the inside, making it easier to solve production issues, properly communicate management innovations to employees, motivate other people by example and overall raise the level of satisfaction with the company employees. The prospect of career growth from the very beginning of work in the company motivates the employee to work according to the rules established in the company, to be more demanding of their work and to show themselves from the best side. The importance of this method is reflected in the results of a study conducted by CareerBuilder (in 2014 among 3 thousand people), one of the reasons for the dismissal of employees is no career growth. So answered 45% of respondents. The economic methods of personnel management include all options for material stimulation of employees. These methods are divided into 2 groups:

- operating within the enterprise. This is a system of material incentives for labor, participation of employees in the profits and capital of an organization, a system of penalties and incentives for the quality of work and work efficiency.
- nationwide. This includes the tax system, credit and financial mechanisms within individual regions and the entire country.

Economic methods, of course, include the establishment of decent wages. Many managers recognize this method as very important, sometimes almost the only decisive one, but, despite its high efficiency, the role of money in employee motivation should not be overestimated. Not all problems with personnel can be solved with the help of salary increase. Let's understand this method. I think it is difficult to dispute that the high level of earnings that an employer promises attracts a greater number of applicants. Due to the large flow of candidates, the company can choose for itself the most valuable candidates, with excellent knowledge of the theory of their profession, good work experience, having the necessary skills and abilities, or meeting other requirements important to the company. Just a high level of wages allows you to save valuable personnel in the company, which is certainly very important. Quite a few companies lost their valuable employees when the latter were offered higher wages in another organization. The development of employees through the acquisition of practical experience, the passage of theoretical training in their specialty and other methods is usually accompanied by an increase in employee self-esteem and, consequently, an increase in the amount of desired earnings. Socio - psychological methods include all methods that have a psychological and moral impact on the employee, as well as related to social relations in groups. These include: the ability of the manager to exert a motivational influence, effectively manage personnel and show a personal example in the work; the formation of working groups and teams, taking into account the psychological types and characters of the staff to create a creative atmosphere and an optimal psychological climate; involvement of employees in the development of solutions, participation in management; motivating and stimulating benchmarks: objectives and goals of the company,

a sense of ownership; providing opportunities to meet the spiritual and cultural needs, the organization of leisure of workers; support of generally accepted social and ethical standards; providing employee social security — bonuses, benefits, social packages, free meals and extended medical care, mobile communications and travel compensation; creation of a system of incentives and moral sanctions, combining both negative and positive incentives [3,67]. This group of methods includes employee training. Anyone, even the most competent employee in the company, can be taught something new, to develop his skills and abilities. An employee who has returned from training feels that he is not indifferent to the company and comes not only with new knowledge and skills, but also motivated by new achievements. In the process of learning, there is always an awareness of how wide the range of what is worth learning is that it introduces a new interest in life, thereby motivating the employee to new accomplishments. However, managers using such a method should not forget that it brings a positive result only when an employee can use this theoretical knowledge in practice.

3. CHAPTER 3

The theory of personnel management considers various types of personnel policy, including:

- passive personnel policy (the company's management does not have a pronounced program of action in relation to personnel, and personnel work is reduced to accounting functions and eliminating the negative consequences of personnel errors);
- reactive personnel policy (the company's management monitors the symptoms of a negative state in working with personnel, its causes and the situation of the emergence and development of conflict situations, investigates the causes of any personnel problems, etc.);
- preventive personnel policy (management of the company seeks to have reasonable forecasts for the development of conflict situations. In these programs, short-term and medium-term forecasts of personnel requirements, as well as tasks to improve personnel management, are formed in these cases);
- active personnel policy (carried out at enterprises when management wishes to have not only a personnel forecast, but also anti-crisis personnel programs and seeks to monitor situations and adjust the execution of programs in accordance with the parameters of the external and internal situation at the enterprise);
- open personnel policy (when the management of enterprises seeks to make personnel dynamics issues transparent to all employees. Usually, such a policy employs any specialist, if he has the relevant qualifications, without taking into account work experience in related organizations);
- closed personnel policy (used when a company focuses on the inclusion of new personnel from a lower level of office, and the replacement of higher positions comes from the number of employees of the enterprise. Such personnel policy is typical for companies focused on creating a certain corporate atmosphere, forming a special spirit of involvement, and also, opportunities to work in conditions of a shortage of human resources).[1,135]

Personnel policy of the enterprise, as a rule, includes:

- development of general principles of personnel policy, determination of priorities of goals;
- planning of the need for labor resources, formation of the structure and state, destination, creation of a reserve, relocation;
- creation and support of a personnel information movement system;
- formulation of the principles of distribution of funds, ensuring an effective system of incentives for labor;
- ensuring the development program, vocational guidance and adaptation of employees, individual promotion planning, professional training and advanced training;

- performance evaluation or analysis of compliance with the personnel policy of the enterprise strategy, identification of problems in personnel work, assessment of personnel potential and other methods for analyzing the effectiveness of personnel activities.

A part of enterprises that have been operating for a long time (in the domestic market this is typical of companies that work closely with foreign partners and foreign representative offices) has a documented idea of the personnel policy of the corporation, personnel processes, events and the order of their implementation. For another part of enterprises, the idea of how to work with staff is more likely at the level of understanding or is under development. Although any enterprise, as a rule, is interested in the fact that personnel policy is carried out thoughtfully. Effective personnel policy management cannot be carried out without an understanding of the essence of the domestic system of management of industry and the economy in the country, as well as the strategic goals and development objectives of a particular enterprise arising from this (see section 1). Without studying these issues, any developed enterprise development strategy will never be adequate to the true, and not the “book” problems of industrial development of any collectives. Unfortunately, very many works on the theory and practice of managing enterprises and enterprise groups are not very suitable for Russian conditions, since the history of Russian management and the system of industrial management in Russia that has developed in it is not at all analogous to Western or Eastern counterparts. Its specifics are so different from those declared in pro-Western, oriented manuals and monographs on industrial management that the use of the recommendations of the latter can hardly allow business leaders to achieve the desired results.

4. CONSLUSION

Developing training programs and improving their qualifications. In order to obtain a result in the form of objective information, you need to literally indicate the objective indicators by which personnel will be evaluated. There is a need to establish a specific set of criteria, showing personnel qualifications. Criteria can identify, as well as similar for all workers, the moments of activity in general, and highlight the features characteristic of each employee. There are four main groups of criteria.

4.1. Staff evaluation criteria

Criteria	Content criteria
Professional	Professional knowledge, abilities, skills, professional experience, qualification, results of work
Business	Responsibility, organization, initiative, efficiency
Moral and psychological	Psychological stability, honesty, ability to self-assessment, justice

Table 1: Staff evaluation criteria

Today, it is assumed that the main asset of any organization lies in people [1,67]. Quality, productivity, profitability, customer satisfaction and the image of a company depends largely on training, coordination and motivation of its staff. For a company to function properly it requires that the persons composing know, willing and able to work properly. Inadequate people management can lead to myriad problems that hinder the performance of an organization:

- Lack of motivation
- undefined responsibilities
- Lack of training / information
- Lack of internal communication

- Non-cooperation
- Lack of coordination
- Conflicts of interest

In the present document provides a summary of some of the methodologies Sinapsys Business Solutions, SL uses in its consulting services to solve such problems. Any change initiative must develop the necessary direction and leadership with a commitment to continuity. Initiate change and create expectations that are not met can cause frustrations and worsen the situation. The implementation should be done professionally and after a proper diagnosis to select the right tools to each individual case (single or combination of several of them) [1,78].

4.1.1. Leadership

Leadership can be defined as the ability of an individual to develop the potential of a team in pursuit of a common interest.

There are different leadership styles (authoritarian, participatory, consultative, ...). Each style may be appropriate to the context and characteristics of employees. The source of leadership may be the charisma, the hierarchical power, the power of knowledge or behavior.

Through education and training, people who have responsibility for others can develop optimal leadership style. A leader does not command it runs, does not impose, but seeks consensus, not divide but unites. Example: In a food business problems were identified by marking their authoritarian style of leadership. In a leadership course were explained leadership styles. Participants were able to assess your leadership style by completing a questionnaire. In addition, each participant learned to evaluate the pros and cons of each style and know how to apply the most appropriate in each circumstance.

4.1.2. Mentoring

The mentoring (mentoring) is a process by which a person (mentor) teaches, advises, and guides to another (the mentee) in their personal and professional development. It is the traditional "sponsorship" that currently is used primarily in high positions in organizations.

Mentoring should not be improvised requires setting goals, planning and monitoring of results. Although there are similarities, mentoring differs from coaching in the mentor must have expertise in the field in which you want to start the mentee, while the coach does not have to have an experience in this field.

Some advantages of mentoring:

- Mentoring is a powerful tool that facilitates the retention and transmission of knowledge in the enterprise
- Increase satisfaction guardian and the ward
- Increase staff retention and commitment of these with the company.

Example: A director of a company in the construction sector, with no time or discipline to study for a master, hired a mentor to learn what I needed from a practical (less formal) and personal assistance. This training helped her improve her leadership style and management techniques are people in your company.

4.1.3. Education Climate Assessment diagnostic technique

Education Climate Assessment diagnostic technique allows for an objective assessment of the degree of satisfaction of people in an organization, understand their needs and expectations at work and their perception of existing problems. There are circumstances that may hinder the effectiveness and objectivity of an evaluation process work climate, including:

- Labor disputes

- job dissatisfaction
- Lack of communication[3,23]

Must be taken into account these conditions, so before starting the survey process may have to be a media campaign upon, to explain what, why and what it intends to carry out this diagnosis. If there is union representation in the enterprise should plan this process with their collaboration and consensus. The evaluation should be completely anonymous and the results published at all levels. The assessment should be followed by an improvement plan aimed at resolving conflicts and problems have been detected. Assessment should be repeated once the improvements made in order to verify their effectiveness and strengthen the process of continuous improvement. Example: In a furniture manufacturing company, is still a problem of lack of motivation, lack of teamwork and internal tensions. The results of a work climate assessment revealed that the main areas of improvement were: to define responsibilities, establish incentive system, improve staff training and development capabilities to offer.

4.1.4. Competence Management / Knowledge Management and Performance Evaluation

This methodology allows to reconcile the interests of the company with the interests of each individual. While comparing the knowledge and skills required by the organization to those who reside in people.

- we define competence as the ability or quality which makes a person is able to play a role, management skills, involves identifying all you need for people to know, willing and able to provide full value for the benefit of the organization.
- skills management, requires:
 - An identification of the skills necessary for achieving the objectives of the organization (strategic, tactical and operational)
 - skills assessment in the Members of the organization
 - A plan to bring existing powers with the necessary
 - setting and monitoring targets both individual and collective performance. These goals should be possible to verify the use of these skills

Example: In a private agency established a competence management system, identified the functions of each position were defined quantitative targets for each position and each department and set up a training plan that took into account the training needs of each person.

Figure following on the next page

Figure 1: The activities making up the human resources field [6,45]

Summarizing all the above, the researchers of this topic emphasize that it is competence that serves as a tool for obtaining economic benefits, i.e. results from the use of knowledge as assets. Since competence requires managing complex, iterative processes of integrating technologies, integrating training in many parts of an organization, repeating it is difficult. Thus, in a globalizing global economy, when developing and implementing a strategy, an organization should be based on increasing the competence of the organization as a whole. and each of his employee. It should be noted that the competence approach as a research, scientific and applied direction is an effective way to create new competitive advantages in both domestic and foreign markets. Successful individual company activity in many ways depends on effective human resource management. In the modern world, the role of human resources and their management is becoming increasingly important. The ability to correctly select qualified, meeting all the stated requirements of staff for their organization is quite a challenge.

In this regard, the issue of personnel appraisal becomes even more relevant. There is a need for the availability of objective information, the state and prospects of staff development. What does the notion of "personnel appraisal" mean? Evaluation of personnel — a system of methods for measuring the value of the main human resource. In the economic sense, is characterized by the efficiency of the resource in terms of the objective function (optimality criterion). Thanks to its use, the best use of available resources (labor, production, natural, etc.) is achieved.

ABSTRACT

Nowadays the role of tourism is especially important for the restoration and development of Georgian economy. Tourism in Georgia is distinguished by its unique potential and diversity all around the world. However, in spite of this potential it is necessary to renew and improve of the touristic infrastructure permanently, also to promote the development of both the hotel as well as the family guest houses. We believe that it is important to pay attention to such regions where the tourist flows are growing constantly and the supply is overturned by demand. For example: Khevi, Khevsureti, Tusheti, some districts of Kakheti and others. The problem is exacerbated in this and other areas with a nonexistence of three-star budget hotels. It is true that in recent years, the number of hotels is growing, but in most regions they do not meet the international standards. Taking into consideration all the factors, it is difficult to establish an effective management system, especially when it has become a platform of social infrastructure that significantly determines the level of socio-economic development of the country. Nowadays the significance of tourism in Georgia is especially important for the development of economy of the country.

Keywords: *tourism, infrastructure, international standards, Socio-cultural factors, effective management systems*

1. INTRODUCTION

The economy represents a healthy mechanism; the tourism is on the most essential chain of it. Development of tourism implies strong resorts, more workforce, reduction of unemployment, stability of currency, possibilities of economic growth, infrastructural development, investment and what is the most important, it - it raises the country's awareness abroad. Georgia is a country with a high potential of tourism development with unique natural-climatic conditions that allows the country to be attractive, interesting and exciting for the whole year and such conditions can provide the country with more and more tourists. Tourism at the current stage represents the whole industry and it consists of not just individuals, but the whole economy with taking into account its diversified species. Tourism industry combines: transportation of cargo / transportation of travelers, tourist flows, food production and service facilities, hotels, travel Agencies, sport-recreational events, leisure, entertainment, etc. Tourism is one of the priority fields of the economy of Georgia and its development is in a special interest. In recent years, Georgia has moved from the 72nd to the 31st place among the most demanded countries for tourists and significantly outstripped neighbor states with this indicator.¹

2. METHODOLOGY

This section provides the methodological tools used, consisting of the analysis of the problem and main challenges, the data and statistics on the basis of the official reports of the country.

¹<http://gnta.ge/ge/public information>

2.1. Statistical data and analysis

International experts forecast the great future of tourism in Georgia. According to the analysis of the current potential of tourism, it will be perspective to develop and promote the following kinds of tourism, such as: cultural, medical, resort, adventure, eco, etc. In addition, it is possible to develop the small-scale tourism directions as well, such as: walking and biking tours, agro, youth (traveling of young people in a cognitive, sport and recreational way), extreme, ethnic, nostalgic, etc. With these above-mentioned advantages, the experts emphasize the geographical proximity of the country to the world's main tourist market –Europe. Years 2010-2017 - The number of foreign visitors arriving directly at the border of Georgia is as follows (see Figure 1).

Figure 1²: The number of foreign visitors arriving at the border of Georgia in 2010-2017 years

According to the Figure, the number of foreign visitors in Georgia in 2010-2017 is characterized by the tendency of growth, during which the average annual growth amounted to 789 031 visitors. The main market of international travelers in Georgia is neighbor countries. In 2016, there were represented the 89% of total revenues. More Concretely, Turkey had 27%, Armenia 25%, Azerbaijan 23% and Russia 17%. The origin of visitors has an impact to lots of factors, including:

- Duration of visit;
- Costs, food, shopping amount;
- Activities and visited sightseeing;
- Places visited in Georgia;
- Types of accommodation and tours.

The latest three years of statistics show that most part of international travelers visit Georgia in July and August. Armenia, Azerbaijan and Turkey represent the top three in terms of amount of travelers (see Table 2.). Approximately 76% of international travelers who visit Georgia come from these three countries.

Table following on the next page

²Source: Figure is created based on the data of the National Tourism Administration website.

Table 2³: Top ten countries according to the international arrivals in Georgia (2016-2017 years)

Country	Years		Change (%)
	2016	2017	
Armenia	1 496 437	1 718 016	+14,8
Azerbaijan	1 523 703	1 694 998	+11,2
Russia	1 038 750	1 392 610	+34,1
Turkey	1 256 561	1 246 745	- 0,8
Iran	147 937	322 918	+118,3
The Ukraine	174 858	193 002	+10,4
Israel	92 215	125 319	+35,9
India	34 410	59 732	+64,1
Kazakhstan	48 849	56 765	+16,2
Saudi Arabia	21 257	56 247	+164,6

As it is shown in the Table 2, the number of visitors has decreased by 0,8 percent from Turkey in 2017 compared to 2016, while the same indicator in other countries are: Armenia - 14.8 percent, Azerbaijan - 11.2 percent and Russia - 34.1 percent. Despite the fact that the share of arrivals from other countries in Georgia increases annually, the difference is still quite obvious. We think that this cannot be caused by the distance, but also because of the low awareness of the country all over the world. It is noteworthy that the trend of visitors' growth on the basis of data of 2017 is maintained by the European Union countries. In this regard, we can highlight the UK - 40%, France - 30%, Germany - 29%, Latvia - 21%, Lithuania and Italy - 17-17%. From Central Asian Countries: Kazakhstan - 17%, Uzbekistan - 75%. It is worth to mention that the indicator for US citizens is also growing by 25%.⁴ Currently the Adjara coastal region and Tbilisi dominate in the hotel market. There are 1058 accommodations in Georgia totally with 37 252 beds. By the number of beds in the first place is Adjara region. 67% of their number comes from hotels. Then there are guest houses (18%) and family hotels (16%). Along with the leap increase of the number of travelers in the recent years in the medium-term perspective the demand on accommodations exceeds the supply, which can become the basis for increasing the number of accommodations in the prospect. The same reason will lead to increase in land prices across the region, predominantly along the seashore.⁵ As regards the international incomes in Georgia according to the types of the borders of the country, we have the following percentage: 78% - land road, 20.5% - aerospace, 1% - railway and 0.5% - marine (see Figure 2).

Figure following on the next page

⁴<http://reginfo.ge>

⁵ХелашвилиИ., "Развитие средств размещения туристического назначения земель (например в регионе Батуми)", Materials I International Scientific and Practical Conference 24-30th October, 2017, pg.53-54

Figure 2⁶: Travelers according to the border types

These data clearly show that there are sectors in Georgia that need more rapid development. This is mainly about air traffic and also, the marine transport is very interesting and prospective. Despite the fact that Kutaisi airport is open at this stage, the share of tourists from the airspace is still low, which is due to the high prices for similar services. According to the data of the National Bank of Georgia, income from tourism in 2017 was 2.8 billion US dollars. According to the National Tourism Administration, in the first two months of the current year, transactions carried out by foreign cards amounted to 219 million Georgian lari which is more than it was in the previous year by 47 million Georgian lari. Besides, since the number of visitors has increased, we can assume that the revenues from tourism have also increased.

Figure 3⁷: Dynamics of revenues from tourism in 2010-2016 years

As it is shown in the Figure, with the number of visitors arriving in the country in 2009-2012 years, income from tourism is growing also at a rapid pace. The situation has radically changed since 2012 when the growth rate of revenue from tourism has slowed down and the lowest growth was in 2014. A special contribution in this process was made by the introduction of new visa regulations in the country, namely: Georgia lifted visa-free regime in 24 countries, which

⁶Source: Figure is created based on the data of the National Tourism Administration website.

⁷Source: National Bank of Georgia. National Tourism Administration

in turn contributed to the number of visitors arriving in the country and income from tourism. One year after the visa regulation tightened, the Georgian government recognized the mistake and simplified the visa regulations to mitigate the negative influence of the strict visa regime. The result of this decision was reflected in the tourism sector in the same year and the number of visitors arriving in the country and the increase in revenue from tourism has again returned to the growing tendency. In 2016, revenues from tourism grew by 11,9% and amounted to 2,02 billion US dollars and in 2017 - 2.8 billion US dollars, which is 30% higher than the previous same index. As for the domestic tourism, it is different from international tourism and it is distinguished by a close distance and characterized by repeated behavior. Internal visitors different from international visitors know the culture, climate and language of the host. Due to the closeness of the location in local tourism mainly land transport is used, which reduces time and travel costs. Internal tourism has less prominent seasonality than international tourism and contributes more to the distribution of revenue between town and rural settlements. Also, domestic tourism is less sensitive to the current economic shocks and crises in the world.

Figure 4⁸: Distribution of internal visitors in Georgia by regions

According to the data of 2017, the majority of domestic visitors visited Tbilisi (26%), the second place goes to Imereti (18.5%) and the third place goes to Adjara (12,6%). As for expenses incurred by domestic visitors, average monthly expenses amount to 158 million Georgian lari (costs are different according to seasonality and reach the highest point in the third quarter when the average monthly expenses are close to 260 million GEL). The largest share of expenditure comes on food shopping and transportation. The analysis of modern state of tourism and the experience of advanced countries assures us that international tourism development reflects to a domestic, national tourism promotion, and vice versa. Domestic tourism contributes to the stability of the national economy, development and unity of the economy sectors which are traditional for the country, have enough resources and in turn, contribute to the overall stability of the economy.⁹

3. RESULTS

As noted above, Georgia's tourism potential is not doubtful, however, it is used only a very small part of it. In order to make real shifts to maximize the prospects of this potential, it is necessary firstly to analyze the hindering factors that are obstacle for intensive and extensive development of tourism. Simultaneously with the social and demographic challenges, the diversity of the protected areas in Georgia leaves space for many different tourism marketing arrangements (info- and press-tours, presentations, organizing festivals, publishing new printed materials and improving the awareness of tourism infrastructure among target groups), which must be implemented on a regular basis. The tourism potential of Georgia in the international market is advertised in an irregular and non-coordinated manner. Presenting Georgia in potential markets is not based on systemic market ranging or approved methods of the market penetration.¹⁰ Part of these hindering factors is beyond the scope of the country's influence. However, they can be minimized and the rest of the problems are totally based on the country's efforts.¹¹ Currently, tourism indicators are not realistically estimated in Georgia and correspondingly, their quantitative analysis is impossible. Because of non-adequate and incompatible information, precise determination of touristic opportunities with its anticipated results and predictions is also impossible.

4. CONCLUSIONS

Nowadays, the fear of tourists to visit the partly occupied country in militant conditions with unstable political and social environment is a very important objective obstacle, but there is a possibility of its recovery and further development. The fact that today Russia is actively under pressure in the international arena to fulfill its obligations taken in 2008 creates certain guarantees to maintain existing status quo and not to combat hostilities. As for political stability in the rest part of the country, the only contributing factor is to increase democratization, improve the social-economic situation of the population and others. Providing the world with this information in an appropriate way and level and will reduce the risk for tourists in Georgia and accordingly it will increase the number of tourists. Under the modern trends of tourism development it is importance to improve the quality of informational provision of tourism statistics and implement an appropriate analysis. For this purpose it is necessary an intensive interdepartmental work of National Statistics Office of Georgia, the National Tourism Administration and the National Bank which is designed to develop and support tourism statistics.

ABSTRACT

Under a dynamic and volatile changes that affect the marketplace, consumers face trade-offs in their buying decision on a daily basis. In such turbulent economic environment, producers are also facing a challenge by constantly developing and innovating their products, in order to satisfy much more demanding consumers who are seeking for extra benefits. In line with consumer's choice being a complex process affected by consumer's socio-demographic, economic and behavioral determinants, there is a set of several intrinsic and extrinsic product-related attributes that influence forming expectations during the purchase decision process. Since consumers' perceptions of product quality changes over time as a result of new information, increased competition or changing expectations, marketers need to have insights on consumer behavior to properly anticipate and respond market challenges. Understanding the process of forming expectations can provide guidelines to marketers and brand experts to identify the key parameters for developing a more efficient and focused product strategy. This study aims to investigate the relative importance of the selected extrinsic product attributes, since a better and more comprehensive understanding of trends in consumers' buying behavior and product attributes that mostly affect their buying decisions can enhance the product placement process. The research findings will result in several contributions, with respect to future marketing communications, product positioning and further scientific research.

Keywords: *branding, buying behavior, consumers' choice, product attributes, purchase decision*

1. INTRODUCTION

The market serves as a dynamic and volatile environment for the consumer - they face trade-offs that affect their buying decision from day to day. Since retail stores are getting more abundant in different brands of goods, the trade-offs between different brands can get even more difficult, especially in a turbulent economic environment caused by economic crisis. On the other hand, producers are facing a challenge in constantly developing and innovating their products, in order to satisfy more demanding consumers who are seeking for extra benefits. Consumer choice can be described as a complex process, affected by different product attributes and consumer perception developed under the interaction of product characteristics and personal socio-demographic, economic, psychographic, behavioral and cognitive determinants. Consumers are forming quality expectations based on quality cues during the purchase decision process (Tuorila et al., 1998), hence extrinsic attributes (for example price, brand name, country of origin, etc.) are responsible for purchase decision, while intrinsic attributes will affect liking a product or service and affect brand loyalty.

A substantial body of consumer research confirms that extrinsic product cues such as packaging and branding influence the consumers' product evaluation on specific product group like food, garments, etc. (Acebrón and Dopico 2000; Schifferstein 2001; Bernués, Olaizola and Corcoran 2002; Mueller and Szolnoki 2010; Almlí et al. 2011; Rahman, 2011). However, the main purpose of this research will be to shed some light on the consumer decision process in a multi-category research that compares important extrinsic attributes among different product groups. The main objective of this paper is to review the literature regarding this field of research and explore which of the product extrinsic attributes mostly influence purchase intent. The theoretical research findings presented in this paper will be used in future research of Croatian consumer perspective on the relevance of the extrinsic attributes while making buying decision. The relevance of this research topic has several implications, with respect to future marketing communications, product positioning and further scientific research. Extrinsic attributes that will be investigated in this paper are price, brand name and country of origin.

2. CONSUMER BEHAVIOUR

Buying decision process is a complex and dynamic mechanism, that is influenced not only by different product attributes, but also a wide range of different cultural, social, psychological and personal aspects of an individual or a household. The complexity of buying decisions can vary from very simple decisions such as buying an everyday product like bread, or buying a car or apartment that is a very complex decision that demands longer time and deeper problem solving engagement (Kesić, 2003). With that in mind, the problem of anticipating consumer behavior is a problem of anticipating the demand for different products in general, therefore, understanding consumer's expectation can give competitive advantage in today's volatile market conditions.

2.1. Decision-making process

Developing a well marketing strategy regarding product positioning and differentiation thus requires understanding the target consumer's behavior and anticipating his needs. According to Rakić (2008), consumer decision-making process is a complex process that develops under several different influences that can be categorised in 6 different groups: (1) geographic, (2) demographic, (3) social, (4) economic, (5) psychological and (6) situation factors (Rakić, 2008). Nevertheless, there are five different stages that consumer goes through during the buying decision process (Kotler et al. 2006):

1. problem awareness and recognition
2. information search
3. evaluation of alternatives
4. purchase decision
5. post-purchase behaviour

Usually, some of the decision-making stages can be skipped, especially during purchases that can be categorised as a routine buying process. However, when consumer faces a new product or a product that requires more time and effort, all of the aforementioned stages have to be engaged to properly complete the buying decision process. At the very beginning, the purchase decision process starts with the recognition of a need or problem that arises with the consumer's state of discomfort or a desire, both physiological or psychological. The awareness of the need can be triggered by internal (hunger, thirst...) or external stimuli (marketer's effort to create the need). After the need recognition, the consumer engages with information search. The consumer firstly seeks for information within his or her own memory - if the consumer's memory is lacking information, the information search continues among different external sources such as family and friends, or marketing ads and the Internet.

The next stage in the consumer's buying decision process is the evaluation of alternatives. The evaluation of alternatives is carried out using evaluation criteria that are a part of the cognitive structure of an individual (Previšić and Došen, 2007, pp 116), and will therefore vary among different customers and purchases. The consumers dedicated to evaluate alternatives will carefully evaluate product attributes among several brands. During this evaluation process, there are two kinds of decision making rules: compensatory and noncompensatory. The main difference between compensatory and noncompensatory decision rule is oriented towards a possibility to compensate for some product attribute. After the product attributes evaluation and choosing the best possible alternative, consumer is ready to proceed to the product purchase. Although most of the answers were already acquired during the first three stages, there is a possibility that the consumer gets affected by attitudes of others or brand images created by marketers also in this stage. The final stage of the consumer's buying decision process is the post-purchase behaviour, during which consumer evaluates the product and decides whether his or her expectation of the product have been met. Depending on the level of satisfaction (or dissatisfaction) with the product purchased, consumer will form an attitude towards buying the specific product or brand in the future.

2.2. The importance of alternative evaluation

In this paper, the main focus is directed towards the third stage of buying decision process that analyzes consumer's alternative evaluation. During this process, consumer is forming attitudes towards different product producers/brands based on product attributes evaluation (Rakić, 2008, pp 205). The results of the attributes asesment will affect the consumer's preferences and buying decision process, but also, the development of brand image. From the producers' perspective, the product attributes are buying incentives that can be constantly altered in order to stay relevant to our target group and influence the buying decision, while other characteristics that are given by consumer's internal and external environment can be understood and therefore, controlled of during developing marketing strategy. It is common knowledge that marketers can affect buying decisions by adjusting the elements of the marketing mix to satisfy the target market, hence the understanding of important attributes that can affect the buying decision process becomes even more relevant.

3. PRODUCT ATTRIBUTES

In line with the theory and a vast body of research, products generally contain several product-related attributes, which can be characterized as intrinsic and extrinsic. An intrinsic attribute is always a part of the product, while extrinsic is related to the product, but is not physically part of it (Olson, 1977). Extrinsic attributes are usually determined by marketing efforts such as price, brand name, place of origin, type of outlet, presentation, influence of store personnel, promotion, packaging, advertising etc. From consumer's point of view, when intrinsic information is unknown, extrinsic cues are more likely to be used to assess product quality, resulting in an evaluation that is more heuristic in nature (Monroe, 2003). Hence, this paper aims to elaborate the relative importance of the selected extrinsic product attributes (brand name, price, and country of origin) according to a specific product group.

3.1. Brand name

Regarding the literature concerning food consumption, branding used to be an informational cue strong enough to attract consumers and influence their buying behavior (Jacoby et al, 1971; Kendall and Fenwick, 1979). Brand name was usually related to higher levels of perceived quality, therefore brand image used to be a risk reducer making consumers confident on how a specific brand will perform (Sheth and Venkatesan, 1968, Chernatony, 1991). The importance of branding is even more visible while reviewing the fashion industry, since they are highly

correlated to “psychological” consequences such as social status and self-identity (Reynolds et al., 1995). It is not difficult to imagine branding as a powerful tool. In time, some markets became more competitive, while branding was an effective way to achieve product differentiation. Goods were not selling just because of their utilitarian values, but also the hedonic value (Babin et al. 1994) like brand affection, brand identification and brand image. Furthermore, consumers could use brand image during product evaluation in two different, although supplemental ways. From the rational point of view, brand image helps consumers in simplifying their product knowledge about a particular brand (Meenaghan, 1995), while consumers search for a link between their self-concept and brand image in an emotional way. For example, when buying Nike sweatshirt, one is not only buying a quality product made from best fabric and innovative design. An opportunity to express belonging to a specific group represent the value added, due to previously developed brand image that suits personal beliefs and attitudes. According to the research and common knowledge, marketers have long exploited the power of brand image to sell their products. Some previous findings show that the price-brand relationship is product group specific, as the main implication for managers in food industry (Dodds et al., 1991). While branding is a common way to differentiate your product among fashion items and technology, there is a possibility that brand is relatively less important when compared to other extrinsic attributes, especially when it comes to fast moving consumer goods (FMCG) products (with particular emphasis on the food market). In a constantly developing retailing environment and under circumstances brought by global economic crisis, manufacturers of branded goods compete against retailers’ private labels that rapidly increase their product quality, develop package design and set competitive prices. The aesthetic characteristic of a product plays a significant role in purchase intent and buying behavior in general, especially among fashion industry. Although design of a product is subject to personal taste and preferences, packaging attributes can persuade consumers to purchase the product, while combination with sensory attributes will result in liking the product. Packaging and design have to be eye-catching since they have limited time to convince the shopper that it is the right choice among all other products (Rowan, 2000). Thus, it is obvious that branded goods will have a hard time at a FMCG market battlefield.

3.2. Price

Research evidence display price as a relevant cue when consumers are operating without adequate information about intrinsic quality cues, or when it is the only available cue (Zeithaml, 1988). Furthermore, although it depends on products and individuals, some studies have found that price and quality are positively related (Dodds, Monroe and Grewal, 1991). Zeithaml (1988) pointed out that attention to prices is likely to be greater for higher priced than lower priced goods, therefore prices are used as a quality indicator when the perceived risk of making unsatisfactory choice is high (Zeithaml, 1988).

3.3. Country of origin

Country of origin plays a significant role in consumers' evaluation of a product, since it is a matter of perception. A country's good image is positively correlated with consumer's favorable evaluation of a particular product (Parvin and Chowdhury, 2006). Probably it is also a subject of prejudice, since consumers develop a perceived image that some country is specialized in producing particular goods. Just to name some examples: Switzerland and cheese, watches and chocolate; Germany and cars; France and perfumes; Italy and fashion items; etc. If this matter is considered with respect to the globalization and convergence context, there is not much reason for a strong relevancy of aforementioned extrinsic attribute. Hence, the literature suggests the existence of country-of-origin effects on product evaluation (Wall et al. 1991, Chao 1993).

When consumers cannot detect brand quality and value, they consider the country of origin for evaluating a brand. Similar like the price, country of origin may also serve as a proxy variable when other information is lacking. (Parvin and Chowdhury, 2006).

4. CONCLUSION

From the theoretical perspective, identifying the relative influence of the product-related attributes on consumer's choice will contribute in a better and more comprehensive understanding of trends in consumers buying behavior and product attributes that mostly affect their buying decisions. In the practical aspect, identifying the relative influence of the product-related attributes on consumer's choice could have several implications that can provide guidelines to marketers and brand experts to identify the key parameters for developing a more efficient and focused product strategy. Since previous research revealed that extrinsic attributes affects customers mostly when making a purchasing decision, while intrinsic attributes will affect in liking a product, the relative influence of several extrinsic attributes on purchase intent is to be empirically studied. The theoretical research findings presented in this paper will be used in future research of Croatian consumer perspective on the relevance of the extrinsic attributes while making buying decision. After all, consumers' perceptions of quality changes over time as a result of new information, increased competition or changing expectations, so marketers need to have insights on consumer behavior to properly anticipate and respond market challenges. Since buying decision process is a complex and dynamic mechanism that is influenced not only by different product attributes, but also a wide range of different cultural, social, psychological and personal aspects of an individual or a household, the complexity of buying decisions can vary. Accordingly, the problem of anticipating consumer behavior becomes a problem of anticipating the demand for different products in general, therefore, understanding consumer's expectation can give competitive advantage in today's volatile market conditions. The research findings will result in several contributions, with respect to future marketing communications, product positioning and further scientific research.

ABSTRACT

Purpose of the study - The study of the budget mechanism and its elements, the study of methods for the formation and expenditure of financial resources at all the levels of the budget system.

Methodology - Comparison, synthesis and evaluation.

Results of the study - One of the most important tasks of reforming of the budgetary system is the creation of an effective budgetary regulation mechanism at all its levels, taking into account the nature and features of intergovernmental fiscal interactions. The peculiarity of the processes of reforming of the state bodies and the system of relations in the financial and budgetary sphere predetermines the need for rational distribution of revenue powers between the levels of the budget system, filling the revenue sources of the budgets, whose main share is tax revenues, and attracting non-tax revenues to the budgets.

Keywords: *budgeting, budgetary policy, budget revenues and expenditures, state control*

1. INTRODUCTION

The Paper discusses the development of national economics and the mechanisms of its effective regulation by the state. Particular attention is paid to the study of the role of budgetary regulation of macroeconomic processes. The Paper also notes that effective budgetary regulation, in general, the most priority issue in the system of economic management mechanism of the economy. The normal development of the national economy is largely depends on orderly regulation by the state. So, even at the maximum level, the liberalization of the economy does not deny the participation of the state in the management of economic processes. The fact that each state has its own interests and priorities makes it necessary for the state to intervene in all areas of public life. But even this intervention itself must have certain limits. If the economy is too monopolized by the state, then the sense of responsibility of both individuals and economic entities decreases, and they would have no interest in achieving better results, since, the state is not able to evaluate everyone's work equally honestly and fairly. The system of state regulation of the national economy should, in general, determine the level of state influence on economic life. Without the presence of such a regulatory system, it is impossible to effectively coordinate activities for the formation of market relations.

2. PROBLEMS OF STATE REGULATION OF THE NATIONAL ECONOMY WITH THE HELP OF THE STATE BUDGET

With the formation of the economy of the republic in accordance with the principles of a market economy, the development of a diverse economy in our society, the creation on an equal basis of conditions for the activities of various forms of ownership, the privatization process has accelerated. In order to increase the effectiveness of the measures taken in connection with the development of the republic's economy, the state pays special attention to the regulation of economic development and its main component.

In the transition to a market economy, the role of the state in the economic revival of the republic, in establishing international relations, in the total volume of imports and exports and in the development of free enterprise is undeniable. In the modern world, in the conditions of the market orientation of the economy of the republic, a fundamental change of the management mechanism is needed. The transition to a market economy with a mixed economy transforms the state regulation of the economy into a specific management tool. In our conditions, i.e., in the period of formation of market relations on the part of the state management bodies with the help of programming, mechanisms of influence on the development of the national economy should be used in fullest extent. Budget regulation, in general, the most priority issue in the system of economic management mechanism of the economy. As we know, the budget system, being an important management mechanism in a market economy, is formed on the basis of state principles. Budget regulation in general is used to organize the activities of the economic system, to stimulate production and to improve the principles of separation. The scientific substantiation of its limits, analysis and management of factors and outcomes should be based on a number of methodological and practical features. Budgetary regulation has features inherent in each country. In a market economy, the tasks of managing the state budget, revenues and expenditures became even more complicated, and as a result, they faced serious social and economic problems. And therefore, the strategy of managing income and expenses should be worked out and evaluated from the prism of the most important economic and production problems. It is this approach that will enable the creation of a clearer picture of the complex nature and content of the budgets and budgets of the state budget, and, as a whole, the state budget. The budget system is being formed in accordance with the economic system and the political organization of each country. In general, there are “traditional”, “performed” (or “executable”) and “programmatically” budgetary systems. Traditional budgetary systems mainly provide a control over the implementation of the costs stipulated by law. In other words, the control function plays a leading role in this system. Support for economic activity is one of the current issues in the transition period. And, from this point of view, it is advisable to study the “performed” budget systems, which is also called an “executed” budget system. This budget system is made up as a working program. The executable budget systems have two elements: the classification per services; service-financial connection. The “programmatically”, or “planning-program” budget system, unlike the earlier marked budget systems, additionally provides the use of the budget as a strategic program. Here, it is possible to analyze alternative service programs and select the best from a macroeconomic point of view. The basis of this budget system is a system analysis. In other words, if the performance of services is known to achieve any specific goals in the public sector, if attention is given to alternative approaches helping to achieve the goals, if the goals are long-term and if the performance of existing service programs is adequately evaluated, decisions related to the distribution of sources of funds will be more optimal. In general, the budget system expresses the combination of all types of budgets united in the budget of each country. The creation of a budgetary system and the organization of interconnections between its various links express budget construction. Budget construction reflects the mechanism by which the budget system is built. With traditional fiscal policy, it is very important to keep the state budget balance constantly. If the state wants to influence national income, then it must bring the supply and demand for labor to the level that can change the cumulative production. Due to the fact that it is impossible to achieve technical progress that affects the growth of cumulative production, population growth through fiscal policy, fulfilling traditional tasks and ensuring that taxes do not affect the level in economic activity financing of these services, a small but balanced fiscal policy is consistent with the requirements of traditional fiscal policy and theory. Issues of improving budget planning should be implemented in unity with issues of the public administration. The basic condition for the successful implementation of the program-target approach is the implementation of financial

discipline in the implementation of adopted budgets. The main problem for the successful application for result-based budgeting is the difficulty of determining the socio-economic results of the activities of state enterprises, as well as a lack of unified system of goals and indicators, imperfection of the accounting system and of information national security. As it is known, fiscal policy is a regulatory system associated with government spending and taxes. State expenditures refer to expenditures for the maintenance of the institute of statehood, as well as for the purchase of certain goods and services by the state. It can be different types of contracts, for example, the construction of schools, health facilities and cultural facilities, and the purchase of imported goods, military equipment at the expense of the state budget. The main distinguishing feature of all these orders is that the state itself is their consumer. Usually, government contracts are made up of two kinds: less or more stable. Government spending plays an important role in the socio-economic development of society. Therefore, the issues of increasing the efficiency of government spending, their regulatory role in ensuring socio-economic development, the formation of a new quality of economic growth is very relevant/important. Much has been said about the need for systemic changes in the budget process. But, due to various reasons, this problem still remains unsolved. At the same time, it can be said that certain steps have been taken to revise the restructuring of the public sector. The essence of the new approach to the budget process is simple and clear: the costs are not for the sake of costs, but the costs for the sake of achieving concrete results. To achieve this goal, we consider it necessary to solve the following tasks:

- Optimization of the network of budgetary organizations. This is the restructuring and introduction of new forms of financing of budgetary organizations.
- The solution of this task is certainly more complicated and requires the implementation of certain innovations in the current budget legislation. The Ministry of Finance should systematically address this issue;
- Development and use of results-based financing methods.

The decline in GDP in the economies of the newly independent states, the spread of the process of national reproduction, the breakdown of ties between production and financial systems, the deterioration of the socio-economic position of the population is due to these reasons (1). Sometimes, the regulatory role of the state in the economy is associated with its role in production and the level of the share of state ownership. Such an assessment in terms of the role of the state in the monetary system and the effective use of public finances is wrong. This is because the role of the state in the economy is not adequate to the level of state ownership over the means of production. Here, the main thing is the level of national income in the form of public finance. The analysis shows that, in the developed countries of the world, the share of government growth in GDP does not decrease, but develops at an increasing rate. This figure is 30% in the USA, 60% in Denmark, 54.6% in France, 53.7% in Belgium. In a developing market economy, there is no alternative to increasing government spending in GDP and saving strategies. A policy of reducing this government spending itself will result in general reduction of all expenditures, including vital items of expenditure. It is clear that a decrease in capital investments in high-tech projects from the state, budget allocations for the maintenance of the infrastructure providing basic funds will lead to deterioration in the prospects for economic development. At the same time, the decrease in the state sector engaged employees' real wages will cause a decline in labor productivity of those working in this sector and the emergence of social conflicts. It is necessary to take into account that it is difficult to estimate and measure the majority of budget expenditures at market rates. Produced products cannot be quickly realized (sold). In general, non-production state expenditures can be costly for a country's economy. In the modern conditions, new elements are constantly being added to the state financial mechanism that requires the appropriate settlement and control tools.

At this stage, state finances must again be transformed from the category of distribution into the category of reproduction. Government finances do not simply fulfill the function of government provision. It is also an effective element of reproduction processes (4). Integration to the global financial market requires the development of the mechanism of adaptation and of mechanisms for the protection of national interests in the field of state finances. Long-term definition of the concept of a budget strategy is a very difficult issue. In the world practice, there are no long-term financial forecasts. There are a number of objective reasons related to the nature of financial and budgetary processes.

3. METHODOLOGICAL AND PRACTICAL FEATURES OF THE BUDGETARY REGULATION

Economic theory's history knows no purely financial patterns/laws that would allow predicting the financial and economic situation for a quarter of a century. But this does not mean that there is no scientific basis and no impartial need for long-term forecasting. The forecasts of the budget sphere are essentially based on the connection of the budget strategy with the laws of general reproduction and economic growth. The dependence of the dynamics of budget revenues on the overall dynamics of GDP and on business activity reflects the determination of the sphere to common economic laws, which are the first methodological principle. As noted, there is an objective relationship between the level of GDP that reflects the scale of the reproduction process and the amount of financial resources of the state that serves this process. The second methodological principle is the dependence of economic dynamic on the typology of budget strategy and on real budget proportions. This principle is essentially crucial for long-term budget forecasting. The budget strategy should not only passively reflect market processes, but, on the contrary, have to form common economic limits. The third methodological principle is forecasting on the basis of the internal intensity of budgetary relations and the internal factors of the budgetary tax system of budgetary dynamics. This means that the projected budget-tax potential and proportions depend on the use of the internal resources of the existing budget system. The fourth methodological principle is a socio-political accounting of forecasting. In our opinion, the basis of the financial system and the restructuring of the budgetary regulation should constitute the following principles:

- Creating a stable system of financial relations;
- Restructuring should be holistic/complex character and should ensure close links between all elements (financial infrastructure, government finances, insurance organizations, pension funds and other financial institutions) of the financial system;
- Limited resources makes it necessary to use the principle of centralization of financial resources;
- The restructuring of the financial system should mainly be carried out at the expense of internal sources. Foreign loans and investments should play a supporting role.

In our opinion, in the condition of integration, a systemic update of the tax mechanism for improving budgetary relations is one of the factors creating conditions for economic growth. For these purposes, it is advisable to take the following measures:

- The expansion of the tax base by coverage of the "shadow" sector ("shadow economy") of the economy;
- Reducing the tax burden for the real sector of the economy;
- Standardization of tax legislation and tax reports;
- Gradual decrease and differentiation of rates for profits and for VAT;
- Differentiation of income tax for individual sectors of the economy.

4. CONCLUSION

The implementation of the correct fiscal policy can lead to an increase in budget revenues, and a decrease in budget expenditures. To achieve a positive balance (surplus), a number of reforms and programs should be prepared within the framework of the budgetary system. Macroeconomic indicators, directing fiscal policy, reflects the achievement of faster economic growth, the identification of additional sources of budget revenues, an increase in direct participation and influence of the budget, increased financial discipline and transparency, reduced poverty, improved application targeted social assistance and the creation of financial conditions for the development of entrepreneurship and regions. One of the main goals in the budget policy is improving the well-being of the population, increasing incomes and the level of employment, turning the state budget into the main financial source as well as into an economic tool for managing the economy and stimulate its dynamic development (2). One of the primary steps taken to increase the volume of the budget and in general to improve the budget process is to increase control over budget expenditures. Because the lack of proper control over budget expenditures can lead to the growth of corruption opportunities, the legalization of a large amount of illegal incomes, and even to more monopolization. As a result, the state budget revenues will decrease, and in general the economic entity called the budget process will begin to bear a formal character. Thus, in order to achieve progressive movements in the development of economy, the development of effective mechanisms for the implementation of these tasks in the field of fiscal management is of strategic importance. Conducting this control will lead to the concentration of state revenues in the state budget, and this in turn will lead to a reduction in poverty, the continuation of structural reforms in the economy, an increase in budget revenues, ensuring social and investment orientation of budget expenditures, transparency and effective management of expenditures. And in the future, conducting a successful budget/fiscal policy will ultimately have a positive effect on the development of the state from an economic point of view.

UNIVERSITY BRANDING IN AZERBAIJAN: EMPIRICAL STUDY OF STUDENTS' CHOICES FOR EDUCATION

Turan Suleymanov

Azerbaijan State University of Economics (UNEC), Azerbaijan
turan.suleymanov@unec.edu.az

ABSTRACT

Under the intense global and national competition, Azerbaijani universities began branding initiatives to position and differentiate themselves to be the first choice of students. In recent years, both state and private universities in Azerbaijani have been implementing branding and rebranding strategies to attract more students and distinguish themselves in a crowded higher education market. University branding is a recent concept to Azerbaijan, so lacks academic and empirical studies in regard to the impact on Azerbaijani students' university selection choices. The aim of this article is to present exploratory research using survey data collected from four private and public universities in Azerbaijan. It compares criteria used by university students when selecting a particular university from among those that they made application and their views of the university they attended. The study reveals that there are a variety of criteria that Azerbaijani students consider when applying for university. However, there is both economically and statistically significance of the existence of active students clubs/unions in a university as important criteria that influence students first choice for university selection. The study also showed that mostly friends/family, and to a lesser extent, university visits play important role in obtaining information about a university among Azerbaijani students. The research findings should be useful for higher education institutions to review and enhance branding strategies that promote their international positioning and help the sustainable development of Azerbaijan universities. As it is the first research conducted in this field in a dynamic country like Azerbaijan, it should also interest foreign higher education institutions that wish to recruit Azerbaijani students.

Keywords: *branding, name recognition, university, university selection*

1. INTRODUCTION

As result of changes in an educational environment, shrinking financial support from governments, pressure by competitors and decline in university-going population, universities started increasingly using marketing and branding strategies that mainly was adopted by an organization from the for-profit sector. (Hemsley-Brown & Goonawardana, 2007; Stephenson & Yerger, 2014; Wilkins et al., 2015). Based on mainstream reports, there is also an indication of the increase in marketing and branding budget of universities (Chapleo, 2014). Historically, university branding has been done for different purposes. To Joseph et al. (2012) university branding is used to create "awareness among prospective students and their parents; or target donors, professors, business leaders, alumni, and elected officials with branded messages". University branding is also used to improve higher education institutions international ranking (Bunzel, 2007). To Paden and Stell (2006), some universities brand themselves to improve their name awareness, others aimed at creating an entirely new image. To Kurz et al, (2008), among the various approaches to university branding with the foremost common being educational quality, high profile athletics, convenience, co-branding and/or distinctive programs or majors. The intense global and national competition made it inevitable for Azerbaijani universities to start branding initiatives to position and differentiate themselves in order to be the first choice of students. Because more students mean a better financial condition to realize educational and academic projects. Main sources of public universities revenues come from tuition fees and government funds.

Depending on scores gained from national university entry exam, students (with a higher score) get state aid that covers their tuition fees and those with lower score have to pay tuition fee by themselves (parents or another source). However, the tuition fee is the biggest source of revenue among private universities in Azerbaijan. Both public and private universities in Azerbaijan have recently been implementing branding and rebranding strategies to attract more students and distinguish themselves in a crowded higher education market. After the implementation of the Bologna Accord in Azerbaijan this process became intense. Most of the barriers faced by Azerbaijani students were eliminated with the Bologna Accord and a new gate opened for their mobility across the European continent. Azerbaijani higher education institutions realized that they have to deal with European competitors in parallel with national ones. There are many different approaches and motives to university branding that are based on studies mainly in western countries. University branding is a new concept to Azerbaijan. It lacks empirical and academic studies in regard to university branding in Azerbaijan and their impact on Azerbaijani students' university selection choices. This study is conducted to explore which criteria are important to students in Azerbaijan when selecting a university. In this regard, this study is undertaken to clarify how current students at the universities gained information about the universities they considered; and whether there are certain factors that are significantly important than others for students' first choice for university.

2. DEFINING BRAND AND ITS BENEFITS FOR UNIVERSITIES

There are numerous perspectives and approaches to the brand concept. To Keller and Lehmann (2003) brands are a name and most valuable asset of the company that influences customers, and sign of service or a product that differentiate from others. Kapferer (2004) considers the brand as a system of three poles including products and service, brand concept (value proposition), and brand name and symbols. The American Marketing Association (1960) defines a brand as "a name, term, sign, symbol, design or a combination of them, intended to identify the goods and services of one seller or group of sellers and to differentiate them from those of competition." All these definitions help us to understand the meaning and purpose of a brand. However, one of the well-defined explanations of the brand in the higher education institutions was given by Temple (2006). To Temple (2006) 'the brand emerges as a function of how well the institution performs in meeting the needs of its clients: it is the result of effective marketing' (p. 17). To McNally and Speak (2002) consumer's feelings and perceptions about the institutions is the higher education brand. Pinar et al. (2013) mention that in order to ensure sustainability in higher education institutions many universities gradually shift the promotional landscape from traditional tools to branding. Brands can simplify decision and reduce the risk for a consumer (Suri and Monroe, 2003). Brands can also help consumers as a signal of a certain level of quality (Erdem, 1998). To Simms and Trott (2006), brands largely appeal at the emotional level via key association and symbolic image. Balmer and Gray (2003), identify the value of the corporate brand on its ability to differentiate itself in the mind of stakeholders. Berry and Lampo (2004) found out that brandings are very successful in the differentiation of companies in labor-intensive services. According to the study at both private and public conducted by Joseph et al (2012) universities in southern United States in regard to understanding student's choice of an educational education institutions demonstrates that dissemination of information about a university mainly happens by word of mouth from friends/family, university representatives, and /or high school counselor The same study also reveals that amenities/ facilities play more important role as a factor of selection for university. According to Sevier (2007, p.46), strong brand means "more and better students, more full and fuller paying students, more students will persist, more strategic partners" for the university. A successful university branding campaigns result in better students qualifications and increased admission application (LipmanHearner cited in Joseph et al., 2012).

To Moore (2010), increased faculty recruitment and retention rates for professors and students are also benefits of successful university branding. Most of the existing approaches and theories to branding are rooted from studies of commercial products and services. Therefore, there is a limited study of university branding. Previous studies in university branding demonstrate that it is a complex process and there is not a single approach to be implemented for success. To Balmer et al. (2007), there is a difference on corporate branding in regard to relationship between university and students in comparison to relations in the for-profit sector. Students are not just customers; moreover, they are “life-long organizational members of a corporate brand community.” (Balmer et al. 2007, p. 357). Balmer also suggests that approach to branding within higher education institutions is tend to be more student and stakeholder-oriented. Studies on positioning of international education brands conducted by Gray et al. (2003) presented that adaptation branding strategies are more effective in the Asian markets. The study of Jevons (2006) proposes a need for clarification of universities brand meaning and their differentiation from others. To Watkins and Gonzenbach (2013) success of branding in an institution is influenced by its external stakeholder. In this regard, essential to attain differentiation among competitors there is a need for understanding and managing the brand perception of all stakeholders (Davies & Chun, 2008). To Duesterhaus and Duesterhaus (2014) students may not see the university rankings that used by an institution to signal assurance of quality as meaningful in selecting a suitable college. Emotional attributes play important role when students evaluate a potential university (Duesterhaus and Duesterhaus, 2014). This study underlines the need for the development of relationships and the emotional connection that students seek. There is a consensus in regard to understanding institutional branding and great value of clearly developing and communicating the brand for universities. (Hemsley-Brown & Goonawardana, 2007). However, studies also suggest that the complexity of university branding does not allow direct implementation of traditional branding approaches in higher education institutions (Whisman, 2009) and there is a struggle among universities to develop and implement branding strategies (Curtis *et al*, 2009).

3. EXAMPLES OF RECENT UNIVERSITY BRANDING IN AZERBAIJAN

There are a few examples of university branding and rebranding in Azerbaijan. One of the strong university branding initiatives was conducted by Azerbaijan State University of Economics (UNEC). In 2016, Azerbaijan State University of Economics began using a different color and a new logo and new abbreviation of its name (UNEC, 2016). Azerbaijan State University of Economics started to use: UNEC as a trademark. In regard to the new branding initiative, the university wanted to create a new brand of the university that better reflected its high-quality education and services, and so make its employees and students proud of being associated with it. As a part of the branding initiatives, UNEC created a new mission, vision and set of values. UNEC's branding aimed to position itself as the number one profiled economics university in the region to attract more students and better faculty. In this regard, UNEC launched a recruiting campaign to attract young and foreign-educated Azerbaijani professors and lecturers to the University to improve its image in public. Hence, more than 200 hundred young Azerbaijani with foreign education has since been employed as faculty staff and administrative officers at UNEC. University branding was also aimed at ranking in the international ranking institutions. In 2017, UNEC has entered the list of top 150-200 best universities in Emerging Europe and Central Asia ranking of QS. UNEC's vision is to be among the 500 best universities in the world on its 100th anniversary in 2030. Branding process at UNEC is also aimed to contribute to Azerbaijan's global competitiveness and support the sustainable development of Azerbaijan. In this regard, Muradov and Bagirzade (2016, p. 18-41) mentioned that competitive higher education institutions and advance education infrastructure has a positive impact on a country's competitiveness in the global market UNEC

offers full bachelor, master, and doctoral programs in four languages: Azerbaijani, English, Turkish and Russian (UNEC, 2017). ADA University was established as an Azerbaijan Diplomatic Academy under the Ministry of Foreign Affairs of Azerbaijan in 2006. In 2014 it transformed into a university by decree of the Azerbaijan President and began to brand itself as ADA University. When the Azerbaijan Diplomatic Academy was established, it was aimed to train Azerbaijani diplomats. However, soon it expanded its education programs and services to other fields. At the moment, ADA University offers bachelor and master programs under four schools, including the School of Public and International Affairs, School of Business, School of Education, and School of Information Technologies and Engineering. ADA University aims to be the developer of a productive research climate and to stimulate a forum for innovative ideas in Azerbaijan. Its brand positioning can be explained as “an innovative model of learning, a unique setting for collaborative research in a variety of fields – already making ADA University a center of learning in an increasingly strategic geopolitical region of which Azerbaijan is central.” (ADA University, 2018). The language of instruction is English at ADA University. One of the early branding approaches to higher education institutions in Azerbaijan was adapted by Khazar University. Khazar University was established in 1991 in Baku and is considered as the first private university in Azerbaijan. Khazar University offers a wide variety of programs from humanities to biomedical engineering. Khazar University aims to position itself as a leading university in Azerbaijan. Academic credit system to measure and assess students’ work and effort during their study programs, first time, implemented by Khazar University in Azerbaijan (Khazar University, 2018). There is one more Azerbaijani university that has previously started a rebranding campaign. It is Azerbaijan State Oil and Industry University which was previously named as Azerbaijan State Oil Academy. The university underwent a serious rebranding campaign in 2016. The university’s new logo and name abbreviation introduced to the public same year. The aim of the university rebranding was to make the university main destination for study programs in different fields of industry, particularly in the oil and gas sector (ASOIU, 2018).

4. DATA AND METHODOLOGY

Research data is collected through online anonymous survey among 377 students of four universities – Azerbaijan State University of Economics (UNEC), ADA University, Azerbaijan State Oil and Industry University (ASOIU), and Khazar University. One private university included since less than 10% of total students enrolled in private universities in Azerbaijan (Ministry of Education, 2018). A number of correspondents from the private university are consistent with the approximate ratio of students enrolled at private and public universities. Among the survey participants, 203 or 53.8% are female and 174 or 46.2% are males. In the survey, students have reflected their view on “good university” according to 25 indicators. The answer choices change between 0 (not important at all) and 4 (very important). Main descriptive values about the responses of students for each given indicator are tabulated in table 1, below. Brief analytical results display that students of the target universities consider most of the given indicator as very important criteria of “a good university”. In most cases, the mean response value is very close or greater than 3. In this context, *p values* show the level of significance for each indicator. Note that when *p-value* is less than 5%, the null hypothesis of “not important at all” is rejected and vice versa. According to table 1, the *p-value* is less than 1% for the majority and 5% for some remaining indicators. However, the *p-value* is greater than 5%, but less than 10% for low cost education, faculty/student ratio, small class size indicators which show less importance of these criterias for students.

Table following on the next page

Table 1: Main descriptive statistics of responses for each indicator

Indicators	No. of observations	Mean	Std. deviation	T-statistic	P-value
Facilities	370	3.322	0.908	3.657	$p < 0.01$
Latest technologies	370	3.466	0.889	3.898	$p < 0.01$
Reputation of university	372	3.473	0.854	2.321	$p < 0.05$
Low cost education	363	2.467	1.382	1.784	$p < 0.1$
Scholarship opportunity	370	3.151	1.142	2.759	$p < 0.01$
Quality education	375	3.826	0.579	6.6	$p < 0.01$
International accreditation of university diploma	371	3.697	0.698	5.299	$p < 0.01$
Friendly environment	368	3.144	0.978	3.214	$p < 0.01$

Career planning center for students	371	3.303	1.024	3.225	$p < 0.01$
Social conditions for students (student organizations, sport clubs, etc.)	370	2.954	1.155	2.558	$p < 0.05$

Source: Author's own completion according to survey data

The students consider a wide variety of criteria such as quality education, study in foreign language, university-industry relations, name recognition/university image, faculty-student interaction, international accreditation of university diploma, university reputation, latest technologies, career planning center for students, employment opportunity after graduation, and existence of active student clubs/unions for students as important for a good university. However, it should be considered that consideration criteria for a good university may always not be as same as criteria or factors which affects students' university selection decision.

In the survey, it was also revealed that most of the students (67%) reported obtained information about the university by friends/family. To a lesser degree, students (11%) answered that their visit to university was the main source of information about a university.

5. MODEL BUILDING

To investigate the issue beyond brief descriptive statistics, an attempt was made to build the empirical model of factors which affects students' university selection decision. For this purpose, respondents are asked to mention whether the current enrolled university was their first choice or not in the university selection list. Thus, being "the first choice" means to be the best university in a student mind. Therefore, the following base probabilistic model is built for the estimation stage:

$$Choice_i = \delta_0 + \sum_{l=1}^k \mu_l * \Psi_i + \theta_i$$

Whether, $Choice_i$ is a dummy variable, equals 1 if the enrolled university was his/her first choice in a time of university selection, and 0 otherwise. i denote i -th observation. δ_0 is the constant term. Ψ_i include some selected indicators discussed above. μ_l stand for the coefficient of each selected indicator while θ_i is the error term. For robustness of results, specified the same model is estimated by Ordinary Least Squares (OLS), Probit, and Logit estimation methods.

6. EMPIRICAL RESULTS

Table 2 displays empirical results from OLS as well as Probit, and Logit binary choice estimation methods. Indicators are selected after examining various model specifications. Because some indicators given in table 1 are very close to each other, symptoms of multicollinearity problem are detected. That is why some indicators with insignificant effect are removed from the model. Results from all three estimation methods support each other. Findings reveal statistically and mostly the economically insignificant effect of small class size, international accreditation of university diploma, quality education, state sponsored financial aid, faculty/student ratio, the reputation of the university, name recognition and availability of housing/dormitories over the first choice of prospective students in a time of university selection ($p\ value > 0.1$). Surprisingly, results in the negative significant impact of employment opportunity after graduation ($p\ value < 0.1$) and existence of double degree programs ($p\ value < 0.05$) over the first choice while making the university selection decision. There may be several reasons for employment opportunity after graduation to be deemed insignificant. In the first scenario, it may possibly be related to a misunderstanding of this criteria. It may also signal poor perception of the university's role in helping and consulting students to match their dream job in the labour market. In the second scenario, students may possibly not have any desire and or expectation from the university in assisting them with employability after graduation. It may be linked with decades-long traditional component of Azerbaijani culture. Insignificant of double degree programs for students may be related to the perception of higher cost for such programs in Azerbaijan. Therefore, certain limited group of students may consider these factors significant while making university selection. The impact of low cost education indicator is found to be parabolic with a weak significant slope. Slope parameter of *Low cost education*² is statistically significant in OLS ($p\ value < 0.05$) and Logit ($p\ value < 0.1$) while insignificant according to Probit results ($p\ value > 0.1$). This is plausible. Thus, a candidate chooses firstly low cost or free education programs while applying. Especially for those who consider low cost education as relatively very important indicator prone to follow this behavior mostly.

Table 2: Empirical results

Indicators	Coefficients		
	OLS	Probit	Logit
Small class size	0.036	0.152	0.268
Double degree diplomas	-0.054**	-0.256***	-0.449***
International accreditation of university diploma	0.048	0.217	0.362
Employment opportunity after graduation	-0.041*	-0.187*	-0.306*
Quality education	-0.020	-0.056	-0.105
Availability of financial aid (state sponsored)	0.021	0.094	0.165
Existence of active student clubs / unions	0.039**	0.161**	0.296**
Faculty / student ratio	0.0002	0.002	-0.008
Low cost education	0.057	0.219	0.310
<i>Low cost education</i> ²	-0.026**	-0.100	-0.159*
Reputation of university	0.017	0.055	0.115
Name recognition/University Image	0.031	0.139	0.226
Living accommodation / housing	-0.034*	-0.146*	-0.261**
C	0.683***	0.440	0.790***
<i>No of obs.</i>	345	345	345
<i>R-squared</i>	0.107	0.116	0.115

Note: *, **, and *** show the level of significance at 10%, 5%, and 1%, respectively.

Maybe, the most valuable contribution of this paper is finding very important, economically and statistically significant impact (p value < 0.05) of the existence of active student clubs in the target universities which plays a prominent role in the first choice of candidates who consider that as an important indicator of a “good university”.

7. DISCUSSION AND CONCLUSION

This study showed that students in Azerbaijan consider a wide variety of criteria when they apply for a university. However, these considerations may not directly be reflected in their actual behavior in regard to their first choice for university. For example, quality education, study in foreign language, university-industry relations, name recognition/university image, faculty-student interaction, international accreditation of university diploma, university reputation, latest technologies, career planning center for students, employment opportunity after graduation, and existence of active student clubs/unions for students are important considerations for students and they may be critical branding factors in the student's search for a good university. However, active student clubs/unions is an important selection criteria for students' first choice and yet surprising factor in this study. Our study suggests that the existence of active student clubs/unions for students may be important selection criteria to Azerbaijani students when they choose among university alternatives while other considerations are also

presented. In this regard existence of active student clubs/unions in case of Azerbaijan may be more critical factor when it comes to students' first choice for higher education institutions meanwhile branding efforts may be critical in student's search process for a university. The study revealed that although university branding initiatives may shape image of university and increase awareness about a university, friends/family of potential students, university visits and high schools play a greater role on dissemination of information about a university in Azerbaijan. Successful university branding campaigns in Azerbaijan should focus on the target groups of prospective students' family and friends, and organize impressive open campus days for prospective students and their parents. It should also be noted that universities in Azerbaijan differ by size, program offerings, cost, location, and reputation. This study conducted among the four private and public universities situated in the capital of Azerbaijan and importance of selection criteria might have differed if the students surveyed attended the universities that situated in the regions. Since it is first research of its kind conducted in Azerbaijan, it may provide a framework for further researches to use larger student samples and involve regional universities.

ABSTRACT

Social business is a kind of new and modern business that does not damage necessary needs of humanity, dividends and a complete social goal. Social business doesn't aim to make a profit. The aim of this business is to solve social problems by using business methods as well as by organizing sale of products and services. As commercial business types, this type of business operates in many different directions, however as social impact is a major goal of it, all profits should integrate into business again or be used for organization of social work. Development of social business in the country plays a crucial role in eliminating unemployment and poverty, the development of small and medium sized entrepreneurship and solving the problems of society and improving prosperity. The development of social business is one of the main objectives because of these reasons specifically. All newly independent countries declared to move into market economy after the collapse of Soviet Union. However, a market economy made a huge step to take shape in these countries. One of the main problems facing the transition to a market economy is the creation of a favorable business environment and business development. The main task of these countries is to reduce poverty and achieve prosperity. One of these strategies in the modern world is the growth and development of social business. The article will consider the types of social business not only theoretically but also systemically, including world experience. In addition, the study will examine the current state and prospects of social business in Former Soviet union republics. The role of social business in the economies of these countries will be considered and analyzed in a comparative way. Factors affecting the development of social business in the countries will be clarified. As a result, those countries will be given some recommendations based on theory and world experience, and will show prospects for development.

Keywords: *Social Business, Social Business Development, Prosperity Level*

1. INTRODUCTION

Social business is a new type of business. Social business is a business model which provides the most urgent needs of human beings instead of increasing profits. As opposed to this traditional view of economic wealth creation, the concept of Social Business gives priority to a selfless cause of social wealth creation where the objective of earning the profit is only for the sustainability of the firm rather sharing with its owners other than poor. The concept of Social Business was first introduced and shaped by the Nobel laureate professor Dr. Muhammad Yunus in 2007 and since then the idea has started to spark among academician and researchers.

The social business was theoretically and systematically investigated, the current state, experiences and future perspectives of social business in post-soviet countries have been analyzed in the research work. The role of social business in these countries has been revealed, comparative, and relevant proposals have been made. Many books on social business are written in the world. David Bornstein's most famous book is "How to Change the World". 1.5 million copies of this book were sold in India in 2005. The book was later published in many countries. Worldwide researches relating to Social Business are as follows: Muhammad Yunus-Creating a World without Poverty, Dick Atkinson-Cities of Pride: Rebuilding Community, Refocusing Government, Asa Briggs-Michael Young: Social Entrepreneur, Peter Birinckerhoff-Mission Based Management: Leading Your Not-for Profit in the 21st Century, J. Gregory Dees-Enterprising Nonprofits: A Toolkit for Social Entrepreneurs, Johanna Mair, Jeffrey Robinson, Kai Hockerts: Social Entrepreneurship, Alex Nicholls: Social Entrepreneurship: New Models of Sustainable Social Change. Yunus centers are opened in more than 70 universities around the world, as well as at the Azerbaijan State University of Economics (UNEC). The topic which is investigated in most of the countries is one of the key factors promoting economic development.

2. CONCEPTION AND TYPES OF SOCIAL BUSINESS

Social Business conception as a new type of business was created by the Nobel Peace Prize Laureate Muhammad Yunus. Let's start with the generalized description of Mohammed Yunus: Social Business is a financially sustainable organization created solely to solve social problems. While it is possible to withdraw initial investments, all potential profit is reinvested to further enhance the social impact of the organization. (Yunus, 2008, and Yunus Center Website). Understanding the importance of charity work in the world of money-oriented capitalism, the ongoing poverty problems in the world and the role of charity in solving this problem, Mohammad Yunus has implemented the Social Business Concept within the framework of the Social Concept. "Whenever I wanted to solve a human problem - I was trying to think of how to use the business approach and how to help others. These were the new companies, which they did not earn money for themselves. No matter what the company's profits are, we have developed the company for reinvesting in solving more social problems. And I began to name this company as a social business." (Yunus Social Business Investment Report, 2013). He states that social business should not be created for the acquisition of a limited income, but for the achievement of concrete social goals. Social business seeks to make a profit, and clarifies the purpose of such a business - the criterion that needs to be measured is the social benefit of the people who are affected to the problem. The company itself can earn profits, but investors who support it do not get any profit from the company, except for a substantial amount of initial investment. A social business is not a profitable company and has the potential to act as a means of change for the world. (Yunus, 2007, 2008). Hence, Social Business, which is governed by the principle of not to windfall loss and not to pay dividend, is aimed primarily at solving social problems related to poverty (Hoque, 2011). In fact, social business promotes social goals and benefits, but this profit is not shared by the management or the investor and is re-invested to expand the company's positive social impact. Shareholders receive dividends from the investments as a social benefit (Grove and Berg, 2014). The difference between social business and ordinary business is that social business has no idea of getting individual gain in trade affairs (Kickul et al., 2012, pp. 457). However, unlike the businesses which maximize profits, the main focus of social business entrepreneurs is to address social issues, and therefore social business is created for the collective benefit of others. (Grove and Berg, 2014). Thus, the role and contribution of social business is crucial for sustainable development because social business promotes human development through economic, environmental and social sustainability options (Humberg and Klemann, 2014).

In contrary with the institutions that want to maximize profits, the focus is on solving a social problem, so a social business is being created for the collective benefit of others. (Grove and Berg, 2014). Therefore, the role and mix of social business is important for sustainable development because social business contributes to human development by expanding the assistance from the economical, environmental and social point of view (Humberg and Kleemann, 2014). In fact, Yunus sees that social business allows a feature that does not belong to non-profit organizations to promote entrepreneurs' self-sacrifice and attract investors (Peterson, 2015). In general, social business is managed as a long-term business. This business generates revenue from its activities and is driven by long-term impacts-not within donations per year (Wimmer, 2012, p. 195). Muhammad Yunus has recommended seven principles for social business to understand its inherent characteristics. The characteristics are the following:

1. The most important objective of a social business is to alleviate poverty and other socio-economic problems for what the society is largely concerned. The idea suggests that the problems should be eliminated or reduced by using a business model.
2. In no way, the core objective of the firm will be maximizing profit for the business over social objectives.
3. The firm engaged in social business must achieve its economic and financial sustainability so that it does not need to depend on constant charity or donation.
4. Investors will be entitled to take back their investments but they are not permitted to take their business profit. The profit will be reinvested fully for further development of the project or to create any other social impact.
5. The firm engaged in social business must be environmentally concerned.
6. Workers will be given a competitive compensation package and with a better working condition than competitors.
7. Social business would be conducted and operated with pleasure because it holds a purpose, self-satisfaction, and self-sacrifice.

Discussions in connection with the formation of social business are also important. The poors can participate as the owners of the company or as a part of their products and services in social business. According to this conception, social business is divided into two categories: even the produced product is intended for the poors they would start working with any earnings. (Yunus 2007, 2010). By implementing social needs, it is also possible to help poor people who are the main goal of social business.

2.1. The 1st type of Social Business: Commodity and service producers for poors

This kind of social business is a type of business owned by investors who do not suffer losses, do not distribute dividends, invest in the solution of a social problem, and invest all their profits to further expansion and improvement of business. The first type of social business is focused exclusively on a social intended works. The produced product or service i.e. is in the interest of poors and is addressed to the solution of particular social problem. For example: Grameen-Danone is a sample of this type of social business. It is a "Shokti Doi" yoghurt produced in the Bogra factory in Bangladesh. Bangladesh produces yogurt which enhances the necessary additives due to the lack of micronutrients in poor children. This business is struggling with poor nutrition. Adolescents will grow healthy if they consume two "Shokti Doi" yogurt per week for about 8-10 months.

2.2. 2nd type of social business - Producers of Commodity and services for the poors.

These types of social business products are produced by the poors and exported to an international markets, employees (poors) can take benefit from this profit. The second type of social business, taking benefits, whether directly or indirectly can increase their work in

maximum level, while it is related to the poor and the disadvantaged. The product can be produced by the poor, but when it is exported to an international market, net profit can benefit the employees. Grameen-Otto and Grameen Bank are examples of the 2nd type of social business. It must be pointed out that the Grameen Bank belongs to the poor, and its a combination of both types of businesses in this bank, and provides financial services that are not previously existed (without any guarantees for revenue generating activities with soft credit). These financial services relate to the poor, especially women. Today, social businesses exist in developing and developed countries alike. Although many are still in the early phases of development, demonstrate the potential scale of these ventures. Most important, however, are the social and business benefits that these organizations deliver.

Table 1: A Social Business Approach Offers a Range of Social and Business Benefits (BCG analysis)

Social Benefits	Business Benefits
Provides innovative solutions to social problems Yet requires a clear value proposition tailored to customers` needs	Creates greater lasting social impact than traditional donation-based corporate social responsibility (CSR) programs The approach business principles and draws on core capabilities
Creates results that last well beyond the initial investment Reaching financial sustainability is a challenge that requires a thoughtful business model	Provides new opportunities for learning and innovation Understanding new markets and customer segments can lead to new commercial opportunities
Empowers beneficiaries by transforming them from aid recipients into consumers with choices Pricing must be adapted to ability to pay	Improves employee motivation and retention There is greater enthusiasm and pride among involved staff, potential recruits, and all of the company`s stakeholders
Improves accountability by using sales figures as a built-in mechanism to evaluate user acceptance There must be combined with measures showing the extent to which the most disadvantaged are reached	Offers the potential for a positive impact on the brand Gains can be achieved if the business is carefully managed and tangible results are achieved
Leverages the business mindset to increase efficiency Systems for tracking social impact must be integrated with management systems	

3. SOCIAL BUSINESS IN POST SOVIET COUNTRIES

3.1. Russia

World experience has shown that one of the successful and effective tools for solving social problems over the last 30-40 years was the development of a social business enterprise. The first Russian organization dedicated to social business and social entrepreneurship was established in 2007 and is called "Our Future" as a fund of social programs (www.nb-fund.ru). The Social Foundation of "Our Future" operates in the following areas:

1. Identifying types of support for the best business ideas and implementation and improvement of projects.
2. Organising Training and consultings for entrepreneurs, information support, donation and credit support, co-financing of best social projects.
3. Dissemination of information via Mass media for creating positive public opinion on social business and entrepreneurship in society.

4. Mutual experience and exchange programs with both local and foreign non-profit organizations and business partners working in the field of social entrepreneurship.
5. Involve new members and find new ideas in the field of social business and social entrepreneurship.
6. Applying social business ideas to existing and newly created enterprises.

133 social projects were supported by financing 297.5 million rubles in 47 regions implementing social programs over the past seven years (<http://www.nb-forum.ru/>). Every year since 2011, the "Goodwill Award" has been announced to support social business. The competition created by the Regional Social Programs Foundation of "Our Future", was announced for those contributing to the development and promotion of social entrepreneurship and social business in Russia (<http://www.impulsdobra.ru/>). In his speech at the plenary session of the All-Russian Forum "State and Civil Society: Cooperation for Development" in January 2015, Vladimir Putin underlined the importance of business development in social sphere. "If the future crisis is inevitable, it is important to protect the most vulnerable populations. After this speech, "We must learn to combine targets: to limit inflation and stimulate growth (<http://www.kremlin.ru/news/47173>)." the social business area began to develop in Russia. At present, the main organizations for social business in Russia are the follows:

1. Annual social business forum was held with the support of Ministry of Economic Development of the Russian Federation.
2. The foundation of "Our Future"
3. Center for Social Entrepreneurship and Social Innovations of the Higher School of Economics. Conducts research and consultation on social business and social economics.
4. The Russian Microfinance Center was established in 2002. Its two main functions are to increase the availability of financial services for small businesses in small towns and the development of start-ups.
5. Oxfam (UK) Representation of Russia was opened in 2003. The organization's mission is to combat poverty. Oxfam employees have developed small businesses in many cities in Tver, Tula and Yaroslavl.

3.2. Eastren Europe Post Soviet countries - Ukraine, Belarus and Moldova

3.2.1. Ukraine

Social Business and Social Entrepreneurship Conceptions exist in Ukraine in the 2000s. But it has not yet reached the desired level. In 2006, the US-funded Public Relations Network (UCAN) project was presented in Ukraine. American experts conducted trainings for representatives of social organizations. Later, the US government announced a business plan competition and provided grants for the creation of a social business. As a result of another initiative in 2010-2013, British Council, "East Europe" and "Vidrodzhennya", audit company Pricewaterhouse Coopers, "Erste Bank" were included to the Consortium for Promotion of Social Entrepreneurship in Ukraine. The Ukrainian State Entrepreneurship Assistance Fund, a state-owned non-profit organization, also participated. However, after the change of government, the state structure decided to withdraw. The predicted cooperation remained only on paper - in a signed memorandum. This time the trainings were conducted by the British, not by American experts. Business plan competition was announced. However, the winners did not receive a privileged loan from Erste Bank. And then these start-ups had to forget about their capital - the owner of Erste Bank changed and became Fidokombank. At the same time there exists the Ukrainian Social Academy in Ukraine, which teaches social entrepreneurship and social business, helps build and supports existing social entrepreneurs. At the end, we will talk about one of the successful examples of social business in Ukraine. Flour products were created by "Nut House"-i NGO "People's Help-Lviv".

It was necessary to finance the integration program of women into crisis situations. They are provided with social worker and psychologist who will help them to return to their normal living conditions for 14 months. It was the women who propagated the idea of baking. The founder of social business, Yuri Lopatinsky, says the first fund has an Austrian grant because the local government was not ready to give a small amount of money in the budget. Today many people know about "cookies for good work".and support (https://zn.ua/economics_of_regions/).

3.2.2. Moldova

Like in the Moldovan village, women are the most vulnerable and needy people in Ukrainian village today. Especially who brings up children. There is no permanent job and at the same time mobility is lost, you can not leave everything. Today, the "Mara Woman" project is an officially-designed workshop for women in Skoren's village. Elena set up a social business to find a job for rural women. She has passed a long way to the realization of an idea. This was not the waste of time. Today, the Mara Woman project is a workplace where women are officially employed in the village of Skoren and create weaving accessories sold to many socially responsible clients. The revenues from the Mara Woman project are reinvested in new social projects (<https://mobiasbanca.md>).

3.2.3. Belarus

Unlike Moldova, Ukraine is relatively poor developed, and a lot of measures have been conducted for social business and social entrepreneurship. In 2009, the Belarusian Public Economic Portal was created (<http://soccoop-by.info>) and trainings and seminars on social entrepreneurship and social business in different cities have been implemented. In 2011, the Mae Sense crowdfunding platform was launched. In 2013, the first Social Weekend contest for social projects was held. TALAKA platform was created in 2014, within which a social entrepreneurship education project is being implemented, including offline courses and web-seminars In 2014, within the framework of the Second Social Forum, the section of "Social economy and social partnership" was presented, where the development perspectives of social entrepreneurship were discussed in Belarus. In July 2015, a working meeting was held in Belarus to discuss the development perspectives of social entrepreneurship (<http://abad.gov.az/>).

3.3. Transcaucasus Post Soviet countries - Azerbaijan, Georgia and Armenia

In comparison with Georgia and Armenia, social business in Azerbaijan has recently begun to develop. Thus, the first example of social business in Azerbaijan is to support the active participation of citizens in the socio-economic development of the Republic of Azerbaijan, the development of small and medium enterprises, increase the employment level of the population and the formation of competitive households, according to the Decree of the President of the Republic of Azerbaijan dated 23 September 2016 "ABAD" - a center that implements socially-oriented projects (<http://abad.gov.az/>). There are also the samples of social business, such as small, medium-sized entrepreneurship, each created with a social mission. For example, BUTA Art & Sweets, WoWoman Azerbaijan, Green Baku, Azerbaijani Socks, Incebelli, ObaNatur, MyBostan.com, Talent Port, VeloKuryer. On June 21, 2016, Nobel Peace Prize Laureate, professor Mohammad Yunus participated in the international conference on "Social Business - The Road to Development", organized by the Azerbaijan State Economic University and the International Eurasia Press Fund.(IEPF). The Nobel Peace Prize Laureate Mohammad Yunus made a lecture on "Social Business - The Road to Development" at the Conference. Within the framework of the conference, the Yunus Social Business Center (YSBC) was set up at UNEC. The memorandum of understanding on cooperation between UNEC, YUNUS Center and International Eurasia Press Fund (IEPF).

The document envisages the development of mutual cooperation between the parties, the recognition of professor M. Yunus's ideas on poverty reduction and the implementation of the Social Business Concept. Since its establishment, YUNUS Social Business Center has provided various workshops, trainings and projects to convey the Social Business Concept and its relevance to people, especially young people. The final project is an incubation program called Social Business and Social Entrepreneurship. Within the framework of the program the start-ups will be able to realize social business projects. The goal of the program is to help young start-ups and support their social business ideas through various resources. The program operated in 4 directions (education, technology, health, agriculture). 4 winners were selected and each team provided financial support by the university (<http://unec.edu.az/>).

3.4. Northern Europe (baltic regions) Post Soviet countries-Lithuania Latvia and Estonia

The social business in Lithuania has begun to actively develop since 2004 when the country joined the European Union. At the same time, a separate law on social entrepreneurship was adopted and all activities were directed to the development of rural areas. The LEADER (Rural Development Program for Lithuania) program, which is affecting 99% of the villagers, and a total budget was about one million euros. There were many volunteer jobs in these projects, and a special law certainly helped. Today there are more than 200 social business models in Lithuania, of which 4-5 are particularly innovative and successful businesses. There are - "Lech Lech design", give "second chance" for clothes businesses among them. At the same time, 95% of their clothing and accessories are made of recyclable materials and people suffering from various diseases are involved with professional designers. Lithuania is considered to be the most developed country among the post-Soviet countries, even among the European Union countries. Beginning from April 2018, the law on social business has been enacted in Latvia and a rapid development process has begun. Thus, there are many successful New Do (r) Riga, Reach for Change Latvia, Inkubator Creative Industries, etc. examples of social business in Latvia. There are organizations that support the development of social business in Latvia through information support and public training. These include : Social Entrepreneurship Association of Latvia (SEAL), Social Innovation Center (SIC), and Youth Center for Self-Development, Competence and Social Business (OiSTABA). Examples of social business in Estonia: Vihasoo youth camp (<http://vihasoo.ee/baza.html>), youth club, youth club, training center for adults, Lasnamäe school of interest (<http://www.lhuvikool.ee>), Matveyka Family Center (<http://pereprojekt.jimdo.com>), NGO "IndependentLife" (<http://armasasi.blogspot.com>), NCO Labor Center "Töötähe" (<http://www.tootahe.ee/index.php?lang=russian>).

Social Business in Estonia:

- Mainly with Harju County (including Tallinn) and Tartu (including Tartu)
- Most micro-organizations with 1-4 employees
- 1/3 offer social security services
- About 66% of profits are generated by business activity.
- About 1/3 does not receive gift and extra support.
- Increase of business income in the sector by an average of 18%, an annual increase of 7%

3.5. Central Asia Post Soviet countries - Kazakhstan, Kyrgyzstan, Uzbekistan, Turkmanistan and Tajikistan

In comparison with the Baltic states, the post-Soviet countries of Central Asia still take the first steps in social business. However, as in every society, there are also various social problems in these countries, and social business can be a means to solve them. Social businesses in these countries remained theoretically and have very few practical examples.

3.5.1. *Kazakhstan*

There is insufficient information on the concept of social entrepreneurship in Kazakhstan. This is one of the results of a survey conducted by the British Council (British Council). The research was provided to the Information Center correspondents within the framework of the I-SEED: Social Entrepreneurship and Education project implemented jointly by the British Council with Chevron. The survey involved more than 200 respondents: social entrepreneurs; employees of organizations supporting social entrepreneurship; activists interested in this line. The majority of respondents (70%) are the most accurate definition of social entrepreneurship: "Social entrepreneurship is a type of job that you should think of as an entrepreneur and calculate potential risks and opportunities and addressing all the costs and benefits ethics and the solution to your social problem." At the same time, 69% of respondents think that social entrepreneurship is a very complex concept that has no definition. At present the most common answers for social entrepreneurship development in Kazakhstan are: Increase of social entrepreneurship (58%) Relevant legislation (55%) Training courses and trainings on social entrepreneurship (51%) Public funding (40%) creation of single information resources on social entrepreneurship in Kazakhstan (40%). The most relevant areas for social enterprises in Kazakhstan are: job creation for vulnerable people (78%), environmental protection (54%), education services (54%) and healthcare services (45%) (<https://kapital.kz/business>).

4. CONCLUSION

Development of social business plays an indispensable role in raising the level of wellbeing, leading to the elimination of unemployment and poverty reduction, the development of small and medium-sized businesses, and the long-term solution to social problems in society. Social Business promotes the development of vulnerable areas in the country. That is why it is necessary to create favorable conditions for social business in the country, to instil this concept for people, especially must be one of the priorities for post-Soviet countries, which is in transition to market economy condition. There are several examples of social business in the world practice that are gradually becoming global and transnational. It is possible to go to different strategic alliances with them and make suggestions to invest in post-Soviet countries. That is, they can explore certain problems in these countries and produce or service commodities in the solution of these problems. Our suggestions for the development of social business in Post Soviet countries:

1. Adoption of the law on social business and entrepreneurship.
2. Opening specialized education centers at universities. An example of this is the role of the Yunus Center in Azerbaijan.
3. Creating social business and entrepreneurship programs at universities.
4. Organize special courses on awareness raising, seminars on social business and entrepreneurship with financial support of small and medium enterprises.
5. Providing extensive financial services to existing and emerging socially-oriented entities, including grants and investments.
6. Broadcasting of successful social business via the media. (PR)
7. Interaction and support of civil and commercial sectors to enhance the role of social entrepreneurship
8. Ensure government funding for the best ideas and projects.
9. Expanding cooperation with government, regional executive bodies, and representatives of social business at the state and regional levels.
10. Collaboration with international social business companies, assessment of strategic alien capabilities.

ABSTRACT

Nowadays the processes of making and implementing managerial decisions are complicated by the asymmetry of information or its incompleteness. The article explores in detail the problem of information asymmetry in the enterprise and its consequences and gives recommendations on the practical application of information technologies for its elimination based on the Bayesian approach.

Keywords: *Decision making in uncertain states, Information asymmetry, Naive Bayes algorithm*

1. INTRODUCTION

Today the amount of information grows with a huge speed, but processes of acceptance and implementation of administrative decisions become complicated in view of its asymmetry. Big data technologies create a possibility of “special inquiries” for the purpose of elimination of information incompleteness and increase its transparency. It becomes possible when connections between productions, supply and demand are formed as result of identification of the hidden relations, templates and tendencies in data. The purpose of work is the research of an ability to apply new technologies to the management functionality associated with the processing of large volumes of information. Achievement of this goal requires the solution of the following tasks:

1. To investigate methods of receiving and aggregation of data from different sources, mutual and expeditious exchange of reliable information between organizational structures. All these processes require the development of analytical tools in the enterprise.
2. Taking into account the possibility of variants for situations with information asymmetry in making complex management decisions, to analyze the consequences of the problem of information uncertainty and incompleteness, considering these decisions as a concept of strategic orientation and an argument in favor of increasing the information transparency of the company.
3. To investigate the use of information technologies in the protection of confidential data, forcing enterprises to analyze more thoroughly the issue of ensuring the safety of information.
4. To investigate the specific consequences of information asymmetry in the enterprise and provide recommendations on the practical application of information technologies on its reduction by Bayesian method.

2. LITERATURE REVIEW

One of the negative consequences of high-intensity data circulation at enterprises Nikitina (Nikitina, 2011, pp. 61-65) calls information uncertainty situations arising through explosive growth of the information amount; while the task of monitoring and regulating the processes of achievement the set goals is being formed (Akerlof, 1970, pp. 488-460). In most cases decision-making is carried out in the conditions of a lack of information therefore, the qualitative analytics without qualitative knowledge is impossible. Paraphrasing the well-known phrase of Archimedes "Give me a point of support, and I will move heaven and earth", Maier-Shenberger (Mayer-Shenberger, Kuker, 2014) accents that today the huge amounts of data having an opportunity to transform all world data volume. The intensification and globalization of information streams has allowed identifying links and finding semantics in the integrated data, which do not have any sense, whether they are separated. Daas (Daas, Puts, 2014, pp. 22-31) calls such situation "mosaic" effect. Holmstrom at (Holmstrom, Milgrom, 1991, pp. 24-52) writes that the quality of the made decision quite strongly is determined by degree of readiness for information providing. Kudzh (Kudzh, 2016, pp. 23-27) connects a problem of such information asymmetry with complexity of processing of information's large volumes for expert estimation. Zhou (Zhou, 2013, pp. 24–25) sees the solution of this task in providing experts with the most objective data on a problem with the help of probabilistic methods. The relationship between data and their interdependence are inherent to the internal logic of large volumes of data. It allows finding nonconventional ways for the solution of planning problems and methods of plans' updating even after their acceptance, making macroforecasts without prejudice to primary activity in connection with temporary logs and strengthening control in real time (Liu, 2015, pp. 57–66). In this paper, an example of processing of hypotheses by means of Bayesian strategy will be reviewed. This strategy will be used to make a decision after processing information by certain algorithm. Considering a special role, which data play in education, our example concerns the information processing circulating in high school. These data accumulate a huge number of information on the person, since his deep childhood: this information includes data obtained in kindergartens, schools, colleges and universities, in institutions of professional development and vocational courses. The example considers only one aspect of the information asymmetry at university, concerning the employment of future graduates, since the processing of the person's formation involves a training data set, containing several hundred thousand elements and a large number of features (Vasyutinskaya, 2016, pp. 14-20). In the example, the Bayesian algorithm is simple and extremely convenient for working with large data sets, the advantage of which lies the assumption of features' independence (Foreman, 2016).

3. RESEARCH METHODOLOGY

In the solution of specific management problems, the creation and practical implementation of new methods and approaches to the development of socio-economic projects and programs becomes of particular urgency. To achieve this goal, the following tasks were set and solved in this paper:

1. The presence of huge amounts of unstructured information in the enterprise and the impossibility of its processing by standard means contributes to the concealment or loss of useful, valuable information when making managerial decisions. The paper explores how new technologies can meet complex management needs to eliminate problems caused by the circulation of information in the enterprise, thereby reducing its asymmetry.
2. Today, information in the business environment is considered not as a service, but as a product with all its inherent properties, advantages and disadvantages. The problem of information asymmetry of the enterprise and its consequences are investigated.

3. The organization's information security necessarily provides the protection of confidential data. It is shown that the provision of reliable information security in the information system involves the introduction of modern technology products to protect personal data and confidential information.
4. Informational asymmetry can be reflected in various facts and trends taking place in the enterprise. The specific consequences of information asymmetry are investigated and recommendations are given on the big data practical application to eliminate it.

4. RESULTS

Informatization in the enterprise management system generates a huge amount of extremely diverse and rapidly growing data; requests for their processing give impetus to the development of new analytical platforms. These changes are the main reason for the surge in the popularity of the big data concept. However, big data consist primarily of “raw” information, to find meaning in them; advanced technological resources of business management are needed. We will notice that asymmetry of information is shown both in its distribution, and in its acquisition – in our digital age there are unlimited opportunities for information search, but at the same time, there are no guarantees for its reliability. The fact that unstructured information increases the threat of data confidentiality in the enterprise, because data process arrays of complex, heterogeneous, uncertain nature, and spontaneous combinations of these data may contain certain characteristics that facilitate the disclosure of private information. This is an important issue when distributing microdata arrays from big data sources. Modern high-tech information products reliably protect personal data and confidential information for large-scale calculations in any distributed environment (in parallel computing systems, multiprocessor architectures, multithreaded, multitasking technologies, etc.) (Muller, Stallard, Warren, 1996). A distinctive feature of these technologies is a flexible response to changes in the entire IT infrastructure of the enterprise (adding new versions, functions and tools to an existing platform). In addition to high-tech products, national statistical offices and international organizations have clearly defined rules, which are accurately determined by the legislation when collecting, processing, analysis, distribution, preservation, protection and use of information in the activity. These laws and the corresponding strategies are designed to provide the rights of citizens for protection of personal information confidentiality, promoting thereby strengthening of their trust to the government and private institutions. In our article, we model a competitive job market, in particular, the change in market outcomes after the use of big data. We note that there are many uncertainties about the future and the impact of data on the job market (Widenhofer, Ytterstad, 2017). Therefore, we are building a flexible structure that covers a wide range of plausible results. In the study of complex social and economic systems, which require a high degree of uncertainty or information asymmetry Bayesian approach is very perspective. In the proposed paper, a mathematical apparatus is developed on the base of naive Bayes algorithm (NBA) that allows combining the available a priori ideas about the object with selective information with the assumption of signs' independence (Aliyeva, 2015, 257-262). In reality, sets of completely independent signs are extremely rare. Under an unlimited increase of sample size, Bayesian estimates coincide with classical estimates. That is why NBA gives a more effective result when applying to decision-making tasks. In our model, we assume that we have a set of university graduates with a density of 0 to 1, belonging to two categories - those who can expect to find work faster (experience, knowledge, assessments, etc.) and all others. We denote these categories by $k=H, L$, respectively. Employers often classify graduates into different segments based on various observable criteria. In these segments, we believe that there are still differences in intellectual, business, qualification and other status, which are explained by more intangible and unobservable factors. Therefore, our model will allow us to analyze these segments, and then we can think of our graduates as a specific segment of applicants.

We denote the number of graduates with a low employment rate through θ , while the remaining people with a high employment rate are $1-\theta$. Note that the parameter θ can vary. In addition, we assume that there are two types of graduates in each category: with a high probability of acceptance to one or another group, and with a low probability, which make up four groups. Next, we determine the probability of investment's loss in the formation of a particular student D as p^i , $i = l, h$, where $p^h > p^l$, which reflects individual risk. We denote the number of persons with low probability in a group with a low coefficient as t_L , while the number of persons with low probability in the group with a high coefficient is denoted as t_H . The total amount of individuals with a low level of probability is equal $\tau = t_L + t_H \leq I$, and high probabilities will be $1 - \theta + \theta - t_L - t_H = 1 - \tau$. Then we can determine the average probability of employment across the population as $\bar{p} = \tau p^l + (1 - \tau)p^h$. The average probability of employment for the group with a low coefficient is $\bar{p}^L = (t_L/\theta)p^l + ((\theta-t_L)/\theta)p^h$, and the average probability of employment for the group with a high coefficient is $\bar{p}^H = (t_H/(1-\theta))p^l + ((1-\theta-t_H)/(1-\theta))p^h$. We determine the social gradient of the coefficient when the proportion of persons with a low probability level is higher for the group with a higher coefficient level than for the group with a low coefficient, that is, $t_L/\theta < t_H/(1-\theta)$. Inequality arises by adjusting the number of persons for the respective sizes of each category. The result obtained from this inequality is related to the average coefficient in each group, where $\bar{p}^L > \bar{p}^H$. For incompatible events H_1, H_2, \dots, H_i that constitute a complete group, a posteriori probability is calculated by the Bayes theorem, where $P(H_i)$ is the a priori probability of the event H_i , $P(E_j|H_i)$, $j=1, \dots, J$ is the conditional probability of the evident E_j , provided that the event H_i occurred, and the event evident E_j has a nonzero probability (i.e. $P(E_j) > 0$). Before applying the NBA, special attention should be given to preprocessing data. Initially, it is necessary to determine the a priori distribution of the desired multidimensional parameter; for a fixed parameter, to obtain the initial statistical data x_1, x_2, \dots, x_n with the corresponding distribution laws; to calculate the corresponding probabilities, create a likelihood table and using the Bayes theorem compute a posteriori probability for each data class. Work with data means "elimination" of unnecessary data by promotion of some hypotheses and their subsequent verification on the validity. In the considered case we denote these hypotheses as $\{H_t, t=1, \dots, I\}$; the evidence supporting these hypotheses will be denoted as $\{E_j, j=1, \dots, J\}$. Each t -th hypothesis is confirmed by suggested hypotheses, a priori probabilities of the truth of the suggested hypothesis, a posteriori probabilities of the truth of the suggested hypothesis, the probability of realization of the evidence even in the case of hypothesis' disproof. The key element of the considered methodology is the calculation of the price of evidences $O(E_j)$, $j=1, \dots, J$. The Bayesian approach is based on the idea of the validity of the suggested hypothesis. Even a negligible a priori probability can successfully transform into a posteriori probability when big data are received (Ramachandramurthy, Subramaniam, Ramasamy, 2015). The advantage of this approach is a consistent "enrichment" of the proof of hypotheses' validity, when a priori probability at each iteration of processing by big data, being guided by evidences, is modified into a posteriori. As an example, we study the impact of information asymmetry in the university on the future employment of young specialists. Our task is finding out which hypothesis with a particular evidence is reliable. The research is being conducted on data taken from (Trifonov, 2015). First, we need to find out the reasons for the appearance of asymmetry in the university. As reasons we accept the following hypotheses:

- H_1 – information asymmetry in the delivery of educational material;
- H_2 – information asymmetry in the perception of the educational material (the dynamics of the perception of the teacher);
- H_3 – static information asymmetry due to the state (the initial state of the student is characterized by the information asymmetry of professional self-determination).
- The following statements will act as evidences:

- E_1 – value of repeatability factor of the same transactions for decrease of information asymmetry in education market;
- E_2 – low characteristics of subjects’ awareness;
- E_3 – overcoming “information gap” between labor market and education.
- E_4 – influence of computer literacy.

The initial a priori information about specific hypotheses, the evidence obtained after processing by naïve algorithm, and the subsequent calculations, we fix in the following table:

Table 1: The initial a priori information about specific hypotheses and evidences (Authors)

H	1			2			3		
P(H)	0,92	0,92	0,92	0,81	0,81	0,81	0,6	0,6	0,6
No. of evidences	0,8	0,15	0,1	0,8	0,1	0,6	0,15	0,1	0,6
P(E H)	0,4	0,8	0,9	0,3	0,8	0,8	0,9	0,6	0,8
P(E \bar{H})	0,8	0,15	0,1	0,6	0,12	0,4	0,4	0,2	0,4
P(\bar{E} H)	0,6	0,2	0,1	0,7	0,2	0,2	0,1	0,4	0,2
P(\bar{E} \bar{H})	0,2	0,85	0,9	0,4	0,88	0,6	0,6	0,8	0,6
P(H E)	0,8	0,98	0,99	0,68	0,96	0,89	0,77	0,81	0,75
P(H \bar{E})	0,97	0,73	0,56	0,88	0,49	0,58	0,2	0,42	0,33
P(H E) - P(H \bar{E})	0,1	0,25	0,42	0,20	0,47	0,30	0,57	0,38	0,41
$P_{\max}(H)$	0,99			0,99			0,9		
$P_{\min}(H)$	0,13			0,13			0,04		
Class of hypoth.	Probable			Probable			Probable		

The results of Bayesian classifier are reflected in the next table:

Table 2: The prices of evidences after first, second and third iterations for $O(E_j)$, $j=1,2,3$ (Authors)

The price of evidences	$O(E_1)$	$O(E_2)$	$O(E_3)$
	0,321111	0,185341	0,170165
	0,825227	0,690449	0
	1,292974	0	0
	0,724738	0,566734	0,532106

After first iteration, the third evidence has the highest estimation (figure1) and we pass to the next iteration. In the constructed diagrams, columns denote the probabilities of the hypotheses.

Figure following on the next page

Figure 1: The results of the first iteration (Authors)

After second iteration the second evidence has the highest estimate. We pass to the next iteration (figure 2).

Figure 2: The results of the second iteration (Authors)

Figure 3: The results of the third iteration (Authors)

According to the calculations, the main reason for the information asymmetry is the static information asymmetry, and data visualization shows that the first hypothesis with the fourth evidence is reliable (figure 3).

5. CONCLUSION

In the very nature of the organization structure there is a certain “conflict of interests, reflected in the functional and professional differences between departments, the essence of individual, qualifying and business qualities of employees, the priority of personal interests over corporate ones, which can only be limited, but not excluded. On the asymmetric relations between the leaders and subordinates, the administrative vertical is built. Asymmetry as a characteristic feature of managerial relations promotes the emergence of social interests and forms a communicative mechanism of social progress. The modern environment is subject to constant changes and perturbations, which challenge traditional economic and business concepts. However, as the resources promoting distribution and acquisition of information increase there are more and more opportunities for decrease of its asymmetry. The article proposed a method for processing complex information queries using big data technologies based on the Bayesian approach, that make possible to extract the necessary information from many different sources, providing a higher return on their use, reducing the asymmetry of information and increasing its transparency. Bayesian approach may provide some results, even if there is absolutely no sample data. This is due to the use of the a priori probability distribution, which does not change in the absence of statistical data, and the a posteriori distribution recounted by the Bayes theorem coincides with the a priori distribution. In real economic systems, the development of non-standard, relevant, effective and, most importantly, interpreted knowledge becomes paramount in order to support the adoption of proper managerial decisions. Using this approach, carrying out additional experiments to refine the data states in the study of the various nature of decision-making problems is possible. The most important resource and tool for acquiring this knowledge is a deep and comprehensive analysis of data describing possible cause-effect relationships in social and economic systems. This is exactly the role that modern information technologies play today.

ABSTRACT

This study aims to reflect on the principles to be followed in the concrete consideration of the interests of the contracting parties in foreign investment contracts. The purpose of this reflection is to achieve a fundamental reference framework that can serve as a basis for decision-makers, judges or arbitrators faced with the task of resolving disputes arising from foreign investment contracts. The most common mechanism for settling disputes in this venue is international arbitration. In this research we analyse the phenomenon of arbitration as a paradigm in the solution of the emerging foreign investment litigation, its benefits and its contribution to greater legal certainty in the economic relations between the parties and in the social progress of the host state. Considering the legal concepts and the most relevant problems in the relations between the investing State and the host State, we intend to establish a logic based on equity, proportionality and the right balance between the interests of both. We try to find a meeting point between the economic interests of the investor and the social progress of the host State. International arbitration under the umbrella of ISCID, complemented by bilateral treaties (BITs) and investment contracts, requires an approximation of the two main objectives of foreign investment: efficiency in the return of investment and technological and social progress of the host State.

Keywords: *foreign investment contract, social progress clause, arbitration*

1. INTRODUCTION

In view of the economic globalization that has developed in recent decades, there has been an increase in relations between large multinational companies and developing countries, with a lack of direct foreign investment to boost their growth and economic and social development. Foreign investment has thus become a strong and ubiquitous subject in the economic and legal community, awakened by the liberalization of markets and capital, with a set of new legal problems to solve. In this new world order, it is noted that the States of origin of foreign investors enter into agreements with the States potentially receiving such investment, with the purpose of protecting investors, namely securing the desired profit and outlining the legal framework regulating economic-legal relations between the parts. The latter, focused on the economic development of their territory and therefore avid for external capital, often accept agreements restricting their regulatory capacity and administrative power in the conduct and supervision of foreign investment contracts. It should be noted that the implementation of certain government policies aimed at improving the quality of life of the population has, from the point of view of investors, caused real violations of investment agreements. Although the latter contain the panacea of the obligations assumed by the parties, the host States are often limited in their regulatory power, resigning from the functions that are inherent to it, thus infringing upon the most fundamental rights. It is therefore imperative that the host States and the States of origin of the investors adopt a normative framework capable of reconciling and

balancing the interests involved and respect for those fundamental rights. For an effective protection of these Rights, it is urgently necessary to hold the investing entity accountable to society in general

2. LITERATURE REVIEW

According to several authors, foreign investment is an instrument through which companies seek to capitalize, optimize production and access control of natural resources (Bohoslavsky, 2015, pp 4). The colonialist attitude of investors, centered on maximizing profits, has not allowed an effective development and social progress of the populations. (Jacob, 2010, pp16-17). The lack of concern for the protection of human rights has been the subject of reflection by the OECD, the United Nations and the European Union (Perez, 2016, pp 89). Transnational corporations with high economic power involved in investment should view corporate and social responsibility as a strategic factor in the market in which they operate. Their oligopolistic nature tends to divert their behavior from the social focus (Anjos, M. R. 2016, 88-91). To ensure long-term investment and its counterparts, investors must be involved in the social progress of host states (Pego, 2006, pp 44). The social welfare achieved from foreign investment is the main guarantee of business success and stability, both from the investor's perspective and from the host state [Costa, 2005, a), pp 16 and b), pp 21]. In these foreign investment contracts, the usual means of settling disputes is international arbitration, especially under the auspices of the World Bank. However, arbitration is dominated by the principle of contractual freedom and equality of the parties, which, in this case, does not occur, given the state of subjection of the host States, dependent on foreign capital (Soria, 2015, pp 5-6). This paper aims to reflect on all these issues, highlighting the need to reach a balance between the interests involved and their respective protagonists, prioritizing social and corporate responsibility and effective respect for human rights. In short, foreign investment contributes to an effective increase in the welfare and social progress of the population and not to a globalization of poverty (Chossudovsky, 2003, pp 10). Host States should not relinquish their role of caring for the effective public interest of their population. We must not forget that these are contracts with prerogatives of administrative law that cannot be left to the parties' will. The Administration of Host States cannot refrain from taking care of the general interest, since it is not its holder, but rather its servant and, therefore, the law must triumph in the face of arrogance and corruption. (MEILÁN GIL, J.L., 2013, pp 66-67).

3. FOREIGN INVESTMENT AND SOCIAL PROGRESS: "STATEMENT QUESTION"

Foreign direct investment is an instrument that companies use to capitalize, to optimize production and to gain control over natural resources. The investor, through foreign direct investment, acquires a lasting interest in companies located in other territories, thus being able to operate across borders. The investment relationship presupposes, in most cases, the existence of a parent company and a foreign subsidiary, which is under the control of the parent company. It has been understood that such control acquires expressiveness with the ownership by the parent company of at least 10% of the shares or the voting right in relation to the second. Foreign direct investment boosts capital flows, which is why companies can expand their business through subsidiaries located in other states. Foreign investment is of particular relevance in the sectors of natural resource extraction, manufacturing industry and services. Not forgetting their contribution to sustainable development. But to what extent is the investor's contribution to the technological and social progress of the host state ensured in each foreign investment contract? Investment regulations should take into account the political, economic and social specificities of the States involved, the global situation and the international market, not neglecting the living conditions of the populations in the territories where the investment will take place. Today, companies are the protagonists of world economic development.

It is necessary to reflect deeply on its role in the global world with the necessary assumption of social responsibilities and consequently protection of human rights. That said, it is necessary to analyze the means of solving these disputes by means of arbitration, especially that of foreign investment (ISCID), seeking to ascertain whether it is sensitive to social issues or not. These are the issues under review.

4. THE IMPORTANCE OF INTRODUCING A “PROGRESS CLAUSE” IN FOREIGN INVESTMENTS CONTRACTS

The markedly colonialist behavior of investors has shown great disinterest in the face of the needs of the populations affected by the investment. In most agreements, investors are committed to improving the living conditions of populations, including the implementation of schools, hospitals and infrastructure. However, often after the realization of the investment, they forget the fulfillment of the social obligations assumed. It is urgent to hold investors accountable, but above all, the politicians in the host states for the lack of transparency and lack of sense of state in many of these foreign investment contracts. Put simply, it is necessary to introduce in each of these contracts, clauses suitable for the defense of the host peoples, in order to guarantee the general interest of the populations. In this sense, it would be enough to include a clause in foreign investment contracts, which would guarantee the obligation of the investment companies locally to provide technological, economic and social development resulting from the investment itself (MEILÁN GIL, J. L. 2006, pp 33-38). This "progress clause" to be included in each foreign investment contract should ensure that knowledge, training and manufacturing processes are shared between the parties in order to allow a fair share of the economic gains derived from foreign investment. To ensure, in short, that the investor undertakes to ensure the preservation of resources by adjusting production or extraction processes in accordance with technological knowledge and advances in science, protecting local populations and enhancing their economic and social development, the sectors targeted by this investment are often public services of general economic interest. The forecast in each contract of a clause stipulating public service obligations to be carried out in the host State may be, therefore, the factor of rebalancing the interests in presence. (MEILÁN GIL, J.L., 2006, pp 36). It is fundamental to counteract the tendency of a new world order based on the use of the resources of humanity, without equity in the redistribution of profits, which is nourished by poverty and destroys the environment, without respect for human rights and without concern for the well-being and progress population. This principle, based on fairness and proper consideration of the interest of the parties in the interest of the investor, but without prejudice to the general interest of the populations of the host state, must be present in all State conduct, whether in the negotiation of a contract of (MEILÁN GIL, 2013, pp 38), internal or international, or in the implementation of market competition in essential public services or, in the European designation, services of general economic interest (ANJOS, M.R. 2015, pp 29). Another path is unacceptable, unjust and generates potential conflicts of uncontrollable consequences for the fragile economies of the host states, to which political regimes are unstable and conducive to extremisms easy to settle in a context of unjust sharing of the benefits of foreign investment. Most of the existing studies on foreign investment are focused on analyzing the purely economic effects of investment (wealth multiplier effect / accelerator). From our point of view, we have to humanize the analysis. This is one of the reasons for this reflection. The focus of this paper is to highlight the importance of the impact of foreign investment on the social progress of populations. From this point of view, it is an approach focused on the humanization of the law itself, as an instrument of protection that promotes the well-being of the populations in the emerging economies (host states). Multinational companies must, in addition to corporate responsibility, be accountable to their shareholders and clients for their behavior, both in relation to workers and in relation to society in general.

This is a social and corporate responsibility, understood as the set of good practices developed by multinational companies, to guarantee workers' rights and protect the environment of the territory in which they operate (Costa, 2005, pp 46). Such accountability is intended to implement the social welfare of the community, bypassing the lucrative purpose, promoting the evolution, effectiveness and application of the domestic law of host States (Cardia, 2014, pp 18). Business practices should be based on models of economic, social and environmental sustainability. It is imperative to foster dialogue between all the protagonists. In the event of an emerging dispute, an appropriate balance of interests must be weighed, which requires sound, exempt and non-committal arbitration with the parties to the dispute. Nevertheless, the nature and power of the companies involved in foreign investment imposes greater care in order to avoid that the profits of the investment made are entirely absorbed by the investors to the detriment of the well-being of the populations in the host states. On the other hand, it is also necessary to protect the human and social rights of the peoples of the states where the investors come from, since their choice to carry out the investment in other countries is often motivated by the flight to the high social responsibilities that the legislation of the most developed states imposes, in particular, labor law, social protection and fiscal burdens (Chossudovsky, M. 2003, pp 78). In Europe, the European Commission announced in 2011 its new policy on corporate and social responsibility, although the results are still far from reaching the desired one. This responsibility should be a strategic factor for the competitiveness of companies, with a view to combating an inhuman globalization, alien to human rights and leading to an unprecedented globalization of poverty. (Chossudovsky, M. 2003, pp 81). In this regard, the benefits of social peace, risk management, cost reduction, access to capital, customer relations, human resources management and innovation capacity should be highlighted. In short, the social progress of the peoples will guarantee, in the long term, greater political stability, social peace and better reception of investment companies. Corporate and social responsibility must also be a mechanism that fosters good relations between companies, including employees and consumers, fostering sustainable business models that contribute to the increase of trust in relationships, reflected in growth itself (Nunes, 2015, pp 12-13). Finally, "corporate social responsibility is clearly in line with the objectives of the Europe 2020 strategy for smart, sustainable and inclusive growth, in particular with the employment target of 75%. Responsible business behavior is especially important when private sector operators provide public services "(European Commission, 2011, pp 10). Companies are now encouraged to adopt innovative strategies and minimize all negative impacts. In this sense, there are also international guidelines, notably the OECD and the United Nations, which tend to influence the behavior of companies regarding environmental protection and legal discipline of socio-economic relations. In this context, the United Nations has not only implemented a Global Compact to encourage companies to adopt social, corporate and sustainability policies, promoting dialogue between companies, trade unions, non-governmental organizations and others, as well as encouraging the global market, its inclusiveness and sustainability. In order to achieve this, the business community has been mobilized, especially internationally, through the implementation of principles, linked to human rights, namely in the field of labor, environment, anti-corruption and white-collar crime (Anjos, MR, 2016, pp 55).

5. THE IMPORTANCE OF THE “PROGRESS CLAUSE” IN ARBITRATION AS A MEANS OF SETTLING DISPUTES IN FOREIGN INVESTMENT

In view of all the foregoing, we conclude that the introduction of a 'progress clause' in the clauses of foreign investment contracts is also crucial as a guideline for future arbitration decisions in dispute settlement. It should be pointed out, with reference to the famous and recent "Philip Morris vs. Uruguay" decision, that even in the absence of a clause expressed in the foreign investment agreement / agreement clauses, it is the duty of the arbitral tribunal to weigh

interests properly, proportional, fair and consistent with the principle underlying the merits of foreign investment. We argue that this 'progress clause' is an imperative enshrined in the spirit of contract law and the benefits of international trade. We know that investment agreements provide international arbitration as a means of settling disputes. While the investment brings benefits to the two parties involved, there are conflicting interests. On the one hand, investors want to maximize profits, and, on the other hand, States intend to take advantage of this relationship, either through fiscal policies or through the assumption of commitments as a currency of exchange for certain objectives to be attained. The recourse to arbitration also seeks to avoid the performance of the state courts of the host country of the investment. Let us not forget the great skepticism on the part of the investors as to the lack of impartiality of these organs, the procedural slowness, the inadequacy of the national laws and the complexity of the questions to be decided. They also invoke authoritarian political regimes, political instability and a lack of seriousness in the fulfillment of the contractual obligations assumed by host States. Infringement of such agreements gives rise to arbitral proceedings and, frequently, to the condemnation of host States in large amounts of compensation to investors. Thus, the arbitration clause inserted in the agreements is understood as a protective clause for the investment and the investor, with the particularity that only investors can sue the States through arbitration. Such a situation constitutes a genuine breach of the principle of equality between the parties, operating in stark disfavour to host States (Bohoslavsky, 2015, pp 16). The proliferation of foreign investment undoubtedly contributed to the regulatory easing of investment, with greater benefits in favor of the investor. The clauses of fair and equitable treatment, the most favored nation and expropriation are real examples of this. The generalization of standard clauses, general clauses and indeterminate concepts, allows great arbitrariness to the judge. Since the signing of the Washington Convention and the creation of the International Center for the Settlement of Investment Disputes under the World Bank, foreign direct investment litigation has mostly been submitted to ISCID arbitration. ISCID arbitration has been revealed by investors, often condemning host states for allegedly violating their Bilateral Investment Promotion and Protection Agreements (BIT'S). The Philip Morris judgment seems to have announced an inflection in this trend. But it is justified to clarify the spirit behind the defence of foreign investment with the engine of development.

6. CONCLUSIONS

Regulating foreign direct investment is a controversial issue. The national laws of host states, which would be naturally applicable, as laws of the place where the investment occurs, have not been applied to this type of relationship because of the great skepticism of the investors. Their lack of flexibility and adequacy to this type of situation have undoubtedly contributed to their non-application. The option is to apply the rules contained in the agreements or investment contracts themselves and in the Public International Law, which regulates relations between States. An inevitable reflection on the assumption of corporate and social responsibility on the part of the investing companies is necessary (Kaushal, 2009, pp 5). It is important to consider the enormous economic and political power of these investing companies, accustomed to developing their activities in oligopolistic markets and holding a dominant position capable of controlling the political power of the host states (Pego, M. 2007, pp 46). Investment agreements should contain specific clauses capable of obliging their subjects to implement sustainable development, in addition to protecting purely economic interests. This clause requires the introduction of a 'progress clause', which imposes an obligation to promote technological, productive and social progress by the investor. We also know that foreign investment is mainly focused on certain sectors, namely in mining, chemical, iron, petrochemical, energy, gas, telecommunications, among others. These sectors, as we know, are responsible for the emission of pollutants with a strong environmental impact.

Therefore, in the relations between the parties, the corporate social responsibility of the investor should be safeguarded. It is not enough for companies to comply with the law, refraining from causing damage. They must consider in their investment or other costs social responsibility for the technological, economic and environmental progress of the host State. (Pérez, 2016, pp 3). In this context, international regulations are very limited, expressing themselves mainly through soft law standards, insufficient to guarantee the general interest in the host State. (Schreuer, 2010, pp 11). The principles of human rights must be transversal, both to decision-making bodies and to normative production from a state or consensual source. The economic functionality, the basis of foreign direct investment, must be articulated with the protection of those Rights. (Jacob, 2010, pp 3). "Transnational" relations, due to their specificity and interests, make the contractual instruments the pillar of regulation, enhancing the supremacy of business interests. Thus, despite the UN's efforts to include clauses protecting fundamental rights, it is necessary to be more incisive and stronger in including results obligations for the technological, economic and social progress of the population of the host State. It should be noted that the fair and equitable treatment clause has the same meaning as the international minimum standard of treatment afforded to aliens and their property, NAFTA Article 1105 (North American Free Trade Agreement). However, it is necessary to go further by avoiding the discussion about its autonomous guarantee nature, considering criteria of justice, equity and good faith, and respect for human and social rights in presence (Soria, 2015 and Schreuer, 2010, pp 6-7). On the other hand, UNCTAD - the United Nations Conference on Trade and Development - has understood that the standard of fair and equitable treatment is an element of extraordinary importance in foreign investment agreements. Not forgetting that it is the pattern most invoked by investors in investment conflicts (Arenhart, 2013, pp 9). In this context, the introduction of a progress clause appears to be a crucial complement to the rebalancing of the interests of the parties and to serve as a further guiding principle for arbitration tribunals to resolve disputes in this area. It is the obligation of the Contracting States to fulfill their role of defending the general interest in the presence by negotiating the investment agreement / contract. We conclude, citing MEILÁN GIL that "In complying with the legal system, the Administration is serving the general interest specified in the contract. The prerogative, as history and praxis have shown, has not always been exercised in the public interest. Not infrequently it is an imposition that masks the deficiencies of the Administration in the preparation of the contract with the acquiescence of the contractor, exacerbated in times of economic crisis. The abandonment of the prerogative that is proposed is not the triumph of private interest over the public, which is still prevalent, but the triumph of the law in the face of arrogance and corruption." (MEILÁN GIL, J.L., 2013, pp 12)

ECONOMETRIC ANALYSIS OF THE IMPACT OF HUMAN CAPITAL COMPONENTS ON UNEMPLOYMENT

Vusala Teymurova

*PhD in Economy, Associate professor of the Department of "Statistics and Econometrics",
Azerbaijan State University of Economics (UNEC), Azerbaijan*

Leyla Huseynova

*PhD in Economy, Assistant of the Department of "Statistics and Econometrics", Azerbaijan
State University of Economics (UNEC), Azerbaijan*

ABSTRACT

The main purpose of the research work is to assess quantitatively the impact of the components of human capital vector upon the level of unemployment in the labor market. So that the econometric investigation has been conducted in order to consider the impact of those components of the human capital vector from the state budget to education and health on the level of unemployment. The various methods of econometric modeling have been used during the study. Econometric testing of built-in regression models has shown that these kinds of models are far more adequate in real-time and can be used to foresee and define unemployment levels within the labor market.

Keywords: *causality, education costs, healthcare costs, human capital vector, stationarity, unemployment*

1. INTRODUCTION

According to the classic approach, the main part of the economically active population of the country does not participate in the creation of goods and services, which engenders an unemployment problem, and becomes a severe challenge for the world economy that directly affects the living standards of the population. Currently, this problem reflects itself as a concrete violation of the balance between the "demand and supply" of the labor force in the labor market. It is an undeniable fact that in contrast to the world practice, the unemployment phenomenon in the labor market of Azerbaijan has a number of peculiarities. Thus, the main complications of the unemployment within the society are specific tendencies such as the deepening of social tension and the lack of sustainable economic security in the country that can be considered relatively stable. On the other hand, there is no direct linkage between unemployment with demographic factors, wave periods in the economy, and transformation processes in Azerbaijan. Therefore, the main source of unemployment in Azerbaijan should be investigated in other platforms by taking into consideration the socio-economic factors. So that one of the vital components of the vector that characterizes this aspect is the role of human capital. Consequently, one of the key priorities of Azerbaijan's socio-economic life and economic security is to determine the place, role and development of the human capital in reducing unemployment.

2. THE INVESTIGATION OF THE ECONOMETRIC IMPACT OF HUMAN CAPITAL ON THE UNEMPLOYMENT PROBLEM

During the process of econometric study of the human capital impact on unemployment, we will consider the impact of two elements of the human capital vector - the level of education and health in the unemployment rate of the country. The core reason is that education is considered a focal factor that directly affects GDP by shaping the knowledge, skills, and capacities of the country's population. Simultaneously, the impact of health on this macroeconomic indicator is unambiguous and cannot be a subject of discussion.

Some researchers point out that education as the human capital investment has the capability of creating “value-added” by increasing the knowledge and skills of the country's population generated by their labor earnings. Thus, education not only increases efficiency in the process of production, ultimately GDP, but also weakens the stratification and inequalities among different social groups (Note: we associate this stratification with quantitative characteristics of income and social inequalities). It has to be noted that today, education plays a crucial role in shaping the human capital, which is a significant factor in the success of the economic entity in the market, the country's economic growth, as well as the increase of its scientific and technical potential and capability. [14. V.E.Teymurova, pp.43]. The indicators such as the share of investments in education in the country's GDP, distribution of such investments in the public and private sectors, the allocation of expenditure on education from the state budget to education levels, and education expenditures per capita in the country are considered to be more noteworthy in the quantitative characteristics of education. Another key component of the socioeconomic factors affecting the human capital and the unemployment level is the health of the society members, or mainly the health factor. The main reason relates to the impact of health on economic growth, including GDP. Merely the healthy individual can act as a productive force for the community providing human capital development, and economic growth in the country [18. Chesebiev. A.A., pp. 35]. The health factor also serves for the effective functioning of education, as it may be of interest to individuals who are only physically healthy and are far more likely to benefit from the capabilities of the human capital. This is the key reason why many researchers perceive allocations from the state budget to the health sector (health costs-HC) as an important investment in human capital development. The estimated duration of life, the number of births and deaths, the specific weight of expenditure on the state budget in GDP, the structure of the investments directed to the area, health expenditures per capita, etc. can be shown the examples of quantitative characteristics of health care.

2.1. Statistical analysis of factors affecting unemployment

The following table summarizes the dynamics of the indicators involved in the research between 1995 and 2017 (Table 1) [Internet resources 26,27].

Table following on the next page

Table 1: Time series of human capital indicators

Years	Number of unemployed population (in thousand) (Business segments)	Budget allocations on education from the state budget (in million manats)	Budget allocations on health care from the state budget (in million manats)	Revenues of the state budget (in million manats) (in this order)
1995	583,7	75,2	29,5	316,9
1996	561,2	101,8	40,1	402,6
1997	559,3	112,8	38,8	513,0
1998	554,6	116,3	31,1	465,5
1999	552,6	159	37,2	559,5
2000	514,7	181,8	40,9	714,6
2001	476,7	186,2	42,0	784,8
2002	438,6	191,2	44,8	910,2
2003	400,9	234,8	55,3	1220,9
2004	348,7	294,1	73,5	1509,5
2005	317,8	372,5	115,3	2055,2
2006	291,2	479,1	162,0	3868,8
2007	281,1	723,0	257,2	6006,6
2008	262,2	979,7	346,2	10762,7
2009	260,2	1147,9	402,4	10325,9
2010	258,3	1180,8	429,2	11403,0
2011	250,9	1268,5	493,4	15700,7
2012	243,1	1453,2	609,4	17281,5
2013	236,6	1437,7	618,9	19496,3
2014	237,8	1553,9	665,3	18400,6
2015	243,7	1605,1	708,2	17498,0
2016	252,8	1754,4	702,5	17505,7
2017	251,7	1742,8	704,7	16516,7

Table 1 Analysis of data. The summary of the dynamics of statistical indicators reflected in this table below:

- The majority of unemployed population dynamics
 Dynamics according to the previous year (1995 year – 1,000)
 {1,000; 0,961; 0,997; 0,991; 0,996; 0,931; 0,926; 0,920; 0,914; 0,870; 0,911; 0,916; 0,965; 0,933; 0,992; 0,993; 0,971; 0,969; 0,973; 1,005; 1,025; 1,037; 0,996}
- The dynamics of expenditure on education from the state budget
 Dynamics according to the previous year (1995 year – 1,00)
 {1,00; 1,35; 1,11; 1,03; 1,37; 1,14; 1,02; 1,03; 1,23; 1,25; 1,27; 1,29; 1,51; 1,36; 1,17; 1,03; 1,07; 1,15; 0,99; 1,08; 1,03; 1,09; 0,99}
- The dynamics of health expenditures from the state budget
 Dynamics according to the previous year (1995 year – 1,00)
 {1,00; 1,36; 0,97; 0,80; 1,20; 1,10; 1,03; 1,07; 1,23; 1,33; 1,57; 1,41; 1,59; 1,35; 1,16; 1,07; 1,15; 1,24; 1,02; 1,07; 1,06; 0,99; 1,00}
- Dynamics of the state budget revenues
 Dynamics according to the previous year (1995 year – 1,00)
 {1,00; 1,27; 0,91; 1,20; 1,28; 1,10; 1,16; 1,34; 1,24; 1,36; 1,88; 1,55; 1,79; 0,96; 1,10; 1,38; 1,10; 1,13; 0,94; 0,95; 1,00; 0,94}

The study of the dynamics of the number of unemployed population depicts that there has been a steady decline in this indicator between the period of 1995 and 2017. Overall, this figure dropped off 2.3 times over the same period and reached out 251.7 thousand in 2017. [7. Vasenkova EM, p. 42]

Figure 1: Dynamics of unemployment level change in Azerbaijan

According to the dynamics of unemployment, the overall slowdown was observed in the decline in this indicator shown here, however, the seasonal breakthrough occurred in 2009 and the unemployment rate constituted 87% as in the previous years. As a result of the global financial crisis, within the last five years, the tendency to decrease the number of unemployed in the country has weakened and then relative growth has begun. The systematic analysis of the dynamics of budget expenditure (allocations) on education and healthcare shows that there is a steady growth trend. Thus, the amount of expenditure on education increased up to 2.5 times in 2000 compared to 1995, more than 13 times in 2010, more than 23 times in 2017 and reached out 1742.8 mln. manat. According to the dynamics of the allocated budget, these indicators were 1.4 times, 14.5 times and 23.9 times respectively, and amounted to 704.2 million manats in 2017. The study of the dynamics of education and health expenditures show that the share of these expenditures from the state budget has remained relatively constant. So that if the health expenditures accounted for about 39% of education costs in 1995, whilst it was 40% in 2012. On the other hand, the rate of increase in education expenditures has faster than health expenditures, which is still more common in the indicators up to the 2010 year. Thus, only 5 potential years have been required to increase the cost of education twice, while this level of healthcare has been achieved after 10 years. In recent years, there has been some stagnation in the growth dynamics of expenditure on education and healthcare. Regarding revenues of the state budget of Azerbaijan, the analysis of the relevant clusters indicates a steady growth trend. Therefore, this indicator increased by 2.25 times in 2000 compared to 1995, 33 times in 2010, and 52 times in 2017 and amounted to 16516.7 million manats. It should be noted that in recent years there has been a stagnation in budget revenues due to the decline in oil revenues. So that the absolute decline was observed in this indicator in 2014. To sum up, there is the direct and indirect links between the level of unemployment and the education and health expenditure components of the human capital vector, as well as the state budget revenues. Thus, it is possible to estimate the quantitative dependence of those indicators through the correlation and regression methods of econometric modeling.

3. EVALUATION ON STATIONARITY AND CAUSALITY OF TIME SERIES OF HUMAN CAPITAL VECTOR

One of the prerequisites for econometric modeling is to determine the statistical characteristics of the time series used during the research process, or more precisely, to define their level of stationarity. Thus, the mathematical expectation and dispersion of the sequence at any moment of time must be evaluated whether stable or not stable. Studies show that determining the stationarity of time sequences is an essential condition that characterizes economic systems. Therefore, since the statistical characteristics of stationary and non-stationary sequences do not coincide each other, they can not be evaluated in the same way. In some cases, the lack of stationarity in time sequences is associated with the overall trend at this time. If this trend is abolished, then the sequences are stationary [2. Gujarati D., p. 750]. The correlogram method was successfully at Table 1 (ACF and PACF auto-correlation functions) to test time series in stationarity.

The failure to apply single root tests (DF, ADF, KPSS, and PP) in order to check the stationarity of the time sequences is mainly explained by the low number of observations in the dynamic sequence. The table given below shows the outcome of the stationarity test upon the time series of the number of unemployed people. (Figure 2)

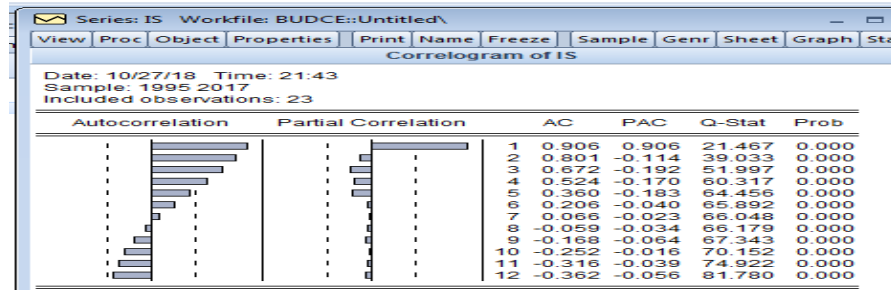

Figure 2: Correlogram of stationarity test of time series of unemployment indicator

The analysis of correlogram shows that the time series of the number of unemployed is not stationary, because in this ACF (1) the price is approached to the unit, and then correlation decreases with a sinusoid. If we use the growth function to bring out the time series of the number of unemployed to the stationary level, then the following correlogram will be made for this series (Figure 3).

Figure 3: The correlogram of time series of a number of unemployed in stationarity

As can be seen from Figure 3, the unemployed are not at the timelines, but they are stationary in trends. So that, the cost of the ACF (1) autocorrelation function constitutes 0.7. Note that similar results were obtained while checking the stationarity of other time series (health, education, budget sequences) in Table 1. That is, in the first approach, the time series were not stationary, but then were stationary due to their growth. One of the most interesting moments in econometric research is the problem of the cause-effect relationships (causality) between the variables reflecting the economic system. For example, is the increase in direct education costs reducing unemployment within society? [15. The author is Galiulina LM, p. 47]. So, to clarify this problem, Granger's proposed "cause-effect" dependence test (Granger causality) is used. As a result of the analysis, it was revealed that budget and education expenditures, as well as budget revenues, play a role of Granger's cause for unemployment in the country (The probability of impact for all regressors is $P = 0.00$).

3.1. Establishment of regression models of the human capital indicator on unemployment

The results of the econometric analysis upon the causality between the level of unemployment in the country and the components of the human capital vector have shown that, as regressors affecting the unemployment rate, expenditure on education, health expenditure, and the budget's own income are reasonable for Granger theory.

Thus, this dependency can be specified;

$$\text{Unemployed} = \beta_0 + \beta_1 EC + \beta_2 HC + \beta_3 BR + \varepsilon_i^*$$

EC-education costs, HC-health costs, BR-budget revenues *.

in the form of multiplication linear regression equation as an econometric model [Dougherty p. 332].

The statistics of the selected linear regression model via the Eviews software package were illustrated in the following table (Table 2).

Table 2: Statistics of Econometric Analysis of Selected Regressors on Unemployment Indicators

Variable	Coefficient	Std. Error	t-Statistic	Prob.
Dependent Variable: Unemployed				
Method: Least Squares				
Date: 11/11/18 Time: 22:45				
Sample: 1995 2017				
Included observations: 23				
C	539.7310	25.86852	20.86440	0.0000
EC – Education costs	-0.741330	0.202938	-3.652987	0.0017
HC – Health costs	1.637674	0.568916	2.878584	0.0096
BR – Budget revenues	-0.011814	0.011101	-1.064293	0.3005
R-squared	0.816550	Meandependentvar		364.2783
Adjusted R-squared	0.787584	S.D. dependentvar		132.3560
S.E. of regression	61.00098	Akaikeinfocriterion		11.21643
Sumsquaredresid	70701.27	Schwarzcriterion		11.41390
Log-likelihood	-124.9889	Hannan-Quinncrier.		11.26609
F-statistic	28.19019	Durbin-Watsonstat		0.517770
Prob(F-statistic)	0.000000			

According to the statistics shown in Table 2, the following regression model was revealed in the dependence on the level of unemployment from budgeted education expenditures, health expenditure, and budget revenues.

$$\text{Unemployed} = 539,731 - 0,741EC + 1,638HC - 0,012BR \quad (1) *$$

P (0,00)(0,00)(0,00)(0,30)

EC-education costs, HC-health costs, BR-budget revenues *.

(1) According to the economic interpretation of the regression model, the state budget expenditure on education amounted to 1 mln. manat increase causes the reducing of the number of unemployed up to 0.741 thousand people, however, 1 mln manat increase in the cost of health expenditures leads to the increase of the number of unemployed by 1,64 thousand people.

According to this regression model, will be \$ 1 million. The increase in the budget revenues up to 1 mln. manat results in the decrease in the number of unemployed in the country by 0.12 thousand people. Although the determining factor of the regression model is $R^2 = 0.82$ with the high quality at first glance, and it is pointed out that 82% of the regression equation is scattering the unemployment indicator, we do not consider this model to be of good quality. Because, according to statistics of this model, the coefficient of the budget revenues is insignificant.

(BR (budget revenues) → $P = 0.30$)

This result can also be checked out by the elasticity of the dependent variable according to Xi regressors [7. Vasenkova EM, p. 12]. The following prices have been obtained for the elasticity coefficients amid the research process.

$$E_{unemployed(EC)} \approx -1,535; E_{unemployed(HC)} \approx 1,299; E_{unemployed(BR)} \approx -0,250^*$$

EC-education costs, HC-health costs, BR-budget revenues.*

Thus, the 1% increase in budget expenditures according to the mathematical expectation reduces the unemployment rate by 1,535%, and the 1% increase in health expenditures according to the mathematical expectations increases the unemployment rate by 1,299%. Indicators for budget revenues constitutes 0.25%. This shows that budget revenues have a weaker effect on the level of unemployment than budget expenditures for education and health. (1) Consequently, in accordance with the regression equation statistics, the decision on the inadequacy of budget revenues to the unemployment has been confirmed once again by the cost of this elasticity ratio of $E_{unemployed}$. Hence, the (1) model has not been properly clarified and it is advisable to deduce the budget revenues (BR) from the study.

3.2. Improving the quality of the built-in regression model

The following regression model has been established based on the econometric modeling statistics for the new composition of exponential variables.

$$\text{Unemployed} = 543,770 - 0,735EC + 1,300HC \quad (2) \\ P(0,00)(0,00)(0,01)$$

Pursuant to this model, the budget expenditure on education amounts to 1 mln. manat growth in the country reduces the unemployment rate by 0.74 thousand people. However, the cost of health expenditures up to 1 mln manat increases the unemployment rate by 1.30 thousand people in the country. It should be noted that the increase in health expenditures affecting on the level of unemployment can be explained by "healthy body mental health" syndrome. That is why people who have regained their health cause an increase in supply in the labor market.

(2) According to the statistics of the regression model, $R^2 = 0.81$. that model, for example, explains 81% of scattering in the unemployment rate. However, since $DW = 0.44$ ($d_i = 1,168$ and $d_u = 1,543$), this indicator falls to the range of $0 < DW = 0.44 < d_i = 1,168$ on the scale and proves the existence of positive autocorrelation in the model [10. Yeliseyeva II, p. 22].

(2) In this model, the presence of the first compressed positive autocorrelation is confirmed as a result of testing the presence of autocorrelation by a correlation method. The statistical characteristics of the model are close to the norm and there is no need for multicollinearity testing.

However, the source of the first compressed autocorrelation found in the model can be multicolleniarist. Thus, the cause of autocorrelation is the defects in the specification stage, and these defects give rise to the emergence of multicollinearity [5. Borodich SA, p. 228]. In the econometric modeling, the dispersion-inflating factor variance method is used to detect the multicollinearity, which is commonly seen as the presence of sufficiently close statistical relationships between the exponential variables and the usual regression of time series. Because of the fact that this method allows you to determine, which variables generate multicollinearity.

(2) As a result of testing the regression model based on this method of multicollinearity, it was found out that the value of the CCD coefficient for the model variables is significantly higher than the critical price of $CF = 10$. Therefore, there is serious multicollinearity among regressors in the model, and this multicollinearity causes positive auto-correlation. In order to eliminate autocorrelation, the following logarithmized version of the regression equation is used [2. Gujerati D., p.183].

$$\text{Log}[\text{unemployed}] = \beta_0 + \beta_1 \text{Log}(\text{education costs}) + \beta_2 \text{Log}(\text{health costs}) + \varepsilon_i \quad (3)$$

(3) The following regression model is obtained based on the econometric modeling statistics for the regression model:

$$\text{Log}(\text{unemploy.}) = 7,723 - 0,298\text{Log}(\text{edu. cost.}) - 0,0102\text{Log}(\text{health. cost}) \quad (4)$$

For this model, $R^2 = 0.95$ is taken and the value of the determinant ratio has increased compared to the model (2). However, other statistical characteristics for the model (4) have deteriorated. Therefore, it is desirable to use spider web and inductive methods to eliminate positive autocorrelation in the first embodiment [9. Dougherty K., p. 367] The logarithmic regression model will be described on the basis of these methods (3) as follows:

$$\begin{aligned} \text{Log}(\text{unemploy.}) \\ = \beta_0 + \beta_1 \text{Log}(\text{edu/costs}) + \beta_2 \text{Log}(\text{health/cost}_{t-1}) + \beta_3 \text{Log}(IS_{t-1}) \\ + \varepsilon_i \quad (5) \end{aligned}$$

(5) The EViews software package and econometric modeling have provided the following regression model, which reflects the dependence of the unemployment factor on the regression model:

$$\begin{aligned} \text{Log}(\text{unemploy.}) \\ = -1,395 - 0,0954 \text{Log}(\text{edu. cost}) + 0,156 \text{Log}(\text{health cost}_{t-1}) \\ + 1,199 \text{Log}(\text{unemploy.}_{t-1}) \quad (6) \end{aligned}$$

According to the given model, the state budget spending on education and health has a one-year delay in the country's unemployment rate. The unemployment indicator also affects itself in the same way. (one year delay).

(6) Regarding the economic meanings of the exogenous parameters of the regression model, 1 mln. increase in the cost of education causes a decrease in the level of the unemployment rate by 0.0954 units, however, the increase up to 1 mln. manat in health expenditures leads to an increase in the unemployment rate by 0.156 thousand people.

(6) The regression model's determinant coefficient is $R^2 = 0.995$. Taking into consideration the determination of the coefficient, which is close enough to the unit and $1260,563 = F_{\text{sta}} > F_{\text{criterion}}(0.05; 3; 18) = 3,16$. So that it is possible to reach an initial decision on the level of unemployment (6) that the regression model is important. In order to determine the validity of this decision, it is necessary to assess the presence of autocorrelation and the degree of homoscedasticity of the model.

4. TESTING THE QUALITY OF THE REGRESSION MODEL OF THE HUMAN CAPITAL INDICATOR ON UNEMPLOYMENT

The Ramsey Generalized "RESET" test is used to scrutinize the specification of the linear regression model in econometric studies, because, "RESET" test linear regression model is able to detect specific errors. For example, some of the explanatory variables are not included in the study or the functional form is not selected and so on. More precisely, this test determines whether or not the additional variables should be included in the equation. As a result of Ramsey's RESET test of the linear regression model of unemployment (6), it was known that this regression model was $F_{\text{stat}} = 0.1427 > 0.05 = \alpha$. Hence, (6) the regression model has been properly codified. One of the mechanisms used to test the regression model for homoscedasticity is the White test [10. Yeliseyeva II p. 160; 21. Melnikov RM p. 67]. Since the number of variables in the regression model that we have already investigated (6) constitutes $m < 4$, the homoscedasticity of this model has been tested by the Cross version of the White test [15. The author is Galiulina LM, p. 39; 7. V. Vasenkova, p. 77]. The test statistics show that the Wait test statistics for the model (6) is giving $P(F_{\text{stat}}) = 0.4157 > 0.05 = \alpha$, meaning that the hypothesis of the model is homoscedastic. To sum up, the systematic econometric surveys underline that all the characteristics of the linear multidimensional regression model depending on the level of unemployment from the state budget to education and health expenditure (6) are within the scope of the Gau - Markov theorem. So, it has to be noted that this model can be considered a useful mechanism for predicting a quality adequate model for real conditions [2. Gujerati D., p. 72].

4.1. Predictability of unemployment level

The econometric model (6) obtained during the research process was considered to be an effective mechanism to predict the level of unemployment in the country, taking into account the impact of the human capital vector on expenditure components for education and health. The following figure illustrates the actual level of unemployment and the comparison of the forecast parameters obtained by this model (Figure 4).

Figure 4: Comparative schedule of actual and forecast levels of unemployment

As you can see from the chart, the actual price of the unemployment coincides with the forecast prices of the model. It further proves that the model (6), which reflects the degree of dependence of the level of unemployment on human capital indicators, has been properly specified.

According to the forecast results, the error of the unemployment rate (6) in the research process is 0.64% for the 2018-2019 period based on the regression model. The quality of the model is reaffirmed since it has more than 0.5 characteristics.

The lower and upper interval of unemployment prediction is 0.124570 and 1.22711. Thus, if we assume that the unemployment rate for 2017 amounts 251.7 thousand people, then it is forecasted that 95% of 2018 will be in the range of 251.122 and 262.93 thousand people [8. G.O. Chitaya and others, p. 189].

5. CONCLUSION

The existence of peculiarities of unemployment in the labor market of the Republic of Azerbaijan requires a different approach to its research. The basis of this approach is the approach of human capital to unemployment within the context of socio-economic factors. Studies show that the cost of the human capital vector from the state budget to education and health directly impacts the unemployment rate in the country. Econometric testing of the stability of time series of these indicators showed that they are not stationary due to the existence of the deterministic time trend, but may be considered as stationary time sequences relative to the growth indicator. The testing of the cause and effect relationships between the components of human capital including education and healthcare costs has shown that education and healthcare components play the role of "Granger's cause" for the unemployment level in the labor market. During the course of econometric research, the multivariate linear regression equation has been set up based on the dependence of the level of unemployment on the labor market of Azerbaijan from the state budget to education and health expenditures. The model specification has been modified and the model has been set up into a real-life mechanism. The econometric testing from the different approaches to the quality of the latest version of the model has shown that this model fully meets the conditions of Gau-Markov, there is no autocorrelation, and it is homoscedastic. Taking into account the quality of the established econometric model, the unemployment rate has been predicted on the basis of this model. The forecast prices of the model have coincided with the actual prices of unemployment by 0.64% of error. The inaccuracy of the forecast less than 0.5, once again showed that the model proving the dependence of the level of unemployment on the components of the human capital vector is indeed, adequate and predictable for realistic conditions.

ABSTRACT

The high level of dependence on imports of grain and grain products, as well as the low quality of grains used in the country for the purpose of food use, is the marketing problem of this sector. Due to the low quality of grain produced in the country, dependence on imports of grain and grain remains high. Solution of these problems is possible due to the increase of productivity and quality of grain produced in the country. Additionally, it is important to take into account the role of key factors influencing to increase the production of grain and its offering to the market in order to increase food security on account of domestic production. While purposeful measures have been taken to increase grain production in Azerbaijan, it has not yet been achieved to significantly reduce the country's import dependence on this product. In some cases, the measures to regulate the grain and grain market have not been systematic, so the effect of the implementation of those measures was less than expected. In order to increase the effectiveness of the measures implemented in this area, first of all marketing research of the grain and grain products market should be undertaken and this should be a complex and systematic approach to solving problems in the market. Based on the information obtained from these studies, it is possible to provide desirable development of the market and to develop scientifically substantiated proposals for the country's food security.

Keywords: *dependency on the import, food security, grain and grain products market, marketing research of the market, self-supply*

1. INTRODUCTION

For many years, there are problems in the grain and grain market of Azerbaijan. The dependence of the country on the international grain and grain products market and the fact that it acts as a net importer is an indication of the problem in the market, and it is difficult to speak about food security and independence in the grain without eliminating the problem. The low productivity of grains produced in Azerbaijan and the fact that its quality indicators do not meet the standards in some cases have led to the dependence of the food market on this product segment on international markets. Although certain targeted efforts to reduce dependence in this area are implemented, dependency remains high, so it is important to continue the activities and to make adjustments to the measures taken in this area, depending on the conjuncture of the grain and grain market in the country. Development of effective measures in this field requires market research of grain and grain products.

2. THE IMPORTANCE OF MARKETING APPROACH IN FORMATION OF GRAIN AND GRAIN PRODUCTS MARKET

The share of bread and bakery products in the concentrated consumption of foodstuffs of Azerbaijan population is higher and most of the energy consumed by the population from the

daily consumption of foodstuffs falls on bread and bakery products. This will be the case in the near future, as the likelihood of changing the culture of consumption that has been taking place for many years is usually very low. Therefore, the demand for high quality bakery and bakery products, as well as the availability of sufficient livestock products in terms of balanced nutrition depend on the development of the grain and grain products market. From this point of view, the grain-growing has a systemizing role in the agricultural products market and, depending on the level of development of this area, the development of the relevant segments of the agrarian products market (e.g. livestock product segments) is ensured. It is impossible to achieve the coordination of the interests of all market participants without the marketing approach to the formation of the grain market. From this point of view the marketing approach to the formation of this market is emphasized in the works of many economists. "We are looking at the grain market and efficiency of its semi-complex from marketing position, taking into account the apparent impact of the grain market in terms of meeting the population's demand" [4, p.67]. Providing the desired development of any market also requires knowledge of the market development law. This also applies to the grain and grain products market and the acquisition of this information can be based on marketing research. The substantiated decision-making on the solution of the problems arising in the grain market is possible as a result of the information obtained through the marketing research of this market. "The solution of these issues requires knowledge of the laws of development of internal and external grain markets and their ability to adapt to their requirements, as well as the ability to control the set of instruments that will influence the situation in them. Achieving it in full is possible on the basis of marketing approach to managing the grain market. At the same time, the principles of marketing activity and methods of their implementation are universal for both state and the business" [5, p.33]. Famous Russian economist scientists Klyukach V.A, Altukhov A.I, Vasyutin A.S, showing the importance of marketing approach to the formation of the grain market, emphasize the importance of a market-based approach to development of measures on regulation of the same market. [5].

3. RESEARCH OF DEPENDENCY ON IMPORT OF GRAIN AND GRAIN PRODUCTS AND SELF-SUPPLY

Experts believe that 40% of development of the agrarian-industrial complex is directly related to the development of grain-growing. In their view, the multiplier effect from the development of grain-growing is 1.5-2 times higher than the effect obtained from development of agriculture within the economy. Along with all of these, grain is considered to be a strategically important product that has a bigger share in ensuring the productivity of both food security and profitability of product producers. In some cases, grain is also used as a product that performs the function of value measuring. Given these features, in countries where market economy develops, the state interferes more in the market to direct the processes emerging in the grain and grain market to the desired direction. "Grain market between agricultural products, raw materials and food commodities is also characterized by its specific features. In modern conditions, in the grain producing countries of the world, the most important of them is the state's ever-increasing role in shaping demand and supply. It is conditioned by the fact that grain is the basis of the whole food system, and its supply is an important indicator of the state's economic independence" [5, p.34]. Over the last two decades, certain achievements have been achieved in the development of grain growing in Azerbaijan. Thus, compared with 1995, in 2017 the sowing area of the grain increased by 1.6 times, the productivity - 2.0 times, and the grain production - by 3.2 times. During 2008-2017, the sowing area of the grain was increased from 897,000 hectares to 977,200 hectares, during that period the production of grain increased from 2502,63 thousand tons to 2912,06 thousand tons, and the productivity per each hectare was increased 2.79 tons to 2,98 tons.

The analysis based on the index method shows that 54,65% (223,76 thousand tons) of 409.43 thousand tons of grain production increase fell on the sowing area and 45,35% (185,67 thousand tons) of the it fell on the account of increase of productivity. An important part of grains produced in Azerbaijan falls in the share of individual entrepreneurs, family and households. In 2013-2017, 90.9% - 92.1% of the grain sowing area and 91.0-91.9% of grain produced in the country fell on the share of these farms. The rest of the grain was produced on account of agricultural enterprises. Over the years reviewed, grain production per capita ranged 244.8 - 307.4 kg and wheat production ranged from 148.5 to 196.8 kg. Despite certain achievements in the development of grain growing in our country, the share of imports in the content of reserves of grain and grain products still remains high and the level of self-supply with these products is not high. Researches show that in 2013-2017, the total imports of cereals and leguminous plants totaled 24.91-27.36%. The level of this indicator was 31.31 - 33.28% for wheat, and 64.54-68.52% for rice. Volume of imported wheat during these years amounted to 1195,7-1451,3 thousand tons, the value of import of this product - ranged between 227,2 - 395,4 million USD. Dynamics of level of dependence on import of grain and grain products is characterized by the data of the following tables (Table 1).

Table 1: The level of dependency on import of grain and grain products, %*

	2013	2014	2015	2016	2017
Total of cereals (rice paddy is not included)	36,1	39,4	35,5	36,5	33,7
Wheat	44,1	45,9	45,2	47,1	41,9
Barley	2,2	15,4	4,9	0,1	5,6
Corn	40,0	43,3	45,9	28,9	29,3
Oats	10,7	37,8	6,9	14,3	9,9
Other cereals	97,7	98,9	93,7	71,8	79,6
Flour (of all kinds)	6,5	5,5	5,1	4,0	4,2
Cereals (of all kinds)	80,8	81,9	82,1	83,2	71,0
Cleaned rice	85,5	91,7	90,5	90,0	76,2

Source: the table was compiled by the authors based on the data of the State Statistics Committee.

**- $\text{import} / (\text{production} + \text{export} - \text{import})$ was calculated 100%.*

As seen from the data of the table, the most dependent segments of Azerbaijan food market on the import are wheat, rice and all kinds of cereals. Targeted measures on the first two segments are ongoing and solution of the problems observed in other segments of the food market is directly dependent on solution of problems emerging in these segments. However, problems with the sale of grain continue to remain. As such, for example, the supply of the products to the State Grain Fund currently acts as one of sales channels of products of the grain producers, but in some cases the sale of products on this channel is not possible. Although the producers are satisfied with the supply price of the product (this price varies from 230 to 250 AZN per each ton of quality wheat at present), as the quality of grain produced in the country is low, it is very difficult to sell a significant portion of grain on that channel. For this reason, grain procurement entities buy significant part of the grain from international markets. For example, "Ganja Deyirman" purchased only 15-20% of the grain in the last six years from local producers. In the case where the quality of the grain produced does not meet the requirements, the sale of the produced product is not possible and the level of required profitability of the producers is not provided in terms of their extensive reprocessing. As we noted above, the root cause of this is due to the quality of grain produced and this is the indication of availability of the problem in marketing activities of the farms.

The conducted researches show that in comparison with 2013, in 2017, the level of self-supply was increased by 2.4 % for whole cereals, as well as 2.2 % for wheat, 10.7 % for corn, 0.8 % for oats and 18.1 % for other kinds of cereals. During all these years, the increase of the level of self-supply for all kinds of flour, cereals and rice was accordingly 2,2 %, 9,7 % and 9,3%. In the years reviewed, only the level of self-supply for barley was decreased and it was equal to 3,4% (Table 2). At present, the demand of the country's population for rice is more than 40,000 tons. The existing sowing area of this product and the amount of produced products is too small to cover the demand of the population of the country. As such, only 2.5 thousand hectares of paddy planted in 2016 and 5.6 thousand tons of crops were harvested. In 2017, the sowing area of paddy was increased by more than two times and reached to 5.1 thousand hectares compared to the previous year; 15.6 thousand tons of products were produced in the country and average productivity was 31 c / ha.

Table 2: The level of self-supply for grain and grain products, %*

	2013	2014	2015	2016	2017
Total of cereals	63,9	60,6	64,5	63,8	66,3
Wheat	55,9	54,1	54,8	52,9	58,1
Barley	97,8	84,6	95,1	101,7	94,4
Corn	60,0	56,7	54,1	71,1	70,7
Oats	89,3	62,2	93,1	85,7	90,1
Other cereals	2,3	1,1	6,3	32,0	20,4
Flour (of all kinds)	93,8	94,8	95,1	96,1	96,0
Cereals (of all kinds)	19,3	18,2	17,9	17,6	29,0
Cleaned rice	14,5	8,3	9,6	10,1	23,8

Source: the table was compiled by the authors based on the data of the State Statistics Committee.

**- import / (production + export – import) * was calculated 100%.*

Taking into account the fact that the significant portion of the cleaned rice reserves of the country was formed on account of import, "the State Program on the Development of Rice in the Republic of Azerbaijan for 2018-2025" has been adopted by the order of the President of the Republic dated February 09, 2018. The State Program set forth the goals such as meeting the demand of the country population to the rice, substitution of import, development of paddy processing industry, stimulation of development of paddy-growing field in order to raise the employment level of rural population. To achieve this goal, fulfillment of certain tasks has been identified and directions of action have been specified such to expand the paddy-growing and increase of the productivity of the paddy, to improve the infrastructure of rice, to promote the use of innovative technologies in paddy production and processing, promote the creation of paddy processing enterprises. The program envisages increasing the sowing area of paddy to 10,000 hectares by 2025, its productivity to 40 c/ha and the production volume to 40,000 tons. The efficiency of grain production in some farms operating in the field of agriculture of Azerbaijan is quite high. As such, in the last five years, the overall tendency of profitability of cereals and grains in individual entrepreneurship farms has increased, and the level of this indicator ranged between 24.7 - 34%. This level of profitability is considered to be a fairly acceptable level for the extensive reprocessing of farms and was achieved thanks to the state protection of grain producers. It is enough to remind only one fact that the amount of subsidies paid by the state to the grain producers for fuel and diesel oil is 90 AZN. The high level of grain efficiency in the grain-producing farms can further enhance their interest in production and ensure the allocation of land plots to the production of this product. For this reason, problems faced by grain producers in production and sale activities should also be addressed.

The analysis of technological and organizational and economic factors influencing the growth of product offerings in the grain market of our country shows that there are still problems in this aspect and they have not been completely eliminated. Thus, for example, compared to 2007, in 2017 the number of combine harvesters per 1000 hectares of sowing area of grains decreased from 3.0 to 1.8 pcs. Despite this reduction, combine harvesters used in harvesting are selected by their high productivity and are produced in developed countries of the world. However, as the majority of grain farmers are smaller in terms of their economic and physical dimensions, problems arise when they own and use the same hardware. All of these do not allow the harvesting of grain produced in the country in the optimal period. One of the problems in this area is due to the large number of equipment that is not in good condition in terms of use in the existing technique park used in grain production. These problems, which have been observed for many years, should be eliminated and the level of technical support of grain should be raised to the required level. In terms of fertilization of grain fields, the situation is not at the desired level. Due to the fact that the fertilizer production infrastructure is not developed in Azerbaijan and it is in the process of its formation, the fertilizers that are given to grain sowing areas are imported from foreign countries. Compared to 2008, in 2017 the amount of fertilizers that were given with 100% nutrient substance in the grain sowing area increased from 14 kg to 62 kg, or 4.4 times. However, despite this increase, experts have concluded that the quality of imported fertilizers was not high, and their impact on the productivity of grain was very low. Therefore, the formation of a proper infrastructure for fertilizer production in our country is very important and acceleration of the measures taken in this area can lead to further growth of grain production and increase of productivity from grain sowing areas. An analysis of the organizational and economic factors affecting the increase in product supply to the grain market shows that there is a need for some improvement in the measures taken in this aspect. Particularly, the formation of guaranteed sales channel of grain can give rise to sufficient revenue for the producers of this product, and hence, to promote market development.

4. CONCLUSION

In order to ensure food security at the expense of domestic production, the role of factors affecting the production of grain in our country and its offer to the market should be considered correctly. These factors can be grouped into natural, agro technical, technological and organizational-economic factors. Natural factors include rainfall, temperature, germs and pests, soil, and so on. Agro technical factors can include sowing turnover, share of separate crops in planting area, amount of planting materials, share of zoned grain types in sowing area and etc. Provision of grain producers with hardware, machinery and equipment, technical level and degree of wear, as well as fertilizers and herbal remedies can be indicated as technological factors. Organizational and economic factors include the awareness of grain producers about market processes - delivery of predictable information on demand and its possible future prices to product producers, establishment of efficient grain marketing channel for producers, improvement of measures taken to protect grain producers and etc. Taking into consideration the above mentioned, we should seriously think of quality features in our country, grain production meeting the demands - inform the producers in this field, provide practical assistance to enable them to produce more quality grain. It is possible to speak about provision of food security for this product in the condition of sufficient production of grain meeting the quality features and demands. The per capita wheat demand for food purposes was defined in the level of 186 kg. Taking into account this indicator and the increase of country population in 2019-2023 (taking into consideration the number of population in 2001–2018, $Y=109,16 \cdot X + 7932,4$ forecasted based on the recourse equation, $R^2 = 0,9975$; X - the number of years, Y -the number of population in thousand persons) the demand for wheat ranges between 1861,23 - 1942,46 thousand tones.

At present, the volume of wheat produced in our country is close enough to this forecast, but because of the low quality of the wheat produced, its usefulness for the purposes of food is low. Therefore, urgent measures should be prepared and implemented in the above-mentioned aspects to improve the quality of wheat produced to minimize dependency on foreign markets.

ABSTRACT

The concepts of sustainability management and green project management are relatively new management concepts, especially for Russian companies. Implementation of this concept brings sustainable development principles - including economic, ecological, social, and institutional dimensions - in business strategy and project management processes that leads to long-term sustainability of the organization and increases its ability to cope with complexity. Russian companies face the need to spread the principles of sustainable development among their owners, managers and other employees. Despite the spread of the sustainable development concept over the last two decades, some challenges still remain - including the measurement of the project sustainability; the application of sustainable development principles and their adaptation to the needs of the project and company; the balancing of the economic, social, ecological, and institutional principles of sustainable development. Our study is focused on factors related to the implementation and balancing of sustainable development principles in the business strategy and project management of an organization. The research questions are as follows: What factors lead to the successful implementation of the sustainable development principles in the business strategy and project management of an organization? How to reach a balance between the economic, ecological, social, and institutional principles of sustainable development in project management? To conduct our study we used the method of an in-depth face-to-face interview with top managers of the companies. Our data-frame includes three cases from the Omsk region of Russia.

Keywords: *Green Project Management, Sustainable Development Principles, Sustainability Management.*

1. INTRODUCTION

Our study is focused on the application and balancing of sustainable development principles in the business strategy and project management processes of companies located in the Omsk region of Russia. Green project management and sustainability management are relatively new concepts for Russian companies, but they are getting more popular nowadays. These concepts may help Russian companies to cope with the increasing complexity of society, economy and environment. The concept of sustainability brings many challenges to the project management of an organization, including the measurement of the project sustainability; the application of sustainable development principles and their adaptation to the needs of the project and company; the balancing of the economic, social, ecological, and institutional principles of sustainable development. These challenges led us to ask the following research questions: What factors lead to the successful implementation of the sustainable development principles in the business strategy and project management of an organization? How to reach a balance between the economic, ecological, social, and institutional principles of sustainable development in project management? We followed a qualitative approach to address our research questions regarding sustainability assessment.

To conduct our study, we used the method of an in-depth face-to-face interview with the companies' top managers. Our data-frame includes three cases from the Omsk region of Russia.

2. THEORETICAL BACKGROUND

Sustainability is a key idea that lies in the basis of the concepts of green project management and sustainability management. Sustainability may be considered as the capacity of the system or process to maintain itself for a long time (Moldan and Dahl, 2007). The most known definition of "sustainable development" was made in the 1987 Brundtland report "Our Common Future" as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (WCED, 1987, p.43). Sustainable development may be defined as development that accepts the rights of all people and nations to grow and flourish today as well as in the future (Robertson, 2017). The concept of sustainable development is considered one of the most challenging concepts that has ever been elaborated on, despite its simple idea. Its main challenge is to provide the development of social and economic systems in harmony with the ecological systems of the planet. The sustainable development concept aims to provide everybody with the opportunity to lead a dignified life and protect the planet from damage (Moldan and Dahl, 2007, p.2). The concept of sustainable development includes three main principles: social, economic, and environmental. These three principles are known as the "three E's" (environment, economic, and equity) or the "three P's" (people, planet, and profit) and are also called "the triple bottom line" (TBL), the term introduced by John Elkington (Elkington, 1999). In other words, sustainable development includes the three following dimensions: ecological sustainability, economic opportunity, and social inclusion (Robertson, 2017, p.3). The fourth principle of sustainable development is institutional. This principle was included in the system of sustainability indicators by the UN Commission on Sustainable Development. The fourth principle of sustainability is not so well adopted as the three main principles, moreover there is a need for the development of sustainability indicators for the institutional component (Moldan and Dahl, 2007). The institutional component of sustainability may be considered as the acceptance of sustainability management institutions by an organization, as its intention towards sustainable development and the balance of economic, social and environmental objectives. The ideas of sustainability and sustainable development are associated more and more with green economy, sustainability management and green project management. Sustainability management may be defined as "the organizational practices that result in sustainable development" (Cohen, 2011, p.4). In the broad sense, sustainability management aims to provide the economic efficiency of an organization/project in the long term, simultaneously ensuring a high level of ecological and social responsibility. The Project Management Institute (PMI) defines sustainable development as a new management paradigm, which aids in coping with the complexity and dynamics of an organization, its projects and programs. According to PMI the principles of sustainable development - including economic, ecological and social – shall be used in all project management processes that allow for the improvement of the quality of the project results (Gareis et al., 2013, p.1). Green Project Management Global (GPM Global) is an international organization that develops standards in the field of green project management. According to GPM Global, green project management includes "tools and methods to manage the balance between finite resources, social responsibility, and delivering "green" project outcomes. It was developed for organizations to integrate project processes with sustainability initiatives to achieve business objectives while decreasing negative environmental impact" (Carboni et al., 2013, p.8). In the framework of the Green Project Management concept, "a Green Project Manager embodies the commitment to act as an agent of change by managing and directing efforts to maximize sustainability within the project life cycle, improving the construct and delivery of goods and services produced as a project deliverable" (Carboni et al., 2013, p.21).

To summarize, the concept of sustainability in project management aims to harmonize the economic, social and ecological interests in the short and the long term as well (Silvius et al., 2012). To analyze the green project management of an organization we will use four principles (components) of sustainable development – economic, ecological, social and institutional, applying them to the project management processes and deliverables. To formulate the research questions more precisely, let us proceed to the challenges and research gaps in the field of sustainability management and green project management.

2.1. Research gaps

The concept of sustainability brings many challenges if we want to implement it in project management in practice. One of the main challenges that faces science and practice nowadays is the implementation of sustainable development principles in the business strategy and project management of an organization (Carboni et al., 2013, p.29; Kohl, 2016). Another challenge is the balancing of the economic, social, ecological, and institutional principles of sustainable development in the management of an organization. To achieve the balance between these principles the organization must always meet the trade-offs between the different dimensions of sustainability (Gareis et al., 2013, p.41). These challenges led us to formulate our research questions.

3. RESEARCH QUESTIONS AND METHODS

- What factors lead to the successful implementation of the sustainable development principles in the business strategy and project management of an organization?
- How to reach a balance between the economic, ecological, social, and institutional principles of sustainable development in project management?

We followed a qualitative approach (Patton, 2002) to address our research questions regarding implementation and balancing of the sustainable development principles in an organization and its projects. Phenomenological methodology was practiced by different researchers in their qualitative studies in sustainable development principles (Gareis et al., 2013; Robertson, 2017). To conduct our study, we used the method of in-depth face-to-face interviews with top managers of three companies in the Omsk region of Russia. The structure of the interviews was divided into two modules. The first module is a module of general, or institutional questions in sustainability management and green project management; and the second module is a module of special questions in the three dimensions of sustainability – economic, social, and ecological (Carboni et al., 2013; Cohen et al., 2015; Gareis et al., 2013; Maltzman and Shirley, 2010; Moldan and Dahl, 2007; Silvius et al., 2017).

4. FINDINGS

The interviews were conducted with top managers of a petrochemical company, a chemical company and an engineering company, all located in the Omsk region of Russia. The Omsk region is located in Siberia and specializes in petrochemical refining, chemical production and engineering in urban areas. All three companies are large. Two of the companies implement their projects at the national level of the Russian economy and the other at the international level, and most of the companies' projects are commercial. The interviews were conducted from July to December 2018.

4.1. Module of institutional questions

The first question was about the strategy of sustainable development. The two companies that implement their projects at the national level have short-term oriented strategies of sustainable development that include strategic goals for the next one to three years; the company that works

at the international level has a middle-term oriented strategy of sustainable development (for the next four to six years). The strategies include all three principles of sustainability: economic, social and ecological, declaring that all three principles are equal for all studied companies. Between economic, social and ecological objectives, the economic objectives have a priority in the projects of the petrochemical company; the economic and ecological objectives have a priority in the projects of the chemical company; while all the different objective types are equal in the projects of the engineering company. The project planning of the petrochemical company includes the planning of outcomes for one or two years more after closing a project; the engineering company plans the project outcomes only to the end of the project that shows the short-term orientation (the same as the strategy of sustainable development). The project planning of the chemical company includes the planning of outcomes of some projects for up to 25 years that shows the long-term orientation. We asked our interviewees about the influence of balancing the economic, social and ecological principles in project management on the different indicators. The manager of the petrochemical company told us that balancing the principles of sustainable development in the projects leads to an increase in the value of the project's results, quality of project management processes and the ability of the company to satisfy investors and partners, but doesn't have much influence on the project's success, project risks and image of the organization. The manager of the engineering company considered the positive influence of sustainability management on the image of the company, its ability to find new partners and customers, the value of project results and the ability to reduce any project's risks, and the neutral influence on the project management processes. The manager of the chemical company told us that balancing the principles of sustainable development in the projects leads to a decrease of the project risks, an increase of the chances of the project to succeed, an increase in the value of the project's results, and it has a positive influence on the image of the organization, quality of project management processes and the ability of the company to satisfy foreign customers and partners, but the neutral influence on the ability to satisfy investors. The most important factors for all companies that would lead to the implementation of sustainability management in the organization were the need to find new or to continue to work with existing partners, including foreign partners, and the price increases of energy and materials, as well as in landfill waste. Among the important factors that may have an influence on the implementation of sustainable practices in the management of the organization were government policy, including the tax system; fines and penalties for unsustainable practices; and development of a generally recognized system of sustainability indicators. The need of the new image of a sustainable/ green company was considered an important factor only by the chemical company. The less important factors for all interviewees were the internal culture of the company, as well as the individual point of view of the company top managers, the internal desire for a new culture and new social paradigm. To conclude, the studied companies that work at the national level only partly accepted the sustainability institutions, their strategy and goals are short-term oriented, while sustainable development requires long-term orientation. The chemical company that implements projects on an international level accepted most of the sustainability institutions, its strategy and goals are middle-term and long-term oriented. The companies accept the equality of all three principles of sustainability, but in practice the main principle is still economic. These companies will continue to implement the sustainability principles in practice under the influence of external factors such as partners, markets and government, while the internal factors are less important for all of them.

4.2. Module of special questions

4.2.1. Social dimension

The social objectives are included in the general strategy of all studied companies. All the companies have objectives and use the key performance indicators (KPI) in the field of labor safety, education of the labor force and equal opportunities for all workers. All the project team members have an opportunity to study regularly. The companies aim for equal gender rights and non-discrimination in the recruitment process, but among the project managers 70% are men, while 30% are women, which is the same distribution among project team members in the petrochemical company, and 50/50% distribution in the engineering company, and 90/10% distribution in the chemical company.

4.2.2. Ecological dimension

The general strategy of each company includes some ecological objectives. In the project management of the petrochemical company the following objectives and KPI are included: carbon footprint, consumption of water, energy, and materials, and use of transport. This company doesn't assess the influence of the project on the environment before the project's implementation. The engineering company has the following KPI: consumption of water, energy and materials. The chemical company has the following KPI: carbon footprint and other harmful emissions, consumption of water, energy, and materials, and use of transport, and waste generation and recycling. All the companies use recycled materials in production; and the final products of the companies may be recycled as well. The companies use materials from local producers that allow them to reduce the use of transport and influence on the environment. Renewable energy is not used at all, while most of the waste is sorted and recycled.

4.2.3. Economic dimension

Most of the projects of the studied companies are economically sustainable. The companies use the following KPI: return on investment (ROI); net present value (NPV); cash flow; profitability; liquidity of assets; market share; employment growth; taxation. Such an indicator as agility of business is not used. The sustainability management of the companies has a positive influence on their ROI, market share and the regional economy. Thus, the preliminary results show that the companies that work at the national level of the Russian economy implement the principles of sustainable development partly, these companies don't have complex systems of sustainability management and green project management. The company that works at the international level implements the principles of sustainable development in its project management processes more comprehensively. The existing norms of sustainability management are under the strong influence of external factors. External sustainability requirements play a more important role than internal. To increase the level of sustainability the companies need to pay more attention to existing institutions of sustainable development, to support the creation and implementation of the internal institutions of sustainability, including the system of economic, social and ecological sustainability indicators.

5. CONCLUSIONS

This study provides a starting point in understanding factors related to the implementation and balancing of sustainable development principles in the business strategy and project management processes of an organization. The cases of a petrochemical company, an engineering company and a chemical company located in the Omsk region of Russia were considered. The balance between the economic, ecological, social, and institutional principles of sustainable development may be reached if the organization pays attention to all of them. The institutional dimension of sustainability shouldn't be ignored because it brings sustainability to institutions in the rules and norms of the companies and it allows them to

balance all the other three principles. The internal or external sustainability institutions are needed for the balance of the sustainable development principles. In the case of our companies, the institutions and practices of sustainability are implemented mostly under the influence of external factors (such as government regulations, partners or market influence). We wanted to find out what factors lead to the successful implementation of sustainable development principles in the project management of an organization. The cases of the petrochemical, chemical and engineering companies show that these factors are external incentives: good practices of the partners (especially foreign partners that work at the international level); government policy in the field of sustainability, including the tax system and fines and penalties for unsustainable practices; generally recognized system of sustainability indicators; price increases in energy, materials, and landfill waste. Internal incentives are less important; among them are the internal culture of the company and its top managers, the internal desire for a new business culture and new social paradigm.

ABSTRACT

The national standardization system of the Republic of Azerbaijan has been undergoing the significant reforms to meet the requirements of accession to the World Trade Organization and the process of integration into the European Union. In accordance with these reforms, existing national regulations are being replaced by strict international standards. In this process, it is necessary to bring the private sector in line with the new principles of standardization system, which is not easy and requires large investments. One of the most important elements of the adaptation of the national standardization system with international standards should be especially the development of the private sector to new system requirements. Thus, that will require billions investment from the private sector for the transition to the new system to be able to apply the new national standards based on international standards. To do this, it needs to think in advance about the necessary investments and preferential loan programs. In addition to this, the new system requires from the private sector the establishment of closer cooperation and development of standards, based especially on the needs of the private sector itself. This in turn makes inevitable by private sector to take a more active role in this process, so in order to take that role by the private sector it should be properly informed and the mechanism for participation should be formed. In the paper the authors analyses the changes applied to the existing national system of standardization, as well as aspects related to such a reform.

Keywords: *European Union, international requirements, national standardization system, private sector, World Trade Organization*

1. INTRODUCTION

As known, in relation to the membership of the World Trade Organization (WTO) and integration to the European Union (EU) the national standardization system of Azerbaijan has to be adapted to the requirements of those organizations. This will result in significant changes to the current system. Thus, unlike the current system, in the market economy system only the safety of products is regulated by the state. The quality of the products is regulated by the market itself. Therefore, the requirements on the safety of products, called technical regulations, are mandatory for implementation. The product quality requirements are reflected in standards and application of the standard is voluntary. Enterprises that want to improve the quality of products and thus get ahead of the competition are voluntarily applying these standards. At the same time the government limits its control by security of products. Another important change is taking foodstuffs control out of the national standardization system. In order to fulfill all these requirements the thousands of the existing Azerbaijan standards will be renewed as mentioned to meet international standards.

2. CHAPTER 1

The aspects of adaptation of the national standardization system to meet international requirements.

In general, the adaptation of the national standardization system to the international requirements will be implemented according to the following aspects:

- Adapting of the system itself to the principles of the market economy. Thus, in accordance with the market economy the standardization as technical regulation providing and applying of the mandatory requirements to the safety of the products and standardization defining voluntary requirements to the quality of products should be divided into two parts. This, according to the state control over the economy and the quality of the products safety regulation limiting the market makes it necessary to release the law of supply and demand;
- standards that form the basis of the system requirements for the products to adapt to the requirements of international standards. It is redesigning the existing standards to meet international standards. This is the most difficult element of the adaptation of the standardization system. Because of the fact that standards in former Soviet republics do not meet international requirements the tens of thousands of the existing standards have to be redesigned;
- product safety requirements for each product, product group and its overall safety record for technical regulations is to be developed. The former GOST standards include safety and quality requirements for each product, and this requires the development of standard for each product. But in international practice the security requirements of the product are defined in terms of security parameters, not in terms of product. So, whatever product has a security parameter this product is applied to the relevant technical regulations;
- identification of general requirements to the products in the technical regulations and liberalization of methods to meet these requirements. Along with determination of the requirements for products in the former soviet republics' standards, there a single mechanism to meet these requirements is also reflected. In international practice technical regulations specifies the security requirements only, but how they've met is carried out according to the rules shown in referenced standards or defined by the manufacturers itself. The manufacturers shall be deemed to satisfy the requirements of the technical regulations in case of at least one of the standards or the self-defined method is applied;
- institutional reforms in the management of standardization system. One of the major changes brought by adaptation is change of the structure and authority in government agencies responsible for the management of the national standardization system. So that, is required to carry out the necessary reforms to identify requirements of state bodies' authorities for security of products and limitation of these requirements by ensuring, preparation of standards and liberalization of the authority use, conformity assessment carried out by the private sector, in order to ensure one-sidedness, transparency and public participation;
- improving the safety and quality performance of products in conformity assessment system. According to the former soviet standardization system almost all products are mandatory certified and certification is carried out by state authorities. In addition, compliance with both the production and the market is under state control. But compliance with international standards requires that only high-risk products must be mandatory certified, compliance assessment of low-risk and mid-risk products shall be carried out by the manufacturers themselves, conformity assessment activities shall be carried out not by the state, but by the conformity assessment bodies accredited in accordance with international standards [1].

Apparently, it is necessary to carry out the significant changes in the current system to adapt to international standards. One of the key elements of harmonization of national standardization system with international requirements is taking into consideration the interests and potential of the private sector in Azerbaijan. Thus, the producers are the object of standardization. Those are parties who use the new norms.

Therefore, changes made will affect manufacturers in the first place. Therefore, coordination should focus the private sector as well. Thus, the adaptation of the private sector should be kept in the center of attention as well. Private sector related issues in the process of harmonization of national standards with international requirements. There are the following private sector related issues in the process of harmonization of national standards with international requirements:

- to involve the private sector to the development of new technical regulations and standards;
- to educate the private sector about the new technical regulations and standards;
- to provide transitional period for adaptation to the new requirements, technical support, concessional loans and assistance to the private sector;
- to support of the establishment of private enterprises which will carry out activities on the national standardization system;
- to adjust the consumer market to the new products.

3. CHAPTER 2

Now, let's comment each of these issues separately.

3.1. The involvement of the private sector to the preparation of new technical regulations and standards to the possible extent

As mentioned above, involvement of the private sector to the development of technical regulations and standards gives it a lot of benefits. So, by this participation they fully adopt the applied requirements, achieve taking into account its interests in these documents, learn other manufacturers' views and suggestions on this standard, get without investigation expenses scientific and technical progress achievements included in the standard etc. Therefore, according to the international experience it is considered appropriate that a most effective mechanism to adapt the private sector to the new rules is to involve it to the preparation of these rules. Although relative progress has been made in this area in recent years in our country, there are still problems in terms of unformed mechanism and lack of understanding of the importance of this issue by the private sector. In order to involve the private sector in this process the sectors or technical committees for products should be established. In the first phase it must be involved to develop mandatory subsequently applied technical regulations. As known, the aim of the development of technical regulations is to ensure safety of products for people, animals and plants. While scientific achievements and innovations, best practices and higher requirements on the quality of the products are considered when processing standards, whereas product safety indicators have taken as a basis when processing technical regulations. Therefore, accordingly the aim of participation of the private sector in processing of technical regulations should be development of safety requirements determined for its own products and while study of mechanisms to ensure it, the aim of participating in the development of standards should be in obtaining of the scientific achievements and new technologies and thus in improvement of the quality and competitiveness of their products. However, fulfillment of the safety requirements in technical regulations leads to safe and competitive manufacturers' products, and this in turn leads to increased confidence in their products and being more competitive. That is, in both cases the private sector achieves economic benefit when participated in the preparation of these documents [2,3]. In addition to the participation of the private sector in the national technical committees, its participation in the development of international standards and national standards of foreign countries should be encouraged. This is important either being a requirement of the WTO or taking into account the interests of the national economy in international standards and facilitate subsequent application of international standards in the country. On the other hand, the most important aspect which makes necessary the participation of the private sector in the development of regulatory documents is their contribution to how

the provisions of the international standards, taken as a basis, complies with the interests of the national economy, and which adaptations should be made in the national technical regulations and standards adopted on the basis of this international standard in terms of local climate, geographical, technological, environmental and economic factors. Because, there might be such requirements of international standards, direct application of which, due to the above factors, is not appropriate in our country. In this regard, what adaptations should be justified by the private sector to substantiate its position [5,6]. So, involvement of the private sector in both technical committees, either created under the State Committee on Standardization, Metrology and Patents of Azerbaijan for development of the technical regulations, or under Azerbaijan Institute of Standardization and Certification for preparation of national standards, is a very important issue. To ensure the participation of the private sector in the development of regulations the extensive educational work should be carried out first and then the benefits provided by such participation should be delivered to them. Some countries practiced to use premium payments and awards as promotional tools to motivate the participation of the private sector. Although it is advisable to carry it out for the development of technical regulations in our country, but it can be difficult to apply for the development of standards. In many countries, however, private sector pays the membership fee for participation in the development of standards. In addition to the participation of the private sector in the national technical committees their participation in the development of international standards and national standards of foreign countries should be encouraged. This, in addition to being a requirement of the WTO, is either important in terms of taking into account the interests of the national economy in international standards and further easier application of international standards in the country [7]. For this purpose, in accordance with the relevant technical committees of international standardization organizations an appropriate "mirror" committees should be established and discussion of international standards by these committees should be provided through the participation of local experts and the private sector. For this purpose, it is necessary to allocate funds from the state budget. At the same time, using the center of the inquiry and notification established on the basis of the WTO request the technical regulations of the WTO member states, the obtained projects of conformity assessment procedures passed to the private sector and review of these documents during the given period from the national interests point of view by the private sector must be provided.

3.2. To educate the private sector about the new standardization system

In our country, the representatives of the private sector are misinformed about the new approach due to operation based on the national standardization system requirements stand on Soviet era. While the national standardization system is in line with international requirements based on the proposed mechanism the private sector should be also well-informed about the nature of the new system. Thus, they must be tanned that the safety is the subject of regulation, but the quality is the subject of the market and they must be explained that implementation of either safety or quality requirements is the subject of competition and customer satisfaction in the market economy. It could be considered as a new approach for producers forced by the state to carry out such requirements for a long time. Therefore, the action plan to educate the private sector to be developed and the essence of the new system to be delivered to them through the followings:

- by organization of public events, conferences and seminars;
- by setting up the Training and Consulting Center under Standardization, Metrology and Patents Committee and by providing through it a free training to the representatives of the private sector on the nature and requirements of the new system;
- by giving free consulting to the manufacturers on new technical regulations and standards for their products, as well as on their application using the established center;

- by creating an information portal on technical regulations and standards;
- by preparation of the guidance on the application of any adopted technical regulation and by placing it on the website;
- by creating a system of national awards for safe and quality products production;
- by preparing of training and printed materials on the new standardization system and distributing to the private sector through the Institute for Standardization, universities and research institutes;
- by organizing regular activities and events in the press to raise awareness about the new system;
- by implementing joint events and projects along with public and business associations and other non-government organisations (NGO) etc.

3.3. Providing the transitional period, technical support, soft loans and aids for the private sector to adapt to the new requirements

We've noted that one of the most difficult moments in adaptation of national standardization system to international requirements and in ensuring the transition to the new system is namely application of the new technical regulations and standards to the private sector. So, for a long time the producers operating in Azerbaijan have established their production process in accordance with the current standards of their products. Being tougher and different than in QOST standards the requirements of the new technical regulations and standards must satisfy the requirements of the new regulatory documents based on international standards by making a significant investments. This first of all includes the means of production, in particular, the equipment, raw materials, renewing of the production environment, training for updating knowledges of professionals for new requirements, the assessment of compliance with the new requirements and other operating expenses. In international practice the transition period is given for the application of new technical regulations by the private sector. In our country within the process of WTO accession both for national standardization system to meet international requirements, as well as for the provision of new requirements by the private sector 7-year transition period has requested. After Ukraine has adopted the new technical regulations, except for the necessary safety measures, 1-3 year transition period has allowed for its' mandatory application. During this period the manufacturers are gradually applying the new requirements to their production processes. During this period, the current standards also remain in force [4]. It is considered appropriate to apply this experience in our country. During the voluntary implementation period it's important for the government to help manufacturers to understand requirements and application of new technical regulations by constant education, as well as by providing of free training and consultancy services. Another important point is provision of grants and soft loans to the producers, applying new technical regulations. For example, in this regard, the special state's financial aid program is carried out in Slovakia. So, within this program the government is covering the 65% of the expenses required to meet the guidelines of the European Union by producers [4]. This experience could be applied in our country in regard to manufacturers of the products which have a priority for the economy and export potential. Primarily, it would be advisable the fulfillment of the general requirements of technical regulations and compliance assessment to be met by these manufacturers. On the other hand, to apply technical regulations the preferential loans can be applied to the producers who guaranteed the safety of products and interested in the export of products. Thus, producers will be able to get preferential credit when they applied for it by noting that it aimed to apply the new technical regulations and standards. One of the main advantages of giving either soft loans or grants is safe and quality manufacturing of own products by manufacturers having such a support and by this to promote the government to manufacture the safe products in the local market.

Therefore, it is necessary to use these experiences within the financial opportunities of our country. This should be done in close cooperation with international organizations and financial institutions. Because, some of those agencies are carrying out these types of activities. For example, there is the program of the European Bank for Reconstruction and Development related to the covering of the 40-60% of the costs incurred for the implementation of international standards by the manufacturers of our country. The program is being implemented successfully [10].

3.4. Encourage the establishment of private conformity assessment bodies

Mandatory conformity assessment activities in the country for a long time carried out by the government prevented the establishment of private enterprises in this field. However, passing to the private sector this type of activity in our country as well paved the way for the creation of this type of enterprises. Most of the private certification companies operating in Azerbaijan are foreign and international companies. Local companies have shown little interest in this area. On the other hand, despite the fact that this area is liberalized, the provision of those services by state enterprises prevents the creation of private enterprises. Therefore, the expansion of this field is very important both from obtaining by manufacturers more competitive conformity assessment services and from the development of the business areas related to conformity assessment activities point of view. There are hundreds of private enterprises in this field in Europe. Competition among them leads to service quality improvement and price reduction for the services provided to the manufacturers. In our country, to encourage the industry the awareness and promotion activities should be taken in the first place. As well as technical support to fulfill the necessary requirements of local businesses and their accreditation should be conducted. Because, the lack of accreditation of local businesses means absence of international recognition of their compliance documents, which in turn discourages manufacturers from using their services. The accredited local companies should be registered and those companies should be recommended to the manufacturers [8, 9, 10]. One more issue should be noted that some even international certification companies operating in our country deceive manufacturers by selling fake certificates to them or give them for extra money a certificate before necessary requirements met by manufacturers. That's means delusion of consumers and sale of unsafe products to them. Therefore, in addition to promoting the creation of private enterprises, their operation in accordance with requirements, especially the mandatory certification of the products' safety parameters should be carefully controlled.

3.5. Adaptation of new products in the consumer market

Manufacturing of the products according to the new technical regulations and standards will lead to an increase of their production costs and thus, an increase of their market price. This will result in a rise in consumer prices in the market. Therefore, in order to prevent the increase of the prices of products as much as possible it is necessary to support the manufacturers to reduce their costs by usage of the above-mentioned financial aids, grants and soft loans. At the same time, the gradual measures in the direction of the improvement of social welfare and the increase to the level of consumer purchasing power in Europe should be taken. Another important point is the improving citizens' consumer culture and to be more demanding of products purchased, including the implementation of comprehensive measures for the protection of consumers' rights based on international experience. The harmonization of the product safety regulation system with the international standards leads to the giving more freedom to the manufacturers, which in turn leads to the abuse of freedom by manufacturers. In a market economy consumers are getting better than government to prevent this kind of abuse.

The exactingness of consumers makes manufacturers more sensitive than the exactingness of government. Therefore, the important measures aimed at developing a culture of consumer awareness should be promoted.

4. CONCLUSION

One of the most important elements of the adaptation of the national standardization system with international standards should be especially the development of the private sector to new system requirements. Thus, that will require billions investment from the private sector for the transition to the new system to be able to apply the new national standards based on international standards. To do this, it needs to think in advance about the necessary investments and preferential loan programs. In addition to this, the new system requires from the private sector the establishment of closer cooperation and development of standards, based especially on the needs of the private sector itself. This in turn makes inevitable by private sector to take a more active role in this process, so in order to take that role by the private sector it should be properly informed and the mechanism for participation should be formed.

ABSTRACT

Nowadays, private sources in some degree complement public financing all over the world. Developed countries not only interfere with the growth of private capital in health finance, but also contribute to this. However, the specificity of medical services as a good and market of medical services requires a compulsory regulation of private sector activity by government. The paper considers factors that determine private sector growth, formation of private payment structures in the different country categories. Besides, there are analysis of private funds attraction and the goals and mechanisms of their regulation by government.

Keywords: *co-payments health expenditure, private health expenditure, private health insurance*

1. INTRODUCTION

The reasons for the expansion of private payments include:

- conflict between declared and really provided guarantees for free medical care;
- uncontrollable increase in health care costs; patients' desire to reduce financial risks in this area;
- increase in people's well-being;
- increasing the social importance of health;
- expansion of the range of medical services;
- high specialization of the provided services in health care;
- state policy to stimulate the involvement of private capital in the health sector (for example, granting certain benefits to legal entities when concluding collective PHI), etc.

Private financing in all countries of the world to some extent complements public health financing, but its share in the overall funding structure varies widely by country. Comparative characteristics of the share of personal expenditures of the population in the total amount of expenditures in individual groups of countries allow establishing a feedback between the economic development of the country and the participation of private financing in covering the costs of medical care. For example, in OECD countries, on average, almost three quarters of health expenditure is generated from public sources (either the state budget, social health insurance) (FOCUS on Health Spending, 2015). The level of the public expenditure on health is one of the determinants of attracting private payments at the time of receiving medical care. However, it would be wrong to think that an increase in state funding in absolute numbers helps to reduce private spending of the population. Studies show that the growth of state spending in absolute terms stimulates the growth of personal expenses of the population, as payments on co-payments and services that go beyond guaranteed increases.

The change in the ratio of state and private expenditures in this case is determined by the comparative elasticity of state and private expenditure on income (Xu et al, 2010:12). Studies show that in low-income countries, public health spending grows in parallel with GDP growth, and cash payments lag behind GDP growth. In middle- and high-income countries, public spending on health is growing faster than GDP, while payments from the pocket are growing in much the same way as GDP (Xu et al, 2010:14).

2. CHAPTER 2

2.1. Characteristic and structure of private expenditure on health in different groups of countries

Private payments include direct payments (purchase of services with payment at the time of receiving services in full), co-payments (covering part of the costs of treatment of services), private health insurance, and unofficial payments. Any country uses all these financial mechanisms in one way or another. Direct payments allow for a wider coverage of health services; to provide services of the best quality, at the right time, taking into account special preferences; to strengthen competition in the market of medical services. However, the spread of private payments, as experience has shown, reduces access to health services, worsens the health of the population and poses a threat to national security in the long term. In addition to the above spectrum of negative aspects, they are associated with a number of difficulties associated with ignorance of prices, qualifications of specialists, unpredictability of current and forthcoming monetary costs. On the other hand, the provider is not informed about the patient's previous health condition, which requires additional time and the use of additional diagnostic methods, which are often duplicated. Ultimately, this affects the quality of treatment and reduces effectiveness. These payments are non-consolidated, regressive, unfair, both horizontally and vertically. In addition, direct payments induce demand for services, and contribute to higher health care costs. Finally, in some cases, there are real opportunities for involving the patient in shadow relationships. However, the payment for treatment can be too high for the patient. Financial barriers of a minor degree are also associated with transport costs and lost income associated with disability (Goudge et al., 2009; Clemans-Cope et al., 2008). All this can lead to catastrophic financial losses. In some countries, 11% of the population faces such severe financial problems every year and up to 5% are in poverty. Every year around 150 million people suffer catastrophic financial losses and 100 million people are below the poverty line. Health care expenditure is defined as catastrophic when personal household payments exceed more than 40% of income after deducting expenses for basic needs (Report on world health, 2010). The analysis of household investigations from 59 countries showed a huge range in proportion to those that faced catastrophic payments from their pockets - from less than 0.01% in France and up to 10.5% in Vietnam. However, even in developed countries, this indicator could be more than 0.5% (Portugal (2.71%), Greece (2.17%), Switzerland (0.57%), and USA (0.55%). It is shown that 1% increase in the share of total health expenditure provided by cash payments is associated with an average increase in the proportion of households that faced catastrophic payments by 2.2% (Xu et al, 2003:566,570). The probability of financial catastrophe and impoverishment drops to a negligible level only if the share of direct payments drops to 15-20% of total health expenditure. This is an elusive goal, and richer countries may seek to implement it, while others should set themselves more modest short-term objectives. For example, WHO Member States in the region of South-East Asia and the Western Pacific region have set a target to reduce the share of such payments between 30 and 40% (Report on world health, 2010). The danger is that the receipt of revenues from paid services can become a major factor in the activities of suppliers, especially during a period of declining funding from the state. As for unofficial payments, information about their amounts is severely limited due to the fact that they are usually paid face to face and are prohibited by law.

We also have to take into account the corruptness and opacity of the system itself, which not only hides the facts of informal payments, but also in every way promotes their development and dissemination. The practice of informal payments is most developed in the countries of Central and South-Eastern Europe, the countries of the former Soviet Union. The main reasons for the spread of informal payments are the failure of public funding, low incomes of medical personnel, lack of knowledge of patients' own rights, and in some cases, the connivance of the state, which, in general, is quite such financing of the sphere, which does not require radical measures. The studies conducted by Shishkin S., revealed a significantly higher prevalence of shadow payments in health care in regions, where the practice of developing paid services is not encouraged (Shishkin, 2003:8). At the same time, if the policy of distributing funds received on the basis of paid services does not suit doctors, this may become an additional reason for the development of illegal relations. Informal payments are one of the least solidary and effective forms of personal participation of the population. In Kazakhstan, for example, hospitalization of one member of an insolvent family takes 252% of monthly income, while for affluent people this procedure costs 54% of the total income (Sari et al., 2000:38). One can note the following effect of informal payments on the demand, supply and quality of medical services:

- Increase progress of prices for services and decrease in the volume of services.
- Reducing investment in human capital.
- Reducing government revenues due to large volumes of employees' income through unofficial channels.
- Decrease in the quality of services, qualifications of specialists,
- Slowing services to force the consumer to make unofficial payments.
- Doing the effectiveness of health care financing as a result of erasing the picture of real distribution of funds in health care and introducing practices called creeping privatization or privatization from within.
- Creating an obstacle to the development of a private health care system.

Thus, the increase in the share of informal and direct payments in the overall structure of private spending on health reduces the effectiveness of the health care system, deforms the real picture of the demand for services, efficiency, breaks down the policy of stimulating the activities of health workers, worsens the health of the population, provokes an unjustified increase in health care expenditure. However, in some cases informal payments can be more progressive and more solid than formal payments: health workers have the possibility of individual treatment of patients, if these incomes are not recorded anywhere. Thus, formal and informal direct payments are the least socially acceptable and effective forms of private financing. Analysis shows that payments from the pocket at the time of the provision of medical services act as the main source of funding only in developing countries. At the same time, voluntary medical insurance is considered as the most solid, fair and effective form of attracting private funds of the population. In all OECD countries, PMI is more common than cash payments((The World Bank database, 2018). At the same time, the smallest gap is observed in Latvia and amounts to 597 and 610 US dollars, respectively, for cash payments and PMI, the largest - respectively 1054 and 4815 dollars (data for 2015). The PMI uses the principles of equivalence and closed damage mapping and reveals a direct relationship between the size of the insurance policy and the volume and quality of the medical services received. VHI is relevant only in the market economic system, where it is a financial mechanism for managing the risks associated with human health. Insurers are interested in quickly curing a patient with minimal expenses while doing so. Accordingly, they work with the best specialists. Moreover, insurers are interested in a healthy patient. To achieve this goal, a healthy lifestyle is promoted and encouraged in every possible way. Up to the point that VHI can be carried out by the condition, which provides for the payment of the sum insured not only in cases when the insured is sick, but also when he

does not fall ill. Payment for a healthy lifestyle is made after the termination of the contract (Qinzburq, 2004:61). On the basis of interaction with the state health system, are distinguished:

- Additional VHI programs, which include either those types of medical services that are not included in the guaranteed package, or higher conditions for medical care included in the state program. Naturally, these types of insurance imply a clear definition of government obligations;
- Substitute VHI programs, which give the choice between CHI and VHI. These programs are dangerous because wealthy people have the right to exit their public funding system, which undermines the principle of solidarity. As a consequence, substitute VHI programs have a local distribution (in the Netherlands and Germany), and that are connected with historical traditions;
- Residual VHI programs are designed to compensate those expenses that are not covered by MHI. These programs are widely used in countries where co-payments are practiced. In France, for example, private insurance is widely used to cover approximately 20% of the cost of inpatient care, not funded from SMI funds (Sheiman, 2001:63).

Private health insurance is one of the most solidary and effective mechanisms for financing health care. It is regressive in the cases when it is preferential or compulsory and when the majority of the population uses this for insurance (USA, Australia). Additional private insurance is regressive, especially if middle-income people buy insurance of this kind. An additional alternative or substitute form of health insurance is the least regressive and even moderately progressive because insurance is bought mostly by wealthier people. Private health insurance does not comply with the principle of "horizontal" social justice, i.e. the patient in the original pays more than healthy one. In the countries where there exist the options for withdrawing from the CHI system (Germany, the Netherlands, Spain) (for Germany, the transition from CHI system to VHI is allowed only if the annual income exceeds 59,400 euros), most of the remaining people have low incomes and high risks. Therefore, this system is regressive. However, the possession of broad statistical information creates conditions for the selection of risks, when insurers, based on their material benefits, try to screen out clients with a high probability of disease occurrence - there is a so-called negative selection of risks. Although in many countries such screening is prohibited, mass media can find a way out by offering, for example, programs that do not include disadvantageous types of health services. It is possible also a positive selection of risks, in which the selection is made by the already insured persons, who can impersonate a relatively healthy person and at the same time know that he, needs serious treatment. An important factor is the risk of dishonest behavior of patients, when the possibility of free treatment for medical services induces a temptation for repeated unnecessary appeals. This leads to an unjustified increase in expenditures and the irrational use of limited resources. The same problem takes place in the national insurance system, be it a social or budgetary form. To combat such a manifestation in many countries are introduced co-payments. In the countries of central Europe (Czech Republic, Hungary, Poland, Slovakia) the cost sharing ranges from 24 to 27% (Baji et al., 2012) and cover mainly dental care, pharmacology, and ophthalmology. The co-payments are carried out in the following forms:

- Co-payments of the insurance premium, implying a contribution paid by the employee as an addition to the employer's contribution;
- Co-payment of citizens who are paid for when they receive medical assistance (in the form of a fixed fee or a fee for each service);
- Deductibles - deduction of a certain amount from all insurance payments;
- Balance invoicing - an additional fee charged by the supplier beyond what he receives from a third party payer.

The essence of the co-payments is the joint participation of the state and the population in covering the costs of medical care. This is one of the most fair and effective form of attracting private funds of the population. At the same time co-payment of the insurance premium is better ensured by the principle of social justice, because in the process involved both sick and healthy people. Proponents of charging user charges say that such charges reduce the overall demand for services (initially it was assumed that the number of unreasonable calls is reduced, since completely free services create the temptation of repeated treatment without special need) and increase the income that can be used to expand the supply of medical services. Co-payments are used to ensure continuity and coordination of treatment, if, for example, visits are made to a specialist without referral of a family doctor. The introduction of co-payments to a more expensive drug contributes to a more rational choice in favor of generics. In addition, the introduction of co-payments makes patients not only more responsible for their health, but also more observant about the actions of medical personnel. In the Netherlands in 2013, people had to pay 350 euros (420 USD) before claiming compensation from health insurance. In Switzerland, there is an annual franchise of 300 Swiss francs (211 USD) for all services. However, consumers can choose insurance contracts with lower premiums and higher deductibles (up to 2,500 Swiss francs or 1,756 USD per year). In the United States, many health insurance plans have common deductions. For example, 78% of employees faced franchises in the framework of health insurance plans funded by employers in 2011. The average total annual deductible for all employees covered is \$ 1,135 (Paris et al., 2016:22). At the same time, as a result of some studies, it appears that cost sharing reduces the intensity of use of both inefficient and effective procedures. Studies of Grady, Christensen, and others allow us to draw an important conclusion that co-payments restrain the use of preventive medical care, especially in risk groups-that is, in elderly patients, as well as in patients with chronic diseases, low incomes and (Christensen, 1995; Rice & Morrison, 1994). Another question of interest to us is how important is the role of co-payments in raising the revenues of the health care system. The data allow one to establish that the revenues received from official fees rarely exceed 5% of the total amount of health care income. At the same time, we should not forget that the introduction of a system of co-payments can be accompanied by huge administrative and time-consuming costs. Thus, in 1999, the Netherlands abandoned the cost-sharing system introduced in 1997 due to the high administrative costs associated with carrying out the life of the new policy (Kasje, et al., 2002). For user charges to be effective, one needs to ensure that the cost of charging fees is lower than the additional revenue. The experience of developing countries shows the need to overcome significant administrative, informational, economic and political obstacles. An example of an unsuccessful policy can be cited Czech Republic, where the introduction of insurance co-payments in the absence of incentives to contain costs both from the supplier and the patient led to the opposite result and contributed to a twofold increase in health care costs in the first two years of medical insurance (Massaro et al., 1994:1872).

2.2. State policy on private sector involvement

Although health is one of the priority areas, health care spending should be within the framework of reality, expediency, rationality. Steady growth in spending in the sphere requires significant diversion of funds from other sectors of the economy. Moreover, these costs, due to a number of healthcare features, can not be naturally regulated by market mechanisms. They require the development of the public sector, state regulation, lead to an increase in taxes with all the ensuing consequences. The high level of health care costs not only withdraws part of the funds from production, but also deforms the market, shifts it from the liberal model to the radical one. From this point of view, attracting private capital to the health sector allows one to relieve the state budget, to develop other spheres. In addition, it is possible to ensure the timely receipt of treatment; provision of better services; the formation of the necessary infrastructure;

increase the incomes of medical workers, introduce new technologies, and innovate in the sphere; strengthening competition in the market of medical services. At the same time, countries that have developed health systems are trying to maximally finance the health sector at the expense of public funds (or social insurance funds). Realizing the complexity of the choice of private capital as an additional source of health financing, the governments of the countries try to maximize the share of state funding, and the involvement of private funds into two socially and financially justified forms - VHI and co-payments. The choice of the structure and volume of free medical services defines a field that is free for the development of the private sector. From this point of view, it is very important to choose the right criteria when forming a state package and to improve this process. In Switzerland, for example, personal expenses for dental care that are not included in the guarantee package constitute about 5% of total costs, and for the whole spectrum of primary care, funded mainly by the SMI - only about 4% (De Pietro et al. 2015). There are several models of prioritization. The Dutch model of prioritization, for example, used four criteria: the need, effectiveness, cost-effectiveness of treatment and the possibility of paying for treatment by the patient. The Swedish model is based on three basic ethical principles, the sequence of which determines the order of priority:

- The principle of human dignity: all people have equal dignity and equal rights, regardless of their personal qualities and functions in society.
- Principle of need and solidarity: resources should be directed to the areas of maximum need. It should also pay attention to those groups of the population who are not aware of their human dignity, those who have less opportunity than others to force themselves to hear or use their rights.
- Principle of economic efficiency: the choice of field of activity or methods should depend on a reasonable correlation between costs and economic effect, which is measured by improving health and quality of life. This principle should be used only when comparing different methods of treating the same disease (Bihari-Axelsson, 2002:6-9).

The specificity of medical services as a commodity, as well as the medical services market, requires mandatory state regulation of the private sector. Intervention by the state implies both direct and indirect regulatory measures. To direct it is possible to carry obligatory participation in system of division of expenses; the choice between CHI or VHI systems; the introduction of certain restrictions and prohibitions for insurers on VHI; establishment of the order of the provision of VHI and paid services, co-payments; wider use of licensing and certification; rarely a ban on the introduction, for example, of private payments. Indirect changes include public health financing, the size and structure of the proposed MHI aid, health infrastructure, etc. Analysis shows that private payments can act as an additional, but not an alternative source of health financing. The policy of the state in attracting private funds implies the formation of an additional source of financing, without violating the principle of social justice, solidarity, as well as the equality and accessibility of medical services for all citizens of the country. In order to stimulate VHI, tax privileges are granted to insurers and insurers, the choice is possible between MHI and VHI, the introduction of public VHI. The Governments of Germany, the Netherlands and, to a lesser extent in Belgium, are actively intervening in the replacement VHI market to ensure the availability of this type of insurance for people with low incomes, pre-insurance illnesses and for the elderly. The governments of Germany and the Netherlands also seek to prevent the consequences of selecting applicants according to the degree of risk, within the framework of legally approved and voluntary health insurance schemes. Measures are being taken to increase the availability of private insurance. In France, in 2000, free extended LCA was introduced for people with low income, so coverage of the VHI population increased from 85 to 94% (Mossialos & Thompson, 2004:18-22). One of the main problems in the VHI market is the price increase, the more this applies to individual VHI.

It was assumed that the system for the formation of a single VHI market, approved in 1994 by a Council of Europe directive, would increase competition between insurers, while expanding the choice of types of insurance for the consumer and reducing its cost. However, the increase in competition did not affect the amount of contributions, in particular for individuals. Conversely, individual insurance prices often increase faster than health care costs in general. Therefore, the insurer is required to inform potential customers of the likelihood and scale of the increase in contributions, and it is also recommended to publish data on the increase in contributions in recent years (Mossialos & Thompson, 2004:20). As for co-payments, they are subject to a narrow range of medical services - as a rule, medicines, dental and ophthalmologic care. Inpatient and outpatient primary health care, as well as laboratory tests and diagnostic studies, are covered by the public health system at a higher level. In general, the share of private expenses related to participation in payments under state insurance is insignificant. In Germany, for example, the amount of co-payments paid by patients in the social insurance system is less than 5 billion euros, which is only one-seventh of all cash payments (Busse & Blumel, 2014:133). At the same time, the necessity of the service, to which the co-payment will be applied, its effectiveness, efficiency will be strictly taken into account. Thus, in the group of medicines, the most necessary medicines - for the treatment of life-threatening diseases - are subject to a smaller amount of co-payment for the patient. An analysis of the survey conducted in Ireland showed that in relation to treatment for dentists, the most well-off 20% of the population accounted for more than 28% of applications (Zaborovskaya & Shishkin, 2005:17). Nevertheless, in order to maintain the principle of social justice, in almost all countries there are groups of exceptions from co-payments - children, the elderly, pregnant women, patients with low incomes, with disabilities. They are either generally exempted or are paid at reduced rates. Annual maximums for co-payments are introduced, after which the insurance organization begins to pay services at full cost. Thus, co-payments in developed countries are used not so much to attract additional funds, but to rationalize the funds used, as well as to reduce cases of dishonest treatment.

3. CONCLUSION

Health care is one of the priority spheres of any state. Not surprisingly, health spending in many developed countries is faster than their economic growth. At the same time, growth in health care expenditure is observed both during economic growth and during the economic crisis; although during the crisis there is a drop in growth rates. But an analysis of the structural dynamics of expenditures reveals a more significant increase in private payments in the pre-crisis post-crisis period, as well as in the crisis period. With the overall structure of expenditure, a more significant increase is observed in private insurance. In part, the private sector has expanded as a result of measures introduced in a number of countries. They included an increase in co-payments for prescription drugs and an increase in the reimbursement threshold for pharmaceuticals, a reduction in generic reimbursement, a reduction in dental packages, an increase in inpatient costs, an expansion of primary cost-sharing, and a reduction in benefits for certain population groups. The determining factors in attracting private sector are: economic development of the country, absolute and relative indicators of public health financing; volume, structure, quality of medical services provided in the framework of national insurance; the elasticity of public and private expenditure on income; and also cultural, historical, geographical, political, social features of the country. At the same time, the specificity of medical services as a commodity and the market of medical services require mandatory state regulation of the private sector. The spread of private payments, as experience has shown, reduces access to health services, worsens the health of the population and creates a threat to national security and the prerequisites for increasing health care costs in the long term. The high costs of obtaining medical care, loss of income can lead to financial catastrophes, which are

observed in both developing countries and developed countries. Analysis of the forms of private fundraising shows that payments from the pocket at the time of receiving medical care are the most unacceptable: out-of-pocket payments and unofficial payments. They are characterized by a violation of continuity, coordination in treatment; uninformed about their rights; unpredictability of current and forthcoming monetary costs, inefficiency. These payments are non-consolidated, regressive, unfair, both horizontally and vertically. They contribute to increasing health care costs, deform the real picture of the demand, the effectiveness of medical services, disrupt the policy to stimulate the activities of health workers and create conditions for involving the patient in shadow relationships. That is why direct and informal payments cannot be an alternative source of financing, and as the main mechanism for attracting private capital is used only in developing countries, although to some extent they are also inherent in developed countries. In the high and middle income countries, the most solid and efficient types of private payments are widely used - private health insurance and co-payments. The policy of the state in attracting private funds implies the formation of an additional source of financing, without violating the principle of social justice, solidarity, as well as the equality and accessibility of medical services for all citizens of the country. This implies reducing the share of direct and unofficial payments, and encouraging the expansion of VHI and co-payments with the introduction of new mechanisms to increase their social equity and fairness.

ABSTRACT

Traditional approaches to human capital management do not work practically at all nowadays, since they are based mainly on the hypothesis that employees are conscientious. An enterprise would act as a provider of a social and scientific stereotype of an employee's labor behavior. At that, the focus of individual self-conscience, which grew up during the third industrial revolution, has shifted considerably towards closeness, social deprivation, and economic alienation of a personality from an enterprise, society, and family. Even though present-day CEOs are well aware of the logics of the motivation process, their awareness does not provide comparative advantages in human capital management, since motives are not obvious. Traditional need-based and process-based theories (by F. Taylor, A. Maslow, D. McClelland, F. Herzberg, V. Vroom, J. S. Adams, etc.) make it possible only to guess which particular motives prevail, but it is difficult to "identify" them. Even application of the Total Performance Scorecard (TPS) by H. Rampersad is limited considerably. The main drawback of all those theories is the axiom of progressive development of a company, which does not consider with mentalities of working generations. Owing to strong turbulence of the world economy, one should change approaches of human motivation by emphasizing conscious development of individual human capital; the paradigm of management of those processes at an enterprise has to be altered actively. This paper analyzes employees' motivation to labor and conscious development of their personal human capital by applying J. Collins's developments related to continuous self-improvement of companies; our analysis is based on reasons for bankruptcy of the world's largest companies. Special attention is paid to changes in mentality of employees related to Generation X, Generation Y (the Millennials), and Generation Z. This article presents a complex sociological survey that has concerned Russian and Azerbaijani employees and their employers; this survey has confirmed efficiency of the suggested approach to productive management of human capital.

Keywords: *human capital management, innovative approach, mentality of generations, motivation, turbulence of economy*

1. INTRODUCTION

Modern managers are facing a problem that they did not have to face before – the traditional approaches to management of human capital, which used to be efficient, are of little efficiency now; quite frequently their application leads to the opposite result. Now we all cannot but consider with the current reality of the fourth industrial revolution, which, firstly, is a challenge for the humankind, and secondly, it disorientates the traditional views on life (including labor life), the society, and the family significantly.

New progressive technologies, which have broken into all the life spheres, have changed employees' and employers' labor mentality considerably. Besides, one should not forget about a considerable difference between Generations X, Y, and Z. That is why one has to develop innovative approaches to management, considering with tendencies of technological development and mentality of working generations.

2. APPROACH

One could classify the traditional approaches to motivation in the theory of human capital management as follows: the original and the modern concepts.

2.1. Human Capital Management during the First Industrial Revolution (Late 18th – Early 19th Centuries)

As for the original concepts, which, in our view, may be regarded as pre-scientific ones, one could mention "the carrot and stick policy" applied by managers in large scales practically up to the middle 19th century. At that time, an employee was regarded as an intimidated, uneducated, and always hungry being, who was unable to approach his or her work creatively, as he or she had to earn for living to survive. All that formed a psychological rejection of innovations in the labor process. An employee brought this behavioral stereotype to his or her family, upbringing future generations imperceptible to other means of motivation except for "the stick". This stereotype also restrained one's willingness and need for education. Searches for "sweating" systems of management, which were firmly instilled in management's conscience and which aimed to maximize profits with the workforce's minimal wages, resulted in a considerable slowdown of the social economic development. The human capital was underestimated considerably. Labor remuneration on the point of physiological survival, absence of finances for quality healthcare and cultural development resulted in a rapid "wear and tear" of the human capital. There was a significant imbalance towards unclear knowledge at enterprises, which slowed down introduction of innovations, owing to a high level of staff turnover and a low labor life expectancy of those who had that knowledge. As it is well known, the era of the first industrial revolution began in the late 18th century. It resulted in a mass application of water and steam engines, machinery, and development of metallurgy; it also meant a complete restructuring of the society, urbanization, and a sharp increase in labor output. One should remark that K. Marx regarded a quality change in social characteristics of the labor process and the social structure as the main result of the first industrial revolution. All that required a new type of an employee. Industrial production based on machinery cooperation formed an employee of an essentially new type, who would be able to work as a team member. The very paradigm of views on the labor process was changed – from personalized labor (when the labor was of manual nature) to collective one. One of the first authors, who gave scientific grounds for the pre-scientific concepts of innovations, was A. Smith, whose late-18th-century "An Inquiry into the Nature and Causes of the Wealth of Nations" emphasized the fact that any human would always strive to improve their wealth. That is why one should apply "the carrot method" more actively. Owing to economic development of the society, in his view, rising wages and wealth result in the population growth. One should remark that A. Smith grounded the necessity of higher wages for employees whose positions require special training and education. F. Taylor's work "The Principles of Scientific Management" points out that owing to a new structure of labor, one should pay special attention to more educated people and appoint them to management positions. At that time, the science of management undergoes a new development stage; emergence of scientific management relates to it. Labor time keeping and regulation are introduced. F. Taylor, the founder of this research school, based his ideas on the thesis "high wages and a low labor cost". The first industrial revolution meant not only a shift from the agrarian structure of economy to the industrial one; it also implied the first bonus

systems of labor remuneration. In 1901, H. Gantt developed the first bonus system for labor remuneration; once employers implemented it, they saw the labor output double. H. Gantt was the first to emphasize the key role of the human factor in economic development; he pointed out that a human ought to regard labor not only as earning for living, but also as something satisfying.

2.2. Human Capital Management during the Second Industrial Revolution (Late 19th – Early 20th Centuries)

A high speed of scientific progress during the first industrial revolution resulted in entirely new technological solutions, among which one should mention mass electrification, telephonization, breakthrough technologies in the oil and chemical industries, and invention of automobile. A significant intensification of production required more and more educated employees, whose wages would be high. Need for manual labor decreased dramatically; the social stereotype of value of education began to form. The second industrial revolution convinced both employers and employees that costs for education were non-recurrent; they could be recovered throughout the whole labor life and during several production cycles; educated employees are more efficient for business and more perceptible to new technologies. Yet, as their education level increases, employees become more demanding to considering with their needs. This is when H. Fayol and M. Weber formed the administrative school of management. The researchers believed that each employee ought to strive to accomplish standard and nonstandard goals set for him or her. In accordance with this paradigm, various means of compensation and rewards for additional and high-quality work are welcomed. At that, the administrative school of management laid special stress on not employees' self-development and their non-material needs, but their accomplishment of predetermined goals of production. Besides technical and technological breakthroughs, a rapid growth of Psychology and Sociology takes place at that time. Practically simultaneously with the administrative school of management, the human relations school is formed (E. Mayo, M. Follett); it accentuates on the drawbacks of the former one. These researchers based their school on the paradigm that employees' actions are motivated by mainly non-economic factors (as advocates of earlier management schools believed) – by various needs that money can meet only partially. For the first time it was grounded that confrontation between employers and employees may be relieved by meeting the workforce's social and psychological needs, which can result in an increased labor output by eliminating employees' alienation from the outcomes of their labor. Having accepted this paradigm, the researchers asked themselves the question "How do we meet employees' needs if we do not know them?" As an answer to this question, the behavioral school was formed (D. McGregor, A. Maslow, and F. Herzberg); it focused on increasing the efficiency of an organization by establishing human relations among its workforce. One could identify two essentially different approaches that have formed the need-based and process-based theories of management. The need-based theories (A. Maslow, C. Alderfer, D. McClelland et al.) identified internal motives that make people act a particular way, i.e. they are based on studies of their needs. The process-based theories of motivation (V. Vroom, L. Porter & E. Lawler) are based on human behavior considering with their perception and cognition, expectation of a reward, and their personified assessment of how well-deserved the obtained reward has been. However, despite numerous speculations concerning employees' needs, nothing new (except for piece-rate and time-rate labor remuneration) was invented and suggested. Various motivational non-material approaches to workforce management gave a short-term result.

2.3. Human Capital Management during the Third Industrial Revolution (1970s – Late 20th Century)

The multiplication effect of scientific knowledge of the 20th century resulted in a shifted focus of added-value obtainment from production to projection. If the earlier industry development stages required the maximal amount of resources at the final product manufacturing stage, the later times prioritized the stage of product development. Formation of profit began to take place at the development stage, not at the stage of production. The third industrial revolution took place thanks to digitalization, development of electronics, total automation and robotization of the production process. As I. Agamirzyan states, "the main work is done not on the shop floors; it is done in offices full of designers, engineers, and programmers. On unmanned shop floors, hardworking and industrious robots create products as per the set program. Economic leadership will belong not to the owner of industrial capacities, but to the possessor of the best engineering culture. Modern economy is justly named knowledge-based, since it is indeed based on knowledge" (Agamirzyan, 2018). Accordingly, the approach to increasing the workforce's interest in highly efficient labor underwent changes as well. This time saw the first labor remuneration systems based on employees' participation in the corporate capital. However, they were not applied in large scales. Research focused on strategic management, as part of which attempts to connect the corporate development strategy and decomposition of strategic tasks to the level of structural units and employees were made. The well-known Total Performance Scorecard (TPS) by H. Rampersad has proved its efficiency. As part of this system, a reward matrix was developed; it helped employees realize their positions and identify themselves in relation to corporate values and activities. H. Rampersad wrote that TPS is a continuous process of non-stop, consecutive, and regular enhancement, development, and education; it aims at a sustainable growth of results of activities that employees perform. Enhancement, development, and education are the three basic constituents of this integral management theory. They are in close correlation, and a balance ought to be between them (Rampersad, 2005, p. 6). H. Rampersad, one of the few modern researchers, who pays special attention to internal, not external, human motivation, insists that material motives exert a rather limited influence upon the present-day world. He developed the Personal Balanced Scorecard (PBSC), which includes four groups of elements: the internal group – employees' health and morale; the external one – an individual's social relations; knowledge and education – skills and abilities to study; the financial one – financial demands and ways to meet them); it also includes the sequence of an individual's actions to achieve them. Ways to achieve harmony in each element imply making up a particular "roadmap" for an individual to achieve their life goals by performing labor activities in accordance with the values that guide them. The "roadmap" makes it possible to reveal the shift from a personal mission via personal vision, personal key roles, personal critical factors of success, and personal goals to personal indicators of activities and measures to improve them. A considerable achievement of H. Rampersad's development is an opportunity to demonstrate the workforce adherence to individualistic values with a well-manifested collectivist model of interaction, thus meeting one's needs in involvement. Simultaneously with these positive changes in production technology, employees' knowledge become out-of-date much faster. The total sum of human knowledge doubles each two or three years. Knowledge increases exponentially. Each new knowledge provokes increase in knowledge in adjacent spheres, thus giving birth to a new array of knowledge. All that results in continuous organizational changes, which the workforce resists. Fear is a natural companion for any human, who is afraid of not finding the right place in a new architecture of production. The speed of emergence of new knowledge is much higher than that of employees' training. It provokes people's closedness; as a result, it leads to their social deprivation and economic alienation from their employers, their society, and their families. Prior to the fourth industrial revolution, the humankind faces an unprecedented challenge – humans as a source of labor force

are fully replaced by AI machines, which surpass them hundreds of times. An avalanche-like increase in demand for highly intelligent employees results in objective barriers that are difficult for common employees to overcome and enter the market of highly qualified labor; thus, their work is paid poorly, and an employee cannot make that better. It is aggravated by the fact that researchers' developments included the axiom of progressive development of organizations and did not consider with mentalities of working generations. These are the problems that managers have had to face in the early 21st century.

2.4. Human Capital Management during the Fourth Industrial Revolution (2000s – Present Days)

Global industrial networks, the Internet of Things, the virtual and augmented reality, blockchain technologies, cloud computing – all these innovations have penetrated the production process of present-day companies over the last decade. The fourth industrial revolution has influenced the world stronger than all the three previous industrial revolutions put together. K. Schwab, one of the first researchers to concern the fourth industrial revolution (Schwab, 2017), believes that the current level of management and awareness of the current changes in all the spheres of human existence is rather low if compared with the necessity to reconsider the economic and social systems. Today the question is not whether we are prepared to accept these changes. The question is whether we can comply with the new requirements towards new employees and managers. Implementation of new technologies relates to disqualification of existing employees, a considerable retardation of educational programs and individual paths of an individual and the society. As K. Schwab justly remarks, changes concern not only what we do; they also concern what we are. Here developments by J. Collins could help (Collins, 2012, p. 34), since this researcher foresaw increased contradictions and a high turbulence of economic development. Already in the early 21st century, he considered reasons for not soaring, but slumping of the great business empires. J. Collins pointed out many times that information vacuum is one of those reasons. To overcome this obstacle, according to him, information transparency is crucial. Nowadays the world transparency and active penetration of the digital world into the physical and biological one provide all the opportunities for information transparency. In addition, J. Collins insisted that reasons for slump of leading companies are due to not their CEOs' unawareness of the traditional theories of motivation or absence of an MBI degree, but their inability to identify their companies' positions at a particular stage of decline. The paradigm of management must be revised – it must aim to search for reasons for a company's potential fiasco, not for its success. J. Collins pointed out that once a company has achieved success, it experiences some kind of euphoria and begins to take its success for granted. At the peak of its success, its managers stop being curious and striving to acquire new knowledge. It is in direct relation with the fact that companies are distracted by external threats and by their struggle to retain their market segment, so they pay too little attention to innovations, which, in their turn, require staff's continuous self-improvement.

2.4.1. Stage 1

Arrogance due to success. At this stage, personnel should be motivated by not only headhunting the best specialists with the highest wages, but also arranging regular trainings (both internal and external) to sustain a high level of staff's education and competences; particular employees should study viable innovations to be able to apply the creative approach to future products afterwards.

2.4.2. Stage 2

Uncontrolled striving to get more and more. Striving to make more and more revenues, companies start appointing incompetent people to the key positions; their incompetence is

concealed with bureaucratic procedures, which forms another vicious circle – to comply with those procedures, one has to increase the staff by hiring a large number of incompetent employees, since competent ones either leave that company or become mediocre members of staff. According to J. Collins, bureaucratic rules and regulations erase the ethics of freedom and responsibility from the skeleton of key values and highest standards, so the virus of mediocrity (Collins, 2012, p. 59) infects the company. Besides, easy money at this stage undermines control of expenses: the company reacts to growth of its financial problems by increasing its prices, not by analyzing its problems. Personal interests of managers and their surroundings (material demands, fame, merits, etc.) are set above the company's interests. The top manager's close surrounding forms his or her belief in his or her being an exceptionally competent manager, so the authority succession procedure is ignored. At this stage, when strategic maps are developed to motivate staff, one should provide enough assets to hire competent specialists and "bring up" successors to assume the key top positions afterwards.

2.4.3. Stage 3

Denial of risk and danger. At this stage, there is a tendency to overestimate positive data and underestimate negative information. The company management proclaims ambitious aims, which are not supported with the right resources – this is a direct consequence of the impact that a top manager's flattering close surrounding exerts upon that manager. Any opinions that differ from the top manager's views are not tolerated, so there is not enough room for constructive discussions. Consequently, the number of failures grows, and management searches for the guilty instead of assuming its own responsibility for those failures.

2.4.4. Stage 4

Attempts to save the company. At this stage, as a rule, companies undergo radical changes, which is accompanied with a promotion of its future achievements, thus trying to increase its workforce's and external surrounding's motivation to work efficiently. At the same time, radical changes literally exanguinate the company and its staff both energetically and financially. Its key values are undermined; its staff starts searching for another job. At this stage, one should pay much attention to internal programs of staff's retraining, improvement of their psychological status, and adaptation of the key values to the current reality, provided those changes were made after having them discussed actively by the staff.

2.4.5. Stage 5

Capitalization prior to crisis or death. Professor E. Lazear from the Stanford Graduate School of Business described this final decline stage and identified its main feature: absence of money. He pointed out what one should always remember: one can be profitable and at the same time go bankrupt. A bright example is the 2008 address by the General Motors to the government for financial aid. Once a company has entered Stage 5, all the constituents of its strategic map must be reconsidered and reformulated: from that company's merger with another company or acquisition by it (as a way to ensure its survival) to search for a new leader and the team of "changers". First of all, management should set the priorities to ensure its staff's social protection and form its positive mood. If a company intends to struggle for its survival, Stage 5 may be transformed into the stage of renewal and revival.

2.5. Specifics of Managing Employees Related to Generation X, Generation Y, and Generation Z

In late 1990s, N. Howe and W. Strauss raised the issue of considerable mentality differences between the three successive generations, whose representatives currently work or are about to work (Howe, Strauss, 2000).

The researchers correlated those differences with the conditions under which those people were growing. Now one could identify Generation X (born in 1963-1983), Generation Y (1984-2003), and Generation Z (born after 2003). Generation Xers, also known as wanderers, were born and raised at the beginning of the third industrial revolution. They were influenced by their parents and the society formed at the end of the second industrial revolution, whose specific feature was orientation at collective forms of labor organization, development of the raw materials sector of economy, and sustainability of the bank sector. The emerged reality of the third industrial revolution transformed human conscience; it formed the stereotype of being lost and uncertain in what would happen tomorrow. That is why the specific feature of Generation X is orientation at hard and persistent labor, individual labor assessment, being prepared for continuous career making, and relying only on yourself. At the same time, these people are open for education and regard it as an integral part of their careers, but only within a particular sphere of activities. One should remark that Generation Xers adhere to family values; they are willing to get married and have children at a young age. Their main motivation is their need for security, which implies a steady salary; they do not welcome flexible labor remuneration systems so much. Generation Yers, or the Millennials, was formed during rapid changes in technologies, digitalization of economy, considerable fluctuations in the bank sector, and the beginning of the fourth industrial revolution. Brought up by Generation Xers, having watched how slowly their parents were making their careers, how they restrained their own entertainments and sacrificed themselves for the sake of their children's education, this new generation has formed an antagonistic view on life. They are not prepared to restrain themselves; they aim to make a career quickly; they are very mobile and strive to develop in several professional spheres. To achieve their goals, they are ready to study a lot; their level of technical and information literacy is high. Their basic motivation is financial rewards, availability of high-tech equipment on their workstations, the democratic style of corporate communication, absence of a rigid dress code, and a relaxed atmosphere. Generation Z was formed during the fourth industrial revolution. They are true offsprings of Industry 4.0. Their values were formed during the crisis period, when a human's position in the society, in production, and in the family paradigm was being revised. This generation is believed to become extremely gifted creators and makers, whose philosophy will be unique, who will change the world completely. Now they are just entering the labor market, so it is quite difficult to predict their labor behavior. That is why, when one develops creative approaches to management of the corporate human capital, one ought to consider with mentalities of the target generations; one should remember that the traditional approaches are not efficient any more. To have our conclusions confirmed, we have conducted a sociological survey of Russian and Azerbaijani employees and employers, which has proved a low efficiency of the traditional approaches to management of the human capital. All the surveyed experts agreed that to make management systems more efficient, one ought to consider with mentalities of the working generations and establish personified systems of management that consider entirely different needs of Generation X and Generation Y.

3. CONCLUSION

The authors of this paper have come to the conclusion that the traditional approaches to management of the human capital are not efficient nowadays owing to the humankind's confusion, which is due to the challenges of the fourth industrial revolution, a high turbulence of economy, absence of a well-formed public opinion related to an individual's labor identification, a considerable shift of the focus towards an individual's closedness, social deprivation, and economic alienation from their employer, their society, and their family. The authors have confirmed that formation of a new innovative approach to efficient management

of human capital should be commenced by studying the mentalities of the generations at which managers' activities are aimed.

ABSTRACT

In the Baltic Sea region, several industries have affected different elements that have shifted mussel farming industry's importance. Such changes have influenced fishery industry, too. After analysing different factors it was highlighted that fishery has lost its importance in the Baltic Sea Region.

Aim of the research: to investigate factors affecting the development of mussel farming in the Baltic Sea Region by analysing views of public administrators, entrepreneurs and researchers in selected Baltic Sea Region countries obtained in the survey.

Research methods used: Scientific publication studies on mussel farming development supporting and braking factors, survey of different stakeholders in mussel farming – public administrators, entrepreneurs and researchers; expert interviews. For evaluation of different aspects affecting development of mussel farming evaluation scale 1 – 10 was used, where 1 – do not affect; 10 – affect in great extent. Data obtained in survey were analysed with indicators of descriptive statistics, cross-tabulations, correlation analysis, and factor analysis.

Mussel farming industry is not among the most important industries in the national economy, but it has considerable importance for cleaning seawater and providing new products for consumption, the development of mussel farming industry might encourage marketing events. Among the most important factors affecting mussel farming in the Baltic Sea region were indicated education (including informal education), human resources as well as marketing events. To promote mussel farming industry, it was revealed that end-use market and government support are important factors that affect development of mussel farming industry in the Baltic Sea Region.

Keywords: *Marketing tools, Mussel farming, Survey*

1. INTRODUCTION

Mussel farming is a new field in the Baltic Sea Region that needs to develop the product in the market. Mussel farmers in more saline water focuses on mussels for human consumption, however due to salinity and environmental conditions mussels which are grown in the Baltic Sea are much smaller, therefore small mussels are not demanded so much as human food in comparison to large size mussels which has been grown in other seas. In the Baltic Sea farmed blue mussel is smaller, has thinner shell (Remane, Schlieper, 1972, p. 1-350, Kautsky et al., 1990, p. 203-210) and previous research confirm that they are suitable as feed for animal. Analysing the product and its developing potential it is important to consider developing factors of mussel farming in the Baltic Sea Region based on experts' viewpoint. The Baltic Sea is densely populated, and economical activities have influenced the Baltic Sea and eutrophication has become widespread matter in coastal areas (Ronnberg, Bonsdorff, 2004, p. 1161-1177) and

therefore different innovative approaches for production development of new products including blue mussel production are also on researchers agenda.

2. THEORETICAL FINDINGS

The outcomes of wide socio-economic analysis as well as stakeholder's interest perspectives in mussel farming in the Gulf of Trieste were published and discussed in academic environment and research papers by researchers (Canu, Solidoro, 2014, p. 55-62). Often there are asked reasonable questions: is mussel farming large or small industry – those discussions are on researcher's agenda (Gonzalez-Poblete, et al., 2018, p. 119). Many investigations have been done in the context of Norwegian Blue Mussel farming taking into account the strategies as well as the opportunities realized in an emerging industry (Ottesen, Grønhaug, 2004, p. 19-39). Ahsan and Roth (2010) have published their research on challenges, development and application of risk management strategies applied by mussel farmers in the emerging mussel aquaculture industry in Denmark. Innovative approaches for food are on academic researchers agenda discussed in scientific environment including also blue mussels (Hjalager, Johansen, Rasmussen 2015, p. 2716). The research on oyster, mussel production and consumption in France within the European market has been done focusing on the realisation of produced products (Girard, Mariojous, 2003, p. 319-334) as traditionally this those products are very popular in France and neighbouring countries. Theodorou, et al. (2011, p. 859-874) have discussed in their scientific publications the outcomes of academic research on production and marketing trends of the cultured Mediterranean mussel in Greece taking into account such aspects as history, experience and findings. Mussel filters water and reduces nutrients in water and those aspects are very important to support production of blue mussels also from country management side and therefore numerous research findings are discussed world-wide (Gren, Lindahl, Lindqvist, 2009, p.934-945; Stadmark, Conley, 2011, p. 1385-1388). Evaluation of Mediterranean mollusc producer's knowledge about environmental factors was analysed by Rodrigues et al. (2015, p. 1161-1177). Although in India mussel farmers literacy are very low (Mary, Kailasam, Jansi, Patterson, 2015, p. 5), the studies established the fact that literacy and education has played a key role in the adoption of mussel farming practice in Kerala (Kripa, Mohamed, 2008, p. 612-624). According the political documents (Baltic Sea Action Plan, 2007, 2013) the coastal countries of the Baltic Sea have agreed to reduce nutrients in the water to achieve "good environmental status".

3. EMPIRICAL RESEARH RESULTS

Expert survey was organised to analyse different development aspects and different social partners attitude (government, entrepreneurs, consumers) of mussel farming in the Baltic Sea Region (Denmark, Estonia, Finland, Germany, Latvia, Sweden). Experts were selected by their working experience and were invited to answer questions on the main factors affecting the development of mussel farming. For many analysed elements there were used evaluation scale 1 – 10, where 1 – not affect; 10 – affect in great extent. Experts could mention if they had no opinion on respective analysed aspect – there were two to three percent of responses and they were not included in this analysis.

Table following on the next page

Table 1: Main statistical indicators of evaluation by experts of factors affecting development of mussel farming in Baltic Sea Region

	Labour force /Human resource	Financing (subsidies, loans)	Formal, also informal education	Climate change	Marketing events	Taxes	End-use market	Government support	Environmental pollution
Mean	5,29	8,00	6,31	6,19	6,83	6,25	7,96	8,13	6,58
Std. Error of Mean	0,364	0,312	0,348	0,352	0,294	0,353	0,324	0,266	0,343

Source: Zaiga Ozoliņa conducted survey, evaluation scale 1 – 10, where 1- not affect; 10 – affect in great extent, n = 52

The results indicated that governmental support was the highest marked factor covered with arithmetic mean 8,13 and mode 10 (most often used evaluation) and median 8 (half of experts gave evaluation 8 or more and half of experts gave evaluation 8 or less). As well financing was highlighted as mussel farming developing factor, obtaining arithmetic mean 8, mode 10, and median 8, and end-use market was indicated as the important factor, therefore the arithmetic mean was 7,96, mode 10. Labour force as developing factor for mussel farming obtained the lowest assessment, the arithmetic mean 5,29, mode 4, median 5. Climate change was evaluated as the second lowest one, therefore arithmetic mean 6,19, mode 7, median 6. The highest difference in experts' viewpoint was in labour force / human resources as main developing factors for mussel farming by experts of the Baltic Sea Region.

Table 2: Distribution of expert evaluations on factor – labour force/ human resource affecting development of mussel farming– the Baltic Sea Region countries expert survey results in 2018

Evaluation	Frequency	Percent	Valid Percent	Cumulative Percent
1	4	7,7	7,7	7,7
2	4	7,7	7,7	15,4
3	6	11,5	11,5	26,9
4	9	17,3	17,3	44,2
5	6	11,5	11,5	55,8
6	4	7,7	7,7	63,5
7	8	15,4	15,4	78,8
8	5	9,6	9,6	88,5
9	1	1,9	1,9	90,4
10	5	9,6	9,6	100,0
Total	52	100,0	100,0	

Source: Zaiga Ozoliņa conducted survey, evaluation scale 1 – 10, where 1 - not affect; 10 – affect in great extent, n = 52

The arithmetic mean of experts' evaluations on availability of labour force / human resources is among the lower evaluated aspects by experts and the evaluations of experts for this aspect is with higher dispersion (indicators of variability characterized by standard deviations) of the Baltic Sea Region countries experts' evaluations – it means that the views of experts differ in great extent. Experts' evaluations have mode 4 – made by 17% of respondents, the second largest evaluation obtained 7 – 15% of respondents, therefore median was 5. Correlation analysis of all mentioned aspects affecting development of mussel farming and age group of experts and gender of experts and country of expert had not statistically significant correlation with reasonable significance level – it means that there were no differences in evaluations within experts by expert's gender, age group and country. Average evaluations by the Baltic Sea Region countries experts of analysed aspects on factors affecting development of mussel farming did not show statistically significant differences in average evaluations by expert's age groups confirmed by analysis of variance (ANOVA) - results are included in table 3.

Table 3: Results of analysis of variance (ANOVA) on expert evaluations on factors affecting development of mussel farming – the Baltic Sea Region countries expert survey results in 2018 by expert's age groups

One-way analysis of variance (ANOVA) was performed to determine statistics differences. The results have showed difference regarding tax aspect as developing factor for mussel farming. To analyse tax aspect more detailed the Mean analysis was applied. For experts in age group 35-44 and 55-64 the tax as factor affecting development of mussel farming in the Baltic Sea Region is more important (mean 7,2) than for experts in age group of 25-34 and 45-54 (mean 5,4), for experts in age group of 65-74 (mean 7). Also there is different viewpoint regarding labour force as factor affecting development of mussel farming in the Baltic Sea Region, the experts in age group of 25-34 and 45-54 indicated as less affecting factor (mean 4,6) than for experts in age group of 35-44 (mean 5,9) and 55-64 (mean 5,4). Average assessment by the Baltic Sea Region (representing countries - Denmark, Estonia, Finland, Germany, Latvia and Sweden) experts of analysed aspects on factors affecting development of mussel farming were compared using analysis of variance (ANOVA) and main results were included in table 4.

Source: Zaiga Ozoliņa conducted survey, evaluation scale 1 – 10, where 1- not affect; 10 – affect in great extent, n = 50

The results have showed statistically differences by expert' country in expert evaluations on labour force / human resource factor which affects development of mussel farming. In Germany (mean 3,75) and Finland (mean 3) the experts have admitted that this factor is not affecting development of mussel farming but in Sweden, Estonia and Latvia labour force / human resource factor is moderate. Scientific research in many fields investigate differences in evaluations by expert's gender even considering that expert is expert and gender characteristic attitudes have not influenced the evaluation results. To check experts' viewpoint on factors affecting development of mussel farming in the Baltic Sea Region countries t – test was carried out by expert gender statistical hypothesis testing on average evaluations of analysed aspects. H_0 was stated: average evaluations of experts by expert gender do not differ statistically significant and respectively alternative hypothesis: average evaluations of experts by expert gender differ statistically significant. Average evaluations of experts by gender do not differ statistically significant with reasonable significance level but for all analysed aspects affecting development of mussel farming evaluations averages by female experts were higher – see table 5.

Table 5: Main statistical indicators of evaluations on factors affecting development of mussel farming – the Baltic Sea Region countries expert survey results in 2018 by gender

Analysed aspect	Gender	N	Mean	Standard Deviation	Standard Error Mean
Labour force /Human resource	F	36	5,67	2,662	0,444
	M	15	4,13	2,134	0,551
Financing (subsidies, loans)	F	36	8,00	2,378	0,396
	M	15	7,93	2,052	0,530
Formal, also informal education	F	36	6,17	2,569	0,428

	M	15	6,27	2,865	0,740

Source: Zaiga Ozoliņa conducted survey, evaluation scale 1 – 10, where 1- not affect; 10 – affect in great extent, n = 51

The analysis of obtained results did not show statistically significant differences in expert evaluations testing with t – test.

4. CONCLUSION

The evaluation results of experts' viewpoint regarding factors affecting development of mussel farming in the Baltic Sea Region highlighted that governmental support, financing (subsidies, loans) and end-use market are key factors to develop mussel farming in the Baltic Sea Region. The results have indicated different viewpoint between experts regarding labour force as mussel farming development affecting actor.

In Germany and Finland this aspect was noted as unimportant aspect, however in Sweden, Estonia and Latvia the experts have considered it as moderately affecting factor. In addition, there was different viewpoint between experts in several aging groups - experts in age group of 35-44 or 55-64, and experts in age group of 25-34 and 45-54 - stated aspects regarding taxes and labour force as developing factor for mussel farming. This aspect should be analysed in further research. Average evaluations of experts by gender do not differ statistically significant with reasonable significance level.

KNOWLEDGE-BASED ECONOMIC ACTIVITY AND SOCIO-ECONOMIC DEVELOPMENT

Zeynab Habibagha K. Giyasova

Azerbaijan State University of Economics (UNEC), Azerbaijan
zqiyasova@gmail.com; zqiyasova2@gmail.com

ABSTRACT

The article examines conceptual approaches to providing this activity by defining the importance of knowledge-based activity in innovative development of the economy, evaluates the current situation in this field in Azerbaijan and in the world and defines directions of development based on world experience. The way to public welfare depends on the good use and continuous development of scientific and technological means. In the article it is shown that advanced technology and human capital create a higher added value and assesses how it affects the development of both already formed and new emerging economic fields. Innovation-oriented, efficient and competitive development of the economy first of all necessitates the formation of higher education, science and economy unity. In the article, state expenditures allocated on education in providing knowledge-based economic activity is specially highlighted. Along with this it is also shown that new long-term challenges to the development of human capital in Azerbaijan necessitate the implementation of important measures at financing education. In the world the position of Azerbaijan is determined analyzing the dynamics of costs to R & D expenditures allocated from the General National Product. In the article suggestions for increasing the competitiveness of the "processing industry" and the knowledge economy in Azerbaijan is proposed, in order to achieve new quality of human capital, activities related to qualitative renewal all forms of education system in the country is highlighted.

Keywords: *innovation, knowledge, labor costs, socio-economic development*

1. INTRODUCTION

The world community has moved to a new stage of development by quality. Significant changes occur in the social paradigm, as the most important factor of production the person who carries out the function of knowledge and his development is the main goal of socio-economic development. If capitalism is focused on earnings and capital accumulation, knowledge-based economics will direct innovations to social welfare. In this regard, to study of global trends in the knowledge – based economy and to consider its application opportunities in providing economic development is relevant.

2. THE MAIN CHARACTERISTICS OF KNOWLEDGE ECONOMY AND ITS SOCIO-ECONOMIC SIGNIFICANCE

To look over the knowledge economy in a narrow and broader sense makes it possible to better understand its essence. In a narrow sense, the knowledge economy is such a field of the national economy, where production, processing and management of knowledge takes place. This concept was presented in the works of J. Schumpeter, F. Hayek and F. Machlup. However, in this period the knowledge economy was not widely spread at that time as a term, because it was only understood in the functional-sectoral aspect (as part of the economy). But in the early 1960s a major social change took place in industrialized countries - the number of qualified workers exceeded the number of industrial workers [2]. In the 1990s, the attention of the world community to knowledge-based economy theory was especially relevant. The World Bank, the European Commission, UNESCO and other organizations have begun publishing reports and lectures in connection with this concept.

Many developed countries (US, Japan, Western European countries) have started to identify the information economy as a way for future socio-economic development. Thus, in a broader sense, knowledge-based economy began to be accepted as a type of economy rather than a field. The basis of the formation of knowledge economy includes in three areas of society: research, innovation, education-training. These factors form human capital, information and computer Technologies [11]. At the same time, knowledge is also regarded as a source that is the cause of critical situations and the dangerous changes in the social structure. At present, there is a need to re-evaluate the traditional role of science, the approximation of science and practice. From the 17th to the middle of the 20th century, we can observe the exceptional superiority of science, and the practice realizing new discoveries in social production (material and spiritual production) accompanied science. But with the invention of the laser (1956), this tendency began to change. Now science is focused on the technological development of practice, and attention of scientists focus on technology development. Instead of a scientific-technical revolution, a technological revolution exists. In other words, science has begun to serve the practice. This tendency proves that production activity using traditional factors of production and based on previous economic relations does not generate profit. The existing institutions need to be transformed according to the needs of the modern economy. Already the production of scientific knowledge is now developing as a modern, competitive entrepreneurial activity, and the number of enterprises operating on the basis of universities or interacting with them is increasing, and knowledge centers, technology transfer and research centers have begun to play an important role in the modern economy and added value of developed countries. Knowledge economy is a specific form of economic relations, when maximum efficiency is achieved through the integration of science, industry and education components. In modern conditions, knowledge, education, cognitive technologies and intellectual capital are the basis of ensuring the competitiveness of economic systems on any scale, from private economic entities to international integration institutions, from small enterprises to global corporations. Friedrich List, one of the first economists who systematically approaches the problems of the backward countries from point of view of development, emphasizes the importance of the knowledge economy as: "The present state of the people is the result of the discoveries, inventions, research and development of our ancestors. They created the intellectual capital of today's human race. And today, each individual nation can be productive in proportion to the previous generations of their own, as well as with their own efforts, and only in these circumstances." The vast majority of scientists [5, 6, 7, 9, 13, 16] envision the type of economy under the term "knowledge economy" (the highest stage of the development of post-industrial economy and innovative economy), which intellectual capital is substantially dominant, and they describe the production of knowledge as a source of growth and development of the economy at macro and micro level. In this connection, it is necessary to clarify the concept of "postindustrialism". If we look over D. Bellin's definition of postindustrialism, we are witnessing how knowledge-based economy plays a role in socio-economic development: "The post-industrial society is a society focused on the priorities in the economy priorities from good production to service production, conducting researches, organization of education system and improving the quality of life based on it; In this society, technical specialists class turns into a major profession group and groups that create more value more value-based in society, and most importantly, the application of innovations ... has gradually become dependent on the achievements of theoretical knowledge ..." [19]. The key factor for activation of innovative activity and creation and formation of the post-industrial economy is human capital. The feature of investments in human capital is that increasing the knowledge and experience of individuals helps increase in capital productivity. Human capital plays a leading role in the competitive advantage, and almost it is crucial that human resources analysis and evaluation are an essential

condition for successful activity of each organization. Ensuring competitive advantage is not possible without investing in human resources.

*Table 1: Human development index around the world
 (United Nations Development Programme: Human Development Index 2017.)*

<i>LEADER COUNTRIES ACCORDING HUMAN DEVELOPMENT INDEX</i>		
PLACE	COUNTRY	POINT
1	Norway	0.953
2	Switzerland	0.944
3	Australia	0.939
4	Ireland	0.938
5	Germany	0.935
6	Iceland	0.933
7	Hon-Kong (China)	0.933
8	Sweden	0.933
9	Singapore	0.932
10	The Netherlands	0.931
<i>CIS COUNTRIES AND REGIONAL COUNTRIES ACCORDING HUMAN DEVELOPMENT INDEX</i>		
PLACE	COUNTRY	POINT
49	Russia	0.816
53	Belarus	0.808
58	Kazakhstan	0.800
60	Iran	0.798
64	Turkey	0.791
70	Georgia	0.780
80	Azerbaijan	0.757
83	Armenia	0.755
88	Ukraine	0.751
105	Uzbekistan	0.710
108	Turkmenistan	0.706
122	Kyrgyzstan	0.672
127	Tajikistan	0.650

As can be seen in Table 3, European countries have the highest value of human development index, approximately average equal to 0.94. Then comes the US and Canada, and the average is 0.91. When it comes to CIS Slavic countries, Russia and Belarus are ahead here. In our country, this index is 0.757 and is behind Russia, Belarus and Kazakhstan in CIS space. Comparison of human potential development index with the production of Gross Domestic Product per capita is also especially important. The United States and Canada are the leading countries with the highest per capita GDP - per capita is 35,470 USD per year. Despite this, in Scandinavian countries, this is relatively low level -32,649. USD [21]. Despite this, these countries are superior to the United States and Canada because of their human development index. Apparently, there is no direct dependence between the human development index and GDP per capita production, but high per capita GDP can lead to a high level of human development. Except USA and Canada, in the experience of other countries, we can more clearly observe this dependence. Evidence about direct relations between human development indexes and GDP per capita emerges as a result of the analysis of other countries on the table. However, this discrepancy also comes out in the informations of Luxembourg and Austria which are the Western European countries. So that, Luxembourg (like the Vatican) is a special state with special production, social and political characteristics, and budget expenditures are

not spent for military needs [1, p.37]. At the same time, we see a similar view in Austria, which has drawn attention to its neutrality since the end of the Second World War. That is, these countries can save a great deal of money to spend on GDP, but their human development index is lower than other Western European countries. It is possible to conclude that ensuring human development is closely linked to how much space is allocated to this issue in the economic policy of the state. If we summarize all these, it can be concluded that the development of human capital leads to the deepening of the international division of labor. Countries with high human development index have been successful to form a more competitive economy in modern times by specializing in the production of brain – capacitive product. Practice shows that developed countries prefer to the scientific knowledge focused on the creation and application of new technologies serving the development of the economy, the organization of new production processes, the application of stimulating measures. Because innovation is the key decisive factor of economic development and, by its application, in the economy and at the same time in the science sector serious changes - improving technological processes, realizing the results of scientific researches, etc. occurs. The analysis of the World Bank's indicators determined in 192 countries shows that in the share of total value the share of human, physical and natural capital is respectively 64%, 16% and 20%. In Germany, Sweden and Japan, the share of human capital in national wealth is about 80% [p. 18,139]. In post-soviet countries with transition economy, more natural capital (capital obtained from raw material sales) prevails. For example, the adequate index of human capital in Russia is 14% and natural capital index is 70%. Contrary to all developed countries of the world and the West, human capital plays a major role in the formation of national wealth, and natural capital does not have a significant share. In this regard, the characteristic feature of post-industrial economy is high labor productivity, high quality of life, state support for innovation and education [p. 3 121-122]. Intellectual development, the activation of creative abilities in the post-industrial society play an important role in the value system. Increasing the share of qualified employees, accordingly, will lead to the improvement of the innovation environment. In addition, the development of knowledge-intensive activities in the economy create condition to get more revenue with relatively little investment on innovative ideas and highly qualified workers. It should be noted that labor savings in production and other spheres are already dependent on labor costs in their own sphere of science. This dependency stipulates an objective requirement to the formation of public-necessary expenditures in the sphere of science. How long the stronger the conformity of law of labor savings functions, then a greater part of public labor and resources should be focused on the development of science. This means that the value of scientific knowledge is increasingly rising. The theoretical basis of tendencies of increase of scientific potential of product production, creation and development of agriculture fields namely consists of it. The same theoretical basis should be taken into consideration when developing a scientific-technical and innovation policy at different levels of management. As a result of scientific-technological progress, innovation and modernization over the past 30-40 years, education that is not enriched with practical knowledge and skills, bearing purely theoretical character is losing its fundamental significance. In this regard, in the formation of education content along with academic knowledge, the importance of practical knowledge and skills and competence is highlighted. Competence is a ability to apply obtained knowledge and skills effectively and rationally in practical activity. It ensures transforming the knowledge and skills gained by the person into the result of concrete activities. Competency-based education serves to socio-economic development more effectively. The stage of modernization of the economy does not fulfill its mission if the potential forces of the population are not involved in creativity. This can only be achieved as a whole by focusing on the country's perceived reform requirements. The emergence of new innovative components of economic development and the formation of transitional mechanisms are characteristic in the condition of integrated and modernized

processes for the modern condition in the economy. Increasing attention to the knowledge is the distinctive feature of innovative development, they show themselves more in the form of a competitive tool of competitiveness. In this connection, the problem of rational use of incentives and conditions, intellectual capital (accumulated human knowledge) is conformity to law and relevant for a substantial expansion of the demand for new technologies. According to international analytical studies, now knowledge is necessary for both developed and developing countries [14]. For a positive solution of the problem under these conditions, the innovation economy should be considered as an economy related to the formation, realization and development of the innovation potential of the real sector. In the explained aspect of the economy, innovation state can be imagined as a combination of innovation potential, innovation structure and innovation security. In its turn, the innovation potential – is such a system of restrictions for the establishment of a new economy, its structure also includes the followings [14]:

- cadre potential (here the number of staff dealing with researches, admission to the dissertation defense, number of students per 10000 people); - industrial potential (depreciation rate of fixed assets);
- investment potential (index of investments into fixed capital, specific weight of the harmful enterprises, loans given to legal entities by credit organizations, consumer value index, internal expenses spent to research and developments).

3. KNOWLEDGE – BASED ECONOMY DEVELOPMENT ISSUES IN AZERBAIJAN

The efficiency and potential of research institutions in the development of a knowledge-based economy are extremely important. Analysis of the main indicators of science in Azerbaijan shows that there is almost no increase in the number of organizations fulfilling research and developments. In 2017, the number of enterprises providing such services was 137. There was also a decrease in the amount of value created by organizations engaged in research and developments, in 2012, it decreased from 128 million to 115 million manat. Taking into account that the number of staff engaged in research and development in such institutions is 1.3 times more than in 2000, and the number of doctors of sciences has increased by more than 2 times, this indicator can not be considered so positive. It has several reasons. In world practice more attention is given to the implementation of research and developments in the private sector, and this is considered more effective and rational. In our country, the number of entrepreneurship subjects engaged in research and developments in the private sector has decreased to 9 in 2017 from 19 in 2001. In this direction, it is necessary to implement stimulation measures of entrepreneurship subjects and taking steps related to applying certain concessions for them. Only the number of educational institutions has increased from 25 to 39, which can be considered a positive trend.

Table 2: Main indicators of science [17]

	2000	2010	2015	2016	2017
Number of organizations fulfilling research and developments	137	145	141	135	137
Number of staff engaged in research and developments, numeral	15809	17924	23093	22527	20580
From them: doctors of sciences	678	843	1534	1476	1414
including women, numeral	83	133	251	288	292
Doctors of sciences	3343	3554	6532	6296	6243
including women, numeral	1170	1406	3063	2935	2970

Science expenditures also have a certain impact on the decreasing of the value created by enterprises engaged in research and developments.

Of course, the expenditures on science from the state budget have been increasing over the recent years. If in 2005 expenditures spent on science made 28.8 million manats, in 2017, science expenditures have increased as a whole 4 times by the public sector, private sector, and higher education institutions. However, the ratio of expenditures spent on science to GDP is more than 15 years, 0.2% , which is lower than the world indicator. Also, in proportion to the state budget expenditures, science expenditures decrease by 2 times in comparison with 2000.

Table 3: Expenditures spent on the science from the state budget. [17]

	2000	2005	2010	2015	2016	2017
Expenditures spent on science from the state budget, million manats	9,3	28,8	92,8	113,2	110,2	109,8
in proportion to Gross Domestic Product, with percent	0,2	0,2	0,2	0,2	0,2	0,2
in proportion to state budget expenditures, with percent	1,2	1,3	0,8	0,6	0,6	0,6

When looking at the current domestic expenditures spent on research and developments on the fields, more financial resources have been allocated for design and construction works in technical sciences. And on natural sciences, the funds allocated for fundamental researches have been more than other fields. The entrepreneurship sector has allocated more on research and developments in the field of agriculture, which indicates that this field is a priority in the private sector.

Table 4: Current domestic expenditures spent on research and developments on the fields of science, types of works and sectors in 2017. [17].

	Total	natural sciences	technical sciences	medical sciences	agricultural sciences	social sciences	humanitarian sciences
to fundamental researches	68841,9	27787,6	11 278,8	6 551,0	5 059,1	5 884,6	12280,8
to applied researches	24157,0	2 745,6	11 066,6	2 308,1	4 413,4	3 155,9	467,4
to project- constructor and technological works	26493,3	-	25 430,9	-	-	1 062,4	-
to the preparation of trial samples, sets, wares	8 389,4	-	8 389,4	-	-	-	-
to project works for construction	115,4	-	115,4	-	-	-	-

Taking into consideration the importance of technoparks in research and developments in the world practice, as well as the country's industrial potential, provision of financial resources is of particular importance by identifying priority fields, before by the stimulation of state support in this field, in subsequent stages by the stimulation of entrepreneurship subjects.

In order to create innovative ideas, the state should first of all create scientific-research centers, provide material-technical base, provide access to international information networks, and establish close relations with internal universities and research institutes in order to strengthen the centers' activities [p 4.95]. Most importantly, these centers should be open to all persons and free of use. In international practice, the state receives opinions of enterprises, physical entities with innovative ideas for a certain amount of payment, and offers entrepreneurs for free in return for the implementation of production. Of course, the material payment offered to the idea owners or organizations should bear motivating character to future studies. Entrepreneurs should transfer these ideas into prototypes in the case of collaboration with the idea owners if needed, or investing to the application by starting the production of innovations should put on the market. In this case, it is possible to maintain the existence of knowledge-based, competitive product production in the economy, and the continued existence of innovative trends. In order to form an innovative economy in the country, it is necessary to encourage the expansion of contacts and cooperation between knowledge producers, knowledge transfer agents and knowledge users. Science fields play an important role in creating new knowledge as knowledge treasures, transforming knowledge into new technology and finding areas of application. In the modern era, collaboration between scientific institutions-industry-state has become the most important necessity for technology and knowledge development. The strategic objective of the modern development of the republic is to achieve the highest rate of economic growth through the creation of different competition and sustainable foreign economic factors. The necessity of transition from the industry to the post-industrial system and economy, as well as elimination of strong spatial differences in the differentiation of socio-economic development of the country, are the principal features of the solution of the tasks facing the country. Formation of adequate conditions for modernization of the country economy, liberalization of foreign economic relations, increasing the effect of production factors, stimulation of innovative development of economy, modern solution of contradictions resulting from structural changes is a necessary condition for this growth [8]. State support measures should be implemented and the relevant legislative base should be improved in order to stimulate competitive production by increasing innovation activity, establishing the necessary mechanisms for the implementation of innovation activities, to ensure the efficient use and development of innovation potential.

4. CONCLUSION

Thus, the knowledge economy has become a key determinant of the competitiveness, socio-economic development in a developed world. It is important to build knowledge-based economic relations, taking into account our country's ability to respond to global economic challenges and to actively integrating into the global economic system. Expansion of innovation activities should be one of the main priorities in order to ensure long-term sustainable economic development, to formulate "knowledge economy", to accelerate creation of science potential technology, product (works, services). The relations between science and production should be strengthened in order to create a dynamic economy in the country, and necessary mechanisms should be created for the implementation of applied scientific research according to market requirements. Information and communication technologies have a decisive role in the more effective development of science in the innovative course. In our opinion, the main objectives of the state policy in direction should include:

- creating economic and legal conditions for innovation activities;
- increasing the efficiency of production and competitiveness of products produced by domestic producers by creating and expanding innovations;
- development of entrepreneurship in the innovation sphere;
- finding ways to use the state resources efficiently related innovation activity development.

These features determine the most important character of economic growth. Firstly, it should be long-term and sustainable, secondly, should be differ with high quality, the third should be equally proportional on the entire territory, fourthly, should be competitive, and fifth should be oriented towards improving the level of life of the entire population. To achieve this goal, the implementation of the following objectives should be envisaged:

- investigating the current state of the industry as well as its scientific potential;
- to show the main directions and necessity of formation of the national innovation system;
- identifying priorities and factors for sustainable economic development of the industry.

The current scientific and economic potential of Azerbaijan allows that the each task to be successfully implemented in the direction of the knowledge economy has an active position in the creation of added value in the country.

ABSTRACT

The emergence of the Internet and the ongoing development of technologies exert a powerful impact on the world, national economies, society, culture, as well as human relations and everyday life. The widening of the access to the Internet and modern technologies is referred to as informatization (computerization) and a direct effect of this process is the emergence of the information society. The paper presents an analysis of a particular set of diagnostic features. The variables, whose relevance and statistical accuracy were first verified, formed a basis for the classification of the the US states in terms of the computer and Internet use by physical persons aged 16-74. The data comes from the statistical yearbooks published by the Central Statistical Office and from the Eurostat websites; it covers the years 2012 and 2002. The aim of the analysis is to investigate the level of Internet and computer use in the US states in the years 2012 and 2002 by means of the rank method, which belongs to the group of taxonomic methods.

Keywords: *Econometric Methods, Information Society, Taxonomic analysis*

1. INTRODUCTION

Nowadays, the way we live is closely linked to modern technologies and Internet access. Rapid development of mobile technologies as well as increasingly easier access to the Internet change our rules and patterns of behaviour. Our primary goal is to gather information, and next, to process and use it for various purposes (Globan-Klas, Sienkiewicz, 1999, p. 40-117). Information can be instantly accessed, processed and transferred at any time as there is easier access to the Internet, which, due to a growing number of mobile devices with an Internet access option, no longer depends on our location (Kempty, 1998). Multiple public places, e.g. coffee shops, schools, stores, etc., offer free wireless connection to the Internet. The Internet provides us with an increasing variety of services and facilities. The number of Internet users is growing and their age range is widening (Bliźniuk, Nowak, 2005, p. 15-40), (Giddens, 2006). The Internet has become part and parcel of our work, entertainment and everyday life. We can contact one another via emails, set up forums and discussion groups. It can be observed that the Internet has infiltrated all spheres of life, and we have become heavily dependent on it. Thus, we can state that "the Internet is a global system of computer interconnections which enables people to communicate as well as find visual, audio and text information on web pages without the need for movement in real time, at no cost, with no space constraints, and outside state governments' control" (Giddens, 2006, p.723). In addition, the changes taking place in recent years have led to the creation of the information society, and they will further affect and modify both the society and culture. As the information society, we have become extremely reliant on modern technology and the Internet, which impact on a great number of social processes. To sum up, it can be concluded that technological advancement has far-reaching influence on society, culture, economy, etc., resulting in positive transformations on the one hand, and disruptive, sometimes even dangerous for the society, behaviour on the other. The aim of the analysis is to investigate the level of Internet and computer use in the US states in the years 2012 and 2002 by means of the rank method, which belongs to the group of taxonomic methods.

2. RANK METHOD

Linear ordering allows establishing the hierarchy of investigated objects. In order for linear ordering to be conducted, the variables describing the objects have to be measured on the ordinal scale at least. Otherwise, the variables have to be normalized to make them comparable to each other (Grabiński, Wydymus, Zeliaś, 1989, p.70-80), (Panek, 2009, p. 67). The linear ordering methods include, inter alia, procedures based on a synthetic variable, which can be generated by means of standard and non-standard methods. Non-standard methods require prior stimulation of input variables, while standard methods apply the concept of a reference standard of the required values of input variables. This study employs one of non-standard methods, a rank method. The first stage of the procedure involves variable stimulation. Next, taking into consideration all the variables, the sum of the ranks attached to each object is calculated. When two or more objects have an equal value of the variables, they have to be assigned the same rank. In such cases, the rank is calculated as an arithmetic mean of the respective ranks (Grabiński, Wydymus and Zeliaś, 1989). The value of the synthetic variable is determined according to the following formula:

$$s_i = \frac{1}{m} \sum_{j=1}^m z_{ij}, i = 1, 2, \dots, n \quad (1)$$

where z_{ij} have to be normalized based on the formula:

$$z_{ij} = \frac{x_{ij} - \bar{x}_j}{s(x_j)}, \text{ where } i=1, \dots, n \text{ and } j=1, \dots, m. \quad (2)$$

(for classical standardization we take the value of the arithmetic mean of the variable 0, and for standard deviation the value is 1). (Panek, 2009, p.38)

3. THE APPLICATION OF THE RANK METHOD FOR ORDERING OF THE US STATES IN TERMS OF INTERNET USE IN THE SELECTED YEARS

The first stage of the study focused on the United States in the year 2012, and next in the year 2002. The set of the diagnostic variables, which was established based on the descriptive and formal analysis of these variables, included (Janiga-Ćmiel, 2016), (Janiga-Ćmiel, 2017A), (Janiga-Ćmiel, 2017B), (Janiga-Ćmiel, 2013):

X₁ - Number of the Individual lives in household without Internet use,

X₂ - Number of the Individual accesses the Internet from some location,

X₃ - Number of the Individual accesses the Internet from home,

X₄ - Reasons for not having internet access at home.

The data comes from the statistical yearbooks published by the Central Statistical Office and from the Eurostat websites; it covers the years 2012, 2002 (Panek 2009, pp. 60).

The diagnostic variables: x_1, x_2, x_3, x_4 were stimulated using formula:

$$x_{ij}^S = a - bx_{ij}^D, \text{ where } a = 0, b = 1, \quad (3)$$

x_{ij}^D - value of the destimulants.

This was followed by standardization based on the values of the diagnostic variables (2). The calculation results are displayed in the table below.

		X ₁	X ₂	X ₃	X ₄
1	Alabama	-0.78182	-0.79751	-0.79561	0.798338

Table 1: The value of variables after standardization (based on own research)

In the next stage of the study, a rank was established for each US state based on the values of the diagnostic variables. The value of the synthetic variable for each state was calculated by the formula (2). The stages of the procedure are presented in the table below.

	X ₁	X ₂	X ₃	X ₄	Average		
Alabama	11	11	10	16,5	12,125	<i>District of Columbia</i>	1
Alaska	46	46	46	31,5	42,375	<i>Alaska</i>	2
Arizona	19	19,5	17	2	14,375	<i>Delaware</i>	3
Arkansas	33	33	33	19	29,5	<i>Maryland</i>	4
California	15	15	15	30	18,75	<i>South Dakota</i>	5
Colorado	22	22	22	7	18,25	<i>West Virginia</i>	6
Connecticut	28	28	27	11	23,5	<i>Montana</i>	7
Delaware	45	45	45	33,5	42,125	<i>Utah</i>	8
District of Columbia	50	50	50	28	44,5	<i>New York</i>	9
Florida	4	3	3	23	8,25	<i>Rhode Island</i>	10
Georgia	9	9	9	27	13,5	<i>Hawaii</i>	11
Hawaii	41	42	42	24	37,25	<i>North Dakota</i>	12
Idaho	38	38	38	5,5	29,875	<i>Wyoming</i>	13
Illinois	17	18	20	45	25	<i>Washington</i>	14
Indiana	1	1	1	35	9,5	<i>Vermont</i>	15
Iowa	21	19,5	21	38	24,875	<i>Maine</i>	16
Kansas	32	32	32	25	30,25	<i>Louisiana</i>	17
Kentucky	26	26	26	40	29,5	<i>Oklahoma</i>	18

4. CONSLUSION

The study discusses a taxonomic linear ordering method – the rank method and applies it to examine the level of Internet and computer use in the US states in the years 2012, 2002. The results of the analysis indicate that in the year 2012, the following states held the top three positions: District of Columbia, Alaska, Delaware. The results of the feature-based analyses show that variables X_1 , X_2 , X_3 took the highest value in District of Columbia, Alaska and Delaware, significantly impacting on this state's position in the hierarchy. In the same year, the lowest level of Internet and computer use was observed in New Mexico. In 2002, the first three places were occupied by California, New York, Texas. Variables X_2 and X_3 had the highest values. The lowest level of Internet and computer use was recorded in: New Mexico. The findings indicate that the level of Internet and computer use is determined by a variety of factors, including possibilities for social development, educational opportunities, proximity to big developed cities. Although residents of small towns and villages tend to have poorer access to the traditional Internet, the development of mobile devices offers them ever-increasing access to mobile Internet.

ABSTRACT

The main purpose of the research is to investigate the nature of construction materials and to make suggestions and recommendations to improve the mechanisms for the development and implementation of these marketing strategies based on the analysis of key factors that affect their competitiveness. The research was carried out on the basis of scientific abstraction and research methods such as systematic analysis, induction-deduction, analysis-synthesis, complex-systematic and situational approach, SWOT analysis. As a result of the research, the research restrictions: it requires a wider range of practical information. The practical significance of the research: The results of the research can play a positive role in enriching the scientific and practical knowledge in the field of efficient development of enterprises producing construction products in modern conditions, enhancing the main indicators of defining their competitiveness and strengthening their competitive positions, and effectively implementing marketing strategies. Scientific innovation and originality of the research: There were given suggestions and recommendations for the implementation of marketing strategies and providing competitiveness of construction materials product companies and was presented a generalized model of the identifying competitive positions of these companies in the market.

Keywords: *Competitiveness, competition strategy, balanced indicators, strategic chart, marketing strategy implementation mechanisms*

1. INTRODUCTION

General rules and schemes for solving problems of strategic management appear in the framework of strategic management – fulfilment of analysis, choosing strategies and their realization. However, every field, enterprise, even every manager specifically comprehends and realizes management. At present time the specialist approach to the issue to increase competitiveness of the enterprise in the field of construction materials production and the matter of choosing effective development strategies in our republic are not at the required level. This is one of the reasons that competitiveness of local construction enterprises is low. Generally, as several local researchers have noted, evaluation problem of marketing outcomes studied on the basis of factors that identify strategy of action in market and affect production – sale activity almost remains unsolved at economic entities acting in the Republic of Azerbaijan” [2, p.134]. Management strategy of competitiveness accepted at equal level for all subjects of economic activity is not existed. There is not pre-developed strategy aimed to increase competitiveness of the enterprises at any field. There should not be the prepared decisions for all enterprises, so that they set various goals and settle different matters, activate in diversified competitive environment, possess different internal resources and obtain efficiency at various levels in their activities and etc. Management mechanism on competitiveness of enterprises for production of construction materials are reviewed conforming to general principals in the study held within the scope of this article. To the effect that “Development of serious activity conception of the enterprise and marketing strategy in market, setting of the theoretically substantiated targets and purposes, proper foundation of marketing activity under the circumstance of market require methodological investigations of marketing activity” [4 p.145].

2. MANAGEMENT STAGES OF COMPETITIVENESS OF ENTERPRISES OF CONSTRUCTION MATERIALS PRODUCTION

Management of competitiveness of enterprises of construction materials production combines the following stages: analysis of domestic and foreign environments to identify the key factors constituting the competitiveness potential of the enterprise; evaluation of competitiveness of enterprise on schemes and indicators offered in the study; planning of level of competitiveness indicators, managing organization; evaluation and review of competitiveness in the framework of development strategy of competitiveness of enterprise. Managing mechanism of competitiveness can be described in figure 1 due to the offered principles. While conducting the analysis of external environment of enterprises in the field of production of construction materials, the necessary factors and main internal factors of competitiveness at areal and regional levels are detected; the specific factors for enterprises of construction materials in the territory of Baku city are defined: the highest increasing rate of construction between the areas of economy, raising the levels of incomes of business fields and people, the increasing rate of the construction at living, socio-cultural and industrial fields, the support of exported products, being open the internal market for external products, being relatively high of the expenses charged for the products in the enterprises of construction materials in Absheron district comparing with other districts, becoming the increasing rate of construction in Baku city. It is necessary that the aforesaid factors shall be considered in the process of competitiveness of construction materials. Evaluation of competitiveness of the enterprises covers working out the algorithm and calculating special indicators of competitiveness by the methods of differential, integral and the generalization, expertise evaluation, ranking. It is known that “the methodical approach based on obtainment of generalized indicators is applied to evaluate competitiveness of construction material” [6, p. 140]. Evaluation of competitiveness of the enterprise is comprised of the followings: evaluation of competitiveness of the produced products on the ground of consumer’s requirements parameters (quality of product, quality of sale, level of price), assessment of activity profitability and innovations. Social content of business is used as an indirect indicator of evaluation of competitiveness of the enterprise. The distinct expression of the evaluation results of competitiveness of the enterprises of field of construction materials allows getting the chart that indicates competitive position of the enterprise. The forthcoming stage of competitiveness management is a planning: planning of levels of competitiveness indicators of product and enterprise on the basis of special indicators of competitiveness. The substantial requirement for planning under the circumstance of modern market environment is a dynamics of the planning process. In this respect, it is based on viewing external and internal changes far away and adapting it. To use evaluation indicators resulted while defining level of competitiveness of the enterprises and competitors is purposeful in preparation of competitiveness indicators and on the basis of methodology offered in the scope of current research.

Figure following on the next page

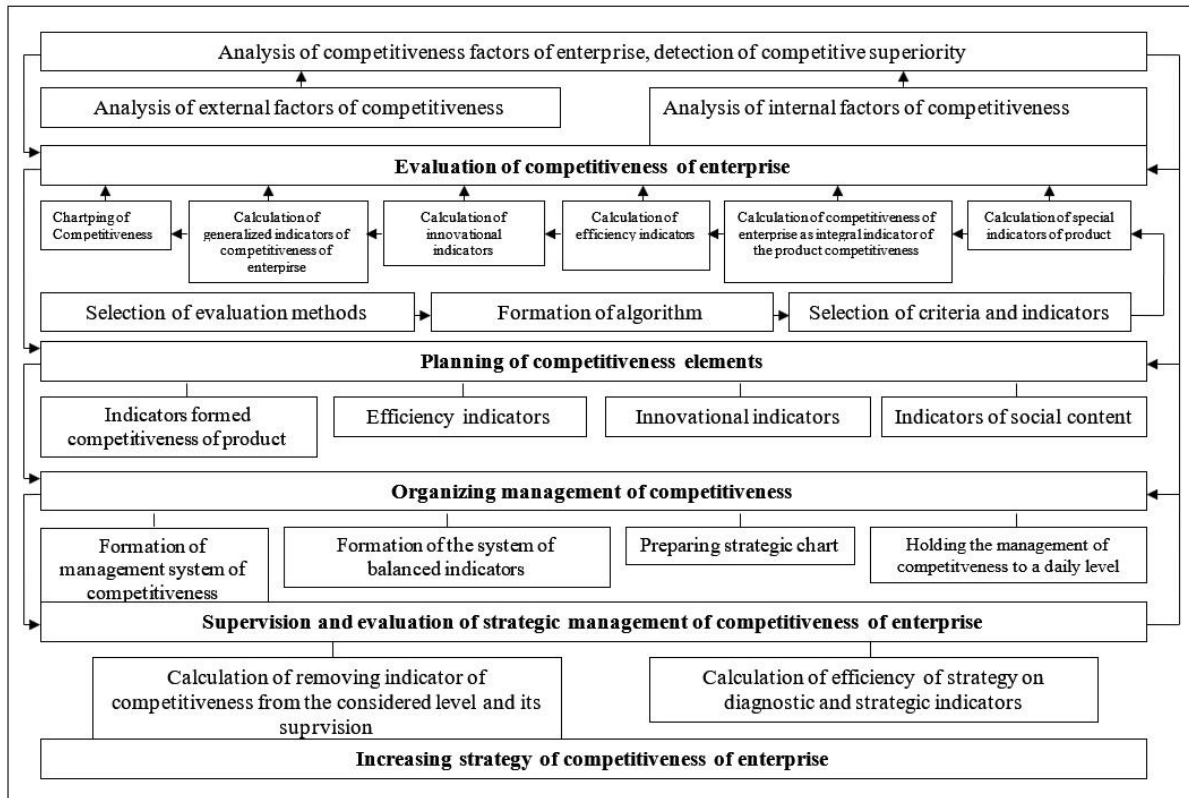

Figure 1: Scheme of management of competitiveness of the Enterprise

Durability indicators for competitiveness of the product and demonstrators on efficacy and innovation of the enterprise denote the strong and the blind sides of its activity. To the extent that “workout or development and realization of management strategy of innovations combines the exploration of competitiveness conditions of enterprises at local and regional markets, raising the strong and the blind sides as initial condition of adoption of strategic decisions” [7 p. 129]. “One of the main terms of formation of highly efficient competitiveness field depends on providing background for broad reproduction. This may be available when the balanced, intersectoral relations are formed” [3 p.151]. This allows for understanding how to mobilize the powers to compare special indicators of evaluation of competitiveness of the product, values of efficiency indicators of activity, to eliminate the blind sides and to intensify enterprise’s position: to make corrections in policy of value whether to direct the powers towards improvement of the product or to increase the efficiency of working with consumers. It is possible to accord with such an opinion of some local researchers: “Different strategies are selected while implementing a policy of price under modern circumstance (defining the purposes)”. Long-term prices function in construction. On this account, selection of the changing price strategy in construction is more purposeful [1 p. 147]. It is more urgent to mark out the most obligatory and easily-removable one among the revealed weak points. The events aimed for intensifying the blind sides of enterprise shall be grounded on planning the level of elements of competitiveness and as well realizing general strategy for increasing competitiveness of enterprise. Organization of management is included into necessary elements of managing mechanism of competitiveness and the supervision is attached to implementation of strategic plan. Implementation of strategy on development of enterprise, increase of its competitiveness relies upon profitability of management system and making strategy at daily operating level and at the level of all participators taken place in administration. This also depends on being understood the goal of strategy by management personnel, managers’ professionalism, and training for realization of their worked-out strategic plans.

According to the results of studies in this field, it may be noticed: “One of the most important duties of marketing under the circumstance of market economy and at competitive condition is a service rendered to consumer. Nowadays, one of the main reasons of being service level low in Azerbaijan is an insufficiency of qualified specialists. In this regard, increase of personnel’s knowledge level will be attached special attention to enhance service level at local companies”. [5, pp. 156-157].

3. REALIZATION OF MANAGEMENT STRATEGIES OF COMPETITIVENESS

Application of the balancing system of indicators acts as modern innovative method of management on realization of strategic purposes which this expresses means of strategic management that provides effective realization of clearly denoted plan of enterprise and ensures the supervision on realization of strategy basing on indicators that characterize to carry out strategic plans at current administrative level and grade for achieving the goals, profitability of management of processes and collaborators’ work. In the beginning of 1990s the system of balanced indicators designated by R.Kaplan and D.Norton has been tested at several foreign companies, different fields of activity and organizations. The system unifies financial and non-financial indicators which allow for evaluation of effect of non-material assets (innovative products, information technologies, professions, employee’s skills and motivation, mutual relation with consumers, providers, financial structures) on results of company’s activity. Strategic management based on system of balanced indicators covers four components: financial component (growth strategy, rentability (cost effectiveness) growth, increasing profitability), component of client (made and promotional strategy of products, working with clients), component of internal business processes (optimizing strategies of business processes directed to establish competitive superiorities), training and development component (to determine priorities of advanced vocational training, to increase staff’s motivation, to improve management organization, information technologies).

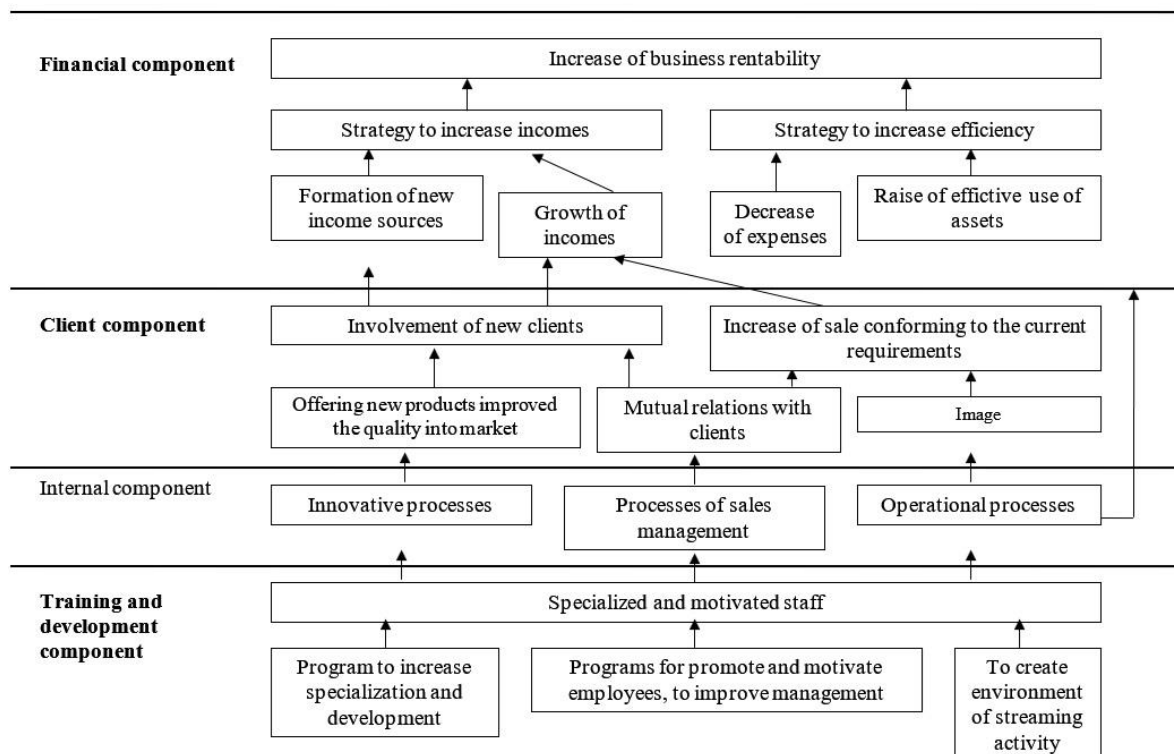

Figure 2: Model of strategic chart of the balanced indicators system

System of balanced indicators constitutes the base of a strategic chart) which is comprised of diagrams expressing strategy and management mechanism to achieve the set goals. Strategic chart describes cause-effect relationships of the arranged level and process of converting to real material (financial) results of non-material assets. Strategic chart contributes to understand directly the course of strategy and its realization. General model of strategic chart is issued in figure 2. While drafting strategic chart of construction materials industry, it should be focused attention on capacity of emptied residential areas having great effect on industrial strategic goals, provision of material base of high growth rate in construction, increase of investment in general economic growth and economy, repair of new constructions and buildings including perspective development of buildings and illustrations as well as construction site which their service life at all fields exceeds 45%. The chosen strategic development orientation of the enterprise depends on complying with modern competitive environment and as a result on providing the material base for all areas of construction and on protecting superiority of our republic in the domestic market of construction materials by joining the WTO. It is possible to totalize strategic goal of construction materials site as providing material base of construction in all directions and this shall be conformed to program relating with development of construction site or territory of this regions, sites and state and growth rate of construction. There is an increase of site incomes facing with financial component of strategy as a duty. Its realization is observed at increase of production capacity of construction materials at operating and new enterprises. Level of client component consists of indicators on customer valuableness which is expressed with followings: offering new materials due to changing construction technology and consumer's requirement; to suggest innovative construction materials that bring down cost price of construction works significantly and make available the dwelling houses at various income levels for humans. Internal (territorial) component of strategy reflects activation processes: To aid organization and application of innovations as well as consultation services, involvement of investments, increase of product quality, fulfilment of ecological programs, provision of aid programs of structural objects, corporation program with regional management structures in coordinating plan of placement and development of site enterprises considering regional opportunities. Training and development component shall have programs of staff training on site, increase of status of agreements on level of salary at site and realization of studying strategic management. The offered algorithm of strategic chart of construction materials site will be as in figure 3. Strategic chart model of the balanced indicators system of construction materials site at enterprise level has been issued in figure 4. The offered model demonstrates various strategic processes and resolutions. They are acceptable at different grades for various enterprises. Strategic chart makes imagine on how to change to material results of delivery system application with different transport means to consumers and for example to increase the gained incomes yielded from sales by involving new clients non-material assets, for instance, specialized high professional collaborators. Supervision to management of competitiveness and evaluation shall be regular work for the enterprise which desires to achieve the considered result, for example, supervision to implement the budget. Supervision system can summarize the gained level of competitiveness comparing with the expected level due to the adopted evaluation system. These evaluation indicators reflect parameters of consumer's requirement, efficiency and innovation on itself. Evaluation of management of enterprise competitiveness creates a comparison of the gained results with the expected results on the basis of realizing the system of balanced indicators.

Figure following on the next page

Figure following on the next page

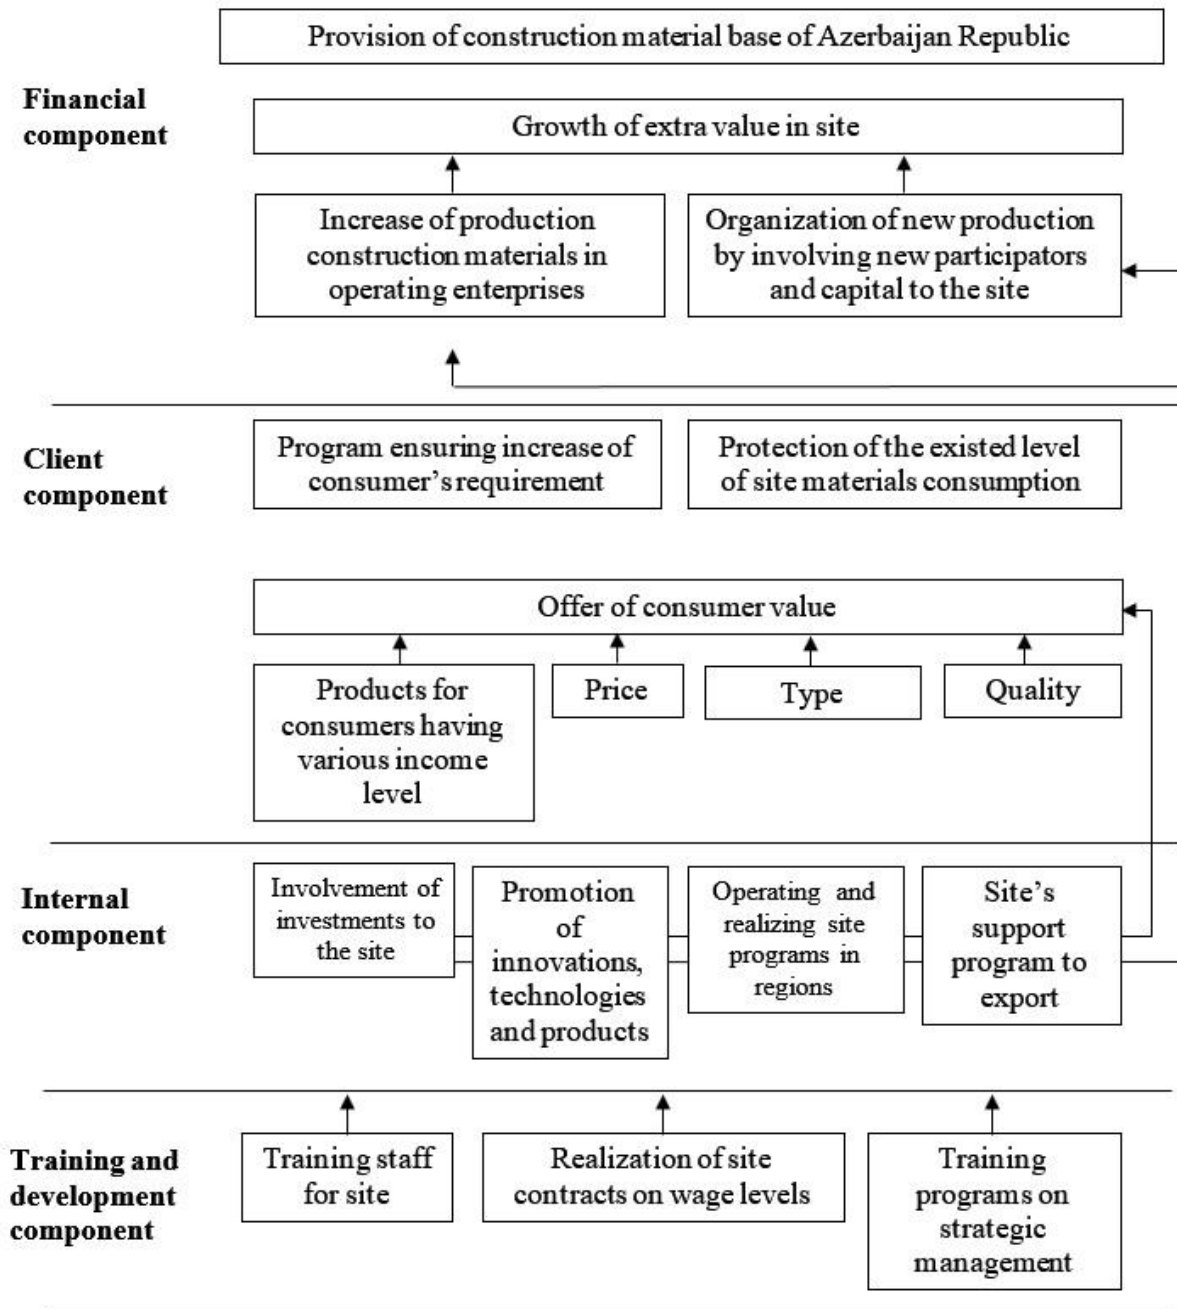

Figure 4: Strategic chart model for construction materials site

4. CONCLUSION

The following results can be noticed generalizing the analysis carried out in the article:

- Managing mechanism of competitiveness of construction materials enterprises shall be worked out and drafted on the basis of and due to enhancement strategy of competitiveness;
- It shall be taken into account of specific features of this field, characteristic factors revealed at internal and external circumstance, resources of manufacturing nomenclature referred to this field, the competitive intensity of different types of construction materials being at diversified degree and others while working out management mechanism of competitiveness;
- use of the balanced site indicators in management of competitiveness of the enterprise controls profitability of realizing the deemed plans of enterprise, implementation of

strategic goals at level of the current operative management and realization of increasing competitiveness strategy of enterprise;

- General model of strategic chart of balanced indicators system is given in figure 2. While drafting strategic chart of construction materials industry, it should be focused attention on capacity of emptied residential areas having great effect on industrial strategic goals, provision of material base of high growth rate in construction, increase of investment in general economic growth and economy, repair of new constructions and buildings including perspective development of buildings and illustrations as well as construction site which their service life at all fields exceeds 45%.
- The chosen strategic development orientation of the enterprise depends on complying with modern competitive environment and as a result on providing the material base for all areas of construction and on protecting superiority of our republic in the domestic market of construction materials by joining the WTO. It is possible to totalize strategic goal of construction materials site as providing material base of construction in all directions and this shall be conformed to program relating with development of construction site or territory of this regions, sites and state and growth rate of construction;
- The offered algorithm of strategic chart of construction materials site will be as in figure 3. Strategic chart model of the balanced indicators system of construction materials site at enterprise level has been issued in figure 4. The offered model demonstrates various strategic processes and resolutions. They are acceptable at different grades for various enterprises. Strategic chart makes imagine on how to change to material results of delivery system application with different transport means to consumers and for example to increase the gained incomes yielded from sales by involving new clients non-material assets, for instance, specialized high professional collaborator.

ABSTRACT

Nowadays the integration process within the EAEU members is being influenced of contradictory factors. The number of political agreements is growing, while the process of economic integration is getting weaker since the creation of the organization. The aim of this study is to identify the degree of discrepancy between the declared opportunities for further cooperation and the real development of the countries. By analyzing macroeconomic data, collected from the various sources, we have revealed the signs of crisis within the framework of the integration organisation. Taking into account inconsistency with established convergence criteria, existing imbalances might be an irrevocable barrier for the further incorporation. Primarily, such factors as inadequate development of the financial markets and the instability of exchange rates along with the inequality in investment attractiveness and balance of payments structures may increase vulnerability of all the EAEU members to macroeconomic shocks in the near future. The combination of these factors leads to a situation where, though considering certain rates of economic growth, a significant part of the negative consequences affects, firstly, the incomes of the population, which invariably fall from the moment of the conclusion of the agreement. At the same time, the EAEU members face the rapid ageing of the population that calls for almost synchronous pension reforms in order to reduce the burden on the state budget. Since the gap between the countries tends to increase over time, the existing imbalances do not allow solving the whole complex of socio-economic contradictions at the supranational level in the short term.

Keywords: *EAEU, convergence criteria, economic integration*

1. INTRODUCTION

The integration process within the EAEU countries is mostly guided by the experience of the European Union as the only association that reached the highest level of institutional incorporation. Nevertheless, it has a number of distinctive features. The economic situation of developing countries linked by a common history and similar culture requires the EAEU members to create their own problem-solving mechanisms rather than to follow the established practices. Primarily, the obvious dominance of the Russian Federation is a driving force for establishing a new political regime of power distribution in the Eurasian region (Mostafa & Monowar, 2016, p. 165). At the same time, the official goals of the EAEU are intrinsically economic (Treaty on the Eurasian Economic Union, Art. 4). Thus, the analysis of the long-term social and economic consequences for the EAEU population is often complemented by the

contradictions of global political interests. Secondly, the differences in the economic potential often do not us to to get a fair view by analyzing absolute indicators. Therefore, in this paper special priority is given to the estimation of relative figures in favor to reveal the degree of their synchronization over the integration process within the EAEU. The study focuses on the analysis of the convergence criteria as a common denominator of the incorporation of national economies. The core priority is given to the examination of several financial indicators that define the distinctive features of the EAEU as a community of developing countries and determine the wealth of the population as the main target recipient of the integration benefits. From our prospective, a complex of these factors is necessary for the comprehensive estimation of possible perspectives.

2. BASIC INDICATORS OF THE EAEU SUSTAINABILITY

2.1. Economic principles of the integration process

A special role in terms of the evolution of integration associations belongs to the European Union, which is currently the sole representative of the highest integration form. Its history, filled with the experience of crises and internal contradictions, serves as an example for building such a structure in the Eurasian space. Thus, the Eurasian Economic Commission recognizes a number of provisions that provide a basis of international economic relations (Eurasian Economic Union: macroeconomic stability and economic growth, 2016, p. 24). Above all, any international agreements is driven by mutual economic interests that enable to maintain the stability of international relations when political and administrative measures do not create incentives for better integration. From our standpoint, the increase of population welfare is the major indicator that reflects the optimal composition of ideological and target-oriented components. Secondly, any economic phenomenon is a result of historic gradual development. In other words, the targets of international agreements can be fulfilled only if macroeconomic indicators meet convergence criteria. At the same time, the levelling of fundamental differences will become a solid basis for strengthening the integration processes and solving the problems of the free circulation of human capital. Thirdly, in today's world the role of supranational institutions is increasing. On the one hand, the transfer of functions to a single body allows to resolve the emerging contradictions and reduce the transaction costs of decision-making process. On the other hand, it requires a high degree of economic and political interaction. In order to narrow the gap between the EAEU economic growth rates and mitigate possible market fluctuations, the following criteria for economic convergence have been officially established (Treaty on the Eurasian Economic Union, Art. 63):

- annual government consolidated budget deficit should not exceed 3% of GDP
- general government debt should not increase 50% of GDP
- annual inflation rate (from December to December of the previous year, not exceeding more than 5 percentage of the inflation rate of another member state with the smallest price increase).

2.2. Convergence criteria

The analysis of the indicators reflects that the economic convergence still can not be achieved (Figure 1). In terms of the compliance with the budget balance requirements, over the past 6 years the Republic of Belarus is the only EAEU member state that has completely fulfilled the criteria. Even with a positive trend, by the end of 2017, a significant volatility of the indicator varies from 4% to 8%. The reason of this phenomenon lies in the synchronization of economic policies by the increase of the burden on the state budget simultaneously in almost all the reviewed countries in 2015-2016 since the trends are similar for all the participants, except for Kazakhstan. In this regard the parallel can be drawn with the dynamics of general government debt, on the item currently two countries do not meet the requirements.

In addition, there is a tendency of a gradually increasing debt, which may be caused by the negative consequences of the economic and political instability.

Figure 1: Convergence criteria and economic growth of the EAEU countries (based on data of Department of Statistics of the EAEU, National Statistics and Finance Authorities)

Despite the attempts to harmonize monetary policies, nowadays the level of inflation in member states stays beyond any acceptable indicators. It should be emphasized that the general dynamics of this indicator proves the impossibility to solve this problem at the current stage because of the chaotic behavior of this indicator within the EAEU. In contrast to the other countries, the inflation curve for the Republic of Belarus was drawn from 2015 owing to the denomination of the Belarusian rouble. This fact prevents us from drawing unambiguous conclusions relating the inflation rate in the Republic of Belarus. At the same time, regarding prospects for economic growth, in 2017 a general decline is replaced by an upward trend. In other words, these indicators show a certain synchronization of economic development, but it is impossible for the EAEU countries to meet the convergence criteria in the short term because of significant deviations.

3. SPECIFIC FEATURES OF THE INTEGRATION PROCESS

There is currently a number of structural problems that impedes successful economic cooperation in the association framework. These factors inevitably affect quite new and relatively underdeveloped financial markets, which in the long run provoke financial difficulties, especially in terms of social projects financing.

Figure following on the next page

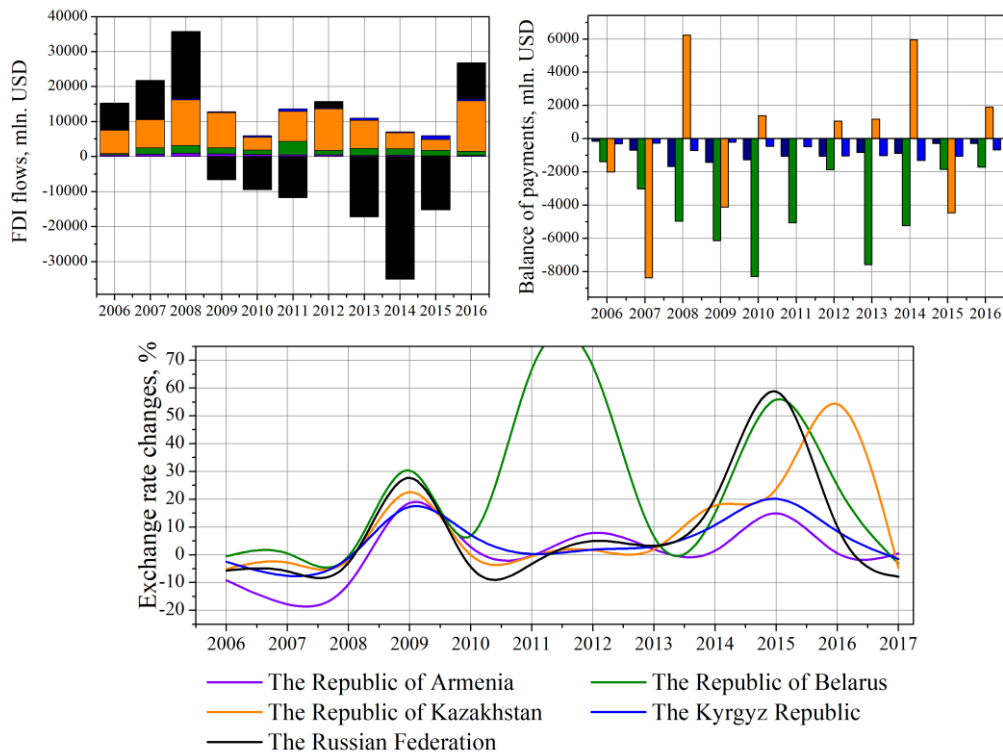

Figure 2: Some financial indicators of the EAEU (based on data of Bloomberg Terminal, World investment report 2017 and World Bank)

The first significant barrier for the substantial development within the EAEU is the outflow of capital from the region (Figure 2), which, studied in details, it is of a local character. Kazakhstan, unlike other countries, is aimed at a increase in FDI, which is a consequence of national policies aiming to increase its investment attractiveness. At the same time, Russia’s investment attractiveness has a negative assessment: if until 2008 there was an inflow primarily due to “hot” capital and a general positive international situation, then at the moment the problem of the “capital flight” is one of the main ones. The share of other countries is extremely little. The outward orientation of the countries also has its own features. As Russia is one of the largest international exporters of raw materials (it was excluded from the graph in order to maintain its scale), the observed countries are characterized by a negative balance of payments. As for Kazakhstan, we can see a negative trade balance. This also creates problems within the framework of the Customs Union, where the Russian Federation plays a leading role in trade. The instability of exchange rates is a threat to the economic integration. At the same time, there was a rather strong correlation of exchange rates against the US dollar, which has a number of features. First of all, this is the volatility of national currencies, which is largely the result of some peculiarities of developing economies. Secondly, it is a strong cyclical nature, which is expressed in a significant reaction to economic crises with a lag of about 1 year. Thirdly, it is worth noting that the currencies follow the change of the rouble as the currency of the most economically strong state. Thus, the financial integration is manifested to a large extent and is largely influenced by the size of the Russian market compared to other countries. Nevertheless, even this asymmetry gradually turns into a “point of power”.

4. CHANGES IN THE WELL-BEING OF THE POPULATION

4.1. Dynamics of income and pension savings in the participating countries

In our opinion, the efficiency of integration processes is largely expressed in the well-being of the population: the growth of trade relations, stabilization and synchronization of economic

policy, the creation of common markets should theoretically lead to the growing income of the population in order to stimulate the aggregate demand and, as a result, the total domestic product. However, in a more detailed analysis we can note (Figure 3) that the real growth of income and pension savings in the participating countries is not growing. At the same time, it is also difficult to talk about its decline as the general trend of both indicators unalterably reaches a zero value. Taking into account the extraordinary synchronicity of changes, we can say that this situation was predictable when the EAEU was being created. However, it should be noted that the lack of real incomes of the population will have several consequences over the next several years. First, it affects the prospects for the GDP growth without the ability to increase the aggregate demand. Secondly, the continuation of this trend can lead to an increase in social tensions, since, psychologically, people perceive the absence of real growth in the welfare as personal losses.

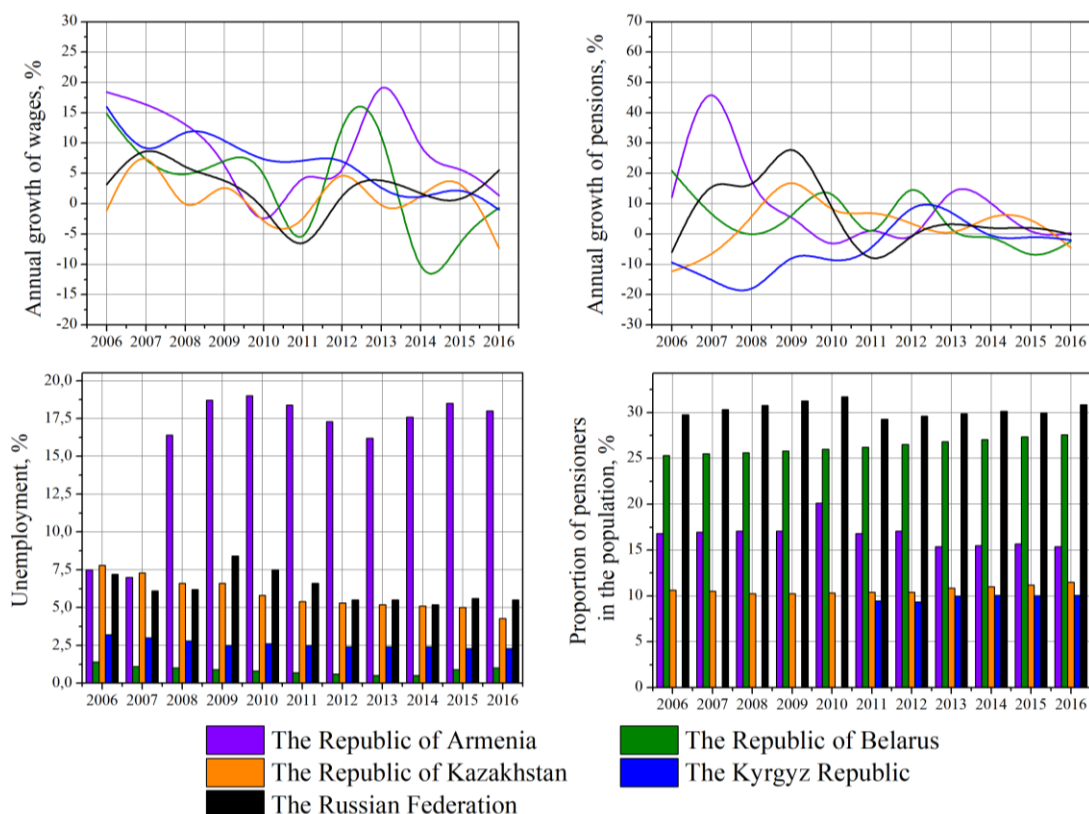

Figure 3: Socio-economic characteristics of the EAEU countries (based on data of National Statistics Authorities and International Financial Statistics. Yearbook. 2017)

However, only in the Russian Federation and the Republic of Kazakhstan the decline in the unemployment rate can be seen. In the Republic of Belarus and Kyrgyzstan there is a stable level of unemployment and a high level of unemployment is registered in Armenia, which is largely due to the strong migration of the people to other countries, especially to Russia. The process of gradual aging of the population becomes especially significant for the Republic of Belarus and the Russian Federation. Pensioners here are accounted for 30% of the population, and that imposes a heavy burden on the pension fund and leads to the need to reform the pension system. This inevitably affects the levels of the overall income of the population, which leads to an increase in social tension. In addition to that, a joint policy in this direction may become an incentive for optimizing the labor migration, and that may become a necessary precondition for the implementation of projects aimed at further integration in the future.

4.2. Measures to synchronize pension systems within the EAEU

The accumulated complex of contradictions actually led to the need to reform pension systems within the EAEU (Disposition of the Eurasian Economic Commission “On the draft Agreement on the provision of pensions to workers of the member states of the Eurasian Economic Union”, 2018). The increase of the retirement age was a controversial decision, but still it allowed to synchronize the retirement age within 63 years, which should simplify the payment system if a person works in one of the participating countries in the future. The presence of similar elements in pension systems and the joint, although unsynchronized, movement towards the increase of the retirement age may partly justify the lack of growth in pension savings as a factor of significant costs. In addition to that, all pension systems have common elements, in particular, in determining the total length of service. The elements of the total length of service are seniority and service record for military men, during which it is necessary to pay the compulsory insurance premiums. Each of the EAEU countries has its own features concerning the main sections of the additional periods. We can identify two aggregated key groups, the directions of which are taken into account when calculating additional periods. First, the service or service experience, which includes the military service record on the territory of a country and other types of service in special state and law enforcement bodies. The number of activities included in this list can be reduced as well as detailed and can influence the seniority of family members. Secondly, the additional periods in all the countries of our study include childcare, care for people with disabilities and people who are over 80 years old who need constant care. The legislation of each of the member countries also contains minimum pension guarantees (for example, when determining the size of the basic pension), described directly or indirectly, as well as the possibilities of early retirement. These circumstances may indicate the similarity of pension systems concerning social guarantees.

5. CONCLUSION

The various discrepancies lead to the ambiguous assessments of the EAEU activities. If the economic situation is taken as the foundation and the institutional and political aspects are its pillar stones, the social component represents in many ways an incentive for further growth. Since the real economic effect of the integration process lies at the center of the interaction of political, economic and social factors, the absence of any one makes the association lose its usefulness. Thus, at the moment, a number of difficulties can be seen within the framework of the EAEU integration agreement. From an economic point of view, the volatility of indicators and quite unsuccessful attempts to harmonize macroeconomic policies in conjunction with capital outflows, the low level of development of financial markets and the instability of exchange rates do not allow to make full use of the integration unity. Significant differences between financial performance and real ability to comply with the agreements do not allow the effective implementation of the policy established at the supranational level. At the same time, it is also inappropriate to say that the EAEU has only formal existence. Despite some difficulties, as well as the crisis situation in the Russian Federation, both political and economic one, social, monetary and some economic indicators show, if not a convergence, but the emergence of strong interconnections. However, it is a matter of concern that the price of this integration agreement is the welfare of the population. If the negative trend of the real income growth rates continues, it may have much greater impact in the long run rather than potential benefits from short-term projects. It is possible that at this stage the stagnation processes in the economy may occur as the result of insufficient aggregate demand, which, under the underdevelopment of national financial mechanisms, remains outside the control of state policy.

MODERN MARKET TRENDS

Zumrud Nadjafova

*The Lecturer of the "Economy" department,
Azerbaijan State Economic University (UNEC)*

ABSTRACT

In the XX century especially in the second half, the market conditions radically changed. Its essence can be understood if we identify new trends that are characteristic of the development of monopolies and competition. The first trend is to increase the monopolization of the market. The scientific and technological revolution brought about a transition to a much higher level of economic integration. The second trend is towards increased competition. A definite guide in this regard is the definition of rating in global competition. The third global trend is too much production of goods. Since the second half of the twentieth century, there has been a trend of oversupply of goods and industrial production. Increased productivity and urbanization of the industry dramatically changed the pricing policy of many companies. Cooperation and corporate communications have become an important factor in the development of the market of Azerbaijan. Thanks to the oil strategy, Azerbaijan became the first state to master the huge energy potential of the Caspian Sea and to form a qualitatively new economic model for the development of the region. One of the main directions of the oil strategy is the transportation of Azerbaijani oil to the world market. H. Aliyev managed to turn the agreement signed on September 20, 1994 in Baku, into the number one event of the whole world, in which both economic and political factors were united. Within a few years, it became clear to the public that this contract is not only economic in nature and that by its implementation we have achieved the use of the promising opportunities of Azerbaijan as a country throughout the world.

Keywords: *Azerbaijan, competition, new economic model, new trends, oil strategy*

1. INTRODUCTION

One of the most important elements of external analysis is the answer to the question about development trends characteristic of the market. Its value is determined by two factors. Firstly, he draws the attention of the strategist to the changes, and secondly, allows him to rank the significance of events occurring in the market, highlighting the most strategically important events. In principle, the discussion of market trends is a kind of summary of the research of buyers, competitors and the market. Common sense suggests that one of the tasks of the strategist is to find areas of growth. At the same time, many people forget the many risks associated with them. In particular, a number of hazards are associated with growing markets.

- The number of competitors interested in the market may exceed its potential "capacity".
- In the market there is a player offering the best product or having a cost advantage.
- The organization does not have the ability to adapt to changes in the KFU.
- Technology is changing.
- The market growth rate is less than expected.
- Price instability leads to an oversupply of production capacity or a decrease in trade (in an effort to attract buyers) of retail prices for "hot" goods.
- The company does not have the necessary resources to maintain high growth rates.

One of the most serious risks is that a growing market is capable of attracting a large number of players who are overstated with respect to market shares. The total sales in the market in this situation may not be sufficient for such a number of firms. Overcrowding was observed and observed in almost all active markets - from rail transportation to aviation services, radio

stations and equipment, televisions and personal computers. The most striking example of the overflow of the market (at least in retrospective terms) was the hordes of competitors rushing into the electronic business. At a certain point, at least 150 online brokerage firms, 1000 travel sites and 30 health and beauty sites competed for the attention of users. Electronic “business-to-business” (B2B) exchanges were created for buying and selling goods and services, exchanging information, providing services in the field of logistics, industrial information and forecasts, as well as many other services. During 2000, the number of B2B companies increased from 250 to more than 1,500, and then in 2003 decreased to less than 250. In the period of maximum growth of electronic business in such an industry as industrial supply, there were more than 140 such exchanges. It is difficult to accurately predict the future, but you can try to understand where the modern financial world is heading. Seventy-five years ago, the World Exhibition was held in New York, where the public saw a new and unknown technology called television. Then many people did not know what to do with television, and the New York Times claimed that television would not be interesting.

2. CHAPTER 2

Today, humanity has learned to better analyze trends and predict the future. Of particular interest are the forecasts for the development of the capital market, since this area has a high degree of unpredictability. Experts identify three current trends that will stimulate markets in the coming years and are good indicators for sensible investors.

2.1. First global trend

The first global trend is the demographic changes of the world community and the aging of the world economy. Humanity began to grow old quickly, people began to relax more and look after their health. This led to a reduction in the work period and a decrease in working hours per week. Many people began to try to retire earlier in order to calmly use their accumulated assets. Pension funds and long-term savings programs made it possible to accumulate enough funds for a comfortable old age. But the aging of the world's population leads to the transition of the financial world to a new level and drastically changes market priorities. Investors will look for greater profitability in bond funds or use a diversified strategy. But they will all have to use insurance companies, and, in addition, they will have to seek additional funding.

2.2. Second global trend

The second global trend is urbanization and re-urbanization. People began to move more, migrating from villages to cities. High rates of urbanization are observed in developing countries, but the United States and European countries are also rapidly merging suburbs and cities. Experts believe that re-urbanization is associated with the priorities of young people who do not want to live in the suburbs and are trying to change their lifestyle. Many of them prefer the urban lifestyle and this trend will only grow. Demographic changes have led people to rent more housing than to buy it. Currently, the rental housing market will be more important for investors than the mortgage market.

2.3. Third global trend

The third global trend is too much production of goods. Since the second half of the twentieth century, there has been a trend of oversupply of goods and industrial production. Increased productivity and urbanization of the industry dramatically changed the pricing policy of many companies. There is a significant deflationary trend in world markets, and new technologies, such as 3D printing, only exacerbate this problem. Some experts believe that a marked oversupply of commodities is controversial. But if we consider the entire cycle of production of goods, we can notice an increase in proposals for many types of products.

This is especially evident in the energy, metallurgical and food industries. High prices for many products led to greater savings in consumption and increased supply in the markets.

3. CHAPTER 3

At the beginning of the XXI century, each state evaluates its capabilities and considers the prospects for development in the global economy. For all countries, their successful integration into the global economic system is very important. This is promoted, first of all, by the consolidation of the foundations of a market economy and the increase in the competitiveness of goods and services both in the domestic and foreign markets. The formation of interstate relations shows that it is impracticable without active trade and economic relations on a global scale. The course towards the integration of Azerbaijan into the international community, taken after the restoration of independence, in addition to political rapprochement with foreign countries, also included integration into the international economic space, and one of the integral components of the intensification was WTO accession. At the present stage, no state can fully develop without involvement in multilateral initiatives, in which in the field of economy and trade CIS countries occupy a significant place in the foreign trade of Azerbaijan. However, approximately 65% of Azerbaijan's foreign trade falls to the EU. The share of foreign trade with the CIS countries and Georgia in the total trade turnover is only 15%. With the CIS countries signed agreements on foreign economic relations in the framework of the Commonwealth. To this day, 1,430 documents have been adopted within the CIS, 150 of which have been signed by the Republic of Azerbaijan. Among the CIS countries in force in more than 1000 interstate and intersectoral agreements, agreements and bilateral documents, 100 of which relate to foreign economic relations. It should be noted that in exports to the non-oil sector of the CIS republic occupy the first place.

4. CONCLUSION

Azerbaijan's new oil strategy has played an exceptional role in turning the country into a rapidly developing country in all vital areas, in strengthening its position in the international arena from the point of view of ensuring national security interests. This successful strategy, the foundations of which were laid by the signing of the Contract of the Century, which created real ground for social and economic growth, the implementation of transnational energy and communication projects, is one of the most glorious pages of the modern history of Azerbaijan. Over time, this step is estimated as the result of a wise policy of universal scale. H. Aliyev managed to turn the agreement signed on September 20, 1994 in Baku, into the number one event of the whole world, in which both economic and political factors were united. Within a few years, it became clear to the public that this contract is not only economic in nature and that by its implementation we have achieved the use of the promising opportunities of Azerbaijan as a country throughout the world. Commenting on this historic event, President of the Republic of Azerbaijan I. Aliyev stressed that "in the modern world, oil is not only a goal, it is also one of the means of solving global problems of both an economic and political nature". It is this tool that turned Azerbaijan into a country independent of anyone. I. Aliyev at the ceremony of signing the "Contract of the Century" stressed that "having signed this agreement, we once again demonstrated to the world the restoration of the sovereign rights of the Republic of Azerbaijan, and that our people are the masters of their national wealth"

STUDY OF QUALITY INDICATORS OF THE PUMPKIN GROWN ON THE TERRITORY OF AZERBAIJAN

Farida Quliyeva

Azerbaijan State University of Economics (UNEC), Azerbaijan
farida-gulieva@rambler.ru

ABSTRACT

The article provides data on the organoleptic and physico-chemical assessment of the quality of pumpkin grown in Azerbaijan. In 2018, we have collected two varieties of pumpkins on the territory of Azerbaijan: Palav-kadu 268 and Perekhvatka. When assessing the organoleptic characteristics of the pumpkin, appearance, maturity, size, and damage were determined. The fruits of these varieties were ripe, whole, healthy, unpolluted, disease-free, with the color and shape of the fruits characteristic of botanical varieties, with a stem, i.e. fully comply with the requirements of the standard GOST 7975 – 68. Organoleptic studies have shown that the pumpkin varieties studied: Palav-kadu 268 and Interception conform to the requirements and standards of GOST 7975-68, deviations from the standard were not observed and these varieties of pumpkin are reasonable to be sold to the public. From the physico-chemical parameters in the studied varieties of pumpkins, the content of water and carotene were determined. A study of the chemical composition of pumpkin varieties in 2018 showed that the pumpkin variety Palav-kadu 268 contains moisture 90%, carotene 1.6 mg; a grade Perekhvatka 88% moisture, 1.9 mg carotene.

Keywords: *expertise, organoleptic method, pumpkin, physic-chemical method, variety*

1. INTRODUCTION

One of the valuable and delicious vegetables is pumpkin, which unfortunately, today is not in wide demand. It is necessary to take into account that the pumpkin, possessing the ability to be well kept, allows to prolong its consumption and, to a certain extent, solves the problem of uninterrupted supply of the population with vegetables. In Azerbaijan, melon growing has primarily begun to develop in the Kura-Araks lowland (in the environs of the ancient city of Ekbatan in what is now Beylagan), on the coast of Kura in Ganja - the Kazakh zone, in Nakhichevan. A small amount of fiber (0.7%) and organic acids allows you to include pumpkin in the diet for diseases of the gastrointestinal tract, and a large amount of pectin has a particularly positive effect in inflammation of the colon. (Гуцалюк , 1997, с.178). Since the pumpkin has a low calorie content, it is advised to eat with obesity. In Azerbaijan, decoctions of pumpkin flowers are used to heal wounds. The yield of carotene per unit area from the pumpkin is significantly higher than that of the mountain ash, red carrots. Pumpkin is rich in a set of almost all vitamins, and since in most cases it is consumed fresh, the whole set is preserved, whereas other vegetables lose vitamins.(Шепелев , 2002. с. 223).

2. EVALUATION OF THE QUALITY OF PUMPKIN (PALAV-KADU 268 AND PEREKHVATKA) ORGANOLEPTIC METHOD

In 2018, we have collected two varieties of pumpkins on the territory of Azerbaijan: Palav-kadu 268 and Perekhvatka. When assessing the organoleptic characteristics of the pumpkin, appearance, maturity, size, and damage were determined.(Базарова, Боровикова,1986, с 295). The fruits of these varieties were ripe, whole, healthy, unpolluted, disease-free, with the color and shape of the fruits characteristic of botanical varieties, with a stem, i.e. fully comply with the requirements of the standard GOST 7975 – 68.(1993, с 6.). The fruits (10 copies of each variety) were loaded loose (in bulk), but with a soft litter of straw 10 cm thick and brought to the laboratory of the Az Research Institute of Food Industry for further research.

2.1. Appearance

In accordance with the requirements of standards GOST 7975 - 68 there should be one economic botanical variety in the batch of vegetables. The belonging of vegetables to the economic-botanical variety is established mainly in two ways - in form and color. Pumpkin should be uniform in color. The variety Palav-kadu 268 has elongated fruits, narrowed in the middle (interception), with a thickening towards the apex and to a lesser extent towards the stem. The ripe fruit is light brown, with a pattern in the form of broken stripes of a darker color than the background. Grade Perekhvatka - the tip of the fruit is slightly thickened, in the form of a cylinder, mature fruits become orange in color.

2.2. Magnitude

The size of most varieties of vegetables is determined by the maximum transverse diameter in cm: for the variety Palav-kadu 268 - 19.5 grades Perekhvatka-12.

2.3. Maturity

According to technical requirements all vegetables must be of a certain ripeness. The maturity of vegetables is determined by the size, color, condition of the skin, the density of the pulp. Mature fruits include fruits with a color of pulp, characteristic of this botanical variety, seeds mature or close to ripening. To determine the maturity of the fruit, installed on the internal structure, cut no more than 10% of the fruits of the mass of the sample taken. Both varieties taken are mature. Varieties Palav-kadu 268 and Perekhvatka have orange flesh, dense-crunchy, tender, leathery seeds, easily defined, the seed cavity is small (only in the upper part of the fruit in Palav-kad 268). In the Intercept variety, the seeds are of medium size, and in the Palav-Kadu variety 268, they are smooth, round and pale-dirty.

2.4. The presence of disease.

All vegetables harvested and marketed must be healthy. Admissible microbiological diseases include the pumpkin crab. Fruits affected by these diseases within the established norms, are considered standard, in excess of the norm, non-standard. With other microbiological diseases, products are transferred to waste. For each type of vegetables are characterized by different types of damage that is provided in the standards. For example, for pumpkin - scuffed. Taken to study varieties of pumpkins are healthy, without damage. Organoleptic studies have shown that the pumpkin varieties studied: Palav-kadu 268 and Perekhvatka conform to the requirements and standards of GOST 7975-68, deviations from the standard were not observed and (these varieties of pumpkin) it is advisable to implement to the population.

3. EVALUATION OF THE QUALITY OF PUMPKIN (PALAV-KADU 268 AND INTERCEPTION PEREKHVATKA) BY PHYSICO-CHEMICAL METHOD

By this method, we determined the content in the pumpkin moisture, carotene. To determine the moisture in the pumpkin, we took 3 g of raw pumpkin of the variety Palav-kadu 268 and 3 g of the variety Perekhvatka. The analysis was carried out according to the method commonly used in the examination. The total moisture content in the pumpkin variety Palav-kadu 268 was 90%, for the grade Perekhvatka 88%.

3.1. Determination of carotene content

The content of carotene in 1 g of pumpkin is calculated by the formula:

$$X = \frac{0.01 * a * c * 100}{M * b} \text{ mg\%}$$

where, a - the height of the column of the standard solution, sm ; c - the volume of the test solution, ml ; M is the mass of pumpkin puree taken for analysis g ; b - the height of the column of the test solution, sm

We carried out analyzes to determine the content of carotene in the pumpkin of the variety Palav-kadu 268 and in the pumpkin of the variety Perekhvatka. In the first case, we took 100 g of pumpkin varieties Palav-kadu 268 and conducted an analysis using the above method. Thus, a 100 g sample of a variety of pumpkin Palav-kadu 268 in an amount of 100 g contains 1.6 mg of carotene. In the second case, an analyzed sample of pumpkin variety Perekhvatka in the amount of 100 g contains 1.9 mg of carotene.

4. CONSLUSION

Organoleptic studies have shown that the pumpkin varieties studied: Palav-kadu 268 and Perekhvatka conform to the requirements and standards of GOST 7975-68, deviations from the standard were not observed and these varieties of pumpkin are reasonable to be sold to the public. The study of the chemical composition of pumpkin varieties in 2017 showed that the pumpkin variety Palav-kadu 268 contains moisture 90%, carotene 1.6 mg; a grade Perekhvatka 88% moisture, 1.9 mg carotene. Organoleptic studies have shown that the pumpkin varieties studied: Palav-kadu 268 and Perekhvatka conform to the requirements and standards of GOST 7975-68, deviations from the standard were not observed and these varieties of pumpkin are reasonable to be sold to the public. The study of the chemical composition of pumpkin varieties in 2017 showed that the pumpkin variety Palav-kadu 268 contains moisture 90%, carotene 1.6 mg; a grade Perekhvatka 88% moisture, 1.9 mg carotene.

ABSTRACT

External debt is one of the key indicators on the economic growth of a country. However, the underestimation of the risks and unefficient use of received funds resulted on the default of some countries. Lately, Greece, Spain and Portugal faced default due to challenges on paying back the external debt. The purpose of the study is to determine the structure of external debt in Azerbaijan and calculate it by interest rates to assess main economic indicators, such as, the volume of GDP, the income and expenses of the state budget, social inequality, employment and poverty indicators. As an oil rich country, there is a difference on the impact of external debt to the oil and non-oil sector. Thus, the growth of oil sector through external debt is conducted by the international contracts. The research was conducted by conducting statistical, competitive analysis and running econometrical models. According to the research results, external debt does not impact the economic growth all the time. For this, the goals of the external debt, its allocation and control have to respond to international standards. The oil prices of the world market, in addition, the ratio of national currency against the foreign currency, including U.S. dollar has an impact on the borrowed or paid external debt. The competitive economic environment in the country should be maintained and improved for the

growth of the national economy. The innovativeness of the research is that the structure of the external debt has been calculated by the interest rates and economic indicators were assessed by diversification.

Keywords: *External Debt, Economic Growth, Economic Indicators, International Standards, Diversification*

1. INTRODUCTION

External debt is one of the key essential on economic activity of the country. Meaning that, external debt is fellow (countries, The World Bank, IMF, UN and other financial institutions) of the World economy in regard of remedy in terms of efficient tool of the free funds. However, inefficient use of received funds, inaccurate risk assessments face challenges to return of received funds. These challenges might lead to default of the country. The problem on return of received funds negatively impacted on economic and social development and economic growth of the country. Significant decline in world oil prices in 2008 creates certain effects of external borrowing in emerging global financial crisis (Hasanli Yadulla and Ismayilova Simrah. 2017. p.12). It is no coincidence that international financial institutions consider it unnecessary that the ratio of foreign debt to GDP is undesirable, and this is reflected in the calculation of the various international ratings of the international economic institutions, including the Global Competitiveness Report of the World Economic Forum, as an important indicator in calculating the Global Competitiveness Rank-GCR (Klaus, Schwab, 2018, pp. 68-626). Thus, the study of the impact of external borrowing on the economic growth remains a problem.

2. ANALYSIS OF CURRENT STATUS OF AZERBAIJAN'S FOREIGN DEBTS

As it is known, valorization of the national currency rate (especially against the US dollar) is also reflected in the amount of foreign debt. As country rich in carbohydrate resources, the value of the national currency of Azerbaijan depends largely on the world market price of oil. The fall in oil prices in 2008 and starting in the second half of 2014 and the propensity for economic recession of the main trading partners did not sweep without affecting the economy of Azerbaijan. Since, as a result of the depreciation of the national currency against the US dollar by more than 2 times, the ratio of external debt to GDP has increased significantly over the years. The dynamics of a number of economic indicators for 1995-2017 years are given on the Table 1. As can be seen from Table 1, the ratio of the external state debt of Azerbaijan to GDP is expressed by a not-so-big figure. But as a result of the depreciation of the national currency in 2015, the ratio of external state debt to GDP increased from 8.6% in 2014 to 22.8% in 2017. As can be seen from the Graph, 1, the ratio of external state debt to GDP grows and falls with the rise and fall of the national currency price (with the exception of 1996-1998 years). In general, paying attention to the figures in Table 1, one can see that the external debt of the Azerbaijan economy is not at a critical level. Because the ratio of external state debt to GDP in Germany, France and other developed countries of European Union is more than 50%. Even for USA, Portugal, Ireland, Italy this figure is more than 100%. There are some factors affecting this situation.

Table following on the next page

Table 1: Dynamics of some economic indicators of Azerbaijan (Statistical Year Book of Azerbaijan, 2018, p.37-43; (<https://www.stat.gov.az/source/finance/>, http://www.economist.com/content/global_debt_clock))

Years	The amount of external state debt, million USD	GDP, million manat	GDP, million USD	exchange rate 1 US dollar = ... AZN	External state debt to GDP ratio,%
1995	294.0	2133.8	2397.5	0.89	12.3
1996	525.8	2732.6	3332.5	0.82	15.8
1997	549.7	3158.3	3962.7	0.80	13.9
1998	661.6	3440.6	4445.2	0.77	14.9
1999	964.0	3775.1	4339.2	0.87	22.2
2000	1162.5	4718.1	5184.7	0.91	22.4
2001	1264.2	5315.6	5595.4	0.95	22.6
2002	1356.2	6062.5	6186.2	0.98	21.9
2003	1575.2	7146.5	7218.7	0.99	21.8
2004	1587.7	8530.2	8680.2	0.98	18.3
2005	1650.5	12522.5	13611.4	0.92	12.1
2006	1972.0	18746.2	21547.4	0.87	9.2
2007	2441.9	28360.5	33762.5	0.84	7.2
2008	3001.1	40137.2	50171.5	0.80	6.0
2009	3421.8	35601.5	44269.5	0.80	7.7
2010	3857.3	42465.0	52843.5	0.80	7.3
2011	4816.7	52082.0	65926.6	0.79	7.3
2012	5708.4	54743.7	69683.9	0.79	8.2
2013	6058.9	58182.0	74173.9	0.78	8.2
2014	6478.2	59014.1	75234.7	0.78	8.6
2015	6894.3	54380.0	51790.5	1.05	13.3
2016	6913.3	60393.6	37746.0	1.60	18.3
2017	9398.3	70135.1	41255.9	1.70	22.8

The low budget deficit and the associated low debt in Azerbaijan is due to oil revenues. For example, if we pay attention to the law, we will see that 10% (from 2006, 22–26% sources of income are indicated) and more of budget revenues are transfers from the State Oil Fund.

Figure 1: Dynamics of the ratio of Azerbaijan's foreign debt to GDP and national currency rate

Note that there is a certain effect of indicators characterizing the country's external debt on the competitiveness of the country's economy. Since in The Global Competitiveness Report in the estimation of Global Competitiveness Rank-GCR of the countries along with the factors of the "Macroeconomic environment", the indicators "Inflation" and "Total State Debt" are also used (Klaus, Schwab. 2018. p.83) (look at: Table 2).

Table 2: Azerbaijan's place in ranking of countries in Global Competitiveness Index by Macroeconomic stability (Klaus Schwab, World Economic Forum, The Global Competitiveness Report, 2018, p.84. <http://www3.weforum.org/docs/GCR2017-2018/05FullReport/TheGlobalCompetitivenessReport2017%E2%80%932018.pdf>)

Years	Pillar 4: Macroeconomic stability. 0-100 (best)		Global Competitiveness Index in Azerbaijaj rank	Global Competitiveness Index in Azerbaijaj score
	Inflation annual % change	Debt dynamics 0-100 (best)		
2008	130.0	10	69	4.1
2009	123.0	12	51	4.3
2010	43.0	9	57	4.29
2011	101.0	11	55	4.3
2012	106.0	12	46	4.4
2013	1.0	13	39	4.5
2014	1.0	12	38	4.5
2015	1.0	14	40	4.5
2016	81.0	41	37	4.6
2017	127.0	43	35	4.7
2018	128.0	111	69	3.8

As can be seen from Table 2, Azerbaijan's position by score and rank in Global Competitiveness Index has been declined. The main reason for this has been removing the indicators of "Government budget balance", "National saving rate" and "country's credit rating" from the list of "Macroeconomic stability" factors, along with declining its position by "Debt dynamics". Because Azerbaijan's position has not deteriorated much due to the "budget balance of the government", the "national savings norm" and the "credit rating of the country" indicator.

3. ECONOMETRIC EVALUATION OF EXTERNAL BORROWING ON GROSS DOMESTIC PRODUCT

In order to determine the impact of the foreign debt indicator of Azerbaijan and the national currency rate on the country's GDP the following regression equation is evaluated in the Eviews Applied Software Package (Eviews, <http://www.eviews.com/EViews10/ev10main.html>):

$$GDP_USD = 57369.0245549 + 10.1428323026*ESD_USD - 928.381471299*ESDP_GDP - 49944.5816719*ER \quad (1)$$

Here, GDP_USD - GDP volume of Azerbaijan (in millions of USD), ESD_USD - The amount of external state debt (million USD), ESDP_GDP - External state debt to GDP ratio (%) and ER - exchange rate 1 US dollar = ... AZN shows.

The main statistical characteristics of the model (1) are given in Table 3.

Table 3: Main statistical characteristics of model (1)

Dependent Variable: GDP_USD				
Method: Least Squares				
Sample (adjusted): 1995 2017				
Included observations: 23 after adjustments				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	57369.02	4542.041	12.63067	0.0000
ESD_USD	10.14283	0.662172	15.31751	0.0000
ESDP_GDP	-928.3815	281.6402	-3.296338	0.0038
ER	-49944.58	8262.543	-6.044698	0.0000
R-squared	0.967238	Mean dependent var		29711.29
Adjusted R-squared	0.962065	S.D. dependent var		26305.63
S.E. of regression	5123.527	Akaike info criterion		20.07784
Sum squared resid	4.99E+08	Schwarz criterion		20.27532
Log likelihood	-226.8952	Hannan-Quinn criter.		20.12751
F-statistic	186.9795	Durbin-Watson stat		1.776303
Prob(F-statistic)	0.000000			

The main statistical characteristics given in Table 3 are satisfactory (Marno Verbeek, p.29-87). Other characteristic tests of the model (1) also show that the model is adequate (Damodar N. Gujarati. 2003. pp. 212, 217, 258, 267). Thus, the Breusch-Pagan-Godfrey test of the residual equilibrium test showed that there is homoscedasticity of the variance of the residuals remaining from the basic conditions laid down. (Table 4).

Table 4: Heteroskedasticity Test of Remaining Model (1): Breusch-Pagan-Godfrey

F-statistic	0.777375	Prob. F(3,19)		0.5210
Obs*R-squared	2.514465	Prob. Chi-Square(3)		0.4727
Scaled explained SS	1.323079	Prob. Chi-Square(3)		0.7237
Test Equation:				
Dependent Variable: RESID^2				
Method: Least Squares				
Sample: 1995 2017				
Included observations: 23				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-2783040.	24788603	-0.112271	0.9118
ESD_USD	1385.278	3613.865	0.383323	0.7057
ESDP_GDP	-556723.1	1537077.	-0.362196	0.7212
ER	29874066	45093586	0.662490	0.5156
R-squared	0.109325	Mean dependent var		21685219
Adjusted R-squared	-0.031308	S.D. dependent var		27534409
S.E. of regression	27962116	Akaike info criterion		37.28737
Sum squared resid	1.49E+16	Schwarz criterion		37.48485
Log likelihood	-424.8048	Hannan-Quinn criter.		37.33704
F-statistic	0.777375	Durbin-Watson stat		2.158928
Prob(F-statistic)	0.521037			

Table 5: Augmented Dickey-Fuller test of remnants of model (1)

Null Hypothesis: RESID09 has a unit root				
Exogenous: Constant				
Lag Length: 0 (Automatic - based on SIC, maxlag=4)				
			t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic			-4.008228	0.0059
Test critical values:		1% level	-3.769597	
		5% level	-3.004861	
		10% level	-2.642242	

As Figure 2 shows, actual GDP figures and their model (1) prices are very close. This also indicates that the value of the determination coefficient shown in Table 3 is close to the unit. (R-squared = 0.967238).

Figure 2: Prices of Azerbaijan (Actual) and Actual (1) model prices and their Residual Dynamics

The Model (1):

- The US \$ 1 million increase in the amount of the external debt of ESD_USD increases the country's GDP by about \$ 10 million;
- Increase in the ratio of ESDP_GDP, ie the ratio of Azerbaijan's foreign debt to GDP by 1%, causes the country's GDP to decline by 928 million;
- ER - exchange rate 1 US dollar = ... The decline in manat, ie, the decline of the Manat against the US dollar by 0.1 USD will reduce the GDP by about \$ 5 billion.

4. CONSLUSION

The analysis carried out showed that the ratio of the external state debt of Azerbaijan to GDP is expressed by a not-so-big figure. But as a result of the depreciation of the national currency in 2015, the ratio of external state debt to GDP increased in recent years. The low budget deficit and the associated low debt in Azerbaijan is due to oil revenues. Due to the Budget Act budget beginning from 2006 transfers are made from the State Oil Fund. Also there is a certain effect of indicators characterizing the country's external debt on the competitiveness of the country's economy. The main reason for the fact that Azerbaijan's position by score and rank in Global Competitiveness Index has been declined has been removing the indicators of "Government budget balance", "National saving rate" and "country's credit rating" from the list of "Macroeconomic stability" factors, along with declining its position by "Debt dynamics". The results of the econometric modeling showed that the growth of The amount of external state debt by 1 million US dollars positively affected the growth of the volume of GDP. But the growth of the External state debt to GDP ratio (%) and depreciation of the national currency against the US dollar lowers GDP.

ABSTRACT

Formation of a new model of economic development in Azerbaijan means transition from the raw material economy to the diversified economy, reduction of dependence on the oil sector and dynamic development of the service sector, including tourism. Tourism is one of the most promising and fast-growing sectors of the world economy plays an important role in providing human resources' employment, opening new jobs, thus solving social problems of the society. The goal of this article to investigate the impact of human capital on development of tourism industry. For achieving this goal, following issues are solved: statistical analysis of the current situation of tourism development in Azerbaijan is conducted; internal and external factors affecting the tourism sector are investigated; the role of human capital in the development of tourism is substantiated. The article deals with the preparation and use of tourism suggestions as a complex of knowledge and skills of individuals in human capital. The specificity of tourism is related to the fact that there is a constant mutual relationship between producers and consumers, while this demands to improve the quality of provided tourism services, to raise qualifications of the staff and to realize trainings for them. Because of exploring the lawfulness and factors affecting tourism, correlation-regression analysis is carried out, regression equations are formed and the most important factors characterizing the tourism development in Azerbaijan are determined in the article. The density of the relationship between human capital and tourism development is measured, as well as the forecast of tourism indicators is mentioned. The quality of tourism services depends on personal and professional qualities of the staff. Consequently, we can point out that, it is necessary to make sustainable investments in the development of human capital for achieving strategic goals of tourism institutions and preparing competitive tourism suggestions.

Keywords: *human capital, statistical analysis, service sector, tourism development*

1. INTRODUCTION

In our contemporary world, tourism is one of the most dynamically developing areas of the world economy. At the beginning of the 21st century, tourism has come to prominence in international foreign-economic relations, and has started to have a significant impact on the development of the economies in individual countries. At the same time, the influence of tourism on the formation of the gross domestic product (GDP) has also risen. At present, tourism has become a giant international industry covering 10.4% of the gross world product. There are numerous human resources, major production facilities and large capitals in this industry. Tourism and industries it covers play a crucial role in ensuring the employment of the population. According to WTTC (World Travel and Tourism Council, 2017), 313 million workers were employed in tourism in 2017 and it made up 9.9% of total employment. According to an analysis by UNWTO experts from the World Tourism Organization, the total annual income from tourism in 2020 will reach 2 trillion USD dollars. An analysis of the indexes of January-April 2018 shows that there is a 6% increase in international inbound

tourism compared to the previous year (World Tourism Barometer, 2018). One of the priorities of the economic policy of the Republic of Azerbaijan is to achieve the formation of a highly competitive economy based on innovations. An integral part of this policy is the development of the non-oil sector (including tourism), the formation of an innovative economic development model, improving infrastructure, developing information and communication technologies, developing human potential and building human capital. It is necessary to create scientific capacities and highly educated human capital for the formation of innovation based entrepreneurship in the field of tourism. The article analyzes the current state of tourism in Azerbaijan and the main tasks of the state regulation on tourism, then determines the role of human capital in tourism.

2. TOURISM AND ITS IMPACT ON THE ECONOMY

Tourism is a complex socioeconomic system consisting of elements that are interconnected. The main elements of this system include citizens traveling for a certain period of time (tourists); organizational-intermediaries engaged in tour operator and tour agent activities; a set of relationships during travel; the infrastructure of tourism and etc. Let's have a look at the impact of tourism on the country's economy. Mathieson and Wall (1982) in their studies claimed that the amount of foreign tourists' expenditures was the main indicator of the impact of tourism on the economy. Authors used the term "economic effect" to determine the degree of influence of tourism to the country's economy. Currency earnings, income generation; employment growth; improving economic structures and stimulating entrepreneurship such as the main economic benefits obtained were mentioned. The positive impact of tourism on the country's economy is reflected in the works of Frechtling (2010), Kvartalnov (2003), Ilic and Nikolic (2018). According to Pirozhenko (2012), tourism plays an exceptional role in the formation of GDP, provision of employment and activating foreign trade balance in many countries. In recent years, tourism has been advancing dynamically along with being as an innovative field (Hjalager, 2010, p.3). Application of modern information and communication technologies has expanded the geography of tourism and stimulated its development (Ilic and Nolic, 2018). Kozyrev, Zorin and Surin (2001) point out that tourism has a strong impact on the region's (country's) economy; the tourism services sector ensures new job opportunities and acts as a catalyst for the development of the national economy along with as a multiplier of the growth of national income, development of employment and infrastructure and improving the living standards of the local population. Thereby, analyzing sources of literature leads us to come to such a conclusion that the positive economic effect of the tourism sector is one of the main reasons for the formation of the aggregate value, provision of employment, intensification of domestic and international trade, ensuring foreign currency flow, and the formation of the state budget revenue. Fletcher, (1989) and Frechtling, (2010) mentioned in their studies that tourism has a direct and indirect impact on the country's economy. The direct impact is reflected in the increase of the country's income thanks to the direct costs of tourists. The expenditures of tourists are allocated to the development of infrastructure and to increase the employment of the population in the country, thereby it will raise the income of both tourism companies and the countries that accepts tourists. The impact of tourism on the economy is that tourism development stimulates the development of other industries of the economy ("multiplier effect"). Hojo, (2002), Rusu, (2011), Kvartalnov, (2003), Kabirov, (2009) studied tourist multiplier. According to the scientists, the tourist multiplier is a factor that reflects the growth of the country's income, depending on the expenditures of tourists. The tourist multiplier allows to evaluate the impact of tourism on the country's economy compared to other industries and calculate the effectiveness of investment in tourism.

3. PRESENT STATE OF TOURISM DEVELOPMENT IN AZERBAIJAN

Tourism has an exceptional role in the development of the country's economy. There is a strong potential for tourism development in Azerbaijan. Rich natural resources, favorable geographical position, moderate climate conditions, ancient historical temples and monuments, centuries-old cultural heritage and hospitality, tasty and rich cuisine gives the contribution to the development of tourism. But for many years, tourism in our country has not been a priority, and the availability of rich oil resources has positioned Azerbaijan as an oil exporter in the world. The modern development of tourism has begun since 1991, when Azerbaijan gained its independence. In the first years of independence, our country has faced numerous problems, and the indicators on almost all industries of economy have fallen. One of the factors that directly complicated the situation and directly influenced the development of tourism was Azerbaijan to suffer from military aggression and to be in war condition. The turning point in the economy has begun in 1994 with the signing of an oil contract called the "Contract of the Century" with the participation of several foreign companies. Firstly, the contract, which envisaged the development and export of the oil field, also intended the development of non-oil sectors (including tourism) with oil revenues. Socio-economic indicators of Azerbaijan are reflected in figure 1.

Figure 1: Socio-economic indicators of Azerbaijan (Adapted from the collected data from Statistical yearbook of Azerbaijan, 2018)

The schedule depicts that there is almost increase in the dynamics of all indicators compared to 1991. Thereby, GDP increased from 415.4 million manat in 1991 to 12522.5 million manat in 2005, and up to 70135.1 million in 2017. GDP has risen 21.8% annually on average between 1991 and 2017. The highest value of budget revenues becomes 19496.3 million manat in 2013 and it is 9.5 times more than in 2005, when the denomination of manat was observed. In 2017, budget revenues have dropped by 15.3% compared to 2013, but this figure increased by an average of 19% each year in 2005-2017. There was also a steady increase in GDP per capita and incomes of the population. Only in 2015 GDP per capita has been decreasing. Thus, in the last year 2000, the indicator increased by 9.6 times in 2015 to 5706.6 manat in 2015, which is 9% less than in 2014, while GDP per capita in 2017 increased to 7205.0 manat. There is a steady increase in the dynamics of the busy population in the economy, which is related to socio-economic reforms in the country. There was also a steady increase in GDP per capita and incomes of the population. Only in 2015 GDP per capita decreased. Thus, the indicator became 5706.6 manat due to increase by 9.6 times in 2015 compared to 2000, which is 9% less than in 2014, while GDP per capita increased to 7205.0 manat in 2017.

There is a steady increase in the dynamics of the employed population in the economy during those times, in turn it is related to socio-economic reforms carried out in the country.

3.1. The main directions of state regulation of tourism in Azerbaijan

The main goals of state regulation of tourism are follows: ensuring the constitutional rights of people to rest; creating of the appropriate conditions for the development of tourism; using efficiently of country's cultural potential for tourism development. In order to achieve these goals, the government should first assess the position of tourism in the people's lives and create favorable conditions for tourism activities. These conditions must be reflected in relevant legislative and normative documents. For the purpose of creating the necessary conditions for the development of tourism in our country and regions, regulatory and legislative acts on tourism industry include "The Law of the Republic of Azerbaijan On Tourism" (1999), "Tourism Development in the Republic of Azerbaijan in 2002-2005" (2002), State Programs on the Development of Tourism in the Republic of Azerbaijan in 2010-2014, "Azerbaijan 2020: Look into the Future" Development Concept (2012), The Strategic Roadmap for the Development of Specialized Tourism (2016). The Strategic Road Map (2016) intends to develop a tourism development strategy in the country and implement a plan of action related to it. The Strategic Roadmap includes the support of the development of the tourism sector, provision of high-quality and competitive tourism services at international and domestic markets, formulation of tourism experience in line with national values, involvement of new investment projects based on modern ideas and innovations, and interaction of relevant bodies related to the development of tourism. It is forecasted that as a result of realization of the targets for the period up to 2020, the real GDP in Azerbaijan will increase directly to 293 million and indirectly 172 million manat in 2020, and 25000 direct job opportunities will be opened by being only 35000 totally in the tourism sector. To achieve this goal, improvement of tourism infrastructure, successful promotion of local values in the international arena, formation of national tourism brands, improvement of tourism management, and human capital formation in tourism are of great importance.

3.2. Statistical analysis of tourism industry

In Azerbaijan the researches on tourism conducted by Alirzayev (2011), Yeganli and Hajiyev (2006), Hasanov (2014) and Hajiyeva (2017) can be noted. The average number of entrepreneurs in the tourism sector has increased by 4.5% in the last five years (Hajiyeva, 2017, p.330). Let's look at statistical data to analyze the development of tourism in Azerbaijan. The dynamics in the number of tourists coming and going to the country are depicted in the chart below. According to the chart, there is an increase in the number of tourists coming to the country during the period studied. Thus, in 2017, the number of tourists visiting the country increased by 3.5 times compared to 2005. The average growth rate in each period studied is approximately 111%. When looking at the other indicator, it seems that the number of tourists going out from the country exceeds the number of tourists coming. Thereby, in 2017 the number of tourists going out from the country increased by about 3,9 times in comparison with 2005, while it declined by 4% in comparison with 2016 (figure 2).

Figure following on the next page

Figure 2: Number of arrived and dispatched tourists (Adapted from Statistical yearbook of Azerbaijan, 2018)

Let's have a look at the following charts to analyze the number of other factors that contribute to the development of the tourism industry - hotels and hotel-type businesses, travel agencies and tour operators, the income and expenses of these businesses (figure 3).

Figure 3: General economic indicators of hotels and similar establishments (Adapted from Statistical yearbook of Azerbaijan, 2018)

As depicted in the chart, the number of hotel and hotel-type businesses has been increasing since 2003. The number of these businesses increased by an average of 13.5% per year over the last 15 years studied. The revenue gained by these enterprises in 2003-2017 exceeded their expenditures. Also, if we look at the dynamics of revenues, it obviously seems that revenues increased 2.2 times in 2007 compared to 2003, 56.2% in 2012 compared to 2008, and 66.1% in 2017 compared to 2013. As for expenses incurred by hotel and hotel-type businesses for production of goods and services, there was a steady increase in 2009, with a decline of 10.3% compared with the previous year from 2009, but this figure continued to increase in the following years. This can be related to the further development of the tourism industry, construction of hotels and hotel-type businesses that meet world standards, and providing services (figure 4). When we look at indicators of travel agencies and tour operators (Figure 4), we see that in 2003-2017, the number of travel agencies and tour operators has increased year by year as the number of hotel and hotel type businesses. The revenues of travel agencies and tour operators are also on rapid increase.

Figure following on the next page

Figure 4: Main indicators of travel agencies and tour operators (Adapted from Statistical yearbook of Azerbaijan, 2018)

The average relative annual increase was approximately 23% in the latter. Expenditures incurred by travel agencies and tour operators for production of goods and services have declined only in 2016 and have fallen by 5.6% compared to the previous year. But in 2017, the expenditures for production of goods and services increased by 26.2% compared to the previous year and became 36734.6 thousand manat. Thus, it has to be noted that there is the stable development of the tourism industry in Azerbaijan based on the statistical analysis carried out.

4. HUMAN CAPITAL IN TOURISM

Human capital in tourism has become a need due to rapid development of tourism business and the application of modern information and communication technologies. Training of highly qualified managers with innovative management knowledge can be one of the competitive advantages of tourism businesses. Hence, tourism companies must invest in the development of human capital in order to achieve their strategic goals and to introduce competitive tourism offers to the market. In contemporary socio-economic conditions, human capital determines the level of economic development and scientific-technical progress. According to Becker's theory, human capital is a combination of knowledge, skills and experiences gained by people. Becker (1996) studied relationships between investments in education and employment and salaries, thus he came to such an end that the company should invest equally in human capital development as it invests in equipment and production. Cohn and Geske (1990) claimed in their research that directing investments into education is one of the key areas of productivity growth. Improvement of the quality characteristics of the staff, including development of its education, intellectual and creative potential, value system improvement, physical and psychological health, require involvement of investment in this process. Investments in human capital aim at increasing labor productivity and improving the quality of customer service. Authors mention these types of investments in human capital: expenditures on education; extension of the expected life span and health care costs; mobility expenses. Romer's (1990) study describes how companies that invest in human capital have a competitive advantage over market conditions and economic benefits of human capital. In Davenport's (1998) study, a mathematical model was suggested to calculate the aggregate human capital. The growth of aggregate human capital in this model is explained by the existence of multiplier relations (Metilelu, 2016). Based on the analysis of economic literature, human capital development raises productivity and competitiveness of enterprises. Investments aimed at protecting the health of the population, raising the level of education, and increasing the number of trainings held at workplaces are such and investment directed in human capital development.

These investments result in increase of workforce quality, rise in productivity, acceleration of economic growth, and revenue growth. The complete involvement of the company's staff in the production process make the tourism services much more specific; personnel directly participate in the provision of services and as a result it effects the quality of tourism services and customer satisfaction. The human factor is a main factor for the volatility and uniqueness of the quality of tourism services. People with certain knowledge, skills and experience are the main value and productive force of a tourist enterprise. For this reason, investments in staff training and higher education are of exceptional value. The quality and competitiveness of the tourist offer directly depends on these investments (Folarin, Oladipupo, Ajogbeje and Adeniyi, 2017; Metilelu, 2016; Tatarusanu, Onea and Zait, 2016). One of the important aspects of the sustainable economic development of Azerbaijan is the expansion of human capital and opportunities for development of human potential as a whole. Education plays a crucial role in shaping human capital. Today, education is an important factor in the success of the business entity in the marketplace, the country's economic growth and the increase in its scientific and technical potential (Teymurova, 2017, p. 43). While talking about the role of human capital in tourism, it should be noted that around 3 million jobs are opened in tourism and related fields every year. In 2017, the number of employees in tourism and similar fields in Azerbaijan was 46,837. According to estimates of experts, the demand for tourism workers in the country will be more than 75,000 people by 2023. There is a great need for highly-qualified professionals with field-specific education in the country to meet this demand. Specialists in the field of tourism are trained at the Azerbaijan Tourism and Management University (ATMU) and the Azerbaijan State Economic University (UNEC) in the faculty of "Tourism and Hotel Management". In 2017, the number of graduates in tourism has reached respectively 1635 (ATMU) and 192 (UNEC) in these higher education institutions, but this indicators don't meet the current demand for training specialists for tourism.

5. RESEARCH AND DISCUSSION

The correlation - regression method is necessary to measure the relationship between tourism and human capital. In our research, the performance index is indicated with value added in tourism (in million manat (y)), factor indexes with number of persons who graduated from higher education institutions (in person (x1)), total number of people engaged in tourism (in person (x2)), per capita income (in manat (x3)), the expected life expectancy at birth (in age (x4)). According to the official statistics, we formulate a regression model based on the following table 1.

Table 1: Dynamics of indicators affecting on additional value in tourism (Adapted from the collected data from Statistical yearbook of Azerbaijan, 2018)

Years	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Value added in tourism sector ,mln. manats, Y	70,5	100,8	160,3	303,1	343,6	442,7	757,2	897,4	1069,2	1269,1	1312,8	1424,1	1639,8
Number of graduates – total, person, X1	32508,0	28141,0	31278,0	32580,0	34591,0	31071,0	30812,0	35128,0	33758,0	32826,0	33705,0	36951,0	37506,0
Number of employees in travel agencies and tour-operator enterprises, X2	646,0	779,0	1115,0	1174,0	1393,0	1418,0	1541,0	1730,0	1729,0	1794,0	1586,0	1838,0	1891,0
Income per capita, manat, X3	962,2	1201,3	1692,3	2378,3	2560,4	2866,1	3371,7	3789,3	4040,3	4192,4	4380,7	4710,1	5050,5
Life expectancy at birth, number of age, X4	72,4	72,4	73,0	73,4	73,5	73,6	73,8	73,9	74,2	74,2	75,2	75,2	75,4

The regression model of the factors affecting on the added value in tourism was as follows

$$\hat{y} = 11615,782 + 0,01X_1 - 1,061X_2 + 0,8088X_3 - 165,7019X_4 \quad (1)$$

As seen from model 1, if the number of graduates of higher education institutions increases by 1.0, the added value in tourism averagely will increase by 0.01 million manat and if the number of employees engaged in tourism activities increases by 1.0, it will reduce 1.06 million manat, and when per capita income increases by 1.0, it will increase by approximately 0.81 million manat, while the expected life expectancy at birth increases by 1.0, the performance index decreases averagely 165.7 million manat. Although the determination factor is $R^2 = 0.97$, the model is not so effective, because number of graduates - Total (X_1) and Life expectancy at birth (X_4) factors are insignificant as the table value of t-test with 95% confidence is 2.3 as shown in Table 2, thus, we avoid these factors.

Table 2: Regression model parameters

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>
Y- intercept	11615,78171	11687,42805	0,993869794	0,349392627
Number of graduates - total, person, X_1	0,010114677	0,018647906	0,542402849	0,60231877
Number of employees in travel agencies and touroperator enterprises, X_2	-1,061096055	0,370836088	-2,861361369	0,021107205
Income per capita, manat, x_3	0,808827893	0,196136374	4,123803648	0,003326723
Life expectancy at birth, number of age, x_4	-165,701887	164,1650975	-1,009361244	0,342352059

Thus, the new model has received the following form:

$$\hat{y} = -82,447 - 0,82714X_2 + 0,637822X_3 \quad (2)$$

As seen from model 2, if the number of employees engaged in tourism activities increases by 1.0, the value added in tourism will decrease by an average of 0.82714 million manat, while the per capita income increases by 1.0, the performance index will increase by an average of 0.637822 million manat. When determining the model's adequacy with determination coefficient $R^2 = 0.99$, it was clear that factors affecting added value in tourism are statistically significant. In order to check the existence of autocorrelation, let's look at the following graph (Figure 5).

Figure following on the next page

Figure 5: Schedule of fragments

When checking autocorrelation, refer to Darbin Watson's statistics:

$$DW=1,84 \quad d_i=0,86: d_u=1,56 .$$

Because of $d_u < DW < 4 - d_u$ autocorrelation does not exist. Hence, according to the analysis, it was found out that the established model (2) can be regarded as adequate to reality, as it has meet the conditions of Gauss - Markov.

6. CONCLUSION

Thereby, summarizing the conducted research leads us to come to such an end that there is sustainable development of the tourism sector in Azerbaijan. The development of human capital in our country is crucial to increase the competitiveness of tourism services and to introduce quality tourism offers in line with world standards into the market. As a result of the study, there is a strong correlation between tourism graduates from higher education institutions, human resources engaged in tourism, income per capita and expected life expectancy. The proposed model is useful for future research. Based on that, the forecast value of the value added in tourism can be calculated.

MODERN ECONOMIC THEORY IN THE FRAMEWORK OF THE CHALLENGES OF THE XXI CENTURY

Babayev Alijan Pirijan

*Professor, Head of the department of "Economic Theory"
Azerbaijan State University of Economics (UNEC)
ababayev@rambler.ru*

ABSTRACT

Socio-economic theory (political economy) on the basis of main structures of modern economic theory, rational utilization theory (economics) of limited resources and the existence of institutional economic theory have been based on. The major differences of the main parts of the economic theory are worked out in the investigation. Political economy is regarded as a fundamental socioeconomic basics, according to its methodological aspects and the subject matter, differing from the other component of modern economic theory; neoclassic and institutionalism. The increasing of service sector in economy and the declining of share of material production is noted. It has been noted that the modern society can be called as "service community" and it is pointless to claim for the nomination as "postindustrial society".

Keywords: *economic theory, economics, institutional economy, political economy*

1. INTRODUCTION

The economic problems of a general theoretical character are investigated in the framework of modern economic theory in modern conditions. What is meant by modern economic theory? It is supposed that something does not exist yet, but there is a necessity to work out it or reassess accumulated scientific knowledge from the position of modern approaches.

2. PECULIARITIES OF ECONOMIC THEORY TEACHING IN POST-SOVIET COUNTRIES

The transition process from a directive-planned economy to a market economic system has led to significant changes in the official ideology in the CIS countries, including Azerbaijan. It could not find its reflection in the theoretical aspects of economic theory, which was based on the Marxist and Leninist principles in the near past. The forced rejection from teaching of political economy has become a manifestation of this ideological turn in the field of economic education since the early 1990s. The place of textbooks on political economy in teaching of general economic theory has been taken by the textbooks based on neoclassical theory which considered to be the main direction—the mainstream of modern economic thought in the West. In this regard, the actual question arises at what level - the main (basic, fundamental) subject is taught and what functions it carries out especially in economic universities. The various, sometimes polar judgments have been expressed. Sharp discussions concern the coordination of different traditions in the teaching of political economy, the conceptual content of the basic academic discipline, the place and role of economic theory in the system of economic sciences. These are often rooted in methodological differences, including the classical and the neoclassical trend in economic theory, the subject and method of political economy and economics. The teaching of indicated disciplines in the bachelor's and master's levels is now of fundamental importance. The development ways of the science of economics, as well as the future teaching model are widely interrelated. But if the choice is individual in science, it concerns thousands and thousands of people in teaching and that of the young people who own the future. Therefore, the choice of preferring one or another "model" in teaching has a social importance and must be accompanied by a critical approach, to not only one but the all possible methodological principles in teaching, and to finding out if they are able to solve the problems

of economic development in the current realities of post-soviet countries i.e. meet the challenges of time. It will allow to take into consideration the achievements of economic science in general and to contribute to the development of economic theory in the national frame. The divergence of opinions between different scientific schools of economic theory begins in fact with the name of economic science, claiming to perform the function of general economic theory, urging to give comprehensive knowledge of the rules and peculiarities of the development of economic systems in modern conditions and to prepare the appropriate primary unit categories. At the same time, the general economic theory is necessary not only for the formation of the fundamental theoretical basis in the field of economics, but also for the substantiation of making economic decisions. But in its present version, the mainstream of economic theory is not able to perform these functions, i.e. to solve the problems that the world community is currently facing. The economic theory attempts to find answers to the problems of the modern period (strengthening post-industrial trends, the ever-increasing internationalization of the economy, the transitional condition of the former socialist countries) looking for a primary conceptual theory or theoretical model that can explain not only previously not existed processes in social life, but also the logics of development of multipolar world. Therefore, the problem of radical changes in the methodological principles of economic analysis and more effective application of methods meeting the requirements of modern world through updating the academic discipline on economic theory on a pluralistic basis is being analyzed. According to the opinions of some economists, there was no significant leap in the development of economic theory in the past century; therefore, at the turn of the XX-XXI centuries, the problem of changing of the paradigm remains unresolved. Due to the lack of a new concept in economic science the opposite methodological directions are being tried to be revealed at the economic theory tuition courses. The opinion is spread, that there is no common economic theory, but only separate economic concepts. Such judgments are not acceptable, though it is impossible to deny the connection of each methodological direction with others. Among them, the most thoroughly developed are political economy, economics, and institutional economics that has recently become widespread. The question arises: is it possible to create common economic theory on their basis? It is difficult to answer it definitely. It is assumed that the word "theory" in the concept of "economic theory" was formed and evolved exceptionally on the basis of theoretical concepts and comments. It is expressed in one of the textbooks that this attempt, does not give anything, besides eclecticism, as the economic theory has different directions, different objects of research, different subjects, moreover the various methodologies are applied in this theory. The classical interpretation of the subject of traditional political economy, its categories such as price, capital, money, profit, wages, interest and rent are completely denied in the textbooks and in teaching of economic theory on the principles of economics [6]. It inevitably leads to the fact that economic theory is separated from its multi-central roots. As a result, the principle of succession in science is infringed; the scientific and theoretical concepts retaining their actuality are rejected. At the same time, when turning to the textbooks of the economic theory of recent years, the other tendency could be noticed. In some of them, the attempt of "consensus" has been undertaken between the methodology and the theory of classical political economy and economics. The textbooks "Course of Economic Theory", edited by A.V. Sidorovich, "General Economic Theory (Political Economy)" edited by V.I. Vidyapina and G.P. Zhuravleva, although differ in the predominance of ideas of economics can be considered as an example of combining various directions of economic theory in the one scientific foundation class [4;5]. The textbook of "Economic Theory", prepared by the departments of economic theory of the Azerbaijan State University of Economics in the Azerbaijani language under the general direction of T.S. Valiyev, A.P. Babayev and M.Kh. Meybullaev [7] has been developed taking into consideration the parallel existence of the main directions of economic theory.

3. PROBLEMS OF CLASSIFICATION OF ECONOMIC SCIENCE

Today, the solution of the important problem of classification, the logical ordering of the system of economic sciences is of great importance for improving the training course. Economic theory is that field of the system, which is devoted to the study of the content and form of economic relations among the people in the process of their economic activity. Economic activity is studied by the various sciences each of which on one hand, has its own narrower subject and from the specific point of view is relevant to the given activity in accordance with its characteristics, and on the other hand, is distinguished by its methods of cognition, goals, and objectives. From this point of view, economic sciences can be divided into different stages of economic research according to the degree of theoretical generalization of the studied subject. The fundamental economic or general theoretical problems related to economic theory constitute the upper level. The middle level includes the subjects of research of special or functional economic disciplines (labor economics, finance and credit, marketing, management, forecasting, economic statistics, accounting and auditing, analysis of business activity etc.). The problems of the lower stage are the subject of research of field economic sciences (economy of industry, agriculture, transport, construction, etc.). Moreover, it is possible to single out the problems of the transitional stage, being the subject of the study of closely related fields or mixed economic sciences (economic history, economic geography, etc.). The classification forming the whole system of economic sciences are completed with subdividing them into fundamental and applied field of economics. Economic theory belongs to fundamental, and all other economic sciences belong to applied field of economics. Economic theory serves as the starting point for all economic sciences. First of all, it is explained that economic theory studies the general laws of the system of economic relations, reflecting the essence of economic phenomena. The epistemological (theoretical) basis of the fundamental role of economic theory in the system of economic sciences is associated exactly with this. That is why it is ideological in nature i.e. it forms a generalized view on economic processes. Therefore, economic theory, by virtue of its subject matter, provides a methodological resource for other economic sciences. Of course, the specific and applied economic sciences have their own subject and methods of research, otherwise they could not be an independent field of science. But economic theory on the basis of positivist, structuralist, dialectic and synthetic methodologies "supplies" all specific economic sciences, although different in content, but common in the application of research methods in these sciences. The categories established by economic theory, laws, and interrelations between them play the role of methodology for studying the system of economic sciences. The economic sciences developing on the methodological basis rely on the scientific logics of economic theory. In the recent years, the "Americanization" ("Westernization") takes place in teaching of economic theory, with the implementation of microeconomics and macroeconomics, based on the methodology and the method of "economics" in the educational process. At present, a certain amount of experience has been accumulated in this direction and it is time to generalize and objectively evaluate it. If you look at the economic life of society through the prism of "economics", it can be seen that it has not less deficiencies than the traditional political economy, from which we have refused. It is evident that the previous courses of political economy were distinguished by vaunted centralized distribution, and of course by the command economy. But the "economics" itself, which is a self-regulating system and is associated with one of the directions of world economic science, as an abstract-theoretical expression of a market economy, does not answer many questions and does not meet the modern requirements. "Economics" actually does not respond to the acceleration of economic management, its socialization on increasing of socio-cultural factors in its' operation and development. The restriction in the training of specialists in the economic direction with the narrow framework of the "economy" unites this education, and in general, separates it from the current socio-economic reality, especially from the economic life of the country.

It is not about the rejection of the "economics" in the study process. But the task, in front of the study process is to enlighten the socio-economic reality of the country more fully. At the same time, it is necessary to show the existing contradictions, not only on the basis of abstract theoretical judgments of the West, but also relying, first of all, on their own past and present, as well as looking to the future to some extent. That is why it seems appropriate to revise the existing standards of economic education for the preparation of specialists in the sphere of economics. Currently, the vast majority of these standards is focused on the study of the "economics" and basically describe the non-existing ideal market model. It is necessary taking into account their given aspects to focus most of the standards on the socio-economic factors of the country, applying the concept of a post-industrial society and its new economic program.

4. THE MAIN STRUCTURAL PARTS OF MODERN ECONOMIC THEORY

In modern conditions, it became common opinion that the economic problems of a general theoretical character are studied within the framework of the so-called modern economic theory, which implies an exclusively neoclassical approach, more precisely, neoclassical synthesis with different variations (economics). In our opinion, such a theory should imply an unfulfilled, but extremely necessary direction of scientific economic thought, capable of reflecting the scientific knowledge accumulated over many years, implementing their reassessment and promoting to the new results. At the present time, "the modern economic theory", comprehended as a common science with a common subject and with a common methodology of analysis and presentation, interpreted in all its sections as a system of categories (economic concepts) i.e.as an actual scientific synthesis of the development of world economic thoughts and the integral knowledge of its main achievements, confirmed by the realities and tendencies of modern world socio-economic development, does not exist yet. Modern economic theory as a real fact is a selected concept, reflecting not an "organic" or even an "integral" system, but a system as a set of economic theoretical directions, doctrines, differing directly in their methodological principles. It is necessary to designate the general framework (boundaries) of the modern economic theory and the structure of its subject field. In reality, the economy has a complex structure, in which it is divided into three main levels. Firstly, the modern economic structure can be fixed as a set of socio-economic relations, in the center of which stands the character of the economic system, the method of appropriation, and the relations themselves act as a social form of productive forces. Secondly, it can also be understood as a set of functional relationships that develop in the process of movement of commodity, resource and financial flows in the economy and reflect the activities of rational use of resources, ensuring macroeconomic stability and general economic equilibrium. Thirdly, this structure may be a combination of institutions confirmed in the economy. Because of such a multisided economy it cannot be considered within the single coordination system; therefore, its' theoretical understanding should be multidimensional, containing different types of analysis. Modern economic theory, pretending an adequate scientific reflection of reality, should include several directions connected by a common subject- economic relations, each of which has its own direction and its specific narrower subject-socio-economic relations, functional economic relations and economic institutions. [3, p.54]. In accordance with this approach, the main structural parts of such a modern economic theory, as a combination of various basic directions can be represented in the following version:

- a) Socio-economic theory (Political economy). The subject of its research, studies are directly the socio-economic system, the economic structure of society, their form and model;
- b) The theory of rational utilization of limited resources (Microeconomics and Macroeconomics). The subject of this field includes the analysis of economic relations at the micro level (microeconomics) and the macro level (macroeconomics);

- c) Institutional economic theory. The content of the economic system here is considered against the background of the interconnection of economic and other subjects, the influence of such relationship on economic development is investigated. [4, 54]

The study of the world and national economic structure of society as a whole system, comprehended in this sense, is possible by combining in a single tuition course on the general economic theory of socio-economic analysis of real economic relations with the study of the use of limited resources with sufficient information and comparative characteristics of different approaches existing in modern science. In this regard, it is impossible to agree with attempts to deny both political economy and economics having the right to be scientific disciplines taught in higher education. The refusal of the status of scientific and academic disciplines of political economy and economics, having a significant theoretical base, historical roots and conceptual scientific schools, can be assessed as a manifestation of economic nihilism and ignorance.

5. THE INCREASING ROLE OF POLITICAL ECONOMY IN RESEARCH OF MODERN SOCIO- ECONOMIC PROBLEMS

The modern crisis of political economy in the post-socialist countries has taken a concrete form of the crisis of Marxism. It is not by chance, because Marxism was the dominant ideology in these countries. However, political economy as a fundamental scientific discipline was formed even before Marx and Engels. They raised a science to a new level, which was already actively developed and taught, in particular, in England, France and other countries, united various streams and directions. The concepts of mercantilists, physiocrats and classics of bourgeois political economy W. Petty, A. Smith and D. Ricardo should be mentioned. Representatives of all schools and trends in political economy recognized its fundamental nature, proceeding from the fact that the categories and laws revealed by this science do not lie on the surface of the phenomena. Their external forms do not allow to understand a deeply hidden essence; this requires a special methodology of knowledge, a special instrument of research of the nature of economic processes and phenomena. Today, the ability of political economy to refer systematically to economy as a national, social economy, as well as the problems caused by the information revolution and globalization, objectively created the basis for the revival of political economy both in teaching and in scientific research. Political economy reveals the essence of economic relations among the people in regard with production, distribution, exchange and consumption of products, objective economic laws. These fundamental relations of society form the subject of political economy, and those are not directly included in the subject of other economic disciplines. Highlighting the content of industrial relations, political economy reveals the basic structure of society and the nature of the main, stable interactions of groups of people engaged in the economy, establishes the presence or absence of exploitation, describes its mechanisms and consequences, explains the laws that determine the fundamental direction of the development of social production and reproduction. Neither macroeconomics nor microeconomics, as the sections of the economy, sets as its task a special study of industrial relations, the identification of internal, underlying laws of motion of the economy, accessible to the observer, but hiding the essence of economic processes. For the understanding of modern economic realities of the XXI century, it is evident that there is a need for political economy, both as an academic discipline and as a scientific direction. If there exist industrial relations among people in different economic systems (industrial relations in a broad sense), then political economy has the right to exist, whether we like it or not. Today, society expects clarification of nature, character of our economy, the substantiation of goals and development ways from the political economists and economists-scientist. It is absolutely necessary in a situation, when the social tensions increase, strengthen, breaking in various conflicts and dissatisfaction with established economic relations.

Social stratification is deepening, differentiation of owner's incomes, managers and other hired personnel is becoming transcendent, and the working conditions of the latter are worsening. These facts cannot be dismissed. Who but not political economists should explain the present categorical scientific conclusions to other economic sciences and help them to find solutions to the relevant concrete questions? The scientific and technological revolution extending in the recent decades has led to fundamental changes in the development of social production. The share of traditional industries (including material production) in GDP is relatively decreasing, and the field of services are developing, including, education, science, culture, health care, and various kinds of financial and trade services. This circumstance, however, is ambiguously interpreted in the literature. Some authors try to substantiate the conclusion that the sphere of production is being replaced by the sphere of services, that the economy as a whole turns into a posteconomy, and the society itself, respectively, into a postindustrial, post-economic one. Undoubtedly, under the influence of the NIT, the new information technologies, the restructuring of the economy occurred, which could not be reflected on the dynamics of employment. But it doesn't at all mean, that material production is abolished altogether, as a result of which a certain epoch of posteconomics begins and a posteconomic society appears. Such a conclusion can hardly be considered substantiated, since it does not correspond to reality. It should be refused from the paradigm of post-industrial society, because this is a conscious fraud, since there is no post-industrial society yet and most likely a new stage begins in science intensive society. In our opinion, we should agree with V.N. Cherkovets, who notes that there is no reason to judge the level of the so-called "post-industrial" development of the country by such "secondary" indicators as the increase in the share of services in GDP, the share of allocations to the social sphere from the state budget, etc. [3, 121- 122]. Such indicators can reflect both high and low level of development of the country. The "primary" indicators are principally more important, on which the analysis should be done for fundamental changes in the attitude of people to nature, that is, in material production, and in the nature of the labor involved in it. Especially in the instruments, means of labor and technology - the main point of qualitative changes in the productive forces have been revealed. The profound upheavals in this sphere are apparently taking the form of revolutions both in the productive forces and in the socio-economic system. The modern economy, even in the USA, continues to remain predominantly industrial. Mainly, the industrial basis is the fundamental principles for the modern development of individual innovations, such as the cutting edge information systems, biotechnologies and nanotechnologies. Under the conditions of the modern scientific and technological revolution, the integration of material production and the social sphere is increasing. On the one hand, the influence of elements of material production increases within the social sphere, the utilization of machine systems that require the joint work of scientists, engineers, technicians and workers are expanding. At the same time, the role of the social sphere increases within the material production, which is manifested in the increasing of the intellectual and cultural development of the so-called "human capital", the influence of health care on the maintenance and development of comprehensive abilities of personality. However, the increase in the functional role of the spiritual element, mental work, the strengthening of the science role, knowledge, health protection in production does not refer to the boundaries between material production and the social sphere and disappear as their results. The qualitative difference of material production and its role as the basis of the entire life of society and all other types of activities, including the social sphere, remain at all stages of the development of human society. Thus, the social sphere acts not as a single-order in comparison with material production, but as a secondary in relation to its content and functional role in the social reproduction.

6. CONCLUSION

Thus, a new structure of economic theory is being formed in modern conditions, in which the political economy as a socio-economic doctrine plays a special role and serves as a comprehensive analysis of economic life, along with the neoclassical (micro- and macroeconomic theories) directions and modern institutional direction being formed (here you can add-former institutionalism of T. Veblen and his modern followers).

ABSTRACT

This paper considers specific features and tendencies of innovation economy, which set the issue of business competitiveness under such conditions at a different angle. Research of tendencies of present-day management development acknowledges the breakthrough that the world companies are now making and confirms the necessity for modern businesses to master such tools of management. The article emphasizes that revolutionary reforms will not succeed unless they consider with correlations between economy and culture, national and regional mentality. It also states that it is necessary to consider with the obtained findings of the GLOBE project executed by the Wharton School of the University of Pennsylvania (USA) in over 60 countries to identify social and cultural factors that favor or (on the contrary) hamper the development of innovation economy in Russia. It analyzes the factors that hinder the development of innovation economy in Russia in general and Astrakhan Region in particular – a high power distance and a high degree of uncertainty avoidance. Based on analyzing the national culture specifics, the paper provides recommendations for national and regional businesses to set their top priorities – develop unique innovative products, rely on manufacturing small series, experimental production, and creativity instead of mass production. Applying benchmarking, the paper concerns theoretical and practical approaches to determining possible forms of cooperation with the Caspian countries in the field of introduction of digital technologies into activities that CEOs of those countries perform, considering with the adopted Convention of the Legal Status of the Caspian Sea. In this aspect, the article concerns issues related to implementation of flexible methods of management in the field of development of human resources and digital technologies into management practices of the Caspian countries.

Keywords: *innovation economy, benchmarking, management technologies, national mentality, corporate management*

1. INTRODUCTION

At each stage of history, management has been applying the tools that are the most appropriate for the development stage that a company is undergoing. Yet, there are tools of management

that determine an efficient solution to present-day management tasks at any stage of development. What management technologies do most managers of Russian organizations apply under conditions of post-crisis development and impact of economic sanctions? First of all, it is benchmarking, which makes it possible to identify your own position in relation to your competitors, study and adopt the best experience gained by other organizations. If compared with the traditional competition-based analysis, benchmarking is a more detailed, formalized, and ordered tool (Tripolsky, 2008, p. 290). According to annual ranking reviews by Bain & Company, the well-known consultancy, which has been surveying several thousands of CEOs all over the world since 1993 to identify the most widely applied tools of management, benchmarking has strengthened its positions as the most popular tool of management. Analysis of the dynamics of management tools applied by top managers over 2000-2013 has proved that the most popular and efficient tools of management are four classic technologies – strategic planning, benchmarking, the Balanced Scorecard (BSc), and the Customer Relationship Management (CRM). In the rankings of applied managerial tools, benchmarking assumed Position 3 in 2000 and 2004, Position 4 in 2006, Position 1 in 2008 and 2010, and Position 2 in 2013, having yielded only to the BSc. As one can see, benchmarking has deserved its position at the top of worldwide ranking of management tools. As for Russia, according to the Bain & Company's Russian partner, CEOs of Russian companies apply five tools actively. Position 1 is occupied by benchmarking; it is followed by strategic planning, CRM, key competences, and strategic alliances (Milov, 2007). Copying of positive experience gained by competitors is applied more or less widely by 80 % of Russian organizations. As practice shows, managers of successful companies often compare them with their competitors; they regard comparison of their performance with the best business practices as a key process of their management activities.

2. PROBLEM STATUS

In the late 20th and early 21st centuries, the world stepped into a new stage of its development, which was named innovative economy. Its specific features include, first of all, the process of globalization, which becomes the dominating factor in the modern world. It implies extension of the geographical scale of business activities as borders and other barriers are disappearing (Cohen, 2004). The national identity of economy is losing its key role under the current conditions, when transnational companies influence the political and social processes stronger than the national governments. Thanks to globalization, competition has increased sharply; deregulation and reduction of the role played by the government are taking place. Thus, globalization of business, international hypercompetition, emergence and development of new forms of competition, a huge-scale development of telecommunications and the Internet, which cross national and cultural borders, force all the participants of the global markets to accept the principles of business and management that the global consumer requires. M. Zeleny reflected the real consumer preferences under conditions of innovative economy as follows: global consumers wish they got everything all at once: high quality, low prices, prompt delivery, and maximal reliability (Zeleny, 2002, p. 72). We regard innovative economy as a new look of the national economy, successful corporations and enterprises; this new look has been formed owing to influence exerted by globalization, informatization, digitalization, hypercompetition, and processes of knowledge creation and promotion; we regard it as a more efficient economy that applies modern tools of management. It is hypercompetition that requires organizations' continuous identification and sustainment of its key competencies, which indicate the necessity to manufacture what that organization is able to produce its products better than its competitors do. Another new tendency is not possession of knowledge, but the speed of creation of new knowledge. Besides, Russian businesses must not ignore the growth of the population's activity and self-conscience, its striving to achieve social justice (not only within organizations, but also

in relation to financial structures), requirements of the local communities for a better commitment of businesses to tackle social issues for the population and the society. Digitalization of economy becomes of top importance over the last months for both Russian businesses and all the organizations operating in countries of the Caspian Region. Digital economy implies a far more active application of new tools to meet business goals; those tools ought to comply with the fourth industrial revolution, or Industry 4.0. It includes mastering and implementing various tools and technologies at a modern enterprise: cloud computing, 3D printing, tools of the Internet of Things, virtual and augmented reality, Big Data, the blockchain technology, artificial intelligence (AI), highly productive platforms to store and process data (such as HANA), etc. As innovative economy is developing, Russian companies have to face new tendencies, the main of which is an incredibly high speed of modernization. In response to global challenges and tendencies of digital economy, the task to stay competitive is set in a different way. Managers of Russian organizations ought to strive to establish a company that would change with the same speed as its surrounding; innovative activities ought to be continuous and involve each and every member of staff, who should be prepared to take an initiative, be inventive, creative, and deeply involved in their company's activities (Hamel 2011).

3. DISCUSSION

However, few countries have managed to establish innovative economy, as experience gained by various countries demonstrates. Even not all the developed countries have managed to do that, according to A. Auzan, Dean of the Faculty of Economics of Lomonosov Moscow State University (Auzan, 2016, p. 82). More and more frequently, researchers express the idea that modernization reforms aimed to build an innovative economy will not be productive unless they include the "cultural" aspect. Attempts to modernize economy in Russia made over the past decades were based on either application of its economic growth hypothesis, or its general democratic development by creating efficient market institutions; yet, they have not led to the result that was expected. Probably, the unconsidered factor, which is crucial for a competitive, sustainable, and safe development of regional and national economies, is consideration with the national culture and mentality, i.e. the ground on which all those institutions are based? The process of cultural changes takes quite a lot of time. Nowadays everyone has already realized the necessity for Russian managers to enhance such key competencies as ability to adapt, make efficient decisions under conditions of uncertainty, think systemically and strategically, and, what is the most important thing, assume responsibility. The best-known foreign research of specifics of Russian management, which was conducted in middle 1990s by the Wharton School of the University of Pennsylvania (USA), is the GLOBE (Global Leadership and Organization Behavior Effectiveness) project. Its participants surveyed over 17, 000 top managers of 825 organizations in 61 countries, including Russia (Grachev, 1999). This research applied practically the same parameters of comparison as the model by G. Hofstede as the main characteristics of management and business leadership. Right after its first results had been obtained, the research proved that views on assessment of efficient management styles are getting closer. An efficient "world" leader is a trustworthy, energetic, determined, clever, reliable manager who is able to plan beforehand and motivate others. In Russia, an efficient leader is different. The project authors drew his or her psychological portrait as perceived by Russians as follows: "It is quite a contradictory personality with a definitely tough and autocratic style of management. Its main features are: ability to make individual decisions and bear responsibility for them; he or she does not try to save his or her face; they act openly, quickly, and quite competently in an unstable external environment. A leader is not aimed at the result of their activities so much; he or she is more oriented at the very process, being at the same time very attentive to his or her status.

Nevertheless, aggressive style of behavior and absence of vision of the future does not allow him or her to become a strong charismatic leader" (Grachev, 1999, p. 28). From the well-known research of managers all over the world conducted by G. Hofstede in 1980s with respect to his five dimensions of the national culture (the power distance index, individualism vs collectivism, uncertainty avoidance, masculinity vs femininity, long-term vs short-term orientation) to the more recent 1995 research as part of the GLOBE project, the most remarkable changes in Russia occur in the power distance index (it decreases slightly) and in the masculinity index (it decreases as well). It may be due to continuous behavioral changes (but not due to changes in values) of staff of Russian companies owing to social and cultural factors. Prof. A. Auzan, referring to the findings of the GLOBE project, emphasized the social and cultural factors that favor (or, on the contrary, hamper) the development of individual processes. The factors stimulating innovative economy are individualism and long-term orientation, i.e. looking into the future. The two factors that hamper its development are a high power distance and a high degree of uncertainty avoidance (Auzan, 2016, p. 82). A high power distance as a factor hampering the development of innovative economy implies that the Russian authorities still regard their ordinary citizens as "small people"; similarly, the authoritarian style of management prevails in economic life of business companies; there is a fear of disagreeing with a top manager. That is why unpreparedness to negotiate and a belief that authorities will solve all the problems themselves is still a reality in Russia. Regional researchers' findings also prove that management strongly believes that it ought to retain its monopolistic position to form the strategy and have a sufficient number of tools to persuade and force all the other participants of the strategic process to accept their vision (Epifanova, 2013). A high degree of uncertainty avoidance, which is also typical for Russians, is the second factor that hampers the development of innovations in Russia; it reflects Russian people's belief that any change would lead only to a poor result; people are afraid of changing their work, even if they are not content with their salaries and working conditions. The GLOBE project also identifies particular advantages and drawbacks of Russian management. As for advantages, they are: disposition to innovations, being eager to play and take a risk, being ambitious, self-criticism, being ready to help unselfishly, and being keen on studying. Among the drawbacks, they include being too much inclined to politics, a pejorative attitude towards themselves and their country, squandering (with regard to the time resource), egocentrism, greed, and embracing too wide fields of activities (Gorbanev, 2010). Even being aware of specific features of the Russian mentality, which hamper the development of innovative economy in Russia, one should not reject the task to establish a real innovative economy in this country. The change of generations, when the Baby Boomers and Generation X are followed by Generation Yers (ambitious young people born in 1984-2003, who are able and willing to study), seems optimistic. Generation Yers are inclined to innovations and experiments; they are able to operate large volumes of information; they treat their work as a source of pleasure and self-expression; they have good skills to search for solutions as a team; they master new knowledge and skills quickly, and at the same time they do not wish to study by the book; they strive to get a prompt result. Another specific feature of Generation Yers, despite their too high self-esteem when they search for work, is their tendency to whatever is new and innovative; they are never tired of studying and therefore they are always aware of any new professional technique or practice; they welcome teamwork and new fields of activities. They are very creative, but impatient, which must be taken into account when working with them. They ought to be committed to their companies emotionally; this feature may be used when one arranges informal corporate events, especially social projects, volunteering, etc. In our view, a permanent influx of ambitious Generation Yers to Russian companies, which is expected to take place in the near future, should help them overcome numerous obstacles on the way of development of innovative economy in Russia. Generation Y has been raised on social networks; these young people can operate huge volumes of

information; they have skills to search for solutions as a single team; they know how to apply their numerous social contacts. In an innovative economy, one's ability to obtain information promptly, process it, and react to it swiftly is frequently more essential than one's experience. That is why there is a hope that not only a high degree of uncertainty avoidance, but also a high power distance will decrease in the future and that these two factors will no longer hamper the development of innovative economy and introduction of digital technologies. Owing to adoption of the Convention of the Legal Status of the Caspian Sea in August 2018, the right conditions to advance cooperation between the Caspian countries to a qualitatively new level to develop close interaction in various fields (first of all, in the field of digital economy) have been provided. There are five countries washed by the Caspian Sea – Russia, Azerbaijan, Turkmenia, Kazakhstan, and Iran. They regard the Caspian Sea as an object of legal claims and as a source of sufficient incomes for their national budgets. To determine how well advanced management technologies may be diffused there, one should consider with two indices – the global competitiveness index and the corruption perceptions index. These two indicators form the business world's and potential investors' expectations of their penetration into the national markets. The global competitiveness index was developed by experts of the World Economic Forum; it includes indicators of nine basic groups: institutions; appropriate infrastructure; stable macroeconomic framework; good health and primary education; higher education and training; efficient markets; ability to harness the existing technology and produce new and different goods using the most sophisticated production processes; business development; innovations. The 2017 Global Competitiveness Report has indicated that Switzerland and the USA occupy the top position (5.9 points); whereas Yemen holds the bottom position – 2.9 points.

Figure 1: 2017 Global Competitiveness Index of Countries of the Caspian Region, points

As for the corruption perceptions index, it is an aggregate indicator that reflects all the actions (including insignificant ones) that may be regarded as corruption offenses. Based on obtained data, countries are ranked on a 100-point scale. In this ranking, countries with a high level of corruption have 0 points, whereas countries with an extremely low degree of corruption get 100 points.

Figure 2: 2017 Corruption Perceptions Index of Countries of the Caspian Region, points

According to Transparency International, bribery is a phenomenon that more or less spread in all the national economies all over the world. Over two thirds of the countries included in its ranking have received under 50 points; their arithmetical mean value is 43 points. It makes it possible to make the appropriate conclusion about potential diffusion of advanced managerial experience between the countries of the Caspian Region.

4. CONCLUSION

Therefore, one has to make many efforts to create a real innovative economy in Russia. The obtained findings of polling Russian innovators who work in the national innovative sector confirm their professionalism and their being prepared to tackle any problems and initiate any activity. A. Auzan writes about them: "They treat their profession as their vocation, not as a means to earn money. They are able to work creatively; they mobilize themselves quickly and they work well, even though they do not like to think about the distant future. They are good startups; however, they rarely make a career at large innovative companies: they give birth to an idea, but they quickly lose interest to its implementation, and then another bright idea comes to their mind" (Auzan, 2016, p. 83). There are many examples of efficient innovative companies in Russia; they operate in the field of IT, new materials, medicine, robotics, space, and armament. Analysis of the most remarkable inventions of the 20th century confirms that innovations come mainly from startups, which create something; afterwards large companies adopt their developments. Thus, considering with the Russian mentality, it seems more appropriate, first, to develop unique innovative products, rely on small product series, experimental production, and creative industries, since competitiveness of mass production is not so high. It will thereby increase the values of characteristics of social and cultural factors of a Russian manager's profile (since those factors currently hamper the development of innovative economy in Russia in general and in its regions in particular); thus, indicators of the national culture will undergo a gradual enhancement. To form innovative economy in Russia as soon as possible, it is essential to be aware of such a tendency in the world management as the world companies' rapid advance into the digital economy, introduction of flexible management methods (in particular, the Agile Method) and other new organizational innovations in the 21st-century management (principles of self-governing holacracy, establishment of requisite organizations, etc.) into their practices (Fukolova, 2017). Necessity and willingness to apply the best world practices, i.e. principles of benchmarking, is gradually reaching the Russian market. In our view, it is flexible methods that can help adapt to changes and challenges faster, as well as implement innovations, including digital technologies.

Experience gained by the world's most advanced companies confirms that, since those companies also try to comply with the best practices of present-day organizations and adopt methods of the Agile flexible model; they substitute their operational management practices with rates indicating staff assessment, skills development, recruiting and rewarding, support of staff training, etc. Such management activities as provision of new opportunities not only for yourself, but also for your partners from other countries (first of all, from those of the Caspian Region) to integrate joint efforts will help Russian companies cope with the shift to digital business models. No doubt, future establishment of the Caspian Economic Cooperation Organization and the annual Caspian Economic Forum will contribute to the development of contacts between business communities of the five countries of the Caspian Region. In our opinion, cooperation in the field of application of digital technologies in management and HRM should be started by studying new innovative technologies, which have already been implemented in the Caspian Region successfully, and benchmarking them actively.

ABSTRACT

It was possible to overcome the crisis period and achieve economic development by favoring natural resource utilization (hydrocarbon reserves) in transition to the new economic system stage in Azerbaijan. The rapid consumption of certain resources for its recovery creates certain difficulties in the process of economic growth. Therefore, it is necessary to analyze the balance between the consumption of resources and its recovery. Economic development, social development, and economic development, which are the pillars of sustainable economic development, are impossible without adequate financial support. After independence, the most important part of the 250 billion US dollar's investment has been invested in physical capital. The dominance of physical capital investment is characteristic of the Factor-Driven Economies, which is the first stage of economic development of the countries. According to the 2014-2015 report of the World Economic Forum, Azerbaijan is included in a group of countries which passed from the first stage based on factor-based economies to the second stage with an efficiency-driven economy. According to the World Economic Forum's classification of stages of economic development, Azerbaijan's economy is characterized by a transition from the first stage of development to the 2nd stage of development (factor effectiveness), which is more promising for human capital than physical capital. In the transition from the first stage of economic development to the second stage of the economy, which is characterized as an efficient economy, it is possible to create favorable conditions for the transition to innovative development (Phase 3) by creating favorable conditions for human capital development. It is expedient to give priority following to ensuring sustainable development in Azerbaijan: 1. Gradual preference of oil revenues to financing non-oil sector; 2. Creating favorable conditions for the formation of human capital as a result of the development of all forms of education; 3. Achieving an increase in the share of non-oil products in GDP by stimulating regional development; 4. Promoting the use of recurrent (renewable) resources; 5. To achieve an increase in import-substituting products in the national economy; 6. Stimulation of export of non-oil products; 7. To achieve an effective rate of national economy sectors by improving the structure of the economy; 8. Development of the mechanism of returning of this investment to the state budget gradually from the revenues of the economic sectors invested in the state budget;

Keywords: *efficiency-driven economy, factor-driven economy, human capital, non-oil sector, sustainable development*

1. INTRODUCTION

Azerbaijan had started to establish the basics of sustainable development in the first years of independence by ensuring the macroeconomic stability. The target of the policy pursued in the country was to establish the basics of the sustainable development by rationally mobilizing the whole economic potential. Matter of fact, the economic development was achieved by favoring the depleted natural resources in the first period of establishing the basics of the sustainable

development. However, it could not have lasted this way for long. As a result, the ecological balance could have been violated. That is why the substantial part of revenue from crude oil export has been aimed at developing the non-oil sector. The economy is diversified in order to ensure the sustainable development in our republic.

2. CHAPTER 2

The independence of the Republic of Azerbaijan coincided with when the sustainable development concept ("Agenda 21" was endorsed in the United Nations Conference on "Environment and Development" dedicated to the sustainable development challenges, held in Rio de Janeiro on June 3-14, 1992) was approved. While there was an adequate economic basis for transition to the sustainable development in many countries, particularly in the developed countries, the Republic of Azerbaijan was not only capable of ensuring the sustainable development, but also facing the other serious economic challenges - solution of which was so necessary for the country. Among the priorities were to establish the basics of new economic system (market economy) through denationalization and privatization, shape the national economy that could work by the principles of the market economy and an effective integration to the world. The solution to these issues depended on the effective mobilization of the country's economic potential. In the first years of independence, Azerbaijan had to favor the natural resources in ensuring the economic development due to the extreme scarcity of the other resources. Azerbaijan managed to overcome the crisis situation and achieve the economic development during the transition to the new economic system by favoring the utilization of the depleted (hydrocarbon reserves) natural resources. However, this course of action was not suitable for sustainable development. The development through favoring the human capital and the inexhaustible and renewable resources without causing a danger for future generation is the prerequisite for the sustainable development. However, the development of the human capital and favoring the inexhaustible resources depend on the economic development level and economic potential of the country. The weakness of the human capital development and economic potential in the newly-independent countries was causing enough challenges in ensuring the sustainable development. On the one hand, private property relations were being shaped which were the basics of the new economic system that could play a role in ensuring the sustainable development, and on the other hand, the integration to the world that achieved certain successes in terms of ensuring the sustainable development was in process. Ensuring the sustainable development was gradually becoming the reality as the private property relations had the potential to establish the scheme to effectively utilize the resources. Following the optimal ratio of utilizing the depleted and inexhaustible resources is of great importance. This ratio should be achieved by prioritizing the use of inexhaustible and renewable resources. Even the consumption of a certain portion of these resources may outstrip their restoration. Faster consumption of certain resources than their recovery causes certain challenges in the process of economic growth. Therefore, it is necessary to conduct the analysis in order to maintain the balance between the consumption of resources and their recovery (Tracuka, 2015 p 65). As shown above, the main source of the formation of economy in the independent Azerbaijan has been natural resources, hydrocarbon reserves and crude oil. Oil has not always brought happiness for the nations. The oil can bring happiness to the nation that owns it when the independent state utilizes the natural resources to realize the national interests and everyone has a chance to benefit from it. Azerbaijan prioritized to develop the oil industry, the only field that could draw in the foreign investment in then historic stage, which was the locomotive of our economy in order to lead the country out of the state of crisis as soon as it restored its independence. During the Soviet period, over 70% of the main equipments of oil industry were out of date and the applied technology was incapable of reviving the oil production. The existing technological equipments failed to revive the oil industry of the country.

Bringing the new technology became possible by stimulating the arrival of the leading oil companies which in turn played an irreplaceable role in reviving the Azerbaijani economy. It is impossible to realize the environmental, social and economic developments - the pillars of sustainable economic development without adequate financial support. This source of finance has been shaped thanks to the oil revenues in the first stage of forming the new economic system. The foreign investment made in the oil industry of Azerbaijan in line with the international contracts in the first years of our independence has been spent as the investment in the physical capital. After independence, the most fundamental part of about USD 250 billion investments for Azerbaijani economy has been made in physical capital. The dominance of physical capital investment is the feature of the Factor-Driven Economies which is the first stage of economic development of the countries. During the independence, the oil sector has dominated in the production and export for long. The most substantial portion of GDP and export has accounted for this sector. Drawing the world's leading oil companies in cooperating with Azerbaijani oil industries (oil contracts) gave a new life to the development of the Azerbaijani oil industry. The Contract of the Century envisaged to produce 510 million tons of oil in 30 (1994-2014) years. 149 million tons of this oil was meant to pay off the expenditure and 361 million tons were meant as the profit oil. The increase in the oil price in the first stage of oil production resulted in less oil usage intended to pay off the expenditure than estimated. Subsequently, Azerbaijan has gained more profits. Even though 7 years are left until the termination of this contract, 436 million tons of oil has already been produced. We have gained 125.5 billion USD oil revenues so far since the day the Contract of the Century was signed. The New Contract of the Century (till 2050) envisages the joint production of 500 million tons of oil from Azeri-Chirag and Guneshli oil reserves. In line with the Contract of the Century, it became possible to bring the new technologies to the republic which resulted in discovering and operating the new oil reserves. Oil production reached 50 million tons from 12-14 million tons. Oil industry personnel have been trained to have new technological knowledge. World Economic Forum classifies three stages of economic development of countries:

- The first stage: Factor-Driven Economies
- The second stage: Efficiency-Driven Economies
- The third stage: Innovation-Driven Economies

According to the 2014-2015 report of the World Economic Forum, Azerbaijan falls in a group of countries that are transitioning from the first stage to the second stage, from factor-driven economies to the efficiency-driven economies. The formation of efficiency-driven economies certainly requires vast amount of funding. The revenues that the Azerbaijan State Oil Company can gain from the new contracts it signed with the world's leading oil companies may play a fundamental role as the source of funding. SOCAR has signed an important oil contracts with the world's leading oil companies (extending the contract by 2050) in order to continue the joint production in Azeri-Chirag and Guneshli oil reserves. It is predicted that 500 million tons of oil will be jointly produced and 40 million USD will be invested in our oil industry during these years. SOCAR share in the contract increased to 25% from 11.6%. Azerbaijani share in the profit oil will be 75%. It is envisaged that 500 million tons of oil will be produced during this period. Baku-Tbilisi-Ceyhan oil pipeline that accelerated the integration of Azerbaijan to Europe has been built, and the construction of diversified gas pipelines (our gas reserves are estimated to be 2.6 trillion cubic meters) is about to finish. All these processes brought a great amount of currency to the country. Prioritizing the investment in the physical capital for a long time may not meet the expectations. The investment in the physical capital substantially depends on the global market price of the product that was produced with the same equipment and technology. Drop in the global market price of these products turns into the indication of inefficiency of investing in physical capital.

Therefore, active mobilization of the other factors that can ensure the sustainable development is necessary. Like the other countries, the first stage in the development of Azerbaijani economy is characterized as the resource based economy. F.F. Mustafayev puts out: "Large-scale investments in the economy have ensured the fast development, particularly, in oil sector and stimulated the application of advanced technologies. However, growth rate of the other economies lagged behind the fast development in the oil sector. This, however, both brought about the structural deformation in the economy and resulted in the formation of uneven growth pace in terms of economic fields and areas. All this necessitates ensuring the sustainable development in the economy (Mustafayev, 2008 p.87)." According to the World Economic Forum's classification of stages in economic development, since the economy of Azerbaijan is characterized by a transition from the first stage of development to the second stage of development (factor-effectiveness), investment in the human capital is more promising than physical capital in this stage. Gradually realizing the idea of more prioritized investment in the human capital than physical capital is reflected in the State Strategy on Educational Development in the Republic of Azerbaijan and Strategic Road Map on National Economy Prospects of the Republic of Azerbaijan. Fulfillment of the duties posed in the educational development strategy and strategic road map will both shape the efficiency-driven economy and provide the effective conditions for the transition to establishing the basics of innovative development. The development of human capital is of special importance for the second and third stages (efficiency-driven and innovative development) of the economic development. Belarusian economist O.V. Domokur explains: "The Old Economy" was characterized with the material possession of property. However, "The New Economy" is based on definitely distinctive factors of the development and becomes the main source of intellectual resource property" (Collective monograph, 2011 p.24). However, harmonizing the development of human capital with the other factors that characterize the sustainable development that are operation of natural resources, direction of investment, prioritizing scientific-technical development, personality development and institutional reforms will make it possible to ensure the international competition of the Republic of Azerbaijan which plays an important role in ensuring the sustainable development. Putting in operation the scientifically, technically and technologically unanalogous semi-submersible drilling rig named after Heydar Aliyev in the recent days (May 18, 2017) is the mere example for the development of human capital in our country. 80% of the engineering and technical personnel who built this rig that weighs 26 tons with a value of 1 billion USD were the Azerbaijani citizens. It can conduct drilling at a 1000-meter depth of water (During the Soviet periods we could conduct drilling at a 150-200-meter depth of water) and in general 12000-meter depth. One of the necessary requisitions to ensure the sustainable development in the country is to accelerate the socio-economic development of regions by favoring the inexhaustible resources. Even though agribusiness prevails in the regions, considering the characters of the regions, other forms of entrepreneurship, light industry, food industry, processing industry and other industries have been developed while these economic fields are based on inexhaustible resources. As a result of favoring the inexhaustible resources in ensuring the comprehensive development of regions of the Republic of Azerbaijan, territorial structure of the economy has been improved and favorable conditions were provided to develop all forms of entrepreneurship that is the basis of the economic development. Poverty level decreased in the country, and macroeconomic stability achieved thanks to the successful economic policy that was pursued in the recent years for phased eradication of poverty has played a significant role in shaping the sustainable development in our country. In spite of the location of agricultural entities, eliminating the difference among their economic opportunities provides a favorable condition for the utilization of the resources (the difference among the agricultural entities is reflected in their equipments, technologies and skilled workforce).

It is impossible to achieve the development of economic and social fields without ensuring sustainable development in all fields and increasing the efficiency of utilizing production potential. Even though the approaches to the sustainable development are distinct enough, it can most probably be characterized as the general aspect of distinctive viewpoints for indication of improving social life. So, the state programs approved to accelerate the socio-economic development of the regions have been aimed at solutions to the above-mentioned problems. The regional development has played a very significant role in ensuring the economic sustainability in the country for the recent 15 years (2003-2018). The fulfillment of the third state program – “The State Program on Socio-economic Development of the Regions of the Republic of Azerbaijan 2014-2018” is already about to finish. With the beginning of the post-oil era, regional development has been prioritized and reflected in the third state program (2014-2018). Approving the fourth state program is already on the agenda. Regional development is impossible without the strong support by the state. The financial source of the state support is (45 billion USD) allocation of the National Oil Foundation. Certain portion of this allocation is spent as the investment source for the regional development. Subsequently, the balance between the incomes and expenses of regional population and those of the population settled in big cities has been achieved, and serious advancement towards ensuring social justice is observed. The diversification of the economy plays an irreplaceable role in ensuring the sustainable development. The development of transport sector, one of the main sectors of national economy, keeps contributing to ensuring the sustainable development. Moreover, the formation of East-West and North-South railway transportation network plays an important role in ensuring the sustainable development. Baku-Tbilisi-Kars railway project is among the extremely significant projects that Azerbaijan fulfilled after restoring its independence. It is one of the indications that the influence of Azerbaijan increases all over the world. Combining the Trans-Europe and Trans-Asia railway networks, the project that is of extreme importance for Azerbaijan, was already fulfilled on October 30, 2017 and started carrying the freight. Transporting the freight from Central Asian Republics to Baku International Sea Trade Port through the sea and from there to Europe and the Gulf countries has a decisive role in determining the potential of freight transported via Azerbaijani Railway. The added value will be created during the establishment of Free Trade Zone in Baku International Sea Trade Port, formation of logistics center and loading the freights in railway transportation unloading them off the water vehicles. This will turn into one source of income of our country. The diversification of the economy will be deepened and particular share of railway in transport sector and the share of transport products and services in the GDP will increase as a whole. The investment in the transport sector will stimulate the development of fields that it serves, by creating the multiplicative effect. The diversification of foreign relations of Azerbaijan, benefitting from the cooperation with big Asian companies that were established recently and had extremely special prestige in the global market will not be ineffective in ensuring the sustainable development. The development of these regional markets is considered more promising for near future. As shown in the Strategic Road Map on the National Economy Prospect of the Republic of Azerbaijan, it is predicted that number of middle class members will increase from 3 billion to 5 billion in the upcoming five years (2023). Asian countries account for the 80% of this increase. The same development processes will be reflected at the level of companies as well. While the emerging markets cover about a quarter of world companies that currently have over 1 billion USD annual income, it is predicted that this share will increase by half by 2025. It is expected that 3000 new companies that will have total income of 1 billion USD will be established in Asia only. However, the growth of global trade volume on goods and services had further doubled the speed of GDP growth recently. Azerbaijan is able to benefit from this growth in line with its geographic location. Railway freight carrying will play an exceptional role in trilateral (The Russian Federation-The Republic of Azerbaijan-

The Islamic Republic of Iran) cooperation while fulfilling the increasing freight transport to the Asian market. The freight from the Russian Federation will enter the Alat junction (Azerbaijan) from Yalama station through Northern Caucasus Railway and then can be transported to the Islamic Republic of Iran and India, Oman and Gulf countries. Thus, "International North-South Transport Corridor" project will be realized as a result of combining the Russian Federation Northern Caucasus Railway with Astara – Rasht-Gazvin (Azerbaijan - The Islamic Republic of Iran) Railway. Thus, it will provide a favorable condition for the integration of "North-South" transport-information routes (The Russian Federation, The Republic of Azerbaijan, The Islamic Republic of Iran, India and Oman). The fulfillment of cooperation among the Russian Federation, the Republic of Azerbaijan and the Republic of Turkey in the field of railway freight is considered promising in terms of delivering freight to Mediterranean Sea and back. Priority to the following is considered expedient to ensure sustainable development in Azerbaijan: 1. Gradually preferring the oil revenues to finance the non-oil sector; 2. Providing favorable conditions for the formation of human capital as a result of the development in all forms of education by the government; 3. Achieving an increase in the particular share of non-oil products in GDP by stimulating regional development; 4. Promoting the use of renewable resources; 5. Achieving an increase in import-substituting products in the national economy; 6. Stimulating the export of non-oil products; 7. Achieving an effective rate of national economy sectors by improving the structure of the economy; 8. Developing the scheme to gradually return the financial resources to the state budget from the revenues of the economic sectors invested by the state budget. Extremely serious measures are taken to ensure the sustainable development in the Azerbaijani economy. So, during 9 months of 2018, the GDP increased 0,8%, non-oil sector 1%, industrial production 2%, non-oil industry 10,8%, agriculture 4,3%, non-oil export 14%, foreign currency reserves accounted for 45 billion USD, increasing 3 billion USD, while the non-oil sector accounted for 5.8 billion USD of 9 billion USD invested in the economy. Inflation grew 2.6% and population income 9.8% (5). All these are the necessary indications of ensuring the sustainable development in our country. Economical and effective use of financial resources assembled in Oil Foundation and other sources, and sparing a portion of these financial resources for the future generations as their share are among the sustainable development indications. The economic boundaries of our country will surpass its geographic boundaries as a result of harmonizing the development of human capital with the other factors that characterize the sustainable development that are operation of renewable natural resources, direction of investment, orientation to the scientific-technical development, personality development and institutional reforms, by ensuring the international competition of the Republic of Azerbaijan, gradually weakening the dependence on oil, stimulating non-oil sector development, expanding the production of import-substituting products, providing all favorable conditions to expand the export. Ensuring the sustainable development is already becoming the reality.

3. CONCLUSION

The existing level of economic development of Azerbaijan is characterized as a transition from the resource based economy to the efficiency-driven economy. The successful economic reforms pursued in the country have already provided favorable conditions for the development of not only oil sector, but also non-oil sector of the economy. The development of the traditional economic fields as well as science-intensive areas, substantial growth in the export of non-oil products, growth in the production of import-substituting products are playing crucial role in transition to the sustainable development. Dominance of non-oil sector in GDP compared to the oil sector (about 65%/35%), turning oil revenues to national savings, sparing the substantial portion of oil revenues in National Oil Foundation for the future generations (45 billion USD) can be considered to be among the main indicators of transition to the sustainable development.
