The common wealth of Azerbaijan has been estimated as 813.7 milliard dollars and special weight of human capital was equalled to 14%. The common wealth per capita has been estimated 85341 dollars, but human capital volume 11961 dollars. Overall, estimates of human capital wealth per capita are closely correlated with GDP per capita. Building on the underlying growth theory, previous issues of the Changing Wealth of Nations reports measured total wealth as the present value of consumption in the national accounts. Since consumption typically accounts for 80 percent of GDP in many countries, this led to an almost perfect correlation between wealth estimates and GDP, whether in aggregate levels or per capita. Rankings of countries according to their total wealth per capita and their GDP per capita were therefore almost identical (The changing wealth of nations reports, World Bank 2018, pp. 131).

*Table 3: Total wealth and human capital, 2014
 (The changing wealth of nations reports, World Bank 2018, pp.123)*

	<i>Total wealth</i> Billion, US\$	<i>Human capital</i>		<i>Total wealth</i> per capita (US\$)	<i>Human capital</i> per capita (US\$)
		<i>Billion,</i> US\$	<i>Human capital as</i> share of total (%)		
<i>Russian Federation</i>	2714,1	1306,1	48.1	188,715	90,812
<i>Kazakhstan</i>	3127,8	1324,6	42.4	180,911	76,617
<i>Azerbaijan</i>	813,7	114,1	14	85,341	11,961
<i>Turkmenistan</i>	779,3	252,2	32.4	146,831	47,510
<i>Ukraine</i>	2536,5	857,6	33.8	56,053	18,952

<i>Georgia</i>	165,2	79,2	47.9	44,327	21,251

3.1. Estimating the levels of education on the labour resources and employment

The education provides the young to become the active citizens and preparation of specialists raising their opportunity of finding the jobs. The results of the selective survey “On economic activity of population” conducted in our country with the technical support of International Labour Organization (ILO) show that the number of labour resources in 2017 was 7221.6 thousand persons. As it is shown in the table that 15.3% of labour resources were specialists with higher education, but 11.3% were specialists with secondary education and 5.2% - with primary vocational. There is an extreme supply of the labour forces which have no occupational competences, but full secondary education. So, 68.2% of labour resources and 67.4% of total employment do not have the primary vocational education. According to the methodology of International Labour Organization the definition of the economic activity population implies the persons supplying their labours to produce products or services, i.e. the number of employment and unemployment.

The percentage ratio of the number of economic activity population to the number of labour resources reflects the level of economic activity of the population. The level of economic activity of the population in 2017 was 70.3% (Table 4). It is shown from the table that the employment level of labour resources having the education and the primary vocational is higher than other ones. The level of the economic activity among the specialists of higher education is 75.3%, but the employment level is 95.8%. The appropriate indicators among the educated persons having secondary education are 67.1% and 94.2%, but the primary vocational education 74.3% and 93.4% accordingly.

Table 4: The main characteristics of labour market of Azerbaijan on the levels of education, 2017 (The State Statistical Committee of the Republic of Azerbaijan: Labour market (2018) Retrieved 08.12.2018 from <https://www.stat.gov.az/source/labour/?lang=en>)

	Total	High	Secondary education	Primary vocational	Upper secondary	Lower secondary	Primary	No schooling
	<i>Share of labor force, by educational attainment</i>							
<i>Persons,</i>								
<i>thousands</i>	7221,6	1104,9	816,2	375,7	3874,8	876,9	162,4	10,7
<i>Percent</i>	100	15,3	11,3	5,2	53,7	12,1	2,25	0,15
	<i>Share of employment, by educational attainment</i>							
<i>Persons,</i>								
<i>thousands</i>	4822,1	796,9	516,4	260,5	2892,6	306,6	49,0	-
<i>Percent</i>	100	16,5	10,7	5,4	60	6,4	1	
	<i>Share of unemployment, by educational attainment</i>							
<i>Persons,</i>								
<i>thousands</i>	251,7	35,2	31,6	18,5	131,4	33,3	1,7	-
<i>Percent</i>	100	14,0	12,6	7,4	52,2	13,2	0,7	-
	<i>Economic activity and inactivity rate (%)</i>							
<i>Economic activity rate</i>	70.3	75.3	67.1	74.3	78	38.8	31.2	-
<i>Economic inactivity rate</i>	29.7	24.7	32.9	25.7	22	61.2	68.8	100
<i>Employment rate</i>	95	95.8	94.2	93.4	95.7	90.2	96.6	-
<i>Unemployment rate</i>	5	4.2	5.8	6.6	4.3	9.8	3.4	-

The probability of employment on the labour resources having lower education level is low, but probability of economic inactivity and unemployment is high. The economic inactivity means the able-bodied population not willing to work, not seeking the job and aged 15 Years old and over. Labour resources of this group are not involved in working activity and because they are not active participants of the labour market. The level of economic inactivity is defined as the percentage ratio of the number of economic inactivity population to the number of labour resources. The conducting analyses show that the level of the economic inactivity among the educated persons with lower secondary education is 61.2%, among the persons with primary education 68.8%, but among the persons with no schooling is 100%. The persons with the level of lower secondary have the highest unemployment indicator - 9.8%. It predicates that the quality of the secondary education is low. Having no vocational competences and high educations are causes for working of this group of employees in the workplace with lower income besides decreasing the job finding opportunities sharply. The conducted analyses show that one of the main contradictions of labour market is that 16.5% of total employments have a

higher education. It is explained by the low levelled ratio of coverage with high education - 23%. Note that nevertheless average coverage ratio of higher education in the world in 1955 was 2.1%; it increased up to 32.9% in 2017. At present in the developed countries this indicator was 74%. (Muradov, 2017, pp. 13.) Increasing the demand for higher education in the world and being a mass character are explained by creating new knowledge and accelerating the application processes besides this level of education provides the preparation of specialized specialist. The mass character of higher education and its availability provide the transmissions of scientific- technological innovations to the country besides increasing the provision of highly qualified personnel. In the purpose of increasing the number of highly qualified personnel since 1950 in U.S. higher education was relatively open and forgiving. Students who did not do well enough in high school to enter a university could go to a community college and then transfer to a better institution. The institutions of higher education were geographically close to the people, enabling even rural families to send their children to college. The outcome was that sometime in the twentieth century American colleges and universities became the finest in the world (Goldin, 2016, p.18).

3.2. The relationship between the education and populations income

There is a mutual relationship between the population's income and the level of education. Besides raising the labour productivity, the education is an investment object enabling the increase of the population's income. In economic theory, the relationship between education acquisition and income is traditionally embedded within the human capital approach (Becker, 1964; Schultz, 1963; Mincer, 1958). The acquisition of education, synonymous with 'investment in human capital', increases the productivity of people, which converts into higher earnings. In turn, workers earn less because they are less productive, being deficient in human capital. Thus, following the logic of this model, being poor (in terms of income) and illiterate (poorly educated) are synonymous (Botezat, 2016). Increase or decrease in the population's income impacts directly to the volume and structure of expenditures assigning to the human capital of families. If incomes are an adequate to meet the necessary requirements of the families (foods and non-foods), then they are just interested in assigning of a part of their incomes to human capital. In its turn it impacts positively on improving the mode of life, forming the intellectual potential and increasing the role of science and education in the economic growth. The fulfilled analysis shows that in comparison with 2005 in 2017 the annual population income increased by 6.1 times and has reached to 49.2 milliard manats. The appropriate growth in real incomes of population has been observed in previous periods and equalled to 39.8 milliard manats in 2017. In the purpose of increasing the wages and social aids, the government has realized large scaled investment programmes and institutional reforms by using the receiving higher incomes from oil sector. Just distribution of oil incomes through the state transfers programs has caused the increase in the population incomes and improvement of the welfare of majority of population. Consequently, the annual nominal incomes per capita increased by 5.2 times and reached to 5011 manats, but real incomes increased by 5.3 times and reached to 4062 manats in 2017 compared to 2005 (Figure 1). The selective research of budgets of households shows that no schooling is one of the factors defining the decrease in family incomes. So, the head of the families having the better level of education have the higher income levels (Figure 2). In the Figure the incomes per capita in the families of head of families having no schooling have been compared with head of families having higher education. While decreasing the levels of education, i.e. the intellectual levels of the head of the families, in that case their incomes decrease too. The incomes per capita of households with the head of families having higher education are greater than that ones who having no schooling by 17.7%. The appropriate indicator is 6.9% in the families having the secondary and primary vocational education.

Figure 1: Populations incomes per capita (manats) and consumer price index
 (The State Statistical Committee of the Republic of Azerbaijan: Demography, 2018. Retrieved 08.12.2018 from <https://www.stat.gov.az/source/demography/>, The State Statistical Committee of the Republic of Azerbaijan: System of national accounts and balance of payments, 2018. Retrieved 08.12.2018 from https://www.stat.gov.az/source/system_nat_accounts/)

Figure 2: The relationship between the level of the education and incomes
 (The State Statistical Committee of the Republic of Azerbaijan: Budget of households. Retrieved 08.12.2018 from https://www.stat.gov.az/source/budget_households/?lang=en)

Although the special weight of persons with the upper secondary education in the total employments over the country is high i.e. 60% (see: Table 4), we have to note regretfully that the special weight of self employed persons prevail among these employees. The selective research of households shows that greater than 45% of monthly incomes of the head of families having the general and incomplete secondary educations are obtaining the incomes from the self-employments and agricultural sectors. The self-employed persons in the country are doing its activity mostly in the agricultural and trade sector. The employments of population in the agricultural sector are constrained by natural economy, i.e. the employment enables the persons to meet the daily requirements rather than earning the additional income. The higher level of the education doesn't give guarantee for providing the economic growth and improving the welfare of the population. So, the indicators reflecting the economic development and welfare in any country may be lower than the neighbouring country having the lower level of education than that one wherein located in the same region. It may be explained by some factors:

1. Inefficient usage of human capital (for example: employment of higher education and highly qualified specialists in the places aren't needed for such knowledge and skills);
2. Irrationality of investments in education and human capital (for example, personnel preparation without considering the demands of labour market and perspective development trends);

- Low quality of the education (for example, corresponding the knowledge and competences obtained in the process of training with the requirements of the markets, preparation of personnel based on old programmes and materials);

3.3. Econometric estimation of the dependence of population incomes on the level of education

The below mentioned table enables us to compare the average annually and monthly income and wages per capita, as well as indicators characterizing the education. As it seem that the economically developed countries among 18 countries shown in the table the level of education and population` income are higher.

Table 5: Incomes per capita, wages and education index, US dollar, 2017
 (World Data.info: Average income around the world, 2015. Retrieved 11.12.2018 from <https://www.worlddata.info/average-income.php> , Human Development Report: Education index, 2018. Retrieved 11.12.2018 from <http://hdr.undp.org/en/content/education-index> , OECD.Stat: Average annual wages, 2018. <i>New Zealand</i>	46917	3910	38970	3248	0.917	12.5
<i>Norway</i>	65786	5482	75990	6333	0,915	12.6
<i>United Kingdom</i>	45280	3773	40530	3378	0,914	12.9
<i>Iceland</i>	90662	7555	60830	5069	0.912	12.4
<i>Netherlands</i>	52705	4392	46,180	3848	0.906	12.2
<i>Finland</i>	46772	3898	44580	3715	0,905	12.4
<i>Sweden</i>	47783	3982	52590	4383	0,904	12.4
<i>United States</i>	60558	5047	58270	4856	0,903	13.4
<i>Russian</i>	-	-	9230	769	0.832	12
<i>Kazakhstan</i>	-	-	7890	658	0.814	11.8
<i>Ukrain</i>	-	-	2390	199	0.794	11.3
<i>İran</i>	-	-	5400	450	0.741	9.8
<i>Azerbaijan</i>	3684	307	2947	246	0.709	10.7
<i>Turkey</i>	-	-	10930	911	0.689	8

Note that, since 1990 the education index have being computed on the based of database of UNESCO Statistics Institute by UN Development Programme. The education index means a mathematical mean of subindices of Expected Years of Schooling Index and Mean Years of Schooling. Expected Years of Schooling Index is calculated on basis of schooling years along the life of a child reaching to official schooling age. But Mean Years of Schooling Index means the average time spending to the education by citizens aged 25 Years old and over along the life. The required time by the law for calculating the each level of education is taken as the basis. A lot of research carried out UN Development Programme shows that there is a strong dependence between population`s incomes and Mean Years of Schooling.

4. ECONOMETRIC ESTIMATION OF THE IMPACT OF MEAN YEARS OF SCHOOLING TO THE GDP: OPTIMAL MEAN EDUCATION YEAR

It is shown from the table 5 that the countries having a longer mean years of schooling as a rule population incomes become higher too. But it doesn't mean that mechanically increasing the mean schooling years will increase the income as well. Firstly, besides the increasing the mass character of coverage of mean schooling, it is important to increase the quality of the education. For instance, though mean years of schooling is 11, but this one for people aged 25 and over is 10.7. It means that it was not possible to involve the whole population in schooling. On other side raising the years of schooling may vainly increase the expenses of the state and population as well. How long should be Mean Years of Schooling for a maximum effect in Azerbaijan? In order to answer this question the below mentioned regression has been estimated econometrically. By considering GDP per capita as one the main indicator of development, the GDP based on purchasing-power-parity (ppp) per capita have been taken as the result indicator in the model.

$$\text{LOG(GDP_PPP)} = 1.67502 * \text{MYS} - 0.07185 * \text{MYS}^2 + \text{AR}(1) = 0.90544 \text{ UNCOND] } (1)$$

(s.e) (0.084503) (0.008166) (0.180716)

R-squared=0.866538, Adjusted R-squared=0.799807.

Here, LOG(GDP_PPP) – GDP based on purchasing-power-parity (ppp) per capita, MYS – mean years of schooling, (s.e) – standard errors of parameters, R-squared – determination coefficient, Adjusted R-squared – shows the determination coefficient being defined more precisely. In order to provide the adequacy of the model first order autoregressive AR(1) factor have been included in the model. The main characteristics of Model (1) and other appropriate tests having been realized through Eviews 9 evidences that the model is an adequate. As it seems from the regression that the impact of MYS factor on GDP_PPP is in the shape of a parabolic and arms of the graphic are down (as the coefficient of MYS² is negative). Therefore there is such level that where GDP_PPP reaches a maximum. It is known us from mathematical analysis that this level is the point, where the first derivative equals zero.

$$1.67501735129 - 2 * 0.071849983714 * \text{MYS} = 0 \quad (2)$$

If we solve the equation (2) then we will get MYS = 11.65634656. It gives a sense that if mean years of schooling for aged 25 and over in Azerbaijan is about 11.7 years, then GDP per capita reaches a maximum. Consider that nowadays the schooling years is 11, mean years of schooling for aged 25 and over is 10.7 years, while switching the secondary school to 12-year educational system then GDP level will be maximum on this factor.

5. CONCLUSION

Hence the research evidences that the distribution of oil incomes through the state transfers programs has caused the increase in the population nominal and real incomes and improvement of their welfare. The analysis of social-economic indicators shows that there is an extreme supply of the labour forces who have no occupational competences, but full secondary education. So, the major part of the labour resources and employments has not got vocational - qualification training. Besides decreasing their job finding opportunities, it is a cause for working of this group of employees in the workplace with lower income. The selective research of budgets of households shows that not having an education is one of the factors defining the decrease in family incomes. So, there is a strong dependence between population's incomes and the level of education. The household having better-educated head of family have the higher income.

ADVANCING TOWARDS SUSTAINABLE ECONOMIES: EXAMINING RESIDENT ATTITUDES & PERCEPTIONS TOWARDS SUSTAINABLE TOURISM DEVELOPMENT IN QATAR

Ali Abdallah

*Stenden University, Qatar
raheeq-albakry@hotmail.com*

ABSTRACT

Tourism is essential to advancing economies and is better achieved through the three pillars of sustainability due to its positive consequences and is able to implement actions that directly affect residents, economies, and environments. Sustainable tourism development in Qatar faces many challenges from lack of tourism planning to a lack of stakeholder involvement, especially involvement from the local stakeholders' side whose importance is highlighted in this paper. Resident awareness, engagement and participation are essential to the success of a sustainable tourism destination, and thus this research focuses on identifying the attitudes and perceptions of residents towards sustainable tourism development in Qatar. The residents' levels of involvement and willingness to be involved in sustainable tourism actions are also identified in this study. The research measures the local's attitude towards tourism in Qatar by examining and analysing local culture, social customs, and resident behaviours. Data derived from 142 residents were used to perform a hierarchical cluster analysis in order to find three clusters based on the residents' perceptions of sustainable tourism destination, willingness to be involved, and socio- demographic factors. Data illustrated that tourism has positive impacts and negative burdens on locals but perceptions are slowly improving through educational and community involvement methods that the country focusses on. Data all suggested that annoyances perceived by tourists were solely due to their lack of involvement in the planning process of tourism. The research concludes that for Qatar to develop economically through sustainable tourism, all private and public stakeholders must be involved in order to assure a more successfully long term stable economic development.

Keywords: *Economic Development, Resident Attitudes, Resident Perceptions, Sustainable Tourism, Tourism in Qatar*

1. INTRODUCTION

Tourism development has both the positive and negative influence on resident's social lives and a general influence over their lifestyle (Kim, Uysal, & Sirgy, 2013) as it is residents that experience it and are in direct contact with it (Eaterling, 2004), thus becomes an interaction of their day to day lives. The growth rate of tourism has more than doubled in the past decade. From seeing 525,000 international tourist arrivals in 1995, the number rose up to 1.2 billion in 2016. According to the World Bank Group (2017), 2016 was the seventh consecutive year wherein the tourism sector showed sustained growth, despite global challenges in safety and security. A report by the World Travel & Tourism Council (2017) shows USD 7,613.3 billion (10.2% of GDP) as tourism's total contribution to the 2016 global GDP. In the State of Qatar in particular, tourism has a significant effect on the economy. In 2016, the total contribution of tourism to the Qatari GDP was USD 27.9 billion (World Travel & Tourism Council, 2017). Qatar has implemented a tourism development strategy that aims to boost the industry's contribution to the GDP by 5.2% by 2030 and increase the total contribution to employment by

5.3% (127,000 jobs) from the current 1.8%. The strategy also aims to increase international tourism arrivals to the country to seven million tourists in 2030. These goals have been set with sustainable courses of action to support its implementation (Qatar Tourism Authority, 2014). Tourism is a wide-scale global process of change and development (Page & Connell, 2009) and is essential to advancing the three pillars of sustainability "People, Planet, Profit" (UNWTO, 2017). It is merely impossible to eliminate "Planet and Profit" from most tourism research, however, this research aims to explore the "People", both the tourist visitors and the resident hosts, and understand behavioural patterns of the residents of Qatar in regard to tourism and towards visiting tourists. Understanding local's attitude is essential in order to sustain a long-term success for the tourism industry (Andriotis & Vaughan, 2003). Moreover, the influence and impacts of tourism development on residents have witnessed great attention over the past years (Choi & Sirakaya, 2005; Sinclair-Maragh & Gursoy, 2015; Tosun, 2002, and Weaver & Lawton, 2001). Such studies have indicated the importance of understanding residents' attitudes and it supports the development of the tourism industry. Hence, for a country such as Qatar, a middle eastern country that is now focusing on tourism development in the country, understanding resident behaviours is a must in its long-term success. According to Qatar Tourism Authority, a careful tourism action plan has been set for implementation to enhance the cultural dialogues and experiences of tourists in Qatar (General Secretariat for Development Planning, 2008). The plan to attract and involve tourists is clear, but nothing yet considers the locals in such planning, nor considers their desires in attaining such tourism development. Hence, this research aims to create distinct profiles of residents in Qatar based on their sociodemographic factors and attitudes towards sustainable tourism; and investigate the common perceptions and attitudes of each profile.

2. SUSTAINABLE TOURISM DEVELOPMENT

Tourism development encourages cultural exchange between tourists and local residents (Ursache, 2015), increases leisure attractions and improves infrastructure (Zaidan, 2016), as well as it allows the locals to strengthen and value their cultural identity (Akkawi, 2011), and is a great source of economic benefits and offers job opportunities to the community (Rahman, 2010). The UNWTO (2017) provides specific guidelines for tourism development and suggests that tourism must, 1-sensibly utilise environmental resources that adds value to tourism products, taking into consideration the essential ecological processes and aiding the conservation of natural resources and biodiversity; 2-respect the social and cultural values of a host community; contribute to the bridging of cultures; and conserve built and living heritage; and 3-contribute to alleviating poverty by establishing long-term economic operations which benefit stakeholders by providing stable employment, social services, and income-earning opportunities (UNWTO, 2017). Tourism development plans that consider the residents' attitude towards a particular project before its implemented can be seen more sustainable and successful for the economy as well as the environment of a region (Stylidis, Biran & Szivas, 2014; Almeida-Gracia, 2016). However, most tourism plans are implemented without the recognition of resident's attitude and that is because the key drivers are only establishing those plans depending on the economy (Prayag, Hosany & Odeh, 2013; Stylidis, Biran & Szivas, 2014). Butler (1999) argues that sustainable tourism development is fundamentally good and appropriate for tourism and adopting its principles would somehow reverse the negative effects that have arisen from the development of the tourism sector, which refers to resident attitudes and their perception towards tourists. The Gulf region and specifically Qatar in recent year realised the importance of sustainable tourism in the long-term development of their countries. The seven Gulf States, with Jordan and Lebanon, are working towards the expansion of power capacity in order to avoid crippling power shortages, which some countries across the region have already been afflicted with.

However, unlike China, Brazil and India, the GCC's focus is towards economic independence from hydrocarbons. (Patel, 2014) For instance, the United Arab Emirates has implemented a national agenda that addresses the following points: air quality improvement, water preservation, clean energy usage, and green growth plans (UAE Prime Minister's Office, 2017). A national key progress indicator has also been formulated in order to measure and control the strategy's implementation. Furthermore, Oman aims for a sustainable economic diversification due to the decline of fishery production, which contributes directly to Oman's economy (Belwal, Belwal, & Al Jabri, 2015). Qatar on the other hand, has implemented a national development plan that highlights sustainability, and rests on the improvement of its four pillars: human, social, economic, and environmental development. (General Secretariat for Development Planning, 2008) The pillars represent challenges in the different fields and aims to address the difficulties in a sustainable manner. The Prime Minister of Qatar stated that country is beginning a phase of sustainable development. The latter relates to the several sustainable projects that the government of Qatar implemented such as the Msheireb Downtown Doha, Lusail City, and several sustainable initiatives that include sustainability weeks organised by the Qatar Green Building Council. The country is implementing sustainable development and actions in a fashion that combines traditional Qatari architecture with modern techniques (Qatar Tourism Authority, 2014). Moreover, some businesses in the tourism industry have started to exploit the marketability of sustainable development. Failing to realise that ignoring the concept of sustainability dilutes the purpose of the whole movement, these businesses have adopted sustainability in name, but not in action. Small to large scale tourist operations have started to adapt sustainability in hopes of attracting the "green" tourist (Higgins-Desbiolles, 2010). However, sustainability is not merely achieved by attracting green tourists, it is instead the behaviour towards such tourists that determines their return, and thus, the success of the industry. Fennell (2008) calls for tourism enterprises to adopt a deep ethical and responsible business processes approach towards tourism rather than a surface approach as there is a need to centralise human beings in the sustainability approach and get them involved in the process which would lead to the positive change in, and development of, the industry. Andreck and Nyaupane (2011) refer to this as the quality of life as it determines the people's and community's behaviours towards tourism.

3. QUALITY OF LIFE

Moscardo (2009) explains the idea of Quality of Life as the concern of understanding people's perceived satisfaction with the circumstances in which they live. The urge to travel is directly associated with Quality of Life, from the perspective of the tourists (Sirgy, 2010), and therefore, tourism is capable of creating potential that contributes to the improvement of the well-being and will improve the Quality of Life of the local community (Andreck, Valentine, Knopf, & Vogt, 2005). The notion of Quality of Life is used to understand the attitude and behaviour of residents influenced by the visitor pressure, and a good understanding of Quality of Life of the host country can assist in creating a clear structure for examining the impact of the visitors (Venter & Kruger, 2017). Understanding Quality of Life can further aid in understanding the emotional, health and spiritual well-being of the people, and creates a positive relationship with family and friends (Pukeliene & Starkauskiene, 2011). However, Quality of Life when addressed appropriately can lead to positive outcomes; but is also negatively impacted by situations undesired by the local community. For instance, the spread of a disease within a community that witnesses no rapid action from the government witnesses a rapid deterioration regarding Quality of Life within the community. Tourism in another example of the latter as tourism can serve unfavorable aspects to the Quality of Life of the community, by causing an increase of traffic congestion, crimes and environmental pollution, as well as leading a higher cost of living (Deccio & Baloglu, 2002).

Thus, no doubt tourism plays a role in the Quality of Life of people and their local communities, however, education, information and involvement of residents and local communities benefits tourism by allowing the local stakeholders to comprehend the kind of tourism that takes place in their community and to what extent it affects them; and thereby allowing them to make informed decisions (Byrd, Bosley, & Dronberger, 2009). Faulkner and Tideswell (1997) suggest that there are intrinsic and extrinsic factors that contribute to resident perceptions. Extrinsic factors such as high development maturity of a destination or a high level of seasonality contributes to the disgruntlement of residents while intrinsic factors such as social benefits or employment in the tourism industry contribute to positive perceptions. Moreover, the level and degree of a resident connection with tourism and specifically tourists has been determined to affect the local's reactions regarding the effect of tourism on their lifestyle and lives of a community as a whole (Sirakaya, Teye & Sonmez, 2002). For instance, various sources have indicated that residents who have jobs in the tourism industry are more likely to have positive attitudes towards tourism than the other residents (Sirakaya, Teye & Sonmez, 2002). Wang and Pfister (2008) pointed out that the greater level of individual benefit from tourism obtained by local residents, the more the citizens would show support for the tourism development. To ensure the success of a sustainable tourism industry, it is essential to get the support of the 'hosts' communities (Ryan, Chaozhi & Zeng, 2011). Thus, the realisation of the importance of local's perception, has changed the perceived idea that the tourism industry has towards the future plans and development of tourism (Tovar & Lockwood, 2008). Tourism development has always been wrongly accused of being the operator of rapid cultural and social change in the society and host communities, which made tourism get little or almost no attention towards the positive aspects that tourism development brings to the social and culture within a community (Sharpley & Telfer, 2002). An example of this is Shaw and Williams' (2002) suggestion that most hosts tend to change their lifestyle due to the constant encounter with the tourists, as their lives get influenced by them, they start to adapt different ways of looking at norms and traditions. Therefore, Quality of Life for the locals changes due to tourist interaction. Such change is perceived as positive change by some, while others see it as negative change that badly impacts on the community and local culture.

4. RESEARCH FINDINGS

Data was collected form a sample of local national residents of Qatar. The sample gather included a total of 144 participants that consisted of 142 participants filling in questionnaires and 2 participants getting interviewed. Based on the findings of the data collected, socio-demographic characteristics of participants were clustered into three cluster profiles which are identified using hierarchical clustering.

Table following on the next page

Cluster 1 – Cynics
<p>Most likely to be male Most likely expats Between the ages of 18-48, but of all three groups most likely to be between 37-48 Most likely to have a high school diploma or a bachelor’s degree Most likely married, with children Most likely employed full time</p>
Cluster 2 – Apathetics
<p>Could be either male or female Could be expats or Qataris Between the ages of 18-64, most likely to be 25-36 Majority have a bachelor’s degree or an associate degree, Employed full time Most likely married, with no children</p>
Cluster 3 – Supporters
<p>Could be male or female but most are female Could be expats or Qataris Between the ages of 18-64, but most likely to be 18-24 Employed full time, yet most likely of the three groups to be unemployed or students Most likely single Most likely to be students or have obtained a post graduate degree</p>

Table 1: resident clusters / sociodemographic profile

Table following on the next page

Cluster 1 – Cynics	Cluster 2 – Apathetics	Cluster 3 – Supporters
Most strongly disagree that tourism in Qatar is sustainable	Most strongly disagree that tourism in Qatar is sustainable	Most disagree that tourism in Qatar is sustainable
Most have negative perceptions of sustainable tourism development in Qatar.	Split between negative and positive perceptions of sustainable tourism development in Qatar	Most have a positive perception of sustainable tourism development in Qatar
Most are not involved in sustainable tourism activities.	Most are involved and work in tourism.	Most are involved in sustainable tourism projects and most participate in environmental campaigns and through social media.
Most do not care about tourism in Qatar.	Most see the economic contribution of tourism to Qatar's economy.	Most want to be involved by participating in more environmental campaigns.
Most do not want more tourists in Qatar.	Most do not want to be involved with sustainable tourism development projects due to lack of time and awareness.	Most are on Instagram, Snapchat and Twitter.
Most do not want to be involved with sustainable tourism development projects due to not caring about tourism in Qatar.	Most are aware of Qatar Tourism Authority and their social media pages but find their content boring.	
Most are not aware of Qatar Tourism Authority.		
Most are on Facebook and Twitter.	Most are on Facebook and Instagram.	

Table 2: Resident Clusters / Attitudes And Perceptions

The cluster profiles identified show that the group which has the most support for sustainable tourism development projects is also the same group that has been participating in such projects. Studies conducted by Haralambopoulos & Pizam (1996) also found an association between high levels of education and positive perceptions of tourism, thus reflecting the findings of this research. The striking findings of this research was that the majority of respondents, 56.3%, perceiving sustainable tourism in Qatar as negative, and 37.4% remained neutral about it or did not have an opinion. While only 6.3% of the respondents considered perceived sustainable tourism in Qatar at positive. In order to investigate why the majority of the respondents perceive sustainable tourism in Qatar negatively, the respondents were allowed to choose every criterion that they felt justified their choice of perception. The three most selected reasons were the lack of tourism planning, lack of tourism marketing, and lack of infrastructure that supports tourism. Other concerns included the cause of heavy traffic and lack of information about ongoing developments. Although it cannot be denied that most residents in Qatar find tourism unsustainable, the Qatar Tourism Authority (2014) has been taking steps to develop tourism sustainably, and this message needs to be communicated to the residents clearly with educational programmes implemented on various levels. Achieving sustainability in tourism is a continuous process that necessitates continuous monitoring of impacts and innovative problem-solving skills. Sustainable tourism development requires the informed and active participation of all the relevant stakeholders, especially the host community. When locals were asked if they would be happy to meet tourists and welcome them to the city 44.4% of the respondents agreed to do so 36.6% were unhappy about doing this.

This suggests that residents can be welcoming and would do even understand tourists better if educational programmes highlighting the importance of tourists to them were implemented. However, the same participants were also asked if they witnessed interactions between the local residents of the community and tourists, and 62% of the respondents answered 'No'. Respondents have witnessed an increase of tourism into the country over the past few years but believe that such tourists are not interacting with locals. In the context of any other country such findings would be impossible as interactions between local and tourists occur through customer service measures, the host hosts tourists through the services offered and through sales of good. As Qatar is an expat country with over 90% of its residents being non-Qatari, it is impossible to witness Qatari residents working in customer service establishments that deal with tourists as most of the jobs they occupy tend to be governmental in nature. Furthermore, respondents also mentioned that since Qatar is a multicultural and multinational country due to its expat nature, residents cannot differentiate between tourists and the local community, which makes it difficult for the residents to take initiative and interact with the tourists. However, residents would gain more knowledge and learn from the tourists by interacting with them, as well as have more positive attitude towards tourism because of their direct link to the tourism industry, especially those who would sell products or services to the tourists. Thus, promoting sustainable tourism development requires enhancing of Qatari local's Quality of Life by providing them job, or even voluntary tasks, that deal directly with tourists. Results further demonstrated that most of the national residents who are positive about the tourism in Qatar view tourism to be a source of economy, international recognition and trigger for development, while those who showed their disagreement and negative attitude towards tourism, complained about the direct tourists influence towards Qatar such as traffic, language or Western lifestyle which alters local traditional culture. Moreover, when asked if their opinion were considered in tourism projects developed in the country, 55.6% of the respondents answered "sometimes" while an only 8.5% stated "always". However, in an interview with a correspondent from Qatar Tourism Authority the participant suggested that the government values local's opinions and always conducts surveys with local before implementing tourism projects. This suggest that if surveys were actually implanted on local prior the development of tourism projects in the country, residents misinterpret the intentions of such surveys. This draws us to believe that residents want more hands-on involvement in the implementation process of any tourism project being developed in the country. Respondents were further asked if the government should consider the local's opinions on future tourism plans and 73% stated that they would always like to be involved, while 26% answered sometimes, and 0% answered never. Thus, national residents want to always get involved in the process of tourism development, starting from the planning phase, and through the implementation phase. Quality of Life can then improve when they feel they are part of this entire decision-making process and not only participants in a survey conducted by the local authorities.

5. CONSLUSIONS

As Qatar is currently focusing on tourism development in the country and intends to attract larger numbers of tourists in the upcoming years, there is clear and urgent need for a sustainable tourism plan to be implemented with clear measure to be addressed. Results illustrated that a significant number of residents view tourism in a positive manner and see it as a necessity for the future of the country. However, results also demonstrated that lack of interaction between the local community and the tourists in Qatar, yet the local community showed positive attitude towards the tourism industry. Residents then simply understand the benefits of tourism in theory, but in practice are not entirely happy with their lack of involvement and demand to be more involved. The government should be considering the local's perception and opinions, as locals play a big role in the success of tourism projects at all times, as well as enhance the

strategic planning of future tourism plans. Local not only can be the extra mind behind projects but can also be the welcoming face that tourists see when visiting the country. There is clearly a lack of knowledge towards by the locals as they do not know who the tourists are and do not distinguish between the expats living in the country and the tourist visiting it. Hence, the government through its local authorities holds the responsibility of assuring that such distinguishes are made and ensure that locals are more involved with tourists. There are two main streams in assuring the latter is achieved. The first is by getting local involved in the planning and implementation processes on any tourism development project through their continuous involvement by allocating them with payed or voluntary tasks that would contribute towards each project. The second is through educational programmes. There is a clear need for educational programmes that highlight the importance of tourism in the county to be implemented. Local authorities require a closer collaboration between private and public organisations in order to implement educational programmes that explain how tourism if addressed in a correct manner can contribute immensely to the economy, thus, creating more jobs and infrastructural development. Tourism, the boundary breaker of cotenants which encourages collaborations amongst various countries around the world requires educational programmes that can be implemented through communal gatherings, community meetings, conferences, political talks, and classroom courses. Consequently, identifying and clustering residents based on their attitudes and perceptions of sustainable tourism development is beneficial in order to address the lack of knowledge about local stakeholders in Qatar. The creation of local stakeholder profiles which could also support tourism planners and policy makers through understanding which sustainable tourism actions will be most likely supported by the community. In addition to this, planners and policy makers are required to identify the local stakeholders' preferred way of communication and involvement, which can in turn support stakeholder engagement strategies. Achieving sustainability in tourism is a continuous process that necessitates continuous monitoring of impacts and innovative problem-solving skills. Sustainable tourism development requires the informed and active participation of all the relevant stakeholders, especially the host community. The more the local community interact with tourists the more positive social impacts occur within the local community's perception. Interactions of residents and tourists can only occur through the correct involvement of residents, and this is the sole responsibility of local authorities. Positive interaction leads to a better Quality of Life if correctly understood and if appropriately involved, and thus correct measures taken by local authorities lead to enhancing resident Quality of Lives while also increasing tourism numbers to the country, thus, benefitting all parties with no harm caused.

REGIONAL DEVELOPMENT IN PROVISION OF ECONOMIC GROWTH

Alina M. Aliyeva

Associate professor at "Department theoretical and practical economics"

Azerbaijan State University of Economics

Alinaaliyeva1953@gmail.com

ABSTRACT

The importance of the provision of economic growth in globalized world economy, being the strategic aim of national interests, the strengthening of macroeconomic stability comprehensive and sustainable development, improvement of social welfare as a source connected with these problems. Since its independence, volatile development of Azerbaijan's economic growth rate, that is stages of recession, stability and upsurge or boom, was the result of various internal and external factors, affected by the country's strategic importance. For example, if recession in the early years was characterized by internal factors like stagnation and stability, the upsurge stage of the country's economy related to the oil strategy was catalyzed by such external factor as the increase of the oil prices in global economy. Nevertheless, slowdown in economic growth and weakening of economic activity in 2001-2014 with the sudden and sharp drop in oil prices, reconfirmed, that dependence of the economy mainly on oil-related activity is not effective. As a result, decrease in monetary reserves and limitation in sources of economic financing, generated necessity for search of new means of investment in its economic growth. From 2015 it was an imperative course to shift from capital-intensive to essentially new economic growth models based on efficient financing sources and prioritization of non-oil sector development was set forward as the catalytic factor in the process. It is specifically stated in the Strategic Road Map on national economy that development of the non-oil sector plays a crucial role in achieving sustainable economic growth. The chances of non-oil sector development depends on the stabled and balanced development of regions, improvement of economic structure and their implementation and capital investment. The hardness center of regional development of socio-economic development are connected with institutional reforms, the implementation of the measures accelerating economic development in the regions, achieving their balance development caused to the disproportion. Determination of development priorities of the regions, effective utilization of existing natural resources, from the proportional placement of productive forces, approaching of production fields to raw materials, with expansion of innovative production of export orientation of competitiveness, diversification of economy creates conditions and it provides the economic stability of the country.

Keywords: *economic growth, GDP, regional development, regional policy, social wellbeing*

1. INTRODUCTION

The world financial crisis and economic decline followed by slower development rate of most national economies and the unproportional balance between the increasing demand and limited resources makes the economic growth problem the focus of this research as it is one of the key macroeconomic and life rating indicators, that determines the human development index as well as GDP per capita. Affected by some internal and external factors, Azerbaijan's economic growth has been wobbly since independence. While the GDP and economic growth rate decreased due to reduced production and shattered economic structure in first years, the import of crude oil into world market triggered the economic growth until 2014. However, global oil price crash in 2015 resulted in devaluation of national currency "manat" and the reduced investments, thus decreasing the growth rate again. To reduce the economy's oil dependence as well as to ensure the sustainable economic growth, the government approved Strategic

Roadmap on National Economy Development, a document that covers the stages and steps for the productive and effective development of non-oil sector. The socioeconomic development of regions is exceptionally important in securing the economic growth, as the majority of non-oil industries are located in the regions. President Ilham Aliyev's 3-phase government program aims to reduce regional disparities and ensure the balanced regional development. Another important step of regional policy emphasized in Strategic Roadmap is the creation of new labor intensive industries as the lower labor costs in the regions can serve as a new source of economic growth. The successful regional economic development can also address the issues like the creation of equal social conditions for population, reduction of social tension, and improvement of life standards.

2. ECONOMIC GROWTH: IMPORTANCE AND IMPLEMENTATION STEPS

2.1. Importance of Economic Growth

In global world economy, the economic growth is a strategic objective of securing the national interests as it is the main factor in ensuring the sustainable development of economy and improvement of life standards. An indicator of social-economic development of a country, the economic growth provides funds for increased productivity and assesses the real growth rate of GDP and GNP per capita. The factors such as natural and economic resources, production level, technological changes, institutional reforms, participation in international integration process and etc., can affect the economic growth rate of a particular country in a positive or negative way. According to the International Monetary Fund, due to global financial and economic crises, in 2014, the economic growth rate was 3.4 percent - 1.8 percent in developed countries, and 1.6 percent in low-income countries. In 2015, the world economic growth rate decreased to 3.3 percent, and increased back again to 3.8 percent in 2016. Recent global economic downturn followed by the decline in growth rate of national economies has shifted the main focus to the discovery of the most effective ways of the utilization of natural resources and economic potential. A quantitative economic growth can be achieved by utilization of all natural and economic resources, when the effective and sustainable utilization of physical and human capital, natural resources and technological knowledge will lead to qualitative economic growth. Despite the abundance of natural resources, scientific potential and human capital remain as the permanent and inexhaustible resource of economic development. Hence, increasing the quality and competitiveness of these resources play a major role in economic growth (Strategic Road Map, 2016, p. 26). Physical capital and natural resources accounted to 16 and 20 percent, respectively, of world economic growth, whereas the 64 percent has come from human capital. Taking into account the increasing role of science in economic development, increasing investments in education and human capital is becoming more necessary. "It is particularly important to achieve medium and long-run economic growth to ensure sustainable economic growth." (Meybullayev, 2011, pp. 184). While the short-run growth can be achieved through more effective, efficient use of existing resources, the required measures to support the medium-run growth include the diversification of economy, fast development of non-oil sector and regions, creation of a free competition and favorable investment environment for the development of the private sector and so on. For a long-run economic growth, however, it is crucial to create an efficient and innovative economy, strengthen the country's position in the world market, ensure the growth of GDP per capita and improve the standard of living of population. The short- and long-run growth of the national economy depends on the objectives of the economic policy pursued by the state. Fiscal, monetary, social, institutional and other policies can stimulate the growth in short-run, but can have a sustainable impact in the long-run. In other words, short-run growth is defined by effective use of labor and capital, while long-run economic growth is driven by innovative development.

Because the volume and quantity of GDP, as well as the quality of goods and services per capita are important indicators of economic growth, they are carefully measured in the analysis of the economic growth situation in the country. Additionally, the GDP per capita is another main indicator that measures population's wellbeing and determines the human development potential index. It should be noted that not only internal factors, but also external factors can affect the economic conjuncture in the country. With the expansion of globalization, external factors can now change the quality indicators of economic growth. "As the integration process deepens, international division of labor, foreign economic activity, import and export operations and other factors are more apparent ". (Sakaraliyev, A., Saakraliyev G. 2016, p. 41) Since its independence, volatile development of Azerbaijan's economic growth rate, that is stages of recession, stability and growth or boom, was the result of various internal and external factors, due to country's strategic location. For example, if recession in the early years was caused by internal factors like stagnation and instability, the increase of oil prices in global market, the external factor, followed by oil strategy pursued by state contributed to the growth of economy. During the first years of independence, the collapse of the economic structure resulted in the sharp decline in production, the reduced GDP and national income, the high unemployment rate, the low living standards of population, the absence of currency reserves in the country, and other deficiencies, thus causing the economic growth to decline. Financial resources were not available for the solution of these problems. To restore and develop the national economy, the state budget revenues were increased through the sale of crude oil to the world market which resulted in 11.1 percent economic growth (oil sector being dominant in GDP growth) in 2004-2014. Sudden and sharp drop in oil prices followed by slowdown in economic growth and reduced economic activity in 2001-2014, reconfirmed that oil dependence should be reduced to ensure the economic growth. To minimize the negative impact of declining oil revenues and devaluation of manat and maintain macroeconomic stability became a key priority. In 2015, the decline in the currency reserves and limited financial resources necessitated the switch from capital accumulation to non-capital accumulation. Sustainable development of non-oil sector became mandatory. As discussed earlier, the economic growth primarily depends on the real GDP growth rate, sources of its growth, structure and the features of its formation which in its turn affects the changes in the welfare level of the population. While qualitative growth of GDP ensures the expansion of the market value of all the final goods and services produced in a period of time, improvements in its structure will help to meet ever-growing demand, and contribute to a high quality and cost-effective growth. Not only quantitative growth, but structure of output is also important in measuring GDP. Although the share of oil GDP was dominant in economic growth in 2004-2014, the manufacturing, as well as agriculture, communications, construction and transportation sectors played a significant role in GDP growth. The development of the non-oil industry had become a new source of growth after the sharp decline of oil prices negatively impacted the country's economy.

Figure following on the next page

Figure 1: Structure of the gross domestic product (The State Statistical Committee of the Republic of Azerbaijan).

The adoption of the Strategic Roadmap on Development of National Economy emphasizes the importance of reducing the oil dependence of country and utilization of new sources of growth to ensure sustainable economic growth rate. In this strategic document, the country's 25-year (since independence) economic growth is divided into 4 stages, such as decline, stability, high economic growth, and deceleration. The development of non-oil sector was prioritized at the top of the list of required measures to ensure the sustainable growth as it can contribute to the expansion of export, production of competitive products, employment growth, reduction of unemployment and poverty, and creation of new jobs. The development and diversification of the non-oil sector is crucial for ensuring the sustainable economic growth (Strategic Road Map on National Economic Development, Baku, 2016, p 41).

Figure 2: GDP and non-oil sector as percentage of the previous year (The State Statistical Committee of the Republic of Azerbaijan)

There are abundant examples of the oil-rich countries, that used oil revenues not for investments but for current consumption purposes thus failing to build sustainable and competitive economies. In 2004- 2014, foreign companies invested \$52 billion in Azerbaijan's economy. 85 percent of FDI was pumped to oil sector and only 15 percent to non-oil industry. Despite the relatively small share of direct investments, the economic growth rate of non-oil industry was 32.5 percent compared to 8.2 percent of growth in oil sector. However, the inefficient use of foreign investment potential (investing more in infrastructure than in production areas) has resulted in decreased return on investments. As mentioned before, one of the main factors of economic growth is the diversification of economy, in other words investing into other potential sectors of the economy like communications, construction, transport, tourism, engineering, light and food industries, and etc. It should be noted that, despite the 26.1 percent decline in investments in 2016, the funds invested into non-oil sector increased by 20.2 percent while non-oil industry grew by 24.4 percent. In 2017, 15.6 billion AZN was invested into all sectors of the economy, of which domestic investment accounted for 44.6 percent and foreign investment for 55.4% percent. To improve the efficiency of investments and to leave more funds for other social problems by lifting the burden off the state, the role of the private sector in state's investment policy should be expanded (Strategic Roadmap, p 20). Since human capital is one of the most important factors affecting economic growth, investments in science and education develop new knowledge and high-skilled human capital thus creating more opportunities for innovation-based economy. There is a correlation between science, education and economic growth which contributes to the quality of education and the activity of research universities. In short, the increase of investments in science and education as a means of development of the economy is a positive trend, however, the state should not participate in this process alone, but also encourage the private sector (Strategic Road Map for the Development of National Economy, p. 85). Diversification and the creation of a favorable investment climate in agriculture is another significant step in expanding economic growth because as an important part of non-oil industry agriculture contributes to its dynamic growth. The relatively underdeveloped infrastructure is the main cause of slow growth rate of agriculture in Azerbaijan. By stimulating the production and introducing new machinery and equipment, the the gross output of agriculture was increased by 25.1 percent in 2011-2012, and totaled to 5.63 billion manats in 2016. Livestock accounted for 54.2 percent, and crop products to 45.8%. Efficient use of existing lands and utilization of new ones as well as creation of large farms and aquaparks are important prerequisites for conomic growth in this area. The establishment of industrial sites processing natural resources and agricultural products as well as the access to foreign markets will not only control the demand for such products like grains, crops and livestock but also strengthen national food security thus creating conditions for socio-economic development of the country. As outlined in the Strategic Roadmap, reducing import dependence of production areas and expansion their export potential, another factor impacting economic growth, will ensure the country's economy is fully integrated into the global market. The poor diversification of export and its heavy dependence on raw materials, necessitates the production of competitive non-oil products, the main driving force of economic growth. According to the data of the last year, the foreign trade turnover of the country amounted to \$ 26534.3 million, of which export and import accounted for \$17281.7 and \$ 9252.6 million respectively (<https://www.stat.gov.az/news/macroeconomy.php?page=>). Infrastructure network, its complex structure and condition are significant factors affecting the economic growth rate. Socio-economic development of the regions plays an important role in this process. Following the measures and state programs implemented to strengthen the socioeconomic development of the regions, the infrastructure of the country has been condiserably developed in the recent years. As non-oil industry is becoming a major factor in expanding the economic growth through introduction of innovative and efficient measures and majority of non-oil sector sites

operate in different regions of the country, socio-economic development of the regions has become one of the most pressing problems in recent years. According to the President Ilham Aliyev, the comprehensive and sustainable development of the country is tightly linked with the development of regions.

3. ROLE OF REGIONAL DEVELOPMENT IN ECONOMIC GROWTH

3.1. Regional development and policy

Despite the strategic location of Azerbaijan and its rich natural resources, each region has differing economic and geographical position, climate and natural resources, population resettlement, field and territorial structure, historical development characteristics, and population income. And it is very normal. Territorial structures represent a large number of enterprises located throughout the country, and the diversification of production areas are not always present. The existence of resources, historical traditions, strategic and geopolitical objectives of the state, entrepreneurial activity and other factors can affect these disparities. In some regions, for example, mechanical engineering dominates the other sectors, in others mining industry is leading and so. Likewise, in the regional territorial structure, region's climate, natural and human potential, entrepreneurship opportunities and investment attractiveness are the factors affecting the formation of specific industry in the region. Along with Baku, Sumgayit, Ganja and Dashkasan, we can name Ali-Bayramli, Salyan, Mingachevir, Yevlakh, Goychay, Nakhchivan, Sheki, Lankaran and Khachmaz as the main industrial centers. Obstacles, and risks hindering the development of regions, as well as the significant disparities between them derive from each region's specific characteristics and can negatively impact the region's economic security. Therefore, it is necessary to implement a regional policy to prevent these obstacles and risks on time and to gradually minimize the disparities. Additionally, the discovery of other potential natural resources besides oil and gas, effective use of these resources as well as the detection of factors that affect or hinder the economic turnover are directions of the state's regional policy. After the independence, countrywide economic oil dependence and the lack of regional policies, plans and programs resulted in even more increased regional disparities. The share of the capital city Baku in GDP production reached to 76.9% compared to 23.1% that of the regions. Moreover, the centralization of most industrial, infrastructure, production and service areas, including oil and gas industry, in Baku and around it, have also affected the unequal development of the regions. In recent years, 52 out of 72 regions have experienced economic growth while the economy of the remaining 20 regions continued to decline. Economic growth in top 10 regions was increased by 2.2-2 times. Placement of separate production sites close to the raw materials and proportionate deployment and use of productive forces create favorable conditions for socio-economic development of the regions and are considered as successful measures in regional policy implementation. Also, the development experience of industrial countries indicate that by investing in underdeveloped regions, granting subsidies and aids, and allocating special development funds, the governments can eliminate the regional disparity. Additionally, introducing other economic measures such as preferential tax rate or exemption from taxes, interest-free or low-interest loans, debt repayment, will expand production capacities in the regions and increase export potential. During the last 15 years, tax revenues in Azerbaijan went up by 14 times, same as the non-oil revenues (14 times), while regions's tax revenues increased by 14.8 times. The number of taxpayers went up six fold. By 2017, taxpayers have paid 6 billion 971 million 679.6 thousand AZN to the state budget. (The regulations of tax debts of taxpayers existing on January 1, 2017) Likewise, utilization of scientific and technical potential of each region in connection with the city or region's profile, transfer of unsuitable enterprises to the other regions of the country are also effective measures. For example, transfer of activities of new enterprises and facilities in major industrial centers like Baku, Ganja and Sumgayit to other regions can reduce the existing

disparities between the regions. The regional policy of each country addresses the problem of regional disparity, taking into account the realities and circumstances of that country in a specific time period. For example, Russian government uses special economic zones to develop northern regions, whereas development of provinces is more important in Turkey's regional development program. The European Union, a major regional organization, implements the Economic and Social Cohesion policy towards countries included in this organization (Mehdiyev, R. 2018, p 23). Furthermore, regional policy also addresses social issues such creation of equal conditions for and decent living standards for population and reduction of internal social tension in the regions. One of the most important components of social policy is the employment of the population, in other words, the employed population participates in solution of some social problems because the higher the employment, the more funds can be allocated to welfare, unemployment, retirement and veterans funds. Employment also prevents the internal migration of population (from villages to the city) and helps to reduce the emigration. The recent government programs intended to accelerate the socioeconomic development of regions contributes to creation of new competitive and labor intensive manufacturing facilities thus increasing the domestic production and ensuring the balanced development of the regions. As a result of these programs, 1.5 million jobs, of which 1 million is permanent, have been created, in the country. The number of officially unemployed people was 33 thousand. Furthermore, 221 thousand new jobs (177 thousand of them permanent) were created in 2017. According to the macroeconomic indicators of the country's economic and social development, the nominal income of the population reached to 47,368.8 million AZN in January-August of 2018. Per capita income amounted to 4825.3 million AZN while the average monthly salary became 540 manats in this time period (<https://www.stat.gov.az/news/macroeconomy.php?page=>). To summarize, the increased employment of population contributes to the rise in income and the expansion of production of high quality products and services, which consequently strengthens the economic growth rate.

3.2. Main directions of socioeconomic development of regions

With the establishment of market economy, a regional policy, the First State Program on socioeconomic development of the regions of the Republic of Azerbaijan for 2004-2008, was launched to improve the socioeconomic situation in the regions. The First Program aimed to expand production of reusable and low-cost goods and services through processing internal resources, improve the economic performance and activity of production facilities, control the supply and demand by encouraging local entrepreneurship, increase the employment by creation of new jobs, and improve the infrastructure by attracting investments in the regions. The Second State Program (2009-2013) allocated annual oil revenue funds (billions of AZN) to projects in the regions, which served as the driving force for the restructuring and development of infrastructure in the regions. In total, 14.5 billion manat was invested in the implementation of the program over the course of 4 years. As a result of the policy, key problems, such as creation of the entrepreneurship environment in the country, sustainable development of non-oil sector, expansion of regional socioinfrastructure, job creation and employment, attraction of investments, and poverty reduction have been also addressed. Overall, the socioeconomic development policy has resulted in rapid growth of regional macroeconomic indicators over the past ten years. In particular, GDP and GDP per capita increased 3.2 and 2.8 times respectively. Non-oil GDP growth went up by 2.6 times, and average annual economic growth equaled to 12.9 percent. Strategic currency reserves increased 31 times, foreign trade turnover 6.6 times, export 9.3 times, import 4.1 times, non-oil exports 4.7 times. The latest state program, the Third State Program on Regional Development (2014-2018), also identified the regional development priorities, and carried on complex measures to diversify the economy, improve social services and infrastructure in rural areas and develop the

non-oil sector. By utilizing the existing potential, new processing facilities have been created, the social infrastructure has been improved, health, science, education, sports and cultural facilities have been reconstructed and modernized. Foreign and political factors and situation around the country necessitated the participation in regional and international projects. To secure the regional policy and ensure long-run sustainable growth of country, Azerbaijan signed the major international contracts for Baku-Tbilisi-Ceyhan oil pipeline, Baku-Tbilisi-Erzurum Oil and Gas Pipeline, Southern Gas Corridor, Baku-Tbilisi-Kars Railway, Baku (Alya) Sea Trade Port (transportation of cargoes from Asia to Europe), Shahdeniz-2 and other. Another initiative, the "State Program on Industrial Development of Republic of Azerbaijan for 2015-2020" equally emphasizes the importance and development of industrial policy as integral part of regional development program. The program also stresses the importance of modernization and development of chemical industry (non-oil), expansion of export potential, improving the competitiveness of manufacturing products, expansion of production of high-tech and innovative products, creation of high-quality and environmentally friendly food products and other measures in ensuring the economic growth of country. Additionally, multifaceted facilities like Sumgait Industrial Park (chemical products, etc.), Mingachevir Industrial Park (light industry products, etc.), Garadagh Industrial Park (shipbuilding and machinery, etc.), Balakhani Industrial Park (waste management), Pirallahi Industrial Park, Neftchala Industrial District (furniture, construction products, agricultural products processing, etc.), Hajigabul Industrial Park (waggon, car spare parts, etc.), Masalli Industrial Park (furniture, construction materials production, etc.), contributes to a steady increase in non-oil sector and development of major innovative industry areas. Industrial parks and districts are crucial in strengthening economic potential, creation of new production areas, introduction of structural change as well as of increase of employment opportunities (Mehdiyev, 2018, page 15). In summary, the Third Regional State Program has been instrumental in increasing the internal and external investment in the non-oil economy, creation of industrial parks and competitive, export-oriented production sites, improvement of business environment, expansion of the new businesses and jobs, and creation of infrastructure projects. Investments in the regions amounted to 70 billion manat in this time period. In 2018, 20 billion AZN was invested in Azerbaijan's economy, of which the non-oil sector accounted for 15.7 billion AZN. This investments significantly contributes to the economic growth of the regions as the number of new enterprises in the regions grows every year. For example, in 2017, production output was 56 million AZN in Baku, followed by 23 million AZN in Absheron economic region, 6,4 million AZN in Aran, 3.4 million AZN in Nakhchivan Economic Region, 3 million AZN in Ganja-Gazakh, 1.8 million in Lankaran, 1.6 million in Guba-Khachmaz, 1.5 million in Sheki-Zagatala, 73,000 AZN in Kalbajar-Lachin 59,000 AZN in Upper Karabakh, and 7,900 AZN in Mountainous Shirvan. In all the government programs, including "Azerbaijan 2020: Future Development Concept" and Strategic Roadmap, adopted in 2012, the development of export-oriented, competitive, areas with added value products as well as sustainable expansion of high-tech and non-oil industry have been adopted as the main directions of economic growth. The next stage is to develop regional infrastructure by establishing regional development centers, based on competitive advantages of each region. The Strategic Roadmap identifies the development of labor-intensive sites in regions as a new source of growth as labor costs in the regions are relatively lower compared to those of capital city. However, the training of highly qualified personnel and their productivity is a prerequisite. Continuous socioeconomic development of the regions depends on innovation-based economy. The increasing use of scientific and technological innovations, the predominance of high-tech areas, and the expanded production of innovative products and services play a significant role in regional development policy. Development of region is not only defined by its geographical position or natural resources, but also by the quality of governance.

It is, therefore, recommended to use modern regional management methods in the governance of regions (Nuriyev, 2007, p 427). An extensive research on regional marketing as well as the analysis of economics, the condition of products and services produced in the specific region should be conducted in preparation of The Regional Development Program (Huseynova, 2010, p. 224). Entrepreneurship plays an important role in regional economic development policy. Consequently, the cost of entrepreneurial projects in Azerbaijan amounted to 4.4 million AZN in 2003-2017. 34,553 entrepreneurs received 2.1 million AZN of preferential loans, 71.6% of which was invested to the development of agrarian industry and 28.4 percent to other entrepreneurial activity. Since the regional development is regarded as a non-oil industry growth, sustainability of this process, and creation of favorable conditions for entrepreneurial activity, doesn't burden the state budget, instead, increases the role of the private sector. The presence of entrepreneurial activity in a specific region is largely dependent on the investment activity which differs from region to region. Investment activity is the intensification of investment accumulation into the main capital of the region. Investing in imports (wheat, butter, mineral waters, rice, potatoes, medicines, cigarettes, knitwear, detergents, fertilizers, etc.), as well as tax cuts and preferential loans provides favorable conditions for the economic growth. Likewise, agriculture plays crucial role in the implementation of the regional development program. Currently, agriculture produces 5.6% of GDP, 47% of the country's population lives in rural areas and 36.3% of the labor force is employed in agriculture. However, the lack of irrigation systems and infrastructure required for livestock and agriculture is slowing down the development of these areas. In general, the restoration and construction of necessary infrastructure in the regions is being financed primarily by state funds. Nowadays, 43 agroparks, including 27 crop and 16 livestock farms operating in 28 regions play a major role in addressing food security in the country. Balanced development of regions also depends on the development of agrarian-industrial facilities in the regions. Strategic objective of every agrarian industrial facility should be the production of high-quality agricultural and food products, export of these products to the world market, and the expansion of competitive agrarian industrial products under the brand name "Made in Azerbaijan". Development and expansion of foods and areas like tomatoes, fruits, cotton, cereals, nuts, plants, viticulture, olive cultivation, beekeeping, tea making and others will bring extra cash to the country's economy, and contribute to the economic growth. Likewise, other production facilities operating in the regions, such as canning, cotton processing plants, tobacco processing, grape and livestock production that primarily rely on local resources, can also lead to economic growth in the regions. At present, the establishment of logistics centers for procurement, purchase and sale of agricultural products (for example, in Shamkir) implements these tasks. Business Support for Family Business (ABAD), a program to support and encourage family businesses (farmers) to get access to local and foreign markets equipped with modern methods is aimed to increase the competitiveness of agricultural products and their export potential. Construction of drinking water and sanitation systems and gasification of regions with major infrastructure systems leads to improvement of social welfare of the population. Innovations in road infrastructure opens opportunities for tourism development. For example, Shahdag complex, Tufandag ski resort, Naftalan international tourism center, Nakhchivan tourist complex, five star hotels and etc. increases the country's economic potential. (<http://medeniyyet.az/page/news/18396/Azərbaycanın-iqtisadi-potensialinin-gücləndirilməsində-regionların-inkisaf-proqramları.html>)

4. CONCLUSION

Recent global economic downturn followed by the decline in growth rate of national economies has shifted the main focus to the discovery of the most effective ways of the utilization of natural resources and economic potential. In 2015, the decline in the currency reserves and limited financial resources necessitated the switch from capital accumulation economy to non-

capital accumulation. Sustainable development of non-oil sector became mandatory. Since non-oil industry is becoming a major factor in expanding the economic growth through introduction of innovative and efficient measures and majority of non-oil sector sites operate in different regions of the country, socio-economic development of the regions has become one of the most pressing problems in recent years. Placement of separate production sites close to the raw materials and proportionate deployment and use of productive forces create favorable conditions for socio-economic development of the regions and are considered as successful measures in regional policy implementation. Likewise, utilization of scientific and technical potential of each region in connection with the city or region's profile, transfer of unsuitable enterprises to the other regions of the country are also effective measures. Furthermore, regional policy also addresses some social issues like creation of equal conditions for and decent living standards for population and reduction of internal social tension in the regions. As part of overall socioeconomic national strategy, regional policies aim to expand regional growth by reducing the disparities between the regions and ensuring sustainable and balanced economic growth. The Strategic Roadmap identifies the development of labor-intensive sites in regions as a new source of growth as labor costs in the regions are relatively lower compared to those of capital city. However, the training of high qualified personnel and their productivity is a prerequisite. Strategic objective of every agrarian industrial facility should be the production of high-quality agricultural and food products, export of these products to the world market, and the expansion of competitive agrarian industrial products under the brand name "Made in Azerbaijan"

ABSTRACT

Algorithmic sequence on preparation and implementation of agricultural development Master Plan for administrative rayon comprises the followings: a) preparation of the agricultural development strategic plan; b) identification of agricultural reform model; c) support or creation of the inclusive development potential; d) risk preclusion, mitigation or management; e) formation of principles of internal relations for sustainable development ensuring; f) cluster formation as institutional step for inclusive development ensuring; g) mapping of land use and consolidation plans and crop rotation schemes; h) identification of yield/productivity increase and efficient resource utilization ways. Such approach could increase welfare of rural population and productive resource utilization.

Keywords: *agriculture, cluster, inclusive development, reform, strategic plan, sustainable development*

1. INTRODUCTION

Agricultural reforms had long history and low success rates. Final conclusion on success rate of reforms could be expressed after decades only. It is a specific feature of agrarian reforms. Major important issue of reforming is existence of the Sustainable and Inclusive Master Plan (SIMPL) for identified (or known) land plots, settlements, farmers and families. The proposed approach considers agriculture and rural population as integrated system which requires long-term goals establishment and following. Annual changes of targets, crops, production plans, etc. resulting indifferent situation and losses for farmers and economy. To avoid all possible negative consequences one shall follow.

2. STEP 1 - ANALYSIS OF RESULTS OF PREVIOUS REFORMS, PROJECTS AND IMPLEMENTED MEASURES

The first stage requires wide analysis of the reasons of previous failures. That is why cost on resources, level of planned and actual results shall be analyzed and processes and current

situation shall be carefully estimated. Major resources of agriculture – land, water, energy, animals and staff qualified has to be measured/estimated to have a reliable data for strategic planning. All possible directions of productive and social investments shall be reviewed and estimated.

3. STEP 2 – MODEL DEVELOPMENT FOR PREDICTING ACTIVITY

We had developed cluster planning, agricultural production and employment as well as demographic prediction models for 2 regions of Azerbaijan. All 3 models are interconnected and could be expanded for further research and planning purposes. Major results of modelling stage are:

- Evaluation of different scenarios on economic and social development of the territory;
- Estimation of carrying capacity of each territory and demand on non-agricultural jobs;
- Development of the criteria and inclusive development targets based on available resources;
- Request on central government support;
- Other policies and projects to support rural families and farmers.

4. STEP 3 – CLASSIFICATION AND RESTRUCTURING

Resources, operations and activities shall be classified. In Azerbaijan first of all actual types of growers, investors, agricultural workers and service providers shall be recognized as an object of agricultural policy. The following groups of agricultural activity are existing today:

- Farmers;
- Investors;
- Service providers;
- Workers;
- Managers.

Each of these groups are the subject of separate policy and incentives. Other important direction of classification is ecosystem approach to settlement grouping and territory planning. We shall differ natural ecosystem and adjust all human activities to protect nature and ecosystem services. All activities of agricultural groups, communities and settlements population shall be planned around selected development centers by a way of minimum hazards and risks for ecosystem services and protected areas.

5. STEP 4 – RESOURCE EXPANSION AND UTILIZATION

SIMPL shall cover all resource development and utilization options. Major resources of agricultural development – land improvement, water, energy, thoroughbred animals and seed-growing facilities, staff qualified, watering systems, greenhouses, etc. shall be estimated and related investment policy implemented. Having resources, facilities and staff gives a possibility to select best technology and profitable business for subject territory and population. Such directions include crop rotation, technological and economic support by other interested groups and the Government, land productivity increase, etc. All available resources shall be used by the best manner. In addition to modern technologies we shall create the system of internal relations stimulating development and productive use of resources.

6. STEP 5 – INCLUSIVITY AS A CORNERSTONE OF AGRICULTURAL ACTIVITY

Agricultural reforms shall create new attitude to farmers and their families as a part of ecosystem. Accordingly, farmers and their families shall be entitled to cover individual demands in food, consumer goods and services at certain level. At the same time, farmers and their families shall do intrinsic actions related to agriculture only. Activities like financing, borrowing, predicting, planning, technology selection, supply, marketing, trading, insurance,

etc. are function of big farms or specialized consultancy companies and extension services.

7. STEP 6 – THE SUSTAINABLE AND INCLUSIVE MASTER PLAN (SIMPL)

SIMPL shall take into consideration all above requirements and propose Cluster initiative. Cluster shall join input suppliers, traders, processing industry, research centers, financial institutions, NGO and Government representatives to support farmers and families in certain area to realize the above goals.

8. CONSLUSION

Schematically described sequence of major stages is conditional and for illustration purposes only. Indeed such strategy development involves high-level experts and research centers. The major target of experts shall be optimal land use and animals breeding technologies. Correctly selected technology will produce high quality food and raw material which is a guarantee of stable market demand and profitability. The Government shall take care on activity of clusters formed, risk preclusion, mitigation or management. Such approach could increase welfare of rural population and productive resource utilization.

ABSTRACT

The purpose of the study is to determine the conceptual foundations and approaches to the strategy of spatial development of the region based on the principles of "smart specialization" considering the specifics of the resource potential and geo-economic situation. The scientific novelty of the research is connected with the development of conceptual and categorical apparatus of regional and spatial economy in the form of the author's extended interpretation, hierarchy and systematization of such concepts as "region", "space", "territory", "spatial potential of the territory", "spatial development of the region", "strategy of spatial development", "smart specialization". In the process of comparative research using the method of "tag cloud" content analysis of strategic documents of the regional level of the European Union and some regions of the Russian Federation, in the context of their application of various forms of spatial organization of the economy and the principles of "smart specialization" was carried out. It is established that various forms of spatial organization of the economy and the principles of "smart specialization" are implemented by Russian regional authorities sporadically, fragmentary and unsystematic, which adversely affects the spatial development and leads to a lack of formation and implementation of the unique competitive advantages of the territories. The results of the study can be used in the development and updating of strategic policy documents at the regional and municipal level, including the mobilization of internal resources of the regions, the formation and implementation of strategies for socio-economic, innovative and spatial development and network interaction of the regions.

Keywords: *Macroregion, Smart Specialization, Spatial Development, Strategizing*

1. INTRODUCTION

Strategizing of spatial development (as a set of conceptualization, forecasting, strategic staging, modeling, planning, design, programming, implementation and control) is a relatively new direction in the research of problems of regional policy formation, which was developed in the mid-90s of the twentieth century (Bandman, 1977; Bukhvald, Valentik, 2016; Glazychev, 2008; Granberg, Suspitsyn, Minakir et al., 2011; Kleiner, 2011; Kotlyakov et al., 2013; Zhikharevich, Pribyshin, 2014). This was due to the need to develop completely new methods and tools to manage the potential of the regions in the conditions of transformation of the economic space

in the globalization period. However, despite the existing experience of regional strategizing, many fundamental issues remain unresolved. In the context of the economic and spatial development paradigm, regions become fragments of the economic space, where, in the context of globalization and increasing competition for strategic resources and investments, international, national and regional interests are focused and collide. The process of polarization and disintegration of the economic space is growing due to the uneven distribution and concentration of economic activity at the local, subnational, country and international levels. The strategic challenges of the "new regionalization" require the development of a systematic methodology for strategic spatial development of territories, taking into account state priorities, macro-regional and interregional contexts, types of multiculturalism and prospects for the rational use of the unique internal potential of the regions.

2. TERRITORY, REGION, SPACE: EVOLUTION AND TRINITY OF CATEGORIES AND APPROACHES

The influence of the spatial factor on regional development was studied by representatives of different scientific directions (Boudeville, 1966; Enright, 1993; Glazychev, 2008; Granberg, Suspitsyn, Minakir et al., 2011; Hoover, 1971; Isard, 1960; Myrdal, 1957; Richardson, 1969; Tinbergen, 1967) and passed a long way of evolution (Figure 1).

Figure 1: Evolution of Approaches and Categories in the Research of regional development

The research of above-mentioned works in a retrospective allows to claim that for economists of the 19th century not the economic space, and, mainly, the territory as the limited part of the land surface with natural and anthropogenic properties and resources was subject of the analysis (geographical approach). Flourishing at the beginning of the 20th century the theory of economic zoning and the formation of national systems of administrative-territorial and economic zoning concentrated research on the category of "region" or "district" as a territory with different specialization and features of the complex development of the economy, a peculiar geographical location, natural and human resources, which boundaries are defined in the administrative order (regional approach). At the turn of 1980-1990, attention was clearly focused on the category of "economic space". This is due to the filling and saturation of the territory with the development of various objects (settlements, industrial enterprises, transport and engineering structures), strengthening, deepening and complication of the relationship between them, the emergence of prerequisites and opportunities to manage their development (spatial approach).

3. "SMART SPECIALIZATION" IN SPATIAL DEVELOPMENT STRATEGY

3.1. Genesis and Evolution of the Concept of "Smart Specialization"

The concept of "smart specialization" was drafted by an expert group of the European Commission "Knowledge for Growth" (Foray, David and Hall, 2009) as a strategy of innovative development of regions, suggesting the most efficient use of their features and the development of competitive advantages. In the future, as an element of innovative and spatial development, it was developed in a number of works (Barca, 2009; Barca, McCann, 2011; Boschma, 2014;

Coffano, Foray, 2014; Foray, 2015; Karayannis, Grigorudis, 2016; Kutsenko, Alenkina, Kendras, 2018; McCann, 2015; McCann, Ortega-Argilés, 2013; McCann, Ortega-Argilés, 2014; OECD, 2013). These works contain the substantiation of such distinctive features of "smart specialization" as:

- use of implicit knowledge and local competencies to select development priorities;
- evidence through quantitative indicators, building on a broad empirical base;
- principles of diversification, related diversity and strong interdisciplinary connections;
- identification of global technology trends in current and potential regional specializations;
- broad understanding of social and service innovations, including in medium- and low-tech industries;
- search for the region's place in the global value chain, analysis of structurally similar territories and subsequent benchmarking;
- assessment of the potential of interregional cooperation, taking into account the relationship of smart specializations of different regions.

The legal basis for the definition of "smart specialisation" is Regulation of the European parliament and of the council of 17 December 2013 no 1303/2013, where "'smart specialisation strategy" means the national or regional innovation strategies which set priorities in order to build competitive advantage by developing and matching research and innovation own strengths to business needs in order to address emerging opportunities and market developments in a coherent manner, while avoiding duplication and fragmentation of efforts" (European Parliament, 2013). In May 2012, the European Commission developed Guide on research and innovation strategies for smart specialization (European Parliament, 2012). The Guide sets out the main activities that provide guidance for the development of research and innovation according to the strategy of "smart specialization" (RIS3). The Guide consists of six practical steps:

- analysis of innovation potential;
- initiation and management of the RIS3 process;
- development of a common vision for the future of the region;
- identification of a limited number of priorities;
- definition of the relevant "mix" of state policy, development of the road map;
- monitoring and evaluation of the implementation of regional strategies.

Thus, "smart specialization" provides for the distribution of functions by levels of management. At the (above)national level, the general conditions for the development and implementation of strategies, verification of priorities are set, common databases for analytical comparisons are formed. At the regional level, direct selection of priorities for innovation development is carried out, the development of strategies and their implementation, and corresponding coordination structures are created.

3.2. Implementation of the Concept of "Smart Specialization" in the Strategy of Spatial Development

Directions and priorities of development and implementation of the spatial potential of the territories are reflected in the regulatory and legal policy documents, both at the level of integration associations (European Perspective of Spatial Development, the Fundamental Principles of Sustainable Spatial Development of the European Continent, the Territorial Agenda of the European Union until 2020, the Scenario of Spatial Development of the European Union until 2050), states (the Concept of Development "Azerbaijan 2020: a Look into the Future", the Forecast Scheme of Territorial and Spatial Development of Kazakhstan

until 2020., Strategy of Socio-economic Development of the Russian Federation until 2020; Strategy of Spatial Development of the Russian Federation until 2025; Strategy of Innovative Development of the Russian Federation until 2020; State Program of the Russian Federation "Economic Development and Innovative Economy" until 2020), and at the level of administrative-territorial entities. We conducted a content analysis of the strategic documents of socio-economic development of the regions of the Central Federal District of the Russian Federation for compliance with the generalized features of "smart specialization" (Kutsenko, Alenkina, Kendras, 2018) using the "tag cloud" method (Table 1).

Table 1: The Results of Content Analysis of Strategic Documents of Regional Development of the Central Federal District

Region	Principles of "smart specialization"						
	Use of unique competitive advantages of the region	Validity of the chosen specialization	The choice of cross-sectoral priorities	A broad view of innovation	Focus on future markets and technologies	Accounting of strengths and specializations of other regions, including abroad	Synchronization between different levels of management
Belgorod region	+	+	-	-	-	-	+
Bryansk region	+	+	-	-	-	+	+
Vladimir region	+	+	-	-	-	+	+
Voronezh region	+	-	-	-	-	-	+
Ivanovo region	+	+	-	+	-	+	+
Kaluga region	+	+	+	+	+	+	-
Kostroma region	+	+	-	-	-	-	+
Kursk region	+	+	-	-	-	+	+
Lipetsk region	+	+	-	+	-	-	+
Moscow region	+	+	+	+	+	+	-
Orel region	+	+	-	-	-	+	+
Ryazan region	+	+	+	+	+	+	-
Smolensk region	+	+	-	-	-	-	+
Tambov region	+	+	-	-	-	+	+
Tver region	+	+	-	+	-	+	+
Tula region	+	+	+	+	+	+	-
Yaroslavl region	+	+	-	-	-	-	+
Moscow city	+	+	+	+	+	+	-

The results of the analysis showed that the recently developed strategies of regional development until 2035 (Kaluga region, Moscow region, Ryazan region, Tula region, Moscow city) are sufficiently consistent with the principles of "smart specialization", especially in

relation to the development of municipalities. At the same time, the strategic documents of other regions contain significant shortcomings:

- single-industry specialization instead of identification and selection of promising interdisciplinary and cross-sectoral priorities;
- interregional competition instead of interregional cooperation within the framework of national and global competition;
- focus on existing specialization instead of searching for emerging fast-growing promising industries (key enabling technologies);
- lack of synchronization between different levels of management due to the lack of a common methodological and regulatory framework;
- prioritization of the specialization “from above” instead of activating the initiative “from below” through entrepreneurial search;
- duplication of competencies and priorities instead of complementarity and synergy.

In addition to creating a common methodological and regulatory framework in order to promote the countries and regions of the EU in the development, implementation and review of the selected priorities of the strategy of "smart specialization" (RIS3) in 2011, Institute for Prospective Technological Studies (IPTS) has created Smart Specialisation Platform (S3). The tools of Smart Specialisation Platform are:

- Eye@RIS3 is online database of RIS3 priorities. The database is a map and contains information about the priorities of the regions. The purpose of the database is to give an overview of the selected priorities to find unique niches and potential partners for cooperation. The database contains 4 headings: general description, existing opportunities of the region, target markets and sectoral priorities at the EU level;
- ESIF-viewer is a tool to search for planned investments of European structural and investment funds;
- ICT Monitoring is a tool to search for planned investments of European structural and investment funds in the field of information and communication technologies;
- Regional Benchmarking – an interactive tool to identify structurally similar regions across Europe;
- EU Trade is fully interactive web-application for visualization and analysis of interregional trade flows and competitive positions of regions in Europe. The purpose of this tool is to assess regional assets and analyze the economic situation of the region as a fundamental step in the construction of the "smart specialization" strategy;
- R&I Regional Viewer is a tool that allows you to visualize and compare research and innovation investments across different funding channels and EU programs across EU regions.

In our opinion, in the Russian Federation, and possibly in the Eurasian Economic Union EAEU, such a comprehensive ICT tool is also necessary to provide an opportunity to obtain information, methodology, expertise and advice from national and regional policy makers, promotes mutual learning and international cooperation and to help regions to choose a cluster specialization by comparing their own capabilities with those of other territories, assessing their own competitiveness, determining target markets and industry priorities.

4. CONCLUSION

In the conditions of strengthening of economic integration and simultaneous increase of global challenges and threats new methodological approaches to a strategirovaniye of spatial development of territories on the basis of the concept of "smart specialization" are necessary.

Systematic purposeful application of the concept of "smart specialization" will help to ensure the transition to a network cluster model, the creation of new spatial formations of interdisciplinary and inter-sectoral nature, the formation of interregional areas of integrated sectors of the "new" and "traditional" economy, generating significant multiplicative effects and stimulating the competitiveness of the regional economy.

ABSTRACT

Research background: One of the main challenges on the job market is creating a so called employee market. A low unemployment rate and constantly decreasing number of people of productive age cause employers trouble in finding qualified workers and are faced with the challenge of creating solutions allowing subjects to recruit the right employees. This article is focused on the challenges that the Polish work environment is currently facing and possibilities that come with inflow of foreign labour.

Purpose of the article: The aim of this article is to examine the opinions of Polish employers in regards to hiring people from Ukraine and to try to answer whether the inflow of employees from beyond the eastern border can solve the problem of a lack of employees on the Polish job market. The research problem was examined by answering the following research questions: What is the readiness of Polish managers to hire citizens from Ukraine? What experience do Polish employers have in hiring citizens from Ukraine? What is the level of relations built between Polish and Ukrainian employees? What is the level of engagement and competence of Ukrainian workers?

Data and Methods: Quantitative research was carried out using the author's survey questionnaire. Research was directed at 600 responders with a response rate of 15%. During the interpretation of research tabular forms of data presentation, descriptive statistics and nonparametric statistics were used. The analysis was made using the statistical package STATISTICA.

Results and conclusions: Conducted research showed that one the factors contributing to the elimination of the lack of available labour is hiring employees from abroad, especially from Ukraine. Additionally it was found that in the case of hiring Ukrainian employees there were no significant mental or cultural differences.

Keywords: *employee market, unemployment, workers migrations*

1. INTRODUCTION

One of the main challenges facing the Polish labour market is the emergence of the so-called Employee Market. There is already a record low unemployment rate, and the ever falling number of people of productive age mean that employers are more and more often faced with difficulties in hiring qualified personnel and are faced with the challenge of creating solutions to help employers in Poland find the right personnel. One solution to the decreasing resources on the domestic labour market is the search for employees from foreign labour markets. This article focuses on the possibilities as well as the challenges linked to the hiring of Ukrainian employees.

The aim of our study was to research the opinion of Polish business owners on the hiring of Ukrainian citizens, and the presented results of the study are an attempt to diagnose the challenges in this area.

2. CAUSES OF MIGRATION - THEORETICAL BASIS

The movement of people is a wholly natural phenomenon and has existed since the beginning of time. Scientifically, one of the first researches to take up the topic of migration was E. G. Ravenstein who, in the 1880s, made an attempt to systemise empirical facts observed in data regarding migration. During his analysis of these statistical data, E. G. Ravenstein made several discoveries, including the inverse relationship of the size of the wave of migration and the distance covered by migrants, as well as the positive relationship between the intensity of migration and the rate of industrial advance, especially related to transport (Wojnowski, 2002, p. 407). This led him to formulate the "laws of migration" in which he proved that the most significant factors contributing to the movement of people are economic factors. (Kuciński, 2004, p.9). For a long time individuals as well as whole groups have migrated in search of not only better living conditions, but also safety and refuge from armed conflict, persecution and natural disasters (Walaszak, 2003, p.13). Over the years migration has taken on an international character – as an example, the fall of the USSR, Yugoslavia and Czechoslovakia and armed conflicts in Chechnya and Georgia at the end of the 20th century, as well as the armed conflict in Ukraine in the 21st century, brought about the movement of large groups of people. Currently, the most popular reason for leaving one's country is the search for a safe place to live and the building of a future in richer countries.

3. CHALLENGES FACED BY THE DOMESTIC LABOUR MARKET

Poland's entry into the European Union had a far-reaching effect on domestic labour resources. It allowed for the free movement of people over territories of its member states, and as such, many people took the decision to leave their country (Kowalska, 2013, pp. 123-146; Kaczmarczyk, Mioduszevska, Żylicz, 2010, pp. 219-253). The EU directive on the free movement of human capital guaranteed migrants the same rights as domestic citizens. The liberalisation of laws regarding foreigners and a difficult political and economic climate led to a rise in migration (Dykas, Misiak, 2014, pp.57-80; Wozniak-Jechorek, 2015, pp.129-151; Perło, 2015, pp.109-117). This opened the way for migrants to gain employment, promotions, security, continued migration or a return to their home country. For this reason, Polish citizens tend to emigrate abroad in search of more beneficial financial conditions. The Central Statistical Office estimates that over 2.5 million Polish citizens live abroad. The largest groups of Polish citizens can be found in the UK (685 000), Germany (614 000), Ireland (113 000) and The Netherlands (109 000) (www.wyborcza.pl). The direction and scale of migration is dependent on factors including the ability to find employment and the wage offered. Additionally, large differences in the development of living standards in Western and Eastern Europe force people to make decisions on migration. Aside from this, technological advances contribute to the reduction of existing jobs and the creation of new jobs requiring a different skill set. Such a change in qualifications or a high level of qualifications has proven to be attainable for young people. Salaries offered are, however, not in line with the financial expectations of the younger generation. As such, young, highly qualified individuals emigrate in order to find employment - often less prestigious and unrelated to their field of study, but with a much higher salary (Dębkowska, Godlewska, Olszewska, Tomaszuk, Tomaszewska, 2017; Klimek, 2016). For Poland this means a loss of young, qualified people - the so-called brain drain. Older people, however, are often unwilling or unable to meet the challenge of changing their qualifications and starting a job in an area they are unfamiliar with. At the same time, the number of old people in society is ever increasing.

The proportion of people ages 50-74 in the age group 15-74 will increase in Poland from 37% in 2012 to 43% in 2013 and 50% in 2050, after which there is predicted to be a slight decrease to 46% in 2060. This change in composition of the workforce creates a range of challenges which are essential to soften the transition to an economy that makes more use of the potential of older employees, i.e. the so-called silver economy (Sobolewska-Poniedziałek, Niewiadomska, 2016, pp.73-92; Galecka-Burdziak, 2012, pp.109-126). Another element weakening human capital is a demographic dip. Women in Poland are giving birth to fewer and fewer children, and according to CSO statistics the population of Poland will have reached 35 993 069 by 2035. While the CSO does not have estimates for further years, international institutions do possess such estimates. According to Eurostat, the population of Poland will have decreased to 33 million by 2050. Neither is the UN's estimate optimistic. Halfway through the 20th century the population will fall to 32 million - in comparison to the current state this is a loss of 16% of its population. During this time the population of the European Union as a whole will rise, largely as a result of an influx of immigrants. Alongside Romania, Bulgaria and Slovakia, Poland will be one of the countries with the most rapidly decreasing populations (Gadomski, 2012). The most recent population estimate for Poland forecasts that as a result of changes in the intensity of births and deaths and as a result of definitive migration, the population of Poland in 2035 will be almost 36 million (Kostrzewa, Szałtys, 2009, p. 67). The CSO also draws attention to the fact that 2016 was the fifth year in a row which saw a decrease in the population of Poland, after a previous increase during the years 2008-2011. According to the CSO, such a situation can have two causes: the population decrease in 2016 was either caused by negative natural population growth – 6 000 fewer births than deaths were registered and, in addition to this, foreign definitive migration (indefinite leave to remain) was additive in 2016 and amounted to 1500 (Demografia w Polsce w 2016, 2017). Emigrants are mainly aged 20-34 (over 47% of emigrants are in this age group) – young people who want to start a family overseas. In 2017 the largest migrant groups were men aged 20-25 and women aged 25-29. The most recent estimates for the population of Poland forecast that as a result of changes in intensity of births and deaths and as a result of definitive migration, the population of Poland in 2035 will be almost 36 million (Kostrzewa, Szałtys, 2009, p. 67). The aforementioned situation generates an imbalance between the labour supply and the demand for employees on the Polish labour market. The fall in labour supply resulting from the aforementioned processes does not meet employers' demand for employees resulting from the increasing needs of society and the developing national economy (Kryńska, Kwiatkowski, 2013, p. 94). In the processing industry, 35.1% of firms (an increase of around 9% on the previous year) are in need of hiring qualified personnel. In general the demand in processing firms (without taking into account the required qualifications of personnel) rose from 13% in 2016 to 23.9% in 2017; trading companies also complain of a lack of employees - this problem is experienced by 24.4% of firms, in comparison to almost 15% in 2016 (www.rp.pl). The low labour supply forces employers to undertake actions aiming to find the required number of employees with the required qualifications for a given post. Therefore employers are forced to reach for foreign human capital.

4. THE INFLUX OF UKRAINIAN LABOUR FORCE IN POLAND

From the point of view of the Polish economy, Ukrainian citizens have the greatest immigration potential – this is as a result of the conflict with Russia as well as the neighbouring location with Poland, which is more economically developed. The political and military events that took place in June 2014 in the Donbass region have generated a greater number of foreigners entering Poland. Military actions brought about a rise in unemployment, a fall of 16% in GDP, a 50% rise in inflation and a devaluation of the national currency (hryvna) in the Ukraine, leading to an average monthly wage of 190 USD.

The war has harmed the national economy and those who live on the poverty line. The war has affected around 5 million people, of which over 10 000 have lost their lives (Ekspertyza ..., 2017, p. 10). Many Ukrainian men made the decision not to appear before the conscription panel, even though dodging military service carries a penalty of 2 to 5 years in prison (Pieniążek, 2017, p. 255). Flight abroad due to a fear of being drafted into the army initiates a wave of emigration, this is however not the only reason for the movement abroad of Ukrainians. Additional reasons for leaving the country are a lack of feeling of safety, persecution, lack of necessary assistance and indifference of other Ukrainian nationals living outside the easternmost regions, economic problems and joining family members already living in Poland. From January to November 2017, 60 517 foreigners were granted limited leave to remain, 644 were granted long-term resident status and 6920 were granted indefinite leave to remain. Limited leave to remain in connection with employment constituted 78% (Raport..., 2017, p. 9). Border traffic figures including traffic both leaving and entering the country in 2016 reached 20 million crossings over the Polish-Ukrainian border. Reasons for this include easy access to the labour market, cross-border trade and shopping trips as well as significantly lower costs of car registration. Visa-free travel opened the possibility of crossing the border for 235 000 Ukrainians. As stated by the Border Force, 2017 saw an increase of 12.9% in comparison to 2016. This is a result of Polish legislature which, in accordance with the relevant resolution of the European Parliament dated 6 April 2017, guaranteed citizens of Ukraine visa-free travel for tourism, business and family purposes - this excludes travel for the purposes of obtaining employment, however remains a great help for those Ukrainians who find themselves in a difficult political situation. In addition, new migration trends have appeared - the migration of young people and students, young specialists and business owners (Zniesienie ..., 2017, p.23). Poland is often a destination country for emigrants from the East because of its economic, political and social attractiveness. European Commission Data confirm that for emigrants from beyond the eastern border the country in which they can find employment and earn a higher wage is the UK, closely followed by Poland. In 2014 alone, 355 000 immigrants gained leave to remain in our country, most – as confirmed by the European Commission – a were from the Ukraine and Belarus, who choose Poland when searching for new sources of income (247 000 Ukrainians, 74 000 Belarusians, slightly over 6 000 Moldolviens, over 2 000 citizens of China and 654 Russians entered Poland) (www.money.pl). Currently in Poland, according to the press secretary in the Office for Foreigners, Ukrainians make up 31% of all immigrants entering Poland (www.superbiz.e.pl). Over the last three years, the number of foreigners in possession of valid residency documents for our country (including limited and indefinite leave to remain) has risen by almost 90 000 people (by 61%) – from 146 000 to 234 000, whilst bearing in mind these figures do not include those residing Poland on the basis of visas (www.udsc.gov.pl). This offers the opportunity for employers to employ citizens of Ukraine to fill the gap left by the increasing emigration of Poles. As a result of the proximity of Ukraine to Poland, employers engage in cooperation with citizens of this country in order to quickly fill the gap in labour supply and ensure the continuity of business. This process requires knowledge and is conditioned by complicated and constantly changing legal regulations due to Ukraine being outside of the European Union. Problems of a psychological nature are also common: adaptation and acculturation, cooperation (Tomaszук, 2018, pp. 237-248; Tomaszук, 2017, pp. 232-243; Wasiluk, Daniluk, 2013), historical and cultural bias (Szydło, 2018; Szydło, 2017, pp. 263-277), motivation, integration, stereotypes (Tomaszук, 2016, pp. 56-63; Moczydłowska, Szydło, 2016, pp. 203-222; Moczydłowska, Szydło, 2017, pp. 10-19) and language barriers.

5. CHALLENGES ASSOCIATED WITH EMPLOYMENT OF UKRAINIAN CITIZENS – ANALYSIS OF THE RESULTS

The research results presented below were aimed at diagnosing the challenges associated with employing Ukrainian citizens. The following research problems were formulated:

- What is the readiness of Polish managers to hire citizens from Ukraine?
- What experience do Polish employers have in the process of hiring Ukrainian citizens?
- What is the level of relations built between Polish and Ukrainian employees?
- What is the level of engagement and professional competence of Ukrainian employees?

The research was conducted in January 2018 by means of a questionnaire, which was carried out using the CAWI technique. The advantage of this technique is the fact that it can be applied to a large sample and in a short time, additionally the respondent feels anonymous, completes the questionnaire at any time and place, which provides him/her with the opportunity to freely answer questions (www.almares.com.pl/badania-ilosciowe). The research questionnaire was addressed to 600 employers or managers of Polish companies, that either employ or do not employ citizens of Ukraine¹. 92 full answers were obtained (response rate at the level of 15%). Table 1 includes the characteristics of basic information about the respondents and companies they represented.

*Table 1: Characteristics of the respondents
 (own study based on the research carried out by the authors)*

sex	Woman			man		
	39%			61%

	41%		20%		18%	

In the light of the conducted research it can be concluded that Polish employers and managers are ready to employ foreigners, provided that employees meet the qualifications requirements – 65% of respondents declared that in the organizations they manage they note the fact of employing Ukrainian citizens. While analyzing the current state of employment of the Ukrainians in Polish entities (Figure 1) one can notice a large openness in this area – 73% of respondents declared that in the sectors they represent the Ukrainians are employed, every third researched person employs or employed Ukrainian citizens in their own company.

Figure following on the next page

¹ Mailing list shared by INE PAN in Warsaw.

Figure 1: Employing Ukrainian workers on the Polish labor market
(own study based on the research carried out by the authors)

Reaching out to external sources, we can notice much lower declared willingness to employ Ukrainian citizens – only 39% of employers declared that "they think about employing workers from Ukraine", however there were big differences in respondents' declarations depending on the sector – the most open were production companies, slightly less – commercial ones and public sector organizations showed the lowest readiness in this aspect (www.workservice.pl). Perhaps this large discrepancy is caused by the difference in the size of human resources shortages in different markets – the largest staff shortages occur in production companies and the highest employee fluctuation occurs there. In our own studies, this type of dependence was not noticed, however the size of the sample excluded the implementation of advanced statistical analyzes. Respondents were also asked about their readiness to employ Ukrainian workers in their own enterprises. In this respect, we can see a higher level of readiness in the case of people with their own experience - the management practice works for the benefit of Ukrainian employees (Figure 2). Respondents who have already had their own experience in employing Ukrainian workers – and generally they were positive experiences – are more willing to declare their readiness to continue to employ the Ukrainians in the future than respondents who have not had such experiences.

Figure 2: Readiness to employ Ukrainian workers in owned enterprises
(own study based on the research carried out by the authors)

In addition, respondents with experience in employing Ukrainian workers were asked whether they recommend employing Ukrainian workers – 90% of respondents answered in the affirmative way, no responses were strongly negative (Figure 3).

Figure 3: Rekomendation for employing Ukrainian workers
(own study based on the research carried out by the authors)

Respondents were also asked about experiences related to problems during the recruitment of Ukrainian employees – 21% of respondents did not have any problems, others considered the greatest difficulties (order by number of statements) – formal and legal factors resulting from the applicable provisions of law, difficulties in keeping employees (due to their search for better social and living conditions in Western Europe), language barrier, different mentality and work culture, and insufficient qualifications. Analyzing the strengths of Ukrainian employees (in addition to high availability), their high motivation, learning ability and high qualifications (comparable to the competence of Polish employees) can be noted in the respondents' opinions. Employing workers of other nationalities, due to cultural and mental differences, can lead to conflict situations. Therefore, respondents with experience in employing Ukrainian workers were asked if they noticed the occurrence of barriers in the relations between Polish and Ukrainian employees. Exactly half think that there are no barriers to relationships, 37% notice such barriers and only 4% consider them to be significant (Figure 4).

Figure 4: Occurrence of negative relations between Polish and Ukrainian employees
(own study based on the research carried out by the authors)

Analyzing the potential sources of negative relationships (on the part of Polish employees), we can notice that the respondents most often indicated fear of losing their job, general lack of trust, demonstrating their superiority, historical past and lack of openness, which is illustrated in Table 2.

Table 2: Potential sources of negative relations on the part of Polish employees towards the Ukrainian employees (own study based on the research carried out by the authors)

Skurce	% indications
Poles' fear of losing their jobs	42
general lack of trust	38
demonstrating superiority by Poles	38
reluctance conditioned by the historical past	34
lack of openness on the part of Poles	26
sense of dissimilarity and distance towards the Ukrainians	24
perception of the Ukrainian as a conflict person	13

6. CONCLUSION

Managing an organization in the era of ever-changing environmental conditions requires the manager to possess the skill of forecasting employment for its job vacancies. The planning of human capital is the task of employers and those representing them. As Poland became a member of the EU, this process gave managers new directions of development. A high employment rate is both a cause and effect of an efficient economy. Polish businesses are more and more often faced with a shortage of employee – one of the factors leading to the elimination of this issue is the hiring of Ukrainian nationals – more and more business owners and managers and making use of this solution, which confirms the research carried out. An increasing number of businesses employs and recommends Ukrainian employees. On the one hand, the labor market forces them to do this, while on the other, this solution satisfies the needs of firms and employers searching for new sources of human resources.

TANAP AND TAP AS PART OF AZERBAIJAN'S ENERGY STRATEGY

ABSTRACT

Amidst the dissolution of the USSR, Azerbaijan defined two important directions of its energy strategy: 1. the provision of the energy security of Azerbaijan; 2. the contribution of Azerbaijan to the provision of the energy securities of other countries. In this regards, it was utmost important to boost the energy production in Azerbaijan, as well as developments of new opportunities in order to deliver Azerbaijan's energy resources to the international markets. On one hand, the energy resources constituted both an export-oriented commodity (the resource that one can receive benefit of its sale) and foreign policy resources (the resource that can increase the importance of Azerbaijan for other countries) for Azerbaijan. On the other hand, Azerbaijan has a potential of playing significant energy transit role for other countries thanks to the energy infrastructure that it created. Despite the various proposals of Russia and Iran, as well as the existence of the different gas purchase/sale agreement between Azerbaijan and those two countries, Azerbaijan has preferred to transport its oil and natural gas to the Western direction. The implementation of TANAP and TAP is the continuation of this policy. Actually, TANAP and TAP implies an alternative strategic success after the failure of Nabucco project. Because, main of Nabucco was the contribution to the energy security of Europe and TANAP and TAP serve the same mission.

Keywords: Azerbaijan, energy strategy, EU, TANAP, TAP

1. INTRODUCTION

Amidst the dissolution of the USSR, two important issues have parallelly emerged for Azerbaijan. One of them was the energy issues, other one is the Nagorno-Karabakh conflict caused from the territorial claims of Armenia towards Azerbaijan. During that period, Azerbaijan defined certain directions of its energy policy: 1. the provision of the energy security of Azerbaijan; 2. the contribution of Azerbaijan to the provision of the energy securities of other countries. In this regards, it was utmost important to boost the energy production in Azerbaijan, as well as developments of new opportunities in order to deliver Azerbaijan's energy resources to the international markets. On one hand, the energy resources constituted both an export-oriented commodity (the resource that one can receive benefit of its sale) and foreign policy resources (the resource that can increase the importance of Azerbaijan for other countries) for Azerbaijan. On the other hand, Azerbaijan has a potential of playing significant energy transit role for other countries thanks to the energy infrastructure that it created. In this context, Azerbaijan faces two significant problems. First of all, is the definition of the legal status of the Caspian Sea remain unresolved; secondly, the ongoing occupation of the territories of Azerbaijan by Armenia and the possibility of the start of new war. According to certain experts, there are interconnection between those two problems and the energy policy of Azerbaijan. In this article, we have analysed the endeavours for production of the energy resources of Azerbaijan and their delivery to international markets, as well as the energy policy of Azerbaijan in the framework of solution of the legal status of the Caspian Sea.

The author mentioned the official documents and statements of the officials in the article by considering the character of Azerbaijan's both energy policy and foreign policy in general.

2. AZERBAIJAN AND ENERGY: OFFICIAL STANCE

After Azerbaijan gained its independence again in 1991, the foreign policy, national security and military security doctrines of the country have been adopted slightly later. Although there were several uncertainties regarding Azerbaijan's both energy policy and foreign policy, as of early 1994, Azerbaijan remained loyal to its balanced foreign policy course. Unlike many countries, including its neighbours in the South Caucasus, Azerbaijan has adopted its National Security Doctrine a little bit later, in 2007. Although it was mentioned in the National Security Doctrine, the Foreign Policy Doctrine of the Republic of Azerbaijan had not been adopted yet and the Military Doctrine of the country has been adopted in 2010. Prior to that, the "Law of the Republic of Azerbaijan on National Security" has been adopted in 2004. In all adopted three documents, the essences of Azerbaijan's state approach towards the energy issues were duly mentioned. The article 17 ("ensuring the national security of the Republic of Azerbaijan in the economic area") and article 21 ("ensuring the national security of the Republic of Azerbaijan in the environmental area") of the Law of the Republic of Azerbaijan on National Security dated on 2004, touched upon the issues on natural resources. The Article 17 mentions that, in order to ensure the national security of the Republic of Azerbaijan in the economic area, following measures are taken (Law of the Republic of Azerbaijan on National Security):

- 17.2.2. the protection and consolidation of the natural resources, energy bases and transit potentials, which ensure the economic development of the country;
- 17.2.10. the integration of the Republic of Azerbaijan to the world economy through the implementation of the projects on the production and transpiration of the energy resources, as well as the operation of the transport corridor;
- 17.5. the implementation of the complex measures for the purpose of ensuring the continuous and reliable operation of the communication and energy systems... in Azerbaijan.

The National Security Doctrine of the Republic of Azerbaijan dated in 2007, has mentioned rather concrete points (The National Security Doctrine of the Republic of Azerbaijan). In the Article 1, while providing an information on national security in general, mentions that the region that Azerbaijan located in is unstable. Whereas, the rich energy resources of the Republic of Azerbaijan opens new perspectives for the development of the country, as well as makes the country an integral part of international energy supply network and the internationally significant energy source: "the development of the internationally significant transport and communication corridors and the construction of the oil and gas pipelines, which contributes to the development of the economies of both Azerbaijan and the partner countries, is a clear example of the cooperation among the countries in the region." The energy factors has been specifically highlighted in the National Security Doctrine of Azerbaijan in terms of integration into Europe and Euro-Atlantic structures and the regional development in general. The Article 4.1.2 ("Integration into Europe and Euro-Atlantic structures") has emphasized the importance of the Memorandum of Understanding on "Strategic Partnership on Energy Issues" signed between the Republic of Azerbaijan and the European Union in 2006 in terms of both the energy security of Europe and the development and modernization of Azerbaijan's energy infrastructures. The Article 4.1.5. ("Regional cooperation and bilateral relations") has particularly emphasized the ensuring significance of the energy security among the priority areas (other areas: regional security, combating the terrorism, prevention the proliferation of the weapons of mass destruction) in bilateral relations of Azerbaijan with foreign countries.

Meanwhile, the importance of three successful energy infrastructures - the Baku-Supsa, Baku-Tbilisi-Ceyhan oil export pipelines and South Caucasus Gas Pipeline (Baku-Tbilisi-Erzurum), which were realized through the energy cooperation among Azerbaijan, Georgia and Turkey and put the foundation of the vital and secure energy sources for Europe, has been mentioned as well. The National Security Doctrine of Azerbaijan has a particular chapter titled "Energy Security Policy", where it narrates that the detection and elimination of threats to the production in the oil and gas fields located in the Azerbaijani section of the Caspian basin; the construction of the oil and gas platforms; primary oil and gas pipelines and terminals is one the most important activity areas of ensuring the national security of Azerbaijan. In this regard, Azerbaijan pays great attention to creation of the energy corridor between the Caspian Sea and Black Sea and Mediterranean Sea. The Military Doctrine of Azerbaijan dated in 2010, also mentions that the global energy struggle creates risks for Azerbaijan as well (The Military Doctrine of Azerbaijan). The Article 18 of the Military Doctrine mentions that the rich oil and gas resources of Azerbaijan, as well as its geopolitical positions at the crossroads of the international trade, transport and communication lines between Europe and Asia are also risk factors. The exploration of the hydrocarbon fields in the Azerbaijani section of the Caspian Sea and their transportation to the world market, as well as active participation of Azerbaijan in the international energy projects for the development of the East-West and North-South transport corridors turned out to be a serious factor for the military security of the country and the increased the probability of being a target country for terrorist organizations. Apparently, energy factor has been frequently and enough mentioned in the official documents adopted by Azerbaijan government, which is not "eager" to openly publicize the perspectives and the risks of energy factor.

3. ENERGY POLICY OF AZERBAIJAN: PRODUCTION OF THE NATURAL RESOURCES

As a result of three years negotiations, SOCAR and AIOC has signed the "Contract of Century" or so-called "Mega Project" - "The agreement for joint development of oil in the Azeri, Chirag and Guneshli oil fields and production sharing" (or simply "The Production Sharing Agreement") on September 20, 1994 in Gulustan palace in Baku (The agreement for joint development of oil in the Azeri, Chirag and Guneshli oil fields and production sharing in the Azerbaijani sector of the Caspian Sea). Although, SOCAR was supposed to hold 30% stake in the 30-years agreement, its share decreased to 20% after SOCAR transferred 10% to LUKoil. The Agreement came into force on December 12, 1994 following the National Parliament of Azerbaijan ratified it on December 2, 1994. After the ratification of PSA, the AIOC, which was created in February 1995, was initially consisted of 11 partner companies (BP, Amoco, Unocal, Lukoil, Statoil, Exxon, TPAO, Pennzoil, McDermott, Ramco, Delta Nimir) representing six countries (Great Britain, the US, Russia, Norway, Turkey and Saudi Arabia). When SOCAR attempted to give 5% out of its 20% to Iran, it did not happen after the opposition of the Western energy companies. Thus, SOCAR has sold its 5% to US's Exxon and another 5% to Turkey's TPAO in 1995 (thus the share of TPAO in the Consortium reached up to 6.75%). Meanwhile, although LUKoil gained 10% in the "Contract of Century" and the statements of Chernomyrdin, the problems with Russia's position continued. Ministry of Foreign Affairs of Russia declared that it doesn't recognize the oil agreement between Azerbaijan and the Consortium. Russian MFA showed the legal status of the Caspian Sea as a justification and even has sent a verbal note to the UK in April 28, 1995. In the verbal note, Russia mentioned that the Caspian Sea is a shared property of the coastal countries, therefore, any activities in the Caspian should be realized due to the common decision of all coastal countries. The main aim of Russia by presenting this note was to deter the stance of BP, which as a leading company in the Consortium.

However, along with BP, the biggest companies of the US, including AMOCO was presenting in the Consortium. However, Russia did not want to deteriorate the relations with Clinton administration. Therefore, a diplomatic protest towards the UK was an example for other countries as well. Regardless of numerous pressures and protests, the Agreement have been already signed. One of the main aims of Russia and Iran in triggering the legal status of the Caspian Sea was to impede the production of hydrocarbon resources (including the cooperation on Trans-Caspian) of Azerbaijan, Kazakhstan and Turkmenistan in the Caspian. Whereas, despite all pressures Azerbaijan made a vital step by taking the risks into consideration. After the "Contract of Century", the risks of coup-d'etat and civil war emerged in Azerbaijan again in October 1994 and March 1995. However, both process doomed to failure. Japan's Itochu, which didn't participate in the first stage, has later bought the 2.45% shares of McDermott International and joined the Consortium on "Azeri-Chirag-Guneshli". Later, Itochu bought the 1.5% shares of AMOCO and augmented its shares up to 3.9%. Meanwhile, 3% and 5% shares of AMOCO has been bought by Exxon and Unocal respectively. After all those changes, the shares in the Consortium became as followings: AMOCO 17.01%, Unocal 10.04%, Exxon 8.00%, Penzoil 4.81%, BP 17.12%, Ramco 2.08%, LUKoil 10%, SOCAR 10%, Statoil 8.56%, TPAO 6.75%, Itochu 3.92% and Delta 1.68%. Whereas, in the following years, some companies sold their shares to other companies (the most sensational one was the sale of LUKoil). At the present time, the shares in the AIOC is as followings: BP (35.7828%), SOCAR (11.6461%), Chevron (11.2729%), INPEX (10.9644%), Statoil (8.5633%), ExxonMobil (8.0006%), TPAO (6.7500%), ITOCHU (4.2986%), ONGC (2.7213%) (Azeri-Chirag-Deepwater Gunashli). In the following years, new agreements have been signed for exploration of the Azerbaijan's other oil and gas fields. Overall 22 agreements - 15 agreement in the Caspian Sea, 7 in the onshore oil fields within borders of Azerbaijan - have been signed during 1994-2003. During the presidency of Ilham Aliyev, the new agreements have been added to this list. On March 16, 2016, SOCAR and Zenith Aran Oil Company signed agreement on block restoration, exploration, development and production sharing and consequently the number of Azerbaijan's oil and gas agreements signed with foreign companies reached to 32. At the moment the works are ongoing on 14 agreements and 26 companies from 20 countries are taking part in the implementation of those agreements (Oil production). Among the agreements signed after the "Contract of Century", the Agreement on "Shah Deniz" field (Norway's Statoil 26%, UK's BP 25%, SOCAR 10%, LUKAcip (Russia-Italy) 10%, Iran's NICO 10%, France's Total 10%, Turkey's TPAO 9%) signed on June 4, 1996, has of highest importance. First of all, since this field contained huge natural gas resources, it enabled Azerbaijan to a competitor to Russia and Iran in terms of natural gas export. From other hand, this project was a big project, where Iran is presented, but the US is not. The development term of project was 30 years according to the agreement (Shah Deniz). On February 27, 2009, the agreement on "Exploration, Development and Production Sharing in Absheron prospective structure" was signed. The relevant Consortium includes SOCAR (40%), France's Total (40%) and Gaz de France Suez (20%) companies. The first exploration drilling has started on January of 2011 in the framework of agreement (Absheron). In 2009, SOCAR has launched the exploration drilling in depth in the "Umid" structure of the Azerbaijani sector of the Caspian and in November 2010, the giant gas condensate field of "Umid" has been discovered. SOCAR tries to develop this field alone itself. Following the discovery of "Shah Deniz", "Absheron" and "Umid" fields, as well as launching the "Shah-Deniz II" project, Azerbaijan started to present in the energy game with natural gas along with oil. Azerbaijan's President Ilham Aliyev stated in his latest statements that Azerbaijan's proven gas reserves are 2.5 trillion cubic meters, while the estimated reserves are 4-5 trillion cubic meters (Speech by Ilham Aliyev at the ceremony to mark the 20th anniversary of the Contract of the Century and the foundation of the Southern Gas Corridor).

4. EXTRACTION OF NATURAL RESOURCES TO INTERNATIONAL MARKETS: THE TANAP AND THE TAP

The second dimension of Azerbaijan's energy policy is the extraction of the produced energy resources to the international markets. In the early 1990s, there were 7-8 options of route for transportation of Azerbaijani oil to the international energy market, however, only 5 of them were discussed (Aslanli, Hasanov, 2005, pp. 99-100):

1. Northern route: Baku-Novorossiysk;
2. Western route: Baku-Supsa;
3. Southern route: Baku-Iran;
4. Eastern route: the pipeline passing through Afghanistan and Pakistan;
5. Southern-western route: Baku-Ceyhan.

Two of them (Baku-Iran and Baku-Pakistan pipelines) have faced serious resistance since they were raised in the discussions. It is theoretically possible to transport Azerbaijani oil via Baku-Iran oil pipeline through Iranian territories to the Persian Gulf and from there to the world markets through tankers. However, all super powers, including the US rejected this proposal. The Baku-Pakistan pipeline also failed because of the security problems of the Afghanistan section of this pipeline. Therefore, as a result of negotiations between AIOC and Azerbaijani government, the number of routes for the transportation of oil was decreased to three – Baku-Novorossiysk, Baku-Supsa and Baku-Ceyhan (Baran, 2005, p. 105). After the long discussion, on October 9, 1995, official Baku decided that preliminary oil would be transported to the international markets through the Baku-Novorossiysk and Baku-Supsa pipelines. The agreements have been signed on "Baku-Novorossiysk" in Moscow on January 18, 1996 and on "Baku-Supsa pipeline" in Tbilisi on March 8, 1996. Although, one pipeline was enough for the preliminary transportation of oil, Azerbaijan had decided in the frameworks of its strategic targets to bring both pipeline on stream. Thus, both the resistance of Russia and dependence on Russia was decreased. However, the selection of the main pipeline for oil export took much longer. Azerbaijan wanted the pipeline be constructed from Baku till Turkey's Ceyhan port. However, it was not clear that which country (Iran, Armenia or Georgia) the pipeline should pass through. The "Iran" option was not accepted because of the opposition of the Western energy companies; "Armenia" option failed because of its continuing occupation of the territories of Azerbaijan (note: throughout the second half of 1990s, Azerbaijani officials has repeatedly declared that, if Armenia withdraws from the occupied territories of Azerbaijan, Baku is ready to cooperate with Armenia on international energy and transport projects.). In this case, it was decided that the construction of the Baku-Ceyhan oil pipeline would pass through Georgian territories. Baku-Ceyhan oil pipeline was extremely important for Azerbaijan from both economic and political point of view. By virtue of the realization of Baku-Ceyhan oil pipeline, the dependence of Azerbaijan and Central Asian countries on Russia in terms of oil and gas pipeline would be diminished. Secondly, the transportation of Kazakhstani and Turkmen oil through this pipeline was an additional income for Azerbaijan. Baku-Tbilisi-Ceyhan presented new opportunities for the development of trilateral cooperation model between Azerbaijan-Georgia-Turkey. Other pipeline projects in parallel to Baku-Tbilisi-Ceyhan would provide an opportunity for consolidation of relations between the Caspian states and Europe, and the serious role of the Caspian basin for Europe's energy security. The main processes on BTC was going in the second half of 1999. Particularly, thanks to the persistence of former president of Azerbaijan Haydar Aliyev and after the protests of BP and Amoco cooperation ceased, the discussions were held between the states and the Consortium. After the negotiations held during September 27 – October 13, 1999, Azerbaijan, Georgia and Turkey signed an agreement under the Bill Clinton's testimony in the OSCE's Istanbul Summit on November 19, 1999. On October 17, 2000, the Group Members of eight companies (SOCAR,

BP, Unocal, Statoil, TPAO, Ramco and Delta Hess), meanwhile AIOC members, received the title of "Main Export Pipeline Participants" (MEP) after signing the "Sponsor Group Finance and Cooperation Agreement". MEP participants signed the "Host Country Agreements" with Azerbaijan and Georgia on October 17-18, 2000. The final agreement on Baku-Ceyhan pipeline that would carry Azerbaijani oil to the world markets, have been signed in Turkey on October 19, 2000. On August 1, 2002, the "BTC Co." company, which was responsible for the construction, management of the pipeline, has been established in London and the foundation of the Baku-Tbilisi-Ceyhan oil pipeline, has been laid on September 18, 2002. The shareholders of the "BTC Co." company are followings: BP (30,10%); AzBTC (25,00%); Chevron (8.90%); Statoil (8.71%); TPAO (6.53%); ENI (5.00%); Total (5.00%), Itochu (3.40%); INPEX (2.50%), CIECO (2.50%) and ONGC (BTC) Ltd. (2.36%). The 1768 km-long BTC pipeline was put into operation in June of 2006. By the end of 2015, the BTC pipeline has delivered around 2.36 billion barrel of crude oil in total (315 million tone) (Baku-Tbilisi-Ceyhan pipeline). Kazakhstan and Turkmen oil are also included here. The Kazakhstani and Turkmen oil are also transported through the Azerbaijani railway to Georgia's Batumi port. Another pipeline that delivers Azerbaijan natural resources (precisely natural gas) to the world markets is Baku-Tbilisi-Erzurum natural gas pipeline (or South Caucasus Pipeline - SCP). On March 12, 2001, Azerbaijan and Turkey have signed an intergovernmental agreement, subsequently SOCAR and BOTAS have signed a Memorandum of Understanding for the transportation of Azerbaijani gas to Turkey. On September 29, 2001, Azerbaijan and Georgia have signed an agreement on transit and purchase of natural gas. The construction of the SCP has started on October 16, 2004; was completed on late 2006 and the gas from the Shah-Deniz field was started to pumping through this pipeline as of early 2007. Despite the various proposals of Russia and Iran, as well as the existence of the different gas purchase/sale agreement between Azerbaijan and those two countries, Azerbaijan has preferred to transport its oil and natural gas to the Western direction. The implementation of TANAP (Trans Anatolian Natural Gas Pipeline project) and TAP (Trans Adriatic Pipeline project) is the continuation of this policy. Actually, TANAP and TAP implies an alternative strategic success after the failure of Nabucco project. Because, main of Nabucco was the contribution to the energy security of Europe and TANAP and TAP serve the same mission. The first agreement on TANAP was signed on 25 October 2011 during the meeting Turkey-Azerbaijan High-Level Strategic Cooperation Council in Izmir between the two countries. However, the name of the pipeline was declared as TANAP by SOCAR Chairman Rövneg Abdullayev at the third Black Sea Energy and Economic Forum held on 17 November 2011 in Istanbul. On March 13, 2015, the TANAP Partnership Agreement was signed between the Pipelines and Petroleum Transportation Corporation (BOTAS) and British Petroleum (BP) regarding the distribution of shares in the Trans-Anatolian Natural Gas Pipeline Project. The signing ceremony held in Ankara was attended by Minister of Energy and Natural Resources of the Republic of Turkey Taner Yildiz, President of the State Oil Company of Azerbaijan Republic (SOCAR) Rövneg Abdullayev, BP's Regional President for Azerbaijan, Georgia and Turkey Gordon Birrell, BOTAS General Manager Mehmet Konuk, Member of the Board of Directors of TANAP Vagif Aliyev and TANAP General Manager Saltuk Düzyol. By this agreement, the partnership shares in TANAP was set as: Southern Gas Corridor Closed Joint Stock Company (SGC) - 58 percent, BOTAS - 30 percent and BP - 12 percent. On 12 June 2018, the TANAP was inaugurated at the compressor-measuring station in Eskisehir (Erdogan opens new pipeline to pump Azerbaijan gas to Europe). The ceremony was attended by the Turkish president Recep Tayyip Erdoğan, the Azerbaijani president Ilham Aliyev, the Ukrainian president Petro Poroshenko, the Serbian president Aleksandar Vučić, and the Bulgarian prime minister Boyko Borisov, as also by the head of SOCAR Abdullayev, Turkish minister of energy and natural resources Berat Albayrak, and the chief executive officer of BP Bob Dudley.

The TAP is a greenfield development consisting of the design, construction, and operation of natural gas pipeline starting in Greece at the Greek-Turkish border connecting TANAP crossing Greece, Albania and the Adriatic Sea and terminates in Italy connecting to natural gas network of Snam Rete Gas (Trans Adriatic Pipeline). TAP was selected as the shortest and most direct way to export gas from Azerbaijan to European markets. The Intergovernmental Agreement on TAP project was signed among Albania, Italy and Greece in February 2013 (Greece, Italy and Albania sign a tri-lateral intergovernmental agreement, demonstrating their full support for TAP). Although, the problems concerning the legal status of the Caspian Sea are still ongoing, however, the realization of Trans-Caspian pipeline would strongly contribute to this concept as well (Aslanli, 2017, pp. 27-51). Despite the signing of the Convention on the legal status of the Caspian Sea at the V Summit of the Heads of the Caspian littoral States in Aktau, Kazakhstan, on August 12, 2018, all problems related to the Trans-Caspian cooperation have not been resolved. In this context, the relations between the European Union and Azerbaijan as of 2000 played a greater role. The energy factor was the most-focused issue during the visits of Azerbaijani officials to European capitals, as well as during the visit of EU officials to Azerbaijan. Actually, the energy factor has even helped to mitigate the risks of deterioration of relations between Azerbaijan and the EU, including the European states because of the certain political problems (notably due to criticism on human rights). Lately, Azerbaijan has invested a part of its income received from the oil and gas revenues in the energy sectors of other countries. SOCAR owns assets, refineries, pipelines, terminals, ports, trading companies, petrol stations in Georgia, Turkey, Switzerland, UAE, Ukraine, Romania and other countries. The 66% of DESFA – Greece's national gas distribution company – has been purchased by SOCAR.

5. CONCLUSION

To sum up, today the energy policy of Azerbaijan is successfully realized in the framework of targets defined 25 years ago. Although, changing political authorities has criticized the previous governments on certain issues, however, the consistency in the energy policies is noteworthy factor. Today, by virtue of these policies Azerbaijan can ensure its energy security and plays an important role in ensuring the energy security of other countries. The energy factor constitutes the essence of Azerbaijan-Georgia-Turkey relations and meanwhile, plays a vital role in the bilateral relations between Azerbaijan and the EU's leading countries, including the Eastern European countries. Actually, Azerbaijan also experienced several problems while wanted to realize its energy strategy. Among them, resistance of Russia and Iran, as well as domestic instability were the most influential one. The withdrawal of the Russian military bases from Azerbaijan during the Elchibey administration helped Haydar Aliyev easily to conduct balanced foreign policy course and an independent energy policy successfully. During Haydar Aliyev administration, Azerbaijan always took into consideration the "Russian factor", but he has persistently continued its pro-Western energy policy. Along with the successful implementation of BTC, SCP, Baku-Supsa, the realization of TANAP also prove that policy.

ABSTRACT

The basic directions of economic policy, implementing by the government of Azerbaijan , specific weight of forecasted income of non-oil sector in GDP, maintaining sustainable economic growth due to the increase in non-oil sector etc. on the background of unstable economic situation in the world have been researched in the article. The strengthening of achievements, and provision of the stability in the economy will be achieved by expanding the non-oil sector of the economy and its rapid development on the basis of the purposes specified in the Development Concept " Azerbaijan 2020: Look into the future" pointed out in the article.

Keywords: *economic regulation, economic reforms, infrastructure, non-oil sector, socio-economic development*

1. INTRODUCTION

There is a need in realisation of a group of priorities for a more efficient use of the potential of the non-oil sector in Azerbaijan. Azerbaijan economy is experiencing a period of diversification in modern condition. Diversification means expansion of product types. At the same time, the term diversification is used for specify development peculiarities and directions of the national economy, grouping companies and unions by character of their activity. For example, one of the main directions of sustainable economic development is diversification of economy and various production spheres. Modern economic and technical condition of manufacturing industry requires strengthening diversification by all means. With this aim, it is important to use experience gained at the international level. The followings need to be implemented by using this experience: 1) creating a developed market infrastructure; 2) establishing state financial institutions supporting diversification of economy; 3) development of a system of economic motivation of the non-oil sector and 4) adoption of state indicative plans (programs) for diversification of the national economy and for development of the non-oil sector of the industry. The Roadmap for the national economy and main sectors of the economy approved by President Ilham Aliyev shows that two important economic development directions – ensuring substantial increase of demand to products of national producers in domestic market and expansion to foreign markets should be accepted as important priorities. From this point of view, complex and fast development of industry, agriculture, tourism, ICT and other sectors, efficient use of the potential of various sectors of the economy, expansion of production network of national goods that meet high standards, increasing types of export goods, increasing non-oil export and diversification of its export geography, ensuring access to new foreign goods markets are the main elements of acceleration of non-oil sector development (6;p.126-127).

2. REDUCTION OF THE OIL DEPENDENCE AND DIVERSIFICATION OF AZERBAIJAN ECONOMY

It is important to note that most of the big energy projects have been finalised or are under implementation. Large-scale projects have already started in the non-oil sector and processes of reducing dependence of economic development of the country on oil is observed. The process of diversification of Azerbaijan economy, increasing shares of the private sector and service sphere in GDP, accelerating development in industrial fields, including oil and gas machinery, oil chemistry, metallurgy, machine-building, production of construction materials, agrarian sector and production of agricultural goods, increasing the role of new economic sectors – ICT, tourism and space industry, diversification of the structure of foreign trade turnover continue. Agriculture, tourism, ICT, manufacturing industry are considered as priority sectors in development of the non-oil sector in Azerbaijan. International financial institutions specifically note the importance of agriculture and tourism among these sectors. Thus, about 44 percent of employed population of the country is employed in agriculture. That is why, continuous state programs, reforms and attracting new technologies are being conducted. Asian Development Bank closely cooperating with Azerbaijan considers agriculture and tourism as leading fields in the non-oil sector of the country. The Bank considers that improving infrastructure in regions, subsidies to agricultural producers and maintaining tax concessions for them supports development of agriculture sector, which has big potential in Azerbaijan. According to calculations of the Bank, full utilisation of tourism potential of the country will lead to increase of the non-oil GDP. Thus, rich tourism potential existing in Azerbaijan and fast development of tourism infrastructure in recent years promises large income for the country in this field of the non-oil sector. Non-oil products, including electric machinery and equipment, their spare parts, chemistry products, construction materials, final weaving products, etc. currently produced in Azerbaijan are exported to various locations. With the aim of diversification and creating basis for non-oil sector development, billions of dollars were invested within development programs to supporting small and medium size entrepreneurship, allocation of soft loans by the state to people in this business, allocation of subsidies to agriculture, reconstruction of transport and communication infrastructure throughout the country. These investments gave fast return and led to large activation in the non-oil sector. With the aim of realisation of measures envisaged for economic diversification, the “State Programme for Social and Economic Development of Regions of the Republic of Azerbaijan in 2014-2018”, the “State Programme for Poverty Reduction and Sustainable Development in the Republic of Azerbaijan for 2018-2015”, the “State Programme on the Reliable Food Supply of Population in the Republic of Azerbaijan for 2008-2015” and other programmes were approved by relevant orders and decrees of the President. These programs have been successfully implemented. Government of Azerbaijan has implemented a thorough policy from 2008, when the global economic crisis began, and has succeeded in minimizing negative effect of economic crisis on national economy by using necessary means and impact mechanisms. However, the drop in global prices of oil starting from 2015 and changing macroeconomic factors lead to the necessary rise of economic reforms to a qualitatively new level.(5, p 360). The main goal set in this time was to put in action the existing potential in the non-oil sector and to implement economic reforms for ensuring dynamic growth. With this aim, the Strategic Roadmap was approved by the Decree of the President Ilham Aliyev dated 6 December 2016 for flexible adaptation to the processes observed in the non-oil sector, as well as supporting the post-oil economic development model for application of new challenges and opportunities facing the industry. Strategic roadmaps set social and economic development strategy and action plan for 2016-2020, long-term vision by 2025 and targets for a period after 2025. These strategic road maps are a conceptual document that identifies future prospects of Azerbaijan's development on a profound scientific basis.

On the approved roadmap short-, medium- and long-term perspectives have been reflected for the overall national economy and 11 sectors. As a result of the implementation of the Strategic Roadmap, the structure of the industry will be improved, the non-oil industry will become one of the key driving forces of economic growth, shares of heavy industry and machine building in industry and employment will increase, the overall economic potential will be made ready for implementation of goals set for the post-2020 period, i.e. the optimal utilization of available resources, as well as the introduction of efficient production methods in enterprises will start. At the same time, financial and macroeconomic coordination will be ensured, mechanisms will be created for the provision of export incentives from the state budget to those engaged in economic activity, investment and export of non-oil products. The development of the non-oil sector is one of the key factors for strengthening the country's economic potential. As a result, successful state programs and measures taken in recent years have resulted in sustainable development of the non-oil sector, further improvement of entrepreneurship, increased investment and creation of new businesses and jobs.

3. PRIORITIES OF NON-OIL SECTOR DEVELOPMENT OF AZERBAIJAN

One of the priorities of the policy of diversification of the economy is the implementation of a regional development strategy. In this regard, the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018 has been successfully implemented and implementation of other major projects under this programme will contribute to the sustainable development of the non-oil sector and social services and social infrastructure will be further improved. At present, there are some declines in the economy of the republic, but this is primarily a matter of the sharp decline in oil prices in the world markets and the decline in its production. The results are positive in most major sectors of the non-oil sector of the economy. As there are serious improvements in non-oil industry, agricultural production, transport, information and communication services, retail trade, etc., it points to successful reforms being carried out. The importance of economic reforms in Azerbaijan has already been officially announced by management of the World's two largest financial institutions – the International Monetary Fund and the World Bank. This means that as a result of the ongoing social and economic reforms, dependence on oil industry will be minimized in the short run. At present, Azerbaijan is aiming for more confident progression in this path and for completing the post-oil period reforms within the shortest timeframe. At present, the main goal of reforms is to ensure that our state budget revenues are ensured by the non-oil sector over the next few years. After this, the change in oil prices in the world markets will not have any significance. 3,1327.2 million manat of added value was created in the non-oil sector of the economy in January-September of 2017, out of which 56.5% fell to share of social and other services, trade, repair of vehicles and construction sectors.

Figure following on the next page

Figure 1: Breakdown of added value created in the non-oil sector of Azerbaijan by sectors

In January-September 2017, the value added in the non-oil sector of the country's economy increased by 2.5% compared to the same period of the previous year. The share of added value created in the non-oil sector in GDP was 62.6%. The most positive effect on GDP was made by the non-oil sector sub-sectors like transport and warehousing, trade and repair of transport vehicles. The growth rate of the added value created in the non-oil sector was higher than the corresponding period of the previous year. 2.8% growth was in agriculture, forestry and fishing compared to the corresponding period of 2016, 1.5% in construction, 2.1% in trade and repair of transport vehicles, 5.8% in transport and warehousing, 3.2% in hospitality and public catering, 6.2% in the field of information and communication and 1% in social and other services. Recently, industrial zones have been set up to support business activity in the industrial sector and to increase employment in the industry, the necessary infrastructure built for efficient operation of entrepreneurs in industrial parks and industrial sites, which are important for industrial development, preferential regime is applied, and interest of entrepreneurs in industrial zones is increasing. At present, 5 industrial parks and 4 industrial sites have been established in the country, specializing in chemical, recycling, shipbuilding, light industry, pharmacy and other industries. Application of investment promotion mechanisms for production of export-oriented products and incentives to attracting investments give their yields. To date, 251 entrepreneurs have been issued 283 investment promotion documents, which allowed them to invest more than 2.5 billion AZN (manats) in local production and create up to 19,000 new jobs, out of which 141 enterprises with an investment value of more than 1 billion AZN (manats) are already operational. In order to ensure the development of the non-oil sector in Azerbaijan, activities need to be continued for improving the necessary structural, institutional and cultural bases, i.e. for developing commodity and money markets, preparing or engaging specialists in important specialties of non-oil sectors, forming clusters of entrepreneurs and an effective administrative system and so on. One of the directions of the state policy in the field of non-oil sector development is the creation of 79 favorable conditions for the financing of investments in the non-oil sector. One of the factors hindering the development of the non-oil sector today is high interest rates in the country. Expansion of funding sources and reduction of interest rates in the future will be of great importance for the development of the non-oil sector. It is necessary to expand the financing of the non-oil sector development in the country through preferential loans (2, p. 220). One of the key factors affecting efficiency in the non-oil sector is the development of infrastructure in the country. Development of infrastructure determines the speed and value of material, financial and information flows in the country. As the speed of the mentioned streams in the country increases and the value decreases, competitiveness of the national economy, including non-oil sectors, increases.

From this point of view, development of transport, communication, warehouse and other infrastructure sectors is one of the key factors that determine the development of the manufacturing industry and agriculture. Another aspect of increasing productivity in the non-oil sector is related to direct subsidization of their activities and provision of tax concessions. In recent years, the level of taxes has significantly decreased in Azerbaijan. Thus, the profit tax is reduced from 27 to 20 percent and social security allocations from 33 percent to about 25.66 percent. At present, Azerbaijan has limited opportunities to stimulate the development of the non-oil sector through reducing tax rates. It is crucial to create an effective stimulus mechanism to increase the investment attractiveness of the non-oil sector and ensure productivity in these fields. This mechanism should operate until non-oil fields have the opportunity to operate effectively in the free market. At present, such a mechanism is being created for agriculture sector. This sector was exempted from all taxes excluding land tax, provided with seeds, fertilizers and direct financial aid on preferential terms. At the same time, there is a need to improve the mechanism of government support to the development of manufacturing industries, especially export-oriented sectors. In addition, in order to increase the technical and economical level of local production through the purchase of foreign advanced technologies in the country's processing industry or the purchase of foreign enterprises, it would be expedient to compensate a portion of the costs of companies in these areas on the account of the state. At present, achieving high results in our country is linked to increasing competitiveness in the non-oil sector and ensuring high and sustainable economic growth. According to us, there are opportunities and ways for the Azerbaijani economy to increase its competitiveness in circumstances of global influences, provided that a steady increase is ensured for variety of export-oriented non-oil sector products. Azerbaijan exports are located in the outer periphery of commodities, and the distance to the nearest commodity in the current export basket is very large. Therefore, "natural" or "organic" diversification of the economy of Azerbaijan is very difficult. However, under the notions of "natural diversification of the economy" or "organic diversification" in Azerbaijan, there are still prospects for finding effective ways for export potential, which are not few:

- first of all, the country's natural resources, rich underground and on-the-ground resources, workforce and intellectual resources and other factors are sufficient;
- secondly, the potential of non-oil sector sectors with strong potentials should be used effectively and their export orientation should be more deeply identified (chemistry and petrochemistry, metallurgy, oil and gas machinery, agriculture, etc.)
- thirdly, the country's export sector diversification strategy should be optimized, global competition criteria should be taken into account, adequate measures should be identified, etc. (3; p.119-136)

"Azerbaijan 2020: Look into the Future" Development Concept set the target of achieving per capita non-oil exports volume of one thousand dollars by 2020. At present time, the state's approach to the private sector, the non-oil sector and the banking sector with systematic state support mechanisms and the formation of a relatively sustainable economic policy brings to the idea that, accelerating the development of various real economic sectors, diversification of ways to increase their export potential will intensify in coming years. Unfortunately, effective opportunities in this direction have not yet been thoroughly studied and the significance of this activity scheme for entrepreneurship, the process of educating businesses, including the banking sector, have not been widely promoted. Thus, each manat invested in the transport and communications sector creates an additional GDP of 4.5 manats. Each manat invested in the construction sector generates an additional GDP of 4.7 manats. The "multiplication factor" of the increase in the loan amount to the agricultural sector is about 4, etc.

In short, diversification of non-oil sector lending and financing sources is characterized as an important way to increase export potential of this sector.

4. CONCLUSION

Expansion of the influence of globalization and increase of negative effects of financial and economic crises have led to the emergence of new criteria and trends in global economy. It is also possible to claim that the trend of close development of the national economy has come to an end. From this point of view, having a diverse export potential acts as an important and strategic condition for each country. If there is a shortage of natural resources in any country or a lack of national resources, it should overcome many complex tasks in these processes in order to continue competing globally. Countries with relatively rich national and natural resources should evaluate these benefits objectively and valuedly and provide a systematic approach to the production of products and the export of products within national interests for the rational use of them. Stability of exports of commodities and products not reflecting criteria of sustainability in the global competitive environment is not possible in global commodity markets. Implementation of a range of positive strategic measures state programs in this regard suggests that the measures to form more effective, productive and effective ways of using the export potential of the non-oil sector will intensify in the near future.

VALUE CHAIN FOR THE DEVELOPMENT OF THE EVORA REGION. THE CASE OF THE CHICKPEA PRODUCT

Erika Guadalupe Espinoza-Duran
Universidad Autónoma de Sinaloa
Oyeme27@hotmail.com

ABSTRACT

The objective of this study was to perform an analysis of the chickpea value chain, considering the actors, their relationships and functions, as well as the factors that affect their competitiveness. The technique of panels and field studies was used. In this research, experts from the municipalities of Mocorito Angostura and Salvador Alvarado participated in the state of Sinaloa, Mexico. It was found that there is little relationship between the research and the producers; since there are no policies that promote the integration of the value chain and its organization. In addition, there is limited commercial promotion in international markets, where the marketing of Garbanzo is the most vulnerable link. The producers sell their production to intermediaries and these in turn to importers from different countries and it is these intermediaries who appropriate most of the utility offered by this type of product. The structuring between the supply of inputs and the final market is not the most appropriate. Power relations are hierarchical, few purchasing actors have power, information and their relationship with their suppliers. There are no horizontal links at the producer level, which does not allow improving the negotiating capacity and the organization, so it is urgent to reorder the value chain so that the producer is one of the main actors in capturing the value obtained in the market and in this way increase its profitability and competitiveness.

Keywords: *Value chain, Competitiveness, Markets, Chickpea product, Profitability*

1. INTRODUCTION

In Mexico, globalization requires entering into new mechanisms to improve competitiveness in primary production that allow for: a relevant and continuous supply (in volume and quality) to satisfy aggregate demand; increase productivity; improve post-harvest processes; reduce production costs; and improve the organization of the sector. (Peña, 2008). Agriculture is a relatively small sector in Mexico, and continues to fall with respect to the total economy with about 3.7% of the Gross Domestic Product (GDP) according to preliminary figures of the INEGI of 2014. However, this figure alone minimizes the economic and social importance of the sector. Agriculture provides employment for 13% of the population, representing some 3.3 million farmers and 4.6 million wage and unpaid family workers. Of even greater relevance for territorial development is the fact that approximately 24% of the total population lives in rural areas (Ramirez, 2016). In Mexico, 150,000 hectares of chickpea are planted, of which 80% are large white grain for human consumption, almost entirely destined for the export market, Sinaloa being the state with the highest production, particularly in the Évora region. Worldwide, Mexico ranks second as an exporter of chickpeas and third in production. (Perera, 2012). Despite its importance in the national economy, agriculture is fragmented, that is to say, agriculture is not linked to the value chain, it is totally dispersed and far from what happens not only in the national market of the food industry but in the global market; as well as limited access to distribution channels; insufficient infrastructure to articulate agricultural production; a little profitable production, which does not generate added value; it constitutes the main problem of competitiveness in primary production in Mexico; If we add to these facts the need for public policies, aimed at reducing the uncertainty regarding agricultural activities, the problem is even greater. Within this framework, the incorporation of the chickpea producers to the value chain has been proposed, as a strategy that can generate competitive advantages for

this sector that today is fragmented and disarticulated of markets, reason why rural producers are the of most value chains. If they are helped to take advantage of market opportunities, get fair agreements and obtain higher quality products, it will be possible to improve the performance of the value chain, increase rural incomes and employment and stimulate economic growth in rural areas. Consequently, if the great comparative advantages of agricultural production and the development of competitive advantages derived from factors such as the generation of value added to production are not enhanced, Sinaloa will lose market value and lead to a lower economic output than other regions. In that sense, in the Évora Region the situation is even more serious, it can be said that the primary sector of the economy faces serious challenges, since it is one of the activities with the highest risks in terms of investments, because on the one hand it has to face climatological problems, insecurity, producers are isolated from the sources of technology and are only using empirical methods transmitted from generation to generation, resulting in limited knowledge, therefore it is urgent to identify the elements that must be considered for generate added value and contribute to increase their competitiveness.

2. METHODOLOGY

The methodology used has a qualitative approach and is descriptive in nature, which led to observation and rapprochement with chickpea producers in the Évora region to later use the framing of the chickpea product value chain under the panel technique of work that is described by stages or sections categorized by processes, objects or subjects (chickpea producers).

2.1. Work panels

To build the characteristics of the chickpea value chain, the panel technique was used. The panels were formed by groups of experts from the state of Sinaloa in the most productive municipalities located in the Évora region (Angostura, Mocerito and Salvador Alvarado), to achieve the characterization of the production system, its technological level and scales within a range of productive capacity. In these groups, knowledgeable about the chickpea product value chain participated. The first fieldwork session consisted of an orientation on the fundamentals, principles and concepts around the value chain methodology in which the participants defined the first guidelines in relation to the analysis of the chain and the factors that define competitiveness. Using a consensus building process, each panel established a dialogue with the chickpea producers, in order to collect the related information from the production, as well as technical parameters and marketing systems for a base year. In such a way that the information was agreed in consensus by the panelists. Subsequently, feedback was received and strategies and recommendations were built. the assistants were representatives of the value chain of several municipalities as suppliers of inputs, producers representatives of different zones, two of the main processors in the chickpea industry, representatives of SAGARPA, UNPEG and Non-Governmental Organizations. Once the information was captured and processed and in order to ensure the validity and representativeness of the data obtained, the results were validated by the panelists. The validation was carried out through a consensus process, in which the participants of the original panel were summoned again. In this stage, the results were presented with the intention of verifying that the information was complete and correct, in addition to checking whether this information reflected the situation of the value chain. In the same way, it was verified that the panelists agreed that the prospective analysis adequately reflected their expectations on the trends of the sector. The validation process is an indispensable requirement for the publication and dissemination of results (Zavala-Pineda et al., 2012). The Chickpea value chain was modeled with the information given by the group of experts participating in two panels.

2.2. Field surveys

Fifteen surveys were conducted targeting key informants of the chain, which are part of the chickpea product system, or the National Union of Garbanzo Producers and Exporters (UNPEG) in the Évora region made up of the municipalities of Mocarito, Angostura and Salvador Alvarado. The surveys were formed with qualitative questions, which were transformed using a scale of 1 to 5 for a quantitative analysis. The questions asked were for the purpose of generating the variables described below. Conceptual map of the value chain of Garbanzo. To obtain the map of the value chain, the following levels were analyzed: Actors and functions. The agents and the functions that each of them carries out were identified through the questions asked and information search of the Garbanzo Product System. Relations and horizontal links. The interactions between agents or actors and their level of organization were described. Primary information of the International market. Relevant information of the international market, consumption and attributes of the products that are offered were analyzed. Critical support services. Information was collected related to financial services related to access to credit. Primary information of the International market. Relevant information of the international market, consumption and attributes of the products that are offered were analyzed. Critical support services. Information was collected related to financial services related to access to credit. Technical assistance services. Information was presented regarding the technical advisory service to producers. Quality management services. Instruments of a regulatory nature were sought for the transformation of products. Business Intelligence. An analysis was made with the purpose of knowing about the main competitors in the world as well as the external demand of this product in the world properties. Logistics and storage. We sought to identify the actors that participate in this area.

3. CURRENT PANORAMA OF AGRICULTURE IN SINALOA

Mexico has a territory of 198 million hectares, of which 145 million are dedicated to agricultural activity, of these, 26 million are declared as farmland and 115 million are grazing lands, and the area with forest vegetation and forests occupy 45.5 million hectares (Ministry of Agriculture, Livestock, Rural Development, Fisheries and Food -SAGARPA-, 2007, 2013). The Mexican agricultural sector together with the food industry has a participation of 8.4 percent of the Gross Domestic Product (GDP) and employs 13.7 percent of the economically active population, with 6.7 million people. The main chickpea producing countries (*Cicer arietinum* L.) are Turkey, India, Pakistan and Mexico, which provide 80 to 90% of the 7 million tons of world production. In addition, Turkey, Mexico, Australia, Syria and the United States, in that order of importance, supply between 90 and 95% of the export market (Claridades Agropecuarias, 1997). In Mexico, 150,000 ha of chickpea are planted, of which 20% correspond to small grain and coffee, called 'swine' or 'fodder', and 80% are large white grain for human consumption, almost entirely destined for the market export. Worldwide, Mexico ranks second as an exporter of chickpeas and third in production. The area planted in 2006 was 118,490 Ha. With a production of 162,382 tons which was destined to the international market due to its high quality; it is undeniable that one of the main producers of food in the world is Mexico, since it has a great variety of physical and technological factors that make it develop capacities that give it preponderance in the world. The primary sector of the economy in Sinaloa plays an important role since for several periods contributes contributing to the growth of its economy and provides a variety of inputs to the food industry role that played since the fifties and from the decade of the 70 begins to suffer a serious decline.

Figure following on the next page

Figure 1: Main Sectors of Economic Activity in Sinaloa. Source: Own elaboration, based on INEGI. System of National Accounts of Mexico 2014.

It should be noted that one of the crops in which Sinaloa can be competitive is represented by the same chickpea that is mostly produced in the northwest of Mexico, particularly in the Évora Region and which is the object of study of the present investigation. When analyzing the chickpea production report for Sinaloa in 2015, (Amarillas, 2016), it records that the state GDP was 290 thousand 580 million dollars, of which, the primary activities had a contribution of 11.47% represented by 33 thousand 332 mdd, while secondary activities (industrial) were recorded at 21.44% of GDP and corresponds to a total of 62 thousand 289 million dollars. In addition, it is recognized that the tertiary activities (commerce and services) with an amount of 194 thousand dollars, reflected in a 67.09%. The experience curve developed by producers, particularly from the state of Sinaloa, gives us an indicator to identify all the strengths in this field, increasing the chances of competing successfully in international markets against our main competitors such as Turkey and Australia. According to Mario Barreiro Perera the care that both producers and marketers have had in maintaining the quality of the product, the high yields that are obtained, the high mechanization in both irrigation and seasonal conditions, as well as the close link between the productive sector and research, which has allowed today 95% of the cultivated area of chickpea is made with varieties generated in our country, are some of the successes that deserve to be mentioned, (Perera, 2012). As mentioned earlier, even when Sinaloa producers strive to achieve good results, which they have achieved and the chickpea is a clear effort, one of the constraints that hinder good performance is the lack of funding coupled with little aggregation of value and the limited capacity to organize in associations that allow to walk towards the added value of the agricultural production of which the chickpea is no stranger. Derived from the above, the great challenge faced by producers is the search for alternatives and solutions to overcome this aspect since the international chickpea market is a strong and expanding market.

Figure following on the next page

Figure 2: Map of the Évora Region: Regional modernization and centrality in the case of Guamúchil, Sinaloa, Mexico (1940-1960) (Chávez J, 2016, p. 1)

On the other hand, the case of the Évora Region, the situation is even more serious, it can be affirmed that the primary sector of Évora economy faces serious challenges, since it is one of the activities with the highest investment risks, because one side has to face climate-related problems, insecurity, the costs of inputs, market prices, marketing, financing coupled with the small capacity of small producers to organize themselves and generate greater added value to their production. Likewise, agriculture is not linked to the value chain; limited access to distribution channels; insufficient infrastructure to articulate agricultural production; a production that is not profitable, that is, it does not generate added value. However, the Évora Region has a wide variety of soils, which allows it to have a range of products subject to exploitation and important yields. Among these crops that provide good yields to the producer, we can mention the chickpea that, in addition to having acceptable yields, is considered to be the one with the highest quality worldwide. Thus, in terms of markets, it is no longer limited to a few, but according to an interview with Dr. Tomas Sánchez, president of the National Union of Garbanzo Producers and Exporters (UNPEG), it was previously thought only of Spain, Italy and Portugal as destinations, today, as they say in the Northwest region, "you can have 30 different points where to direct it". Also, the sectors of the market have been expanded, not only covering the large white chickpea, but also the one that can be industrialized in can or flour. The main leading states in the production of this legume are Sinaloa Sonora, Michoacán, Jalisco and Baja California, standing out for their quality and levels of production, the first of them especially in the Évora region located in the central-northern region of the state in the northwest of Mexico, and it is precisely there where the present investigation has its origin is here where the largest volume is obtained that is destined to the international markets mainly to Spain, Turkey and Algeria, since the per capita consumption in Mexico is 800 grams. "In the national market when a lot comes to consume about 10 percent of production, most of it is exported." In this environment, it can be said that our country, and particularly the state of Sinaloa in the Évora region, have before us the great problem of finding strategies that allow not only to produce high quality varieties, but to organize themselves in different schemes with the Firm purpose of adding value to the production of garbanzo. That is, the fundamental problem of this type of producers is that, to date, they have not been able to generate organizational schemes that allow them to pass from an agricultural to an agro-industrial economy that allows them to add value to their product.

This will also increase the price and generate an economic spill for producers, appropriate distribution channels and capitalize the regional economy by raising the quality of life of its inhabitants, this is the main problem and challenge to overcome by not only the Producers, but of government and higher education institutions who, when forming collaboration schemes, can achieve the above mentioned, it is necessary to generate added value.

4. CONCLUSIONS

The rural areas of the Évora region have valuable agricultural and human resources not yet used, which means an area of opportunity to improve the value chains of strategic products such as chickpeas; and thus face, the obstacles to unlocking the economic potential and generating employment; In this way, the value chains focused on the farmer / producer can help the rural population to leave subsistence agriculture and obtain the most lucrative profits and improve their competitive level and of course aspire to raise their quality of life. Agriculture to start contributing more to economic development requires more work in research and development, but there are no effective programs to achieve it. On the supply side, research institutes and universities do not have established programs for technology transfer that present flattering results. Therefore, there is no real link between those who are supposed to generate knowledge and those who demand it, that is, there are no programs that bring advances in research and development to the field. The above, coupled with ignorance of markets and marketing channels, high input costs as well as the low capacity of small producers to organize and generate associative schemes that allow in the medium and long term to add more value to their production; they make it more difficult for this activity to be linked to the value chain and to develop a brand of its own that will position Sinaloa's agricultural production in international markets. Therefore, it is necessary to make clear the concept of added value and value chain, therefore, we will understand value aggregation. To understand the concept of added value widely, we must emphasize some definitions that scholars have made of the subject, so we have to use this terminology (Máximo, 2014) illustrates us by referring to the Oxford Dictionary (s.f.), arguing that the concept of added value that approaches the economic, indicating that the added value is "the amount by which the value of a product increases in each stage of its production, excluding the initial costs". This definition includes as important aspects the monetary value of a product (or service) and the production process. On the other hand, from the previous paragraph it can be said that it is also taken up by the Food and Agriculture Organization of the United Nations (FAO) (2004) in a definition that, in spite of its conceptual inaccuracy with regard to the calculation of the added value, rescues two other relevant factors, the quality of the product and the consumer's perception and disposition of purchase: therefore, it can be said that "the added value comes from the difference between what it costs to put a product of certain characteristics in the market and what the customer is willing to pay for it, or what it perceives as value ". In response to the new trends in global agri-food markets and the growing demand for differentiated high-value products, from industries and consumers, was born in France in 1960 in the hands of a group of academics an instrument to improve coordination and distribution of agricultural products. The value chain is based on disaggregating in an orderly and coordinated manner the different activities of the company, in order to observe the activities that add value and observe its cost structure, to optimize them if possible and, look for ways to understand them within of competitive lace. The value chain seeks to unravel the competitive advantages of the company to enhance or rethink them; it is understood that a poorly ordered value chain hinders and obstructs the generation of competitive advantages. The term value chain may be associated with the study of relevant strategic activities to understand the behavior of costs and sources of differentiation, that is, analyze each of the components of the chain independently, identifying key points in which to earn competitiveness, to then put resources into action and generate sufficient capacities to

compete. Two useful definitions are those of Fabre (Fabre, 1994). Fabre defines the value chain as "the set of economic agents (or fractions of agents) that directly contribute to the production, processing and distribution, up to the consumer market, of the same product". It is recognized that the approach refers to the set of operations of production, processing, storage, distribution and marketing of inputs and products, including support services, also, the purpose is to formulate value-added strategies to increase the competitiveness of the chickpea of the Évora Region in the state of Sinaloa, allowing organizations to have a competitive product in the markets, developing value chains and contributing to the positioning of the product in question. The purpose on the other hand is to identify the elements that must be considered to generate added value in the chickpea product and what kind of strategies contribute to its generation in order to increase its competitiveness in this way. It is clear that it is important for the different processes to address the search for elements that add value to different goods and services and that this is retained by those who carry it out in order to create greater income opportunities, but also that this is shared among those involved in its creation, contributing thus to a higher quality of life and the development of economic and social. It is important from my point of view to consider that for agriculture to start contributing more to economic development requires more work in research and development, but there are no effective programs to achieve it. On the supply side, research institutes and universities do not have established programs for technology transfer that present flattering results. Therefore, there is no real link between those who are supposed to generate knowledge and those who demand it, that is, there are no programs that bring advances in research and development to the field. The above, coupled with ignorance of markets and marketing channels, high input costs as well as the low capacity of small producers to organize and generate associative schemes that allow in the medium and long term to add more value to their production; they make it more difficult for this activity to be linked to the value chain and to develop a brand of its own that will position Sinaloa's agricultural production in international markets. Likewise, the purpose is to formulate value added strategies to increase the competitiveness of the chickpea of the Évora Region in the state of Sinaloa, allowing organizations to have a competitive product in the markets, developing value chains and contributing to the positioning of the product in mention. Thus, the purpose on the other hand is to identify the elements that must be considered to generate added value in the chickpea product and what kind of strategies contribute to its generation to increase its competitiveness. It is worth recalling and insisting that in this context of globalization, new trends are required in the global agri-food markets, this leads to facing new challenges in the agricultural sector. In Mexico, globalization requires entering into new mechanisms to improve competitiveness in primary production that allow for: a relevant supply, in volume and quality appropriate to the demand in the markets; increase productivity; improve post-harvest processes; reduce production costs; and improve the organization of the sector (Peña, 2008). Likewise, an agriculture like Sinaloa that is not linked to the value chain, that is, that is totally dispersed and far from what happens not only in the national market of the food industry but in the global market; as well as limited access to distribution channels; insufficient infrastructure to articulate agricultural production; a little profitable production, does not generate added value; urgently requires changes to address what constitutes the main problem of competitiveness in primary production in Mexico and is an important part of this research. Finally, if we consider that in the coming decades one of the most important challenges for the agri-food systems of the world, especially for developing countries, will be to ensure sufficient food supply for their population, this will lead to facing new challenges in the agricultural sector and one of the most important options to achieve success is the development of value chains and the aggregation of this to achieve the required competitiveness and aspire to better levels of wellbeing for the population within the framework of regional development.

ABSTRACT

One of the trends in the development of the modern world economy is the active integration processes. The conclusion of regional integration agreements is dictated by the desire of the participating countries to create favorable conditions for the implementation of the policy of expanded reproduction, improvement of quality and ensuring the competitiveness of domestic products. There are the following models for implementing the integration potential of countries.

- 1. The development of backbone industries of the participating countries. The task of the integration association is the coordination of the choice of the backbone sectors of the economy, the joint development of which will create an additional economic effect.*
- 2. The joint development of mutually complementary branches of national economies in which there is production cooperation or there are potential opportunities for the formation of production chains.*
- 3. Joint development of industries using the competitive advantages of the countries of the integration association. This goal is most relevant in the interaction of countries with different levels of development.*
- 4. Development of industries of specialization based on the competitive advantages of the countries of the integration association. In the case when a country has a set of competitive advantages, sufficient saturation with the products of its market and the markets of the partner countries, then by agreement of the parties, the country's specialization in a particular production can be formed.*
- 5. Joint development of import-substituting industries. The goal of the integration association is to identify and agree on the list of industries and sectors with high potential for import substitution, in the development of which the countries of the association are interested in reducing economic dependence on foreign markets.*
- 6. Development of infrastructure for the expansion of mutual and foreign trade.*

Keywords: *economic integration, import-substituting industries, infrastructure projects, integration potential, specialization*

1. INTRODUCTION

One of the trends in the development of the modern world economy is the active integration processes taking place in it. The establishment of regional agreements is dictated by the desire of member countries to achieve certain economic benefits as a result of integration, including the creation of favorable conditions for implementing the policy of expanded reproduction, accelerating scientific and technological progress, improving quality and ensuring the competitiveness of domestic products and developing infrastructure.

The benefits of creating integration are higher, the more significant the reduction of tariffs in mutual trade will be; the deeper the differences between participating countries in the availability of productive resources and in other factors creating comparative advantages; the lower the barriers to the development of intraregional trade in relation to barriers that limit trade with third countries. In integration associations of developed countries, the share of intra-block trade is significant (for example, in the EU - 61%, NAFTA - 55%). Increased integration has a positive impact on intraregional trade in developing countries as well. For small economies, this effect can be enhanced by gaining access to large (pooled) markets. Thus, the formation of an integration cooperation strategy depends on the economic characteristics of the integrating countries, as well as on the goals that the countries creating the integration union are striving to achieve. The models of realization of the integration potential can be based on the achievement of an "economy of scale", a supplement effect, the development of infrastructure for the expansion of mutual and foreign trade.

2. REALIZATION OF THE INTEGRATION POTENTIAL MODELS BASED ON "ECONOMY OF SCALE"

Integration partner countries seek to take advantage of the "economy of scale", which implies lower costs as production increases, allows for increased market size, reduced transaction costs, and created a new combination of production factors (pro-competitive effect) (Schiff, 2003, pp. 33-34). These effects are most pronounced in the development of structure-forming and import-substituting sectors of the integrating countries.

2.1. The development of structure-forming industries

Structure-forming are understood to be the industries with the largest share in the GDP structure of countries whose production and sales of products or services have a significant impact on the state and development of economies. A prerequisite for the development of integration cooperation in this model is the presence of structure-forming sectors that are identical for all countries of the integration association, whose joint development will create an additional economic effect. For many developing economies, mainly in the African and Asian regions, agriculture remains the backbone industry, forming the bulk of the total national product and ensuring the inflow of a significant part of foreign exchange earnings. In this regard, the priority task for the countries of integration associations is the harmonization of national policies in the field of regulating industrial and agricultural development, the implementation of relevant programs and the implementation of projects aimed at increasing the potential in this area. Thus, the countries of the South Asian Association for Regional Cooperation (SAARC) are implementing a project initiated by the government of Nepal to introduce an agricultural products irrigation system. The main objective of this project is to create favorable conditions for land owners, thereby stimulating their entrepreneurial activity. The countries of the Economic Community of Central African States (ECCAS) adopted a program of regional food security, which includes the coordinated development of agriculture in the partner countries. A classic example of the backbone industry is energy, pouring out the priority direction for the development of relations between the member countries of the Shanghai Cooperation Organization (SCO). In the field of energy: the importance and relevance of establishing cooperation in the development of oil and gas fields and the construction of oil and gas pipelines is stated; "pilot projects", target groups and special working groups on the fuel and energy complex have been created (Aris, 2013, pp. 6-8). It is planned to create the Unified Energy System of the Central Asian countries, bringing together producers, consumers and suppliers of energy resources. One of the first projects in 2003 was the Kensiyak-Atyrau (China-Kazakhstan) oil pipeline, the purpose of which was to ensure the transportation of Kazakh oil to China, as well as its export to world markets.

The implementation of the next three pipelines led to the creation of the Kazakhstan-China Pipeline joint company, which was founded by Kaztransoil JSC and the China National Corporation for Oil and Gas Exploration and Development. In 2009, the Turkmenistan-China pipeline was commissioned, and the construction of a mega-project, the East-West gas pipeline, worth more than \$ 2 billion, began (Alimov, 2018, p. 118). The ECOWAS countries (Economic Community of West African States) in 2004 began construction of the Nigeria-Togo-Benin-Ghana gas pipeline (West Africa Gas Pipeline), which is of particular importance to both participating countries and for the whole community. Implementation of projects for the construction of gas and oil pipelines will create the opportunity to deliver energy from Nigeria to Benin, Togo and Ghana. This subregional network will provide clean and affordable energy to the growing markets of West African countries, and will promote the development of economic integration of the association. Also in January 2005, the West African Power Pool (WAPP) program was approved, which envisages the construction of new power plants and power lines. This program aims to ensure uninterrupted supply of competitively priced energy resources as the basis for the growth of the economies of the partner countries and their competitiveness. The project also aims to promote the growth of trade (electricity) between ECOWAS countries and the flow of foreign investment.

2.2. The development of priority and import-substituting industries

Under import-substituting means the industry, the share of products in the import of each country of the integration association is high. Countries can combine efforts and resources to organize and develop the production of similar competitive domestic products. An example of this model is the development in the ANZCERTA countries (Australia and New Zealand) of livestock industries, in particular cattle and sheep. In order to avoid rivalry in world markets, the countries signed agreements on the implementation of a harmonized policy in the agricultural sectors, providing for coordination of the parties' actions regarding measures of state support for agricultural producers, as well as cooperation in the export of agricultural products to third countries. At the same time, the joint development of import-substituting industries is most clearly revealed in the integration associations of developing countries or countries with economies in transition. Such countries often face problems with the balance of payments, since the share of imported goods in the domestic market is significant. In such a situation, complicated by problems of unemployment and capital outflows, from the point of view of long-term development, it becomes rational to stimulate the creation and development of national production and reduce the share of foreign products in the consumption structure. In 2009, the Bolivarian Alliance for the Peoples of Our America (ALBA) countries, Nicaragua, Venezuela, Dominica, Ecuador, Bolivia and Honduras organized a joint national food industry enterprise in the framework of the food security program of the countries of our America. The new company received an initial investment of \$ 49 million from the integration fund ALBA created during the global financial crisis in 2008. ALBA countries have signed agreements on the formation of mixed enterprises, which contribute to the technical equipment of the national enterprise and personnel training. The countries also agreed on joint investments in rural infrastructure and a joint policy on regional food distribution (Suggett, 2009).

3. MODELS OF REALIZATION OF THE INTEGRATION POTENTIAL, INVOLVING THE DEVELOPMENT OF COOPERATION BETWEEN COUNTRIES

With the development of regional economic integration, after a while, a situation arises in which combining only product markets becomes an insufficient basis for the competitive development of the participating countries. The potential of static integration effects, including the "scale effect", decreases. The close interrelation of partners in the sphere of industrial cooperation and the provision of national markets with mutual supply conditions stimulate the liberalization of

movement across national borders not only of goods, but also of other factors of production, including capital, labor, technology (effect of addition).

3.1. Joint development of complementary branches of national economies

Complementary are considered to be industries in which there is industrial cooperation or there are potential opportunities for the formation of production chains. Prerequisites for the creation of integration can be stable cooperative ties between economic entities of states, the presence of joint production of goods and services, as well as the specialization of integrating countries in the production of components or performing work at certain stages of the technological cycle. An example is the cooperation of Brazil and Argentina in the framework of MERCOSUR in the production of vehicles. Guided by a signed agreement, these countries jointly produce trucks and cars, while the assembly is carried out in Argentina using components from Brazil. Finished products are sold mainly in the domestic community market. Thus, according to the signed agreement, Brazil is committed to import 1.5 million Argentinean vehicles annually (Cobb, 2016). Partner countries can combine their efforts by harnessing each other's competitive advantages. This form of interaction is widely used in the interaction of countries with different levels of development, as is the case in NAFTA. Currently, NAFTA implements numerous projects in the fields of engineering, construction materials, energy, agriculture, where investments and technologies are supplied to the USA and Canada, and Mexico is the labor force. One of the leading industries in Mexico is currently the automotive industry. So, Mexico is the eighth country in the world in the production of cars and the fourth - in exports. More than 70% of exported products are sold in the markets of the NAFTA partner countries. There are 3 automobile plants of the Ford company, 3 of the Chrysler companies and 4 of General Motors located on the territory of Mexico (PwC, 2014).

3.2. The development of industries of specialization based on the competitive advantages of the countries of the integration Association

In the case when a country within the framework of an integration association has a set of competitive advantages sufficient for independent production of finished products, for saturating its market with it, as well as for the markets of partner countries and for exporting these products to the external market, then as part of an integration association to form a specialization of the country in a particular production. Specialization allows to optimize the use of available resources, to obtain economies of scale in the production, and also saves the country from the task of maintaining the development of all industries. The task of the integration association is the coordinated decision-making on the possibility of specialization in the production of certain types of products or sectors of those countries that can provide the integration association market with better, cheaper and more competitive products than the partner countries. An example of the development of industries of specialization based on the competitive advantages of the countries of the integration association is the European Union, where the following situation is observed: Germany, Italy, France, the United Kingdom specialize in the production of engineering, electrical and automobile products; on food - Italy, Spain, Greece; in the production of meat and dairy products - Denmark and the Netherlands; in the production of clothing, footwear and household appliances - Italy, Spain and Germany; in crop production and agricultural equipment manufacturing - the Netherlands; fish products - Denmark; in timber production - Finland; on coal mining - Poland and Germany; in aviation and pharmaceuticals - France, Germany, United Kingdom (Price, 1999). Thus, the development of the participating countries occurs as a result of "selective" competition within the framework of the integration bloc, to which foreign competitors from a limited number of countries (partner countries of the union) are allowed.

4. MODELS OF REALIZATION OF THE INTEGRATION POTENTIAL, INVOLVING THE DEVELOPMENT OF INFRASTRUCTURE FOR THE EXPANSION OF MUTUAL AND FOREIGN TRADE

As part of the construction and implementation of the strategy of integration cooperation, special attention is paid to the development of infrastructure. First of all, countries are making efforts to develop transport infrastructure, since the growing volumes of mutual trade in goods and services, as well as the movement of labor between integrating countries, require a corresponding increase in the capacity of international transport corridors along freight and passenger routes. An example of cooperation of the Asian region in the development of transport infrastructure is the implementation of the project "New Silk Road", which aims to connect the economies of China and the EU with a network of sea and land routes across the countries of the Eurasian Economic Union. To this aim, China has created the Silk Road Development Fund in the amount of \$ 40 billion, as well as the Asian Infrastructure Investment Bank, which began operating in 2016 (Scriba, 2013). Within the framework of the project, cooperation of the governments of the countries and institutional investors is expected. The estimated land project "One Belt, One Road", estimated at \$ 6.7 billion, will include the construction of roads and railways, pipelines and telecommunications networks passing through China, Central Asia and the Middle East, Russia, Belarus and the EU (Zhiltsov, 2015, p. 82). Of particular relevance is the development of information and communication infrastructure, connecting integrating countries into a single information space and creating new opportunities for cross-country interaction. To this model can also be attributed joint actions for information support, as well as for the promotion of products of an integration association to international markets. Thus, in the EU, the partnership in the field of public services is called the Public Value Service. It is represented by three components: non-market services (school education, social security), state obligations (security, justice) and services of general economic importance - communications, energy, transport, utilities. One of the largest infrastructure development programs in the EU framework is the Trans-European Networks (TEN) project, which combines energy (TEN-E), transport (TEN-T) and telecommunication (eTEN) projects (Baldwin, 1997). The role of this program is to increase the efficiency and competitiveness of the economies of European countries. Also, with the aim of stimulating research, enhancing innovation, supporting employment, the European Commission initiated a research program involving the implementation of projects in the fields of manufacturing, construction, and the automotive industry. Thus, in 2008, the international project "Joint Technical Initiatives" was launched to support research in nanoelectronics (ENIAK) and the development of onboard information systems (ARTEMIS). An example of cooperation between the countries of the European Union, Northern Europe, the Baltic States and Russia is the international project "Northern Dimension" in the framework of the Eastern Partnership. It envisages the development of interaction among countries in the following areas: public health and social welfare (NDPHS), transport and logistics (NDPTL), environmental activities (NDEP), culture (NDPC). The largest joint energy project was the Nord Stream project, which envisages the construction of a main pipeline between Russia and Germany under the Baltic Sea. This investment project is being implemented with the participation of Russian Gazprom (51%); German companies "E.ON" and "Wintershall" (15.5% each); French "GDF Suez" and Dutch "Gasunie" (9% each) (Klinova, 2012, p. 101). In 2000, the decision of the European Commission granted the project the status of the trans-European network TEN. Within the framework of G-20, it is planned to launch the Global Infrastructure Initiative, whose activities will be aimed at improving the efficiency and quality of the infrastructure being created. The program provides for the creation of a Global Infrastructure Center for the formation of cooperation between the governments of countries, institutional investors, including small and

medium enterprises, national, regional and multilateral development banks and other stakeholders in order to implement infrastructure projects.

5. CONCLUSION

To achieve the integration goal, an integration cooperation strategy is defined that determines the formation of the institutional, financial, organizational and other mechanisms necessary for the realization of the integration potential. With the development of integration processes and the achievement of goals, the strategy of integration cooperation may change. It may include new industries and areas of economic development of mutual interest. A decision may also be taken on the transition to more advanced stages of integration interaction, through which the necessary conditions and new forms of interaction between countries are being created that meet the goals and objectives set. The models of realization of the integration potential are based on achieving the "economy of scale", the effect of addition, the development of infrastructure for the expansion of mutual and foreign trade. At the same time, the main principle that countries are guided in creating the conditions for the implementation of the strategy of integration cooperation is economic feasibility. This does not imply the elimination of all barriers and the total harmonization of legislation regulating the economy, but the creation of favorable conditions for cooperation in areas relevant to the chosen strategy. Within the framework of these conditions, it becomes possible to implement specific interaction mechanisms in integrating sectors, which are aimed at the practical implementation of the strategy and the achievement of an integration economic effect.

ABSTRACT

Tourism sector accounts for roughly 30 percent of global trade in services. It is known that Azerbaijan, Kazakhstan, and Iran are oil rich countries. In recent years because of the oil price went down, it compelled these countries to develop the non-oil-gas sector. The tourism sector has assumed great importance among the non-oil-gas sectors. The tourism sector is of great importance by the standpoint of accelerating the social-economic and cultural development, increasing the employment level by producing the products in the branches of the service sector, providing with foreign direct investment and currency inflows. Because tourism is included in the composition of some economic activity types, especially service fields it affords the specific difficulties to evaluate its direct and indirect effects on the country's economy like the separate sector. We consider that Input-Output tables reflecting the inter-industrial relations and the models being worked out on these tables are very useful for conducting these types of analyses. In this study, the investments assigned to the tourism and its direct and indirect impacts to the other fields and outputs and employment level of these fields have been evaluated by means of models established on basis of Input-Output tables. Analysis of the results of simulations made with models gives the opportunity to define the efficiency of investments assigned to the tourism sector with respect to the other industries on each of the three countries separately. Afterward, the comparative analysis of the results of the models has been carried out.

Keywords: *Employment, Input-output model, investments, multiplier, tourism*

1. INTRODUCTION

One of the most significant economic sectors in the world is tourism sector. In 2017, tourism revenues in the world have been 1 trillion 317 billion 169 million US dollars. According to the UN World Tourism Organization, the number of people traveling around the world in 2017 has reached 722 million. This ratio has been the highest growth rate since 2010 in the last seven years (UNEWTO, 2018). According to the World Tourism and Travel Council, the share of the tourism sector in global GDP is 10,4%. The number of employees in this sector is 313 million and constitutes 9.9% of the total employment in the world (WTTC, 2018). The fall in oil prices in the world market has forced some oil countries to focus on the non-oil industries, particularly on the tourism sector. Azerbaijan, Kazakhstan, and Iran, in comparison with many countries, have significantly rich sources of historical, cultural and natural beauties.

At the same time, culinary culture and hospitality attract the attention of those involved in international tourism activities. Based on the results of the input-output simulation models of Azerbaijan, Kazakhstan and Iran, the following studies were carried out:

- The multiplicative effects of the change (1 million US dollars invested in the tourism sector for these countries) in the final product on the total output and on the level of employment (creation of new jobs) have been identified, their comparative analysis has been made and their advantages have been found;
- Effects of changes in the value-added norm (in the tourism sector) on the impact of economic activity reciprocally on price and inflation levels have been investigated;
- The multiplier effect of the 1% change in the final product in the tourism industry on the final product and total output of the economic activity has been identified and comparative analysis and its advantages have been conducted.

In order to solve the issues raised, Leonief's input-output analysis method and optimization method with linear programming have been used.

2. INPUT-OUTPUT METHOD

In the Western literature, intersectoral balance tables, called input-output tables, are widely used in the modeling of inter-sectoral interactions. The table of intersectoral balance has been compiled in the USSR for the first time in the world. The input-output tables are the result of the development of the balance method of analysis and planning. The mathematical model of intersectoral balance was developed by Wassily Leontief (Hasanli, 2011, p-8). The national economy of each country in the world has a complex system operating on the background of inter-sectoral relationships. The method of analyzing intersectoral relationships helps in solving the problem of combining micro and macroeconomic models in the study of economic processes. Input-output models developed on the basis of input-output tables are of great importance in the analysis and forecasting of inter-sectoral relations of the national economy. Most of the statistics collected in this table are data on intermediate product flows. Note that the input-output tables are considered a mirror of the economy. Input-output models are one of the methods used to study the reciprocal relationships between industrial sectors of the economy at the international, national or regional level. . Input-output analysis is a method used to calculate the required output level of industries in an economy in order to fully meet the demand for the products produced. That is, the output of an industry can be an input of one or more industries or even itself. In short, the output of an industry depends on the required input of other industries and the necessary inputs of an industry partially affect the output levels of other industries. (Erdogan, 2004, p-327). The United Nations (UN) regularly develops the methodology for the creation of "Input-output" tables suitable for today's market and proposes that the amendments to be made in the Member States should also be taken into account. (Руководства по составлению таблиц затрат-выпуска и их анализу, 2000, p. 304). The end of the past century after the 90s years "input-output" tables to be created on the basis of the rules of our country's social-economic system more comprehensive "Social Accounting matrices" (SAM) has been prepared. SAM is part of the System of National Accounts (SNA) and is created by state statistical institutions in a number of countries. The General Equilibrium Model (GEM), established on the basis of SAM, has an excellent structure. At present, GEM models are used in more than 100 countries around the world to analyze and anticipate the country's socio-economic indicators (including the estimate of different tax revenues of the state budget). The creation and implementation of GEM is based on Leontief's "Input-Output" model. A number of studies have been conducted in Azerbaijan based on the "Input-output" tables. After the declaration of the independence of the Republic of Azerbaijan, the first studies on the economy of Azerbaijan were carried out by Yadulla Hasanli (Hasanli, 2011), Imanov and

others (2006), Hasanli and Suleymanov (2007) with the help of the "Input-Output" tables (2006). However, these studies were carried out only on data for 2006 on 25 economic activities. With the input and output model the number of jobs increased in Azerbaijan has been examined by Abbasov and others (2007). In another study, comparative analyzes were made with the "Equilibrium Prices" model approach based on sectoral balance tables for the production and distribution of goods and services in the Azerbaijani economy in 2001 and 2006 (2010). Hasanli and Salihova (2017) examined the tourism sector's relationship with other sectors of the economy. Similar studies have also been made for the Republic of Kazakhstan. Thus, Hasanli and others have made a comparative analysis with the input-output model of the economies of Azerbaijan and Kazakhstan (2011). Then Bayzakov and others analyzed the input-output table for the years 2000-2011 (2014). Özdil and Turdaliyeva made a comparative analysis of the economies of Turkey and Kazakhstan with the input-output analysis approach and defined the sectors where the two countries could contribute to economic cooperation and trade in the benefit of the two countries if converted into cost advantages for both Turkey and Kazakhstan (2014). Many studies have been done with the input-output analysis approach for different sectors of the Turkish economy. Çakır and Bostan (2000), Dilber (2007), Sarıışık and others (2011), they investigated the effects of tourism on the Turkish economy. Hasanli and Salihova (2018) conducted a comparative analysis of the tourism sector of Azerbaijan, Kazakhstan and Turkey by using the input-output model. A similar study was conducted by Y. Hasanli and N. Moghsoudi (2011)(Moghsoudi N.,2011) for Iran.

3. THEORY AND METHODOLOGY

To achieve this goal, the Leontief input-output model (Leontief, 1979) and methodology recommended by the UN (2000) were taken as the basis. The input-output model makes it possible to determine the overall impact of various economic indicators (e.g. the final product) on other indicators (e.g. volume of commodity production, value added, level of employment, etc.). The Sectorial Input-Output table is composed of three parts:

- I part shows the mutual interconnections of sectors (rows indicates the intermediate goods, and the columns shows quantities of goods and services received from other industry sectors to perform their own production about to be intermediate consumption expenditures) (Calculation of GDP by production method);
- II part shows the components of the final product (consumption, investment, public expenditures, exports, imports) (Calculation of GDP by expenditure method);
- III part reflects the components of Value Added (wages, profit, depreciation, interest etc.), in other words, the calculation of GDP by income (Hasanli, 2011, p-17)

The input-output model of W. Leontief (Leontief, 1979) is as follows:

$$X = AX + Y \quad \text{or} \quad X = (E - A)^{-1}Y \quad (1)$$

Here, E- unit matrix, A- direct cost matrix. X- the total output of goods, Y – volume of final products. Inverse matrix $(E - A)^{-1}$ - is a total cost matrix. If we denote $(E - A)^{-1} = B$, we'll get $X = BY$. B- is a total cost matrix, also it is called Leontief matrix.

The following equation is used to determine the effect of any i-sector of the economy on the total output amount in the final product itself ($\Delta Y = (0, \dots, 0, \Delta y_i, 0, \dots, 0)$) and in other sectors ($\Delta X = \Delta x_i, \dots, \Delta x_{i-1}, \Delta x_i, \Delta x_{i+1}, \dots, \Delta x_n$):

$$\Delta X = B\Delta Y \quad (2)$$

The following equation is used to determine the impact of the change in the value-added of any i-sector of the economy on the price level in itself ($\Delta Y = (0, \dots, 0, \Delta v_i, 0, \dots, 0)$) and in other sectors ($\Delta P = \Delta p_i, \dots, \Delta p_{i-1}, \Delta p_i, \Delta p_{i+1}, \dots, \Delta p_n$):

$$\Delta P = B^T \Delta v \quad (3)$$

Here, the ΔP shows -price level, *the* Δv – value – added ratio, B is the transpose of the total expense matrix.

The effectiveness of the total output amount on the employment can be determined by the following equation:

$$\Delta L = t \Delta X \quad \text{or} \quad \Delta L = t B \Delta Y \quad (4)$$

Here, ΔY - indicates upcoming changes in employment (ΔL) as a result of the change in final product, t- is the direct labor density coefficient, in other words, the labor force needed to output a unit in each sector (person-hour, person-day, person-year).

4. EMIRICAL ESTIMATION IN THE CASE OF AZERBAIJAN, KAZAKHSTAN AND IRAN

In this study, according to the report published by the statistical institutions the “input-output” simulations models for the 15 sectors of Azerbaijan economy (ARDSK, 2006) (ARDSK, 2006), 29 sectors of Kazakhstan economy (ASRK, 2007) and 91 sectors of Iran economy based on the “input-output” tables were carried out.

Table 1: The results of the simulation model of Azerbaijan, Kazakhstan and Iran "input-output" (effect of \$ 1 million increase of final product in tourism sector on output amount and employment, 1 \$ = 1.7 AZN, 1\$=368.3 KZT and 1\$=42105 İRR).

Countries/Sectors	Effect on output quantity		Effect on employment Person/year	
	Directly	Multiplicator	Directly	Total
	Tourism industry	Across the country	Tourism industry	Across the country
Azerbaijan	1,3	1,81	309	391
Kazakhstan	1,4	1,98	143	248
Iran	1.13	1.60	1959	2239

As can be seen from Table 1, the effect of the increase of the \$ 1 million of the final product (Y) in the tourism sector in each of the three countries varies according to the country. The reason for the increase in the final product more multiplier effect (1,98) in the tourism sector in Kazakhstan that this effect is in Azerbaijan (1,81) and in Iran (1.60) in comparison with Kazakhstan, the indirect relationship with other sectors of the economy of the tourism sector can be interpreted as being weak. As a result of the same amount investment in the tourism sector in all three countries, the consequences have found that direct tourism sector will create the 391 workplaces (person-years) in Azerbaijan, in Iran and Kazakhstan respectively 248 and 2239 workplaces. Appropriate values obtained for Iran are higher than in comparison with Azerbaijan and Kazakhstan, and this stems from being low labor productivity and costs in Iran (by US dollar) compared to these two countries.

As mentioned above the number of business places to be more with the account of interest in Kazakhstan is due to the tourism sector and its products are used more than in Iran and Azerbaijan in other sectors of the economy.

Table 2: The results of the "Equilibrium Prices" simulation model of Azerbaijan, Kazakhstan and Iran (The effect of 1% increase in the value added of tourism sector on the price level of other sectors of the economy).

Countries/Sectors	Effect on price level,%	
	In tourism industry directly	Across the country
Azerbaijan	1,293	0,063
Kazakhstan	1,404	0,134
Iran	0,113	0,001

As can be seen from Table 2, the 1% increase in the value added in the tourism sector in Kazakhstan affects more the price level (inflation). Considering that Azerbaijan, Kazakhstan and Iran are petroleum countries, if the value added and or price level in the petroleum sector change, let's look at the simulation results in order to determine the effect of price changes on the price level (inflation) in the country through the "Equilibrium Prices" model.

Table 3: The results of the "Equilibrium Prices" simulation model of Azerbaijan, Kazakhstan and Iran.

Countries/Sectors	Effect on price level,%	
	Direct to oil industry	Across the country
Azerbaijan	1,0064	0,4100
Kazakhstan	1,170	0,272
Iran	1,0003	0,155

As can be seen from Table 3, the increase in the value added rate in the oil sector causes the price level (inflation) in Azerbaijan to be more affected than in Kazakhstan and in Iran. This result can be interpreted as the dependence of the Azerbaijan economy on the oil sector. In addition, the increase in the value added in the oil sector is due to the fact that the price increase in its sector is less than in Kazakhstan, because oil prices in Azerbaijan are under state control.

Table 4: The results of the "input-output" simulation of Azerbaijan, Kazakhstan and Iran (Effect of 1% increase in final product (Y) on output quantity in tourism sector).

Countries/ Sectors	Multiplier		The effect of total output amount,%		Effect on the total final product quantity,%
	In tourism industry	Across the country	In direct tourism industry	Across the country	
Azerbaijan	1.261	1,963	0.332	0.006	0.005
Kazakhstan	0.259	1,084	0.539	0.021	0.020
Iran	1.164	1.624	0.079	1.035	0.009

According to the simulation results obtained from Table 4, the high rate of multiplier ratios of Kazakhstan both on the country and on the sector shows that the interactions of the tourism sector with other sectors of the economy are stronger than other countries and have a sustainable economy. This result is also proof that Kazakhstan is less dependent on oil than in Azerbaijan and Iran.

5. SUMMARY

It is seen that the tourism sector started to increase its activity within the national economies starting from 2000 in the world. The impact of the tourism sector on the country's economies is increasing in parallel with the acceleration of globalization and people's view of tourism as an indispensable part of welfare and living standards. An increase in the final demand of the tourism sector leads to an increase in the production of both the sector and other related sectors. As a result of the analysis from the simulation models, The reason for the increase in the final product more multiplier effect in the tourism sector in Kazakhstan, in other countries in comparison with Kazakhstan, the indirect relationship with other sectors of the economy of the tourism sector can be interpreted as being weak. As a result of the same amount growth (1 mln US dollars) of the final product, the consequences have found that direct tourism sector will create more workplaces in Iran. This is due to the low labor productivity and costs in Iran compared to the other two countries. The number of business places to be more with the account of interest in Kazakhstan is due to the tourism sector and its products are used more in other sectors of the economy. The increase in the value added rate in tourism sector by 1% affects the level of price (inflation) in Kazakhstan both in the sector and in the country. Since the Azerbaijani economy is more dependent on petroleum, the increase in the value added rate in the oil sector causes the price level in Azerbaijan to be more affected than Kazakhstan and Iran. The increase in the value added in the oil sector is due to the fact that the price increase in its sector is less than in Kazakhstan, because oil prices in Azerbaijan and Iran are under state control. Considering the results, investment in the tourism sector in all three countries has a positive impact on the country's economy and other sectors of the economy. Thus, as the amount of capital to be included in the tourism sector increases, tourism revenues will increase. Intensive promotion and investment activities should be carried out in order to get a share from these increased revenues. In order to maintain these activities in a healthy and effective manner, economic sectors participating in tourism activities should be supported and correct economic policies should be followed.

PROBLEMS IN THE ENSURING MACRO-ECONOMIC STABILITY, FISCAL POLICY, PROVISION AND IMPROVEMENT OF ITS ACCOUNTING AND ANALYTICAL CHALLENGES IN THE REPUBLIC OF AZERBAIJAN

Qubadova Aybeniz Anver

Azerbaijan State University of Economics (UNEC), Azerbaijan
gubadovaa@gmail.com

ABSTRACT

The article considers concept of budgetary policy and explains the main forms of this policy by demonstrating its positive and negative effects on the state's fiscal system. Particular attention is given to analysis of main objectives of budget-tax or tax-budget policy, which is more commonly used in the Republic of Azerbaijan and the ways to achieve the effectiveness of budget system. Further, the paper notes the importance of applying SWOT analysis method in order to identify the strengths and weaknesses of the state, as well as its possibilities and threats. At the end, by investigating the given data on the state budget of Azerbaijan Republic, the author summarizes SWOT analysis, and constructs a table that combines the strengths and weaknesses of the fiscal policy, and also demonstrates the opportunities and threats facing the Republic of Azerbaijan.

Keywords: *Sustainable development, stability, fiscal policy, financial globalization, fiscal sustainability, tax-budget policy*

1. INTRODUCTION

As is well known, macro-level financial policy is divided into two: fiscal and monetary policies. Monetary policy pertains to money-credit policy, and fiscal policy is an actions plan that captures all the revenues and expenditures of the state (budget summary). The budget policy is an integral part of fiscal policy. However, in some literatures, financial policy implies only fiscal policy. On the other hand, western literature considers finance of enterprises and financial markets as a financial concept. Issues related to fiscal policy are studied within a public (or state) financial context. According to I.I. Mislyayeva, budgetary policy is determined effort implemented by the state party to manage the key development parameters of budget revenues and expenditures, including public debt. Group of scientists state that the purpose of the budget policy is to achieve sustainable and effective economic growth by optimizing tax collection and rational planning of budget expenditures. In some western literatures, the budget policy is understood as the main directions of the budget's revenue and expenditure policies. Here, the main direction of expenditure policy is being socially- and investment-oriented. At the same time, the substantive part of revenue policy is tax policy. The concept of budget-tax or tax-budget policy is more commonly used in the Republic of Azerbaijan, as well as in the CIS countries in general. This is primarily due to the fact that the budget policy (in the CIS countries, the budgetary policy is primarily understood as budget expenditures) in the CIS countries is determined only by the Ministry of Finance and the tax policy is determined by the Ministry of Taxes (or Tax Inspection). In the economic theory, there are two widespread forms of budgetary policy:

1. expansionist (incentive) - elimination of the periodic crisis by reduction of taxes or increase of budget expenditures,
2. restrictionist (restrictive)- restriction of the periodic growth of economy due to the securitization of budget expenditures or tax increases.

The positive results of the expansionist policy are the elimination of the cyclical crisis in a short-term, and the negative consequences are the increase in budget deficit and inflation, and tax burden on enterprises. The positive effects of restrictionist policy are the reduction in the budget deficit, the decline in inflation and tax burden on businesses, and the negative consequences are the increase in short-term unemployment and the threat of stagnation for long-run. Fiscal capacity refers to detecting and directing to the relevant destination of necessary funding in order to solve socio-economic problems facing the state in conditions of fiscal sustainability for medium- and long-term. At the same time, the difference between the current costs and possible costs should not lead to a decrease in the creditworthiness of the public sector. This explanation indicates that fiscal capacity is focused on identifying additional funding in the budget sector. The concept of fiscal capacity itself is not considered as a new concept. Fiscal capacity can be achieved as a result of the following measures : [1]

- by increasing revenue volumes, through expanding tax base, optimizing tax burden, raising tax rates,
- as a result of grants reduction received from abroad and the volume of public debt,
- through privatization of state property,
- at the expense of increasing the efficiency of tax collection coefficient and expenses, as a result of the fiscal decentralization,
- through cutting back unproductive expenditures.

2. THE ESSENCE OF FISCAL SUSTAINABILITY

The essence of the more fiscal sustainability conception, that have been a lot of discussed lately, is the equal use of revenues from oil or other natural resources (in a percent expression) for a long-term period. In the countries such as the Russian Federation, Kazakhstan and Azerbaijan, the concept, as a rule, is defined on the basis of specified form- the principle of unchanged real expenditures (or revenues). The main indicator used is the percentage ratio of revenues from oil to non-oil GDP and the non-oil budget deficit. Oil is taken conditionally. In this case, the indicator of percentage ratio could also be used on funds received from copper and other natural resources. There should be key criteria for the effectiveness of the budget system. The issue discussed cannot be the definition of criteria for only the efficient use of resources. The key criteria are the protection of fiscal discipline, proper allocation of resources in accordance with the targets set (allocation efficiency), economic efficiency of expenditures financed by the state budget and other budgetary systems. In other words, the effectiveness of budget system, on the one hand, is considered as a proper use of revenues from natural resource, and on the other hand, it refers to debt sustainability, long-term financing of retirement costs, improving the financial performance of state-owned enterprises, and the effect of tax regimes. Experience of Azerbaijan. It is known that the fiscal sustainability of the country demonstrates the volume of all government revenues. On this basis, firstly, it is necessary to clarify the oil components in the context of the summary budget. This category includes three elements of the state budget, the State Oil Fund's revenues and loans to the energy sector. These are the following [2].

State budget:

- SOCAR's taxes paid to state budget
- AIOC's taxes paid to state budget
- Transfers of SOFAZ to the state budget

State Oil Fund:

- SOFAZ's revenues.

3. MAIN DIRECTIONS OF FISCAL POLICY OF THE REPUBLIC OF AZERBAIJAN

The main directions of the country's budget (including tax) policy over the past few years are as follows:

- Macroeconomic indicators guiding the budget and tax policy in accordance with the macroeconomic environment emerged in the country in 2003-2009 reflects the determination of additional income sources to the state budget, expenditure priorities, maximum utilization of funds, increasing the direct participation and impact on management of economy, ensuring its flexibility, development of entrepreneurship, strengthening of financial discipline and transparency, avoidance of inflation, improving the application of targeted social assistance, raising living standards of the population, increasing their income and employment levels, poverty reduction, development of entrepreneurship and regions, as well as, creating financial opportunities for other state measures.
- The main objective of the budget and tax policy is to ensure that the state budget is used to improve the material well-being of the population, increase incomes and employment levels, manage the country 's economy, maximize efficient use of revenues in the medium- and long-term perspective, where the high profitability of the oil sector is achieved, strengthen financial discipline and ensuring transparency, as well as to provide sustainable development of the non - oil sector, increase the role of the state budget in the regulation of the economy, maintain the stable macroeconomic situation in the country, to achieve the possible reduction of financial, economic crises and inflation pressure, and make it the main financial source and economic instrument for stimulating its dynamic development[4].
- Another key purpose of the policy is to improve the state budget expenditures, to ensure that the growth rate of current expenditures does not exceed the growth rate of the non - oil sector of the economy, to promote perspective development along with current work, to ensure establishment of competitive economy and infrastructures, to increase the share of domestic resources in the investments attracted to the economy, and to afford the transition to the distribution of funds through medium-term programs. Minimizing tax discounts, expanding taxpayer circle, and continue efforts in order to reduce tax rates, in accordance with the international practice, are also among the main priorities.
- Complex macroeconomic measures have been taken to ensure economic growth in 2003-2010, to increase financial guarantee of state program for elimination of poverty and economic growth, to develop entrepreneurship, which is of particular importance to the regions, stimulate the export-oriented product production, as well as to meet the population's demand for food products at the expense of local sources through the development of the agriculture sector.

In 2016, The Ministry of Taxes contributed 7.15 billion manats to the state budget, while the forecast was estimated at 7.10 billion manats. During the reporting period, 77.05 percent of the taxes included to the budget was through non-oil sector and 22.95 percent- oil sector [4]. Compared to the same period of 2015, the total amount of tax revenues to the budget from non-oil sector increased by 7.5 percent (377 million manats). If we analyze the performance of tax revenues on payments in 2016, we can see that total tax revenues are mainly formed by VAT and income tax. Also, the increase in other payments, especially in revenue tax, had also affected the general tax receipts.

Figure following on the next page

Figure 1: Non-oil tax receipts, mln. manats

It is possible to observe the decrease in transfers from the AR Oil Fund in the structure of budget revenues for 2016. While the share of transfers from the Oil Fund in the budget revenues in 2015 was 47.4 percent, in 2016 this figure dropped by 3.9 percent and was 43.5 percent. In 2016, 65.9% of state budget expenditures were directed to current expenditures, 24.1% to capital expenditures, and 10.0% to the services related with state debt and liabilities. Also, 35.2% of these expenditures were directed to the financing of social expenditures, i.e. labor payment fund, pensions and social benefits, medicines and food costs and this is 10.1 % more, in comparison with the same spendings in 2015. The total volume of the state budget deficit is 241.2 million manats.

Figure 2: The structure of state budget revenues in 2016

Figure 3 demonstrates the structure of tax revenues by oil and non-oil sector in tax payments to the state budget during the years of 2012-2016. Here we can see clearly that the volume of tax revenues by non-oil sector is steadily growing. Although, revenues from oil and non-oil sector in total tax revenues amounted to approximately the same volume in 2012, there was a significant increase in non-oil sector revenues in 2016.

Figure 3: Dynamics of gross, oil and non-oil tax receipts, mln. manats

4. FORMATION STEPS OF TAX SYSTEM IN THE BUDGET ORGANIZATION PROCESS OF AR

4.1. SWOT analysis of fiscal policy

Several concepts and methods currently applied in fiscal policies have been taken from the private sector. One of these methods is SWOT (Strengths, Weaknesses, Opportunities, Threats) analysis. The purpose of applying this method is to identify the strengths and weaknesses of organization, as well as its possibilities and threats. SWOT is divided into internal (strengths and weaknesses) and external (opportunities and threats) blocks. The strengths of Azerbaijan's fiscal policy are a low level of tax rates, the level of public debt, including external debt, budget deficit and tax burden being below the limit accepted in international experience, as well as, significant increase in the share of direct taxes in recent years, and existence of a specific body (Chamber of Accounts) that can audit the budget. At the same time, significant dependence on oil revenues (including the transfers from State Oil Fund), insufficient funding of social insurance deductions to meet SSPF costs, increase in external debt per capita, raising the debt limit by 3 times, predicting the overall budget deficit at the rate of 10% of GDP can be regarded as weaknesses of Azerbaijan's fiscal policy. The opportunities facing the fiscal policy of Azerbaijan are the expansion of the tax base through development of the real sector, especially the non-oil sector, as well as coordination of budget expenditures with socio-economic targets and increase in effectiveness of expenditures as a result of application of the targeted program budget conception. The threats facing the fiscal policy of Azerbaijan are the SOFAZ's transfers to compensate significant budget losses as a result of sharp fluctuations in crude oil prices on the world market, credits, subsidies, loans and dotations to state-owned enterprises suffered during the global financial crisis and increase in the budget deficit and expenditures with this regard. The following table summarizes SWOT analysis, that combines the strengths and weaknesses of the fiscal policy, as well as the opportunities and threats facing the Republic of Azerbaijan.

Table 1: SWOT analysis summary

	Opportunities	Threats
Strengths	Extension of the tax base for the medium- and long-term period as a result of full or partial exemption of taxes for non-oil sector	Making amendments within the expenditure items of functional and economic classification without exceeding the limit of existing budget expenditures, in order to reduce the likelihood of transferring funds from the budget to the state-owned enterprises suffered during world financial crises
Weaknesses	It is possible to take advantage of the opportunity of long-term use of oil revenues as a result of applying the principle of non-exchangeable real revenue (or expenditure), used as one of the main forms of fiscal sustainability. At the same time, this condition would reduce the dependence of the state budget on oil.	The "golden rule", defined by the legislation for maintaining the overall budget and public debt limit at a normal level (for making changes every year) - defining the limits of deficit and debt for a long-term period.

ABSTRACT

In this article, based on the latest data obtained from the UN, the Organization for Economic Co-operation and Development (OECD) and the State Statistical Committee of the Republic of Azerbaijan, the current state of the international migration of population and labor resources worldwide is statistically investigated, the issues related to the profiles and trends of international migration of population and labor resources, the value and benefits of labor migration, the age and sex of migrants, the social implications of emigration, and the regulation of migration are analyzed, and the influence degree of key factors impacting on the formation of migration flows is evaluated by the way of creating an econometric model with the help of SPSS software package on the basis of statistical data.

Keywords: *analytical analysis, international migration, econometric model, statistical analysis*

1. INTRODUCTION

The process of international migration of population and labor is one of the topical issues of the contemporary world. So, in the modern world, migration is a multifaceted process that affects all aspects of society. Migration has become a large-scale social process rather than the unstable displacement of population due to the reasons such as military and religious conflicts, as well as search for new jobs. Why do we need a statistical study of migration? In fact, the growth rate of migration directly influences the population size, its demographic characteristics, its national and religious composition, the quantity and quality of labor resources, the formation of labor market, as well as the living standards of the family members of migrants in their native countries. Moreover, migration is considered to be one of the most complex elements of international economic relations as the object and the observation unit is human, and has economic, demographic, social, psychological impact on both donor and recipient countries. The economic consequences of migration are reflected in the fact that migrants are active participants in the labor market and migrants' money transfer in many countries is a crucial factor for the growth of income of population and the development of these countries. If there is no reliable information on migration (especially if its volume is significant), it is difficult to predict the population size (Statistics on international migration, 2011, p 11). One of the most important issues in the study of migration processes is the consideration of problems with respect to labor resources flow. The essence of the international migration of the labor force consists of the movement (migration) of labor resources from one country to another in order to make a more favorable employment in the country. Labor migration is an objective process that is inherent in the market economy. Migration is also an objective process like capital flow between countries, expansion of foreign economic relations, international economic integration, etc. In accordance with market laws, labor resources seek a place of application to gain the maximum profit. Such a place is usually standing outside of the homeland and so, they have to change their permanent residence. Unlike other economic resources, labor resources are both objects and subjects of international economic relations.

2. LITERATURE REVIEW

I.V. Ivakhnyuk (Ivakhnyuk ,2011, pp. 29-36) states that the international migration of the population can be one of the most important sources of economic growth or the cause of the socio-economic crisis in any country. In recent years there have been considerable changes in use and structure of the migration flows. M.B. Denisenko, V.A. Iontsev and B.S. Khorev (Denisenko, Iontsev , Khorev,1989, p 96)show that so far, it has not been possible to establish a single methodological approach in order to describe migration processes. S.V. Ryazantsev, V.A. Iontsev, L.B Karacurina *et al.* (Rybakovsky L.L., Iontsev V.A., Karachurina L.B. et al. ,2001)consider that existing theories have independently developed, that is, they describe only some aspects of migration. However, these theories play a major role in understanding the essence of modern migration processes and their impact on the labor markets. Different opinions have been suggested about the identification and classification of the factors affecting the population migration. P. E. Prokhorov and N.D. Epstein (Prokhorov , Epstein ,2016, pp 9-18) claim that some researchers divide factors affecting migration into attractive or pushing, economic or non-economic, objective or subjective factors. For example, the well-known scientist V.I. Perevedentsev (Perevedentsev,1975, pp 107-108) divided the factors affecting the migration of the population into natural and public / social factors and showed that these factors had emerged from the territorial differences, which are considered to be substantial for living standards. In his opinion, natural factors affecting population migration are the territorial differences in natural conditions and social factors are the territorial differences in a social environment. In this sense, he classified natural factors into six subgroups such as orographic, landscape, hydrological, geological, climatic and zoogeographic. Other researchers pay particular attention to push and pull factors ("pull-push") as factors affecting migration.O.D.Vorobeva (Vorobeva ,2003) notes if people leave their region for going to the region with high living standards (as a result of the combination of natural and economic conditions), this called a pull factor. Moscovyn believes that in recent years, labor migration has been shaped by the influence of demographic factors. (Prokhorov , Epstein ,2016, pp 9-18)

3. STATISTICAL ANALYSIS OF DYNAMICS OF THE INTERNATIONAL MIGRATION OF POPULATION AND WORKING ENVIRONMENT

There is a need for data on quantitative indicators of migration to assess the influence of migration on the current situation and predict future effects. Migration has always existed, but over the past 20 years it has been subject to quantitative and qualitative changes. Analysis of the UN data shows that in recent years, the number of international migrants worldwide has increased year over year. So, the number of international migrants has increased to 173 million in 2000, 191 million in 2005, and 220 million in 2010. In 2015 compared to 2000, the number of international migrants and refugees reached 248 million increasing by 71 million or 43.3 percent, to le. At the same time, for 15 years their share in the world population has grown from 2.8% to 3.3%. In 2017, the number of international migrants was 258 million. According to the UN experts, the world population will continue to grow in the medium term perspective and in 2050 the total number of population will reach 9.7 billion people. If the proportion of international migrants remains constant in the world population, then by 2050, the number of migrants worldwide will reach 321 million (Efendiyev , Veliyev, 2018, pp.92-98). Countries with high socio-economic development status (especially, USA, Australia, Canada, all Western European states, as well as states with high incomes from oil and gas sales and countries with rapid economic growth (Saudi Arabia, Kuwait, United Arab Emirates , Qatar, etc.) act as the geographical centers of immigration. Geographical analyses show that 60% of all international migrants live in Asia and Europe. In 2017, 79.6 million of international migrants were in Asia, 77.9 million in Europe, 57.7 million in North America, and 24.7 million in Africa, 9.5 million people lived in Latin America and the Caribbean, and 8.4 million in Oceania (Figure 1).

Figure 1: The number of international migrants in the destination region in 2000 and 2017 (millions) (Authors)

In 2017 compared to 2000, the number of international migrants increased by 30.4 million or 61.8% in Asia, by 21.6 million or 38.4% in Europe, 17.3 million or 42.8 % in North America, 9.9 million or 66.9% in Africa, 2.9 million or 43.9% in Latin America and the Caribbean, and 3 million or 2.5 times in Oceania. Almost half of all international migrants worldwide are females. Thus, in 2000, 49,3% of international migrants were females, and in 2017 this figure was 48,4%. In 2017, the median age of international migrants was 39,2 years. (United Nations, 2017)

Table 1: Females among international migrants and median age of international migrants in 2000 and 2017

Major area, region, country or area of destination	Number of international migrants (thousands)		International migrants as percentage of total population		Females among international migrants (percentage)		Median age of international migrants (years)	
	2000	2017	2000	2017	2000	2017	2000	2017
World	172,604	257,715	2.8	3.4	49.3	48.4	38.0	39.2
More developed regions	103,418	145,984	8.7	11.6	51.1	51.8	40.0	43.4
Less developed regions	69,186	111,732	1.4	1.8	46.6	43.9	34.8	34.3
Least developed countries	10,073	14,442	1.5	1.4	50.0	50.4	26.9	29.7
Less developed regions, excl. least developed countries	59,155	97,331	1.4	1.8	46.0	42.9	36.2	34.9
High-income countries	100,405	164,847	9.6	14.1	49.0	47.7	38.5	40.6
Middle-income countries	64,042	81,440	1.4	1.4	49.6	49.3	38.5	37.3
Low-income countries	7,733	10,915	1.8	1.6	50.5	50.9	27.1	29.8

In 2017, 165 million international migrants or 64% settled in high-income countries, 81 million or 32% in middle-income countries, 12 million or 4% in low-income countries. For comparison, it should be noted that in 2000 the level of these indicators was 58%, 37% and 5%, respectively.

The main direction of the international migration flow is the developed country, especially the US. According to Statistics from the United Nations Department of Social and Economic Affairs (UN DESA), one out of every 5 people who left their homeland for some reason, lives in the United States. In 2017, the flow grew stronger and the number of migrants in the United States reached 49, 8 million, which is about 19% of all migrants. According to the number of international migrants, Russia is among the world's first four countries. In 2017, Russia is in the fourth place after the United States, Germany and Saudi Arabia. Nearly 12 million migrants live in Germany, Saudi Arabia and Russia. The Central Bank of Russia states that the volume of personal money transfers by physical persons from Russia in 2017 amounted to \$ 21.7 billion. In recent years, the United Kingdom, United Arab Emirates, France, Canada and other countries are among the countries that host international migrants. In 2017, the vast majority of migrants - more than 17 million are from India. The second place has been taken by about 13 million Mexicans. Approximately 6-11 million migrants are from China, Bangladesh, Ukraine, Syria, Pakistan and Russia (United Nations 2017). Migration processes are the main factor of social transformation and development in both the host and native countries. Labor force migration holds a leading position in the system of migration processes and expressed as labor migration in the economic literature. It is difficult to keep accurate records of the international labor migration, because it is hard to determine the exact number of illegal migrants, although it is easy to calculate the number and composition of those who legally migrate to live and work in another country. The total number of migrants is always determined by certain predictability. According to the reports of the Organization for Economic Co-operation and Development (OECD) dated November 23, 2018, the number of immigrants in the status of workforce has been as follows: (<http://www.OECD.org/statistics>.)

Table 2: Number of migrant workers (in person) in 2017

Country of birth	Africa	Asia	Europe	North America	Oceania	South and Central America and Caribbean	Other and unknown places of birth

As you can see from the table, there are 852.3 million migrant workers worldwide. 217.2 million or 25.5% of these migrants have lived in the United States, 108.2 million or 12.7% in Japan, 68.1 million or 8.0% in Germany, 62.8 million or 7.4% in Mexico, 48.9 million or 5.7% in Italy, 48.0 million or 5.6% in France, 47.7 million or 5.6% in the United Kingdom, 47.6 million or 5.6% in Turkey, 203.7 million or 23.9% in Spain, Poland, Canada, Australia, the Netherlands, Greece, Portugal, the Czech Republic, Hungary and other countries. About 6.8 million or 0.8% of migrant workers in the world were born in Africa, 123.1 million or 14.4% in Asia, 411 million or 48.3% in Europe, 206.2 million or 24.2% in North America, 13.5 million or 1.6% in Oceania, 81.4 million or 9.6% in South and Central America and the Caribbean, 9.5 million and 1.1% other and unknown places. By affecting native countries of migrants in different ways, labor migration results in the decrease of labor force, as well as migrants' money transfer to their family members. In 2016, the amount of money transfer by international migrants to their family members was \$ 601 billion. This amount is twice as much as the overall amount of foreign financial aid provided all over the world and is equivalent to the total amount of foreign investment. The migration process of the labor force in every state is an important source of foreign currency inputs to the country.

4. STATISTICAL ANALYSIS OF THE INTERNATIONAL MIGRATION OF POPULATION IN THE REPUBLIC OF AZERBAIJAN

4.1 Statistical analysis of the international migration of population in the Republic of Azerbaijan

With regard to the transition to the innovative development direction of the Republic of Azerbaijan and its regions, migration flow management has become one of the important duties of socioeconomic development. In 2005, the number of emigrants who leave for permanent residence from the country was 2000, and in 2017 this number was 3100. On the contrary, the number of emigrants leaving Azerbaijan to live permanently has decreased: in 2005 the number of Azerbaijani migrants was 2900, but in 2017 this figure was 1900. However, despite the fact that the number of people leaving Azerbaijan for permanent residence in 2005 - 2014 declined from year to year (72.4% decrease in 2017 compared to 2005), 2015 - 2017, its dynamics has increased in comparison with 2014 by 2 times in 2015, compared to 2015 by 6.3% in 2016, compared to 2016, by 11.8% in 2017. The analysis of sex and age composition of emigrants leaving the Republic of Azerbaijan in 2009-2017 shows that the number of women dominates. 55% of emigrants in 2009, 55.6% in 2010, 52.0% in 2012, 51.8% in 2012, 60.9% in 2013, 57.6% in 2014, 59.2% in 2015, 52.2% in 2016 and 70% in 2017 are women. The majority of emigrants (about 82%) are between 25-29 and 30-34, and most of them (59 %) are from urban areas. The main reason for this is the fact that men who leave the country have not left the registration in their permanent residence (Report on the Study of the Situation of the Wives and Other Family Members of Azerbaijani Migrants working and living outside the borders of Azerbaijan, 2013, p.18). Most of those who left Azerbaijan for permanent residence in recent years are Russians who migrate to Russia. The number of emigrants leaving for Kazakhstan and Turkey is significantly high, and thousands of our compatriots live and work in the United States and Western Europe. At the same time, businessmen from different countries of the world (US, Turkey, Russia, etc.) come to Azerbaijan to work and live. The following official information provided by the State Statistical Committee of the Republic of Azerbaijan reaffirms the abovementioned figures: (<http://www.stat.gov>).

Table following on the next page

Table 3: Distribution of migrants coming to Azerbaijan and leaving Azerbaijan for permanent residence in the years 2014-2017 (person)

	Immigrants who came to settle permanently in Azerbaijan				Emigrants who left Azerbaijan to settle permanently in another country			
	2014	2015	2016	2017	2014	2015	2016	2017
Total	1859	2649	3233	3073	795	1557	1711	1901
United States of America	7	3	9	5	12	20	28	29
Germany	16	12	8	10	33	17	22	25
Belarus	4	5	14	13	11	52	61	68
Estonia	-	-	-	1	-	1	2	1
Georgia	490	782	1134	830	13	17	27	31
Iran	106	144	145	103	-	-	-	-
Israel	8	3	6	3	8	3	10	8
Kazakhstan	81	103	132	157	99	482	502	474
Kyrgyzstan	16	33	46	51	8	10	12	22
Latvia	2	2	2	-	1	1	2	1

Moldova	5	13	18	22	7	9	12	19
Uzbekistan	68	95	116	136	33	20	23	31
Pakistan	22	30	19	22	-	-	-	-
Russian Federation	623	930	910	988	443	782	816	920
Tajikistan	9	8	7	11	-	-	-	-
Turkey	160	164	214	288	39	66	97	101
Turkmenistan	48	50	124	115	16	17	19	28
Ukraine	72	99	126	149	35	22	29	102
to other foreign countries	120	167	200	166	36	38	49	41
CIS countries	926	1336	1493	1642	652	1394	1474	1664
Other foreign countries	933	1313	1740	1431	143	163	237	237

As it is seen from the table, 988 out of the 3073 migrants or 32.1% who came to Azerbaijan for permanent residence in 2017 were from Russia, 830 migrants or 27% from Georgia, 288 migrants or 9.4% from Turkey, 157 migrants or 5, 1% from Kazakhstan, 149 migrants or 4.8% from Ukraine and 21.6% from Iran, Uzbekistan, Turkmenistan and other foreign countries. In total, 1642 migrants or 53.4% of migrants came from CIS countries and 1431 migrants or 46.6% came from other foreign countries. The Russian Federation is a major destination country for migrants from Azerbaijan. 443 out of 795 migrants or 55.7%, who left Azerbaijan in 2014, 50.2% or 782 out of 1557 migrants in 2015, 48.4% or 816 out of 1711 in 2016, went to Russia to live permanently. In 2017, 920 people or 48.4% of 1901 migrants left Azerbaijan for permanent residence in Russia, 474 or 24.9% in Kazakhstan, 101 people or 5.3% in Turkey, 102 people or 5.4% in Ukraine, 304 or 16% in the US, Germany, Belarus, Georgia and other foreign countries. In total, 1664 or 87.5% of migrants went to CIS countries and 237 or 12.5% went to other countries.

4.2. Econometric analysis of fundamental factors affecting population migration in the Republic of Azerbaijan

The correlation and regression method is of great importance in assessing the impact of the factors affecting the migration flow and determining its direction. Based on the statistical data provided by the State Statistical Committee of the Republic of Azerbaijan on the number of migrants, unemployment rate and average monthly nominal wage in 2008-2017, we compiled Table 5 for correlation - regression analysis and econometric modeling with the help of the SPSS software package:

Table 4: The number of people leaving the Republic of Azerbaijan, the number of unemployed and average monthly wage in 2008 – 2017

Years	Number of migrants from Azerbaijan (thousands)	Number of the unemployed (thousands)	Nominal_salary (manats)
2008	2,5	262,2	268,0
2009	1,4	260,2	298,0
2010	0,8	258,3	325,0
2011	0,5	250,9	356,6
2012	0,2	243,1	391,4
2013	0,8	236,6	419,0
2014	0,8	237,8	442,1
2015	1,6	243,7	462,0
2016	1,7	252,8	494,3
2017	1,9	251,7	525,0

Based on the correlation and regression analysis conducted with the help of the SPSS software package, the following results have been achieved:

Table 5: Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.659 ^a	.434	.272	6.09652	1.105

a. Predictors: (Constant), unemployed_number, nominal_salary

b. Dependent Variable: number_of_migrants

The correlation coefficient (R) 0, 659 indicates that there is a significant relationship between the number of people leaving the country and the unemployment rate and the average monthly nominal wage. The value of the calculated determinant (R square) is equal to 0.434, indicating that 43.4% of the variation is related to the model, and 56.6% are related to non-model factors in migration processes.

Table 6: Coefficients^a

Model	Unstandardized Coefficients		Standardized Coefficients			95.0% Confidence Interval for B		Collinearity Statistics	
	B	Std. Error				Lower Bound	Upper Bound	Tolerance	VIF
1									
(Constant)	-159.074	74.290		-2.141	.070	-334.742	16.595		
Nominal_salary	.004	.003	.469	1.365	.215	-.003	.011	.685	1.460
Unemployed_number	.062	.027	.795	2.315	.054	-.001	.126	.685	1.460

a. Dependent Variable: number_of_migrant

The following econometric model has been established as the equation of the relationship between the number of people leaving the country (\bar{y}) and the unemployment level (x_1) and average monthly nominal wage (x_2): $\bar{y} = -159,074 + 0,062 x_1 + 0,004 x_2$ This shows that the increase in the number of unemployed in the country by one thousand means the increase in the number of people leaving the country by 62. The decrease in the average monthly nominal wage by one manat causes the increase in the number of people leaving the country by four. Thus, the correlation-regression analysis finds that other social, economic, ethnic, historical factors, along with the above-mentioned factors affect migration flows in the country.

5. CONCLUSION

In the Article, only statistical analysis based on official statistics (except for illegal migration) proves that the magnitude and intensity of international migration of the population and labor resources has increased in the recent years. The main direction of the international migration flow is the developed countries, especially the US. There have been some changes in the origins and composition of migrants in different periods of history. Such changes are shaped by the position, opportunities of both donor and recipient countries in the modern world, as well as historically existing ethnic, geographical and historical relations between countries. Researches show that three-quarters of international migrants are migrant workers. Since labor migration is directly related to the country's labor potential formation and development issues, it has a decisive impact on the socio-economic progress of the society. Labor migration influences migrants' native countries in various forms, and largely causes to the decrease in labor force, as well as migrants' money transfer to their family members. Although the number of people coming to Azerbaijan for permanent residence has been increasing year by year and there is a decline in the dynamics of the number of people who migrate from Azerbaijan to live permanently in another country year by year, their number has grown again. Increase in the number of people leaving the country has been affected by impressive and pushing factors. The significant factors change depending on the destination country. For example, these factors for Russia are the common language, personal relations and visa-free regime. The attractive factors regarding Turkey can be the lingual, cultural, social and historical similarities between two countries. Pushing factors include economic factors, high unemployment, average wages, as well as the Upper-Karabakh conflict, the migration of acquaintances or relatives, and the desire to improve the financial situation. In addition, migration is influenced by social and ethnic factors.

ABSTRACT

In order to ensure national security, uninterrupted functioning of the economy, market regulation and price stabilization, practically all countries of the world have created strategic reserves of raw materials. To finance the costs of maintaining and increasing strategic reserves of raw materials, it is advisable to attract funds from the public through the issuance of new financial assets secured by state-controlled stocks of raw materials. For example, receipts giving the right to receive a certain amount equal to the value of the "basket of goods". The value of the asset should be determined on the basis of the range and volume of goods included in the stabilization reserves, as well as their market prices. Being provided with strategic reserves such financial assets can be used to protect cash savings from inflation. The proposed asset will be particularly attractive in a crisis with a limited choice of reliable instruments for investment. In addition, the expansion of government procurement of raw materials in a crisis situation will provide support for certain sectors of the economy. The funds raised can also be used to take measures to ensure the stability of a new financial asset. This will reduce the financial burden on the state budget for the formation of strategic reserves. The introduction of our proposed system will improve the efficiency of commodity price regulation in national economies, significantly expanding the countries' ability to conduct joint commodity interventions to influence price movements in international commodity markets.

Keywords: *commodity interventions, price regulation, state strategic reserves*

1. INTRODUCTION

In order to ensure national security, strategic reserves have been created by almost all countries of the world. Stocks of raw materials, food and fuel were initially formed in case of unforeseen critical situations, such as wars or natural disasters. However, over time, the assignment of strategic reserves has changed somewhat. In modern conditions, state-controlled reserves are a tool to ensure the smooth functioning of the economy, market regulation, price stabilization. Many economists have considered the possibility of stabilizing at the expense of material and commodity reserves in the financial sphere (both at the level of individual countries and globally). So, F. Hayek proposed to create conditions for the introduction into circulation on the basis of the commodity basket of additional monetary units emitted by private business structures. According to the draft scientist, any organization should have the right to issue its own banknotes. The stability of the new currencies was planned to ensure due to their binding to the commodity basket. Each issuer could determine for itself the optimal basket of goods. The purchasing power of the monetary unit was supposed to be maintained at a constant level in relation to the selected commodity basket. The regulation was supposed to be carried out by means of carrying out commodity and currency interventions, as well as adjustments of the

credit policy conducted by issuing companies (banks). It is obvious that the most reliable and not subject to depreciation of banknotes produced by private companies could be in demand (Hayek, 1996). In the mid-fifties of the last century, the economic community was presented with the theory that raw materials stocks should have become the guarantee for the release of the national currency. According to the concept of the scientist, the multi-commodity standard system was to ensure the accumulation of stocks of raw materials and the stability of the national currency. The issue of money in the economy of the country was to be limited to a fixed number of warehouse warrants for a certain amount of stored stocks of raw materials. The plan envisaged the formation of a commodity basket of twenty-five products. It was assumed that the money will be issued only under the full range of products. At the same time, the total price of the basket should have remained fixed, despite possible fluctuations in prices for certain types of raw materials (Graham, 1945). The main provisions of the concept of B. Graham were criticized by many scholars of various economic schools. Firstly, it is controversial to conclude that by regulating the amount of money in circulation it is possible to maintain a constant price level of the product basket. Secondly, the additional issue of cash for government purchases of commodities in an economic downturn can contribute to a significant increase in the level of inflation in the national economy. However, this theory was further developed at the end of the last century. So, J. Soros proposed to introduce into circulation an international currency provided with buffer stocks of crude oil (Soros, 1996). B. Lietar considered the possibility of creating a world currency based on a standard set of constantly renewable inventories created for the normal functioning of national economies, price stabilization, and food security. It was supposed to include various types of metals, oil, grain crops and other raw materials into such a basket (Lietar, 2007). However, these approaches were criticized by modern economists. Emission of currency secured by tangible assets will be limited. Consequently, the money supply of such a currency may not be enough to service trade and capital flows, both at the international level and at the level of national economies. Currency issuance must meet the cash needs of the community. But if this condition is observed, the very fact of its material security may be questioned. Moreover, such a currency will be subject to depreciation, as any national. Therefore, in later works, supporters of the multi-commodity standard more often considered the possibility of creating currencies for which a single commodity or commodity basket could become a value equivalent (no material support was provided for). For example, P. Kuznetsov in his work considered the possibility of creating a supranational currency, the equivalent of the value of which was to become kilowatt-hour (Kuznetsov, 1997, p.4). V. Burlachkov, on the basis of the analysis carried out, concluded that the purchasing power of a supranational currency (artificial monetary indicator) should be determined by the price dynamics for the main international trade goods (Burlachkov, 2012, p.151-154). We believe that in modern conditions, limiting the issue of money by tangible assets is not relevant, since it reduces the effectiveness of financial regulation. However, stabilization reserves created both at the level of the state and private companies can serve as material support for issuing a new financial asset with a limited scope of application. This asset can be a tool for attracting financial resources for servicing and increasing stabilization reserves, as well as a means of protecting savings from inflation.

2. WAYS TO IMPROVE THE EFFECTIVENESS OF THE SYSTEM OF STABILIZATION RESERVES AT THE STATE LEVEL

2.1. Experience in the formation of stabilization reserves

Managing stabilization reserves requires qualified solutions. Ensuring stability in the national economy depends to a large extent on the availability in the strategic stocks of the necessary volumes of goods of a certain nomenclature. At present, the formation of stabilization reserves is carried out taking into account many factors.

The main criterion for the volume of created reserves is consumption over a certain period of time. For example, the EU countries can provide their national economies with oil and oil products for three months at the expense of strategic reserves. In Japan, oil reserves are maintained at the level of 90-100 days of consumption. Countries dependent on imports form stocks of raw materials, taking into account supplies from abroad. For example, in China, oil reserves by 2020 are planned to increase to the level of three months. It should be noted that in recent years, the policy of individual states on the formation of commodity stocks has changed, which somewhat changes the classical view of the main purpose of strategic reserves. Many countries, net exporters create reserves of products supplied by them abroad. Therefore, China accumulates significant reserves of rare earth metals. Significant strategic reserves of oil produced by OPEC countries. Malaysia, Jordan and Russia have begun the creation of state reserves of hydrocarbons. This trend is to a certain extent explainable by the desire of exporting countries to consolidate the dominant position in international commodity markets. In addition, the expediency of such a reservation is because it is not profitable for the supplier companies to reduce the extraction of metals and hydrocarbons in an unfavorable situation with world prices for raw materials. Ensuring the ability to store goods in anticipation of price increases on international exchanges is very important for exporters of raw materials. Currently, various sources of financing are used to create strategic reserves. Reservations can be made directly by the state. In this case, the main costs of creating and maintaining stocks are made at the expense of the country's budget. Such stocks are used in the event of a threat of violation of economic stability or a decrease in the standard of living of the population. For example, government reserves can be used to assist strategically important sectors of a country's economy with a low level of profitability. Information on the volume and range of stabilization stocks, as a rule, were not disclosed. However, it is more expedient to use the state reserve as a tool for stabilizing the domestic market, for which it is necessary to publish information on state stocks in the open press. As is known, information is a regulatory factor, as it affects the expectations of economic entities. The creation of strategic reserves is also carried out at the expense of private companies. In many countries of the world, in addition to the state, commercial reserves have been created. At the same time, law on enterprises imposes obligations on the establishment and maintenance of stabilization reserves. This makes it possible to avoid excessive budget expenditures. Commercial reserves mainly serve to ensure the continuous operation of organizations of individual sectors of the economy and the stabilization of commodity markets. However, a commercial backup system has certain disadvantages. First, it makes it difficult for the state to monitor compliance with the requirements for the volume and quality of renewable reserves. To solve this problem, in some countries, operating organizations (state-controlled) have been established, under whose management stocks of private companies are received. Secondly, the costs of enterprises associated with the reservation can be significant, which worsens the business environment. In some countries, in addition to state and commercial reserves, intervention commodity funds have also been established, which are usually managed at the level of sectorial departments. For example, the Russian Interventional Grain Fund was established under the Ministry of Agriculture of the Russian Federation. Such funds currently operate in the camps of the European Union, the United States, China, etc. The main purpose of their operation is to stabilize prices in the domestic markets by conducting commodity interventions. Thus, to ensure economic stability in the country, state and commercial stocks are used, as well as intervention funds, which together form a single reservation system. This allows a certain degree of diversification of costs for the creation and accumulation of strategic reserves.

2.2. Improving the system of stabilization reserves

We believe that in modern conditions state-controlled inventories can serve not only as a means of ensuring the economic stability of countries, but also as a tool for attracting financial resources. In order to attract free funds of the population and business based on strategic reserves, new financial assets can be created and put into circulation. In essence, such an asset will be a receipt giving the right to receive in exchange for it a certain amount equal to the value of the "basket of goods". The value of the asset should be determined because of the range and volume of goods included in the stabilization reserves, as well as their market prices. Accordingly, the price of the product receipt will be calculated according to the following formula:

$$C = \sum_{i=1}^n V_i \times P_i$$

where

C – the value of the commodity basket;

V – the volume of goods by position;

P – the price of the goods.

This tool should be attractive as a means of protecting money from inflation, since the increase in its value is due to the increase in prices for the goods that make up the basket. As you know, essential goods and raw materials are becoming more expensive than other products. Moreover, even with a significant reduction in prices on the international markets for metals, fuel and agricultural products, the prices of raw materials in national economies decrease less significantly. It should also be borne in mind that the basket is a more reliable security than every product that is part of it, because the reduction in prices for some consumer products will be compensated by the rise in prices for others. Thus, under the provision of stabilization reserves controlled by state structures, three types of new financial assets can be issued: the state commodity receipt (SCR), the commercial commodity receipt (CCR) and the receipt of the intervention fund (RIF). Accordingly, commodity baskets, based on which the value of each type of asset must be calculated, must correspond to the assortment and volume of state reserves, commercial reserves and stocks of intervention funds. Money that goes to the budget when placing SCRs can be used to build and maintain strategic reserves of raw materials. A new source of funding for expenditures required to manage government reserves will appear. Release in free circulation of CCR will reduce business costs for the formation and maintenance of stabilization stocks, controlled by the state. At present, reserves created by private companies are often used by organizations as collateral for loans. However, loans, as you know, need to be returned, and at the same time pay interest. Therefore, it is more profitable for enterprises to attract funds through the placement of CCR. In addition, export-oriented enterprises of individual sectors of the economy with the help of such an asset may receive other benefits. As is known, in the context of global crises, consumption of raw materials is decreasing globally, which often leads to a significant reduction in prices in international commodity markets. Thus, in 1986, oil prices dropped to a record level of \$ 10 per barrel. Preservation of wells in order to reduce oil production and the subsequent restoration of production capacity to ensure the pre-crisis level of exports requires significant costs. Therefore, Russian companies were forced to supply oil abroad at low prices, which significantly reduced the profitability of enterprises. In such a situation, it is more expedient to reduce exports, creating additional reserves. The increase in reserves will provide an opportunity for additional release of CCR. In a crisis, this asset will be in demand, since it is during such periods that it is most difficult to protect savings

from impairment. Thus, the main costs of increasing reserves will be financed from the attracted financial resources. In the future, with the restoration of favorable pricing conditions in international markets, the level of reserves may be reduced. The stocks of raw materials created by the intervention funds can be rationally used to raise funds through the placement of RIF. The money raised should be used not only to maintain and further increase stocks of raw materials, but also to modernize individual sectors of national economies. For example, in Russia, many enterprises in the agricultural sector and the extractive industry need to upgrade their fixed assets. Increasing the reserves of raw materials is most appropriate in an economic downturn. First, it will allow to purchase raw materials at lower prices. In the future, on the rise of the economy, due to the created reserves, it is possible to satisfy the increased demand and maintain control over prices. Secondly, the purchase of raw materials will help support the extractive industries and agriculture. Thirdly, in a crisis, such an asset as a commodity receipt will be in demand from the public and business structures as a means of protecting savings from inflation. At the same time, it will be possible to avoid an increase in inflationary pressure on the national economy, since no additional issue of cash will be required. The funds involved in building up reserves of raw materials have already been issued and are in the possession of individuals and legal entities. Of course, the creation of excess reserves in national economies is not rational. However, given the growth in consumption in the world, it should be recognized that many countries at the present stage should continue to increase their strategic reserves of various types of raw materials in order to ensure national security and increase resistance to external shocks. At present, Japan, China, India, South Korea, New Zealand, and some EU countries are pursuing a policy aimed at increasing the oil reserves of various types of metals. Thus, under the provision of strategic reserves, new financial assets can be created, with the help of which it will be possible to protect cash savings from inflation, as well as to attract free funds of the population and business. This system of measures will reduce the burden of non-state budget, as well as create more comfortable conditions for the development of business of private companies, ensuring the formation of commercial reserves.

3. PROBLEMS AND PROSPECTS OF THE FORMATION OF THE INTERNATIONAL SYSTEM OF STABILIZATION RESERVES

It should be noted that the use of strategic stocks as a regulatory tool is not limited to national economies. As you know, with the help of stabilization reserves, you can influence the volatility of international commodity markets. Currently, there is no unified approach to the formation of strategic reserves of raw materials in the world, but within the framework of the activities of international organizations and agreements between countries, efforts are being made to develop a unified policy in the field of strategic raw materials management. Thus, the Food and Agriculture Organization of the United Nations FAO (FAO UN) has developed standards for carryover grain reserves to ensure food security at the level of individual states. According to the recommendations of the FAO UN, grain stocks should be at least 17% of its annual consumption. In order to reduce dependence on hydrocarbon imports, the International Energy Agency (IEA) has established reserves of extracted oil. According to the agreement on the international energy program, the countries that are part of the IEA, have undertaken to maintain oil reserves at least 90 days of its annual imports. IEA member states have repeatedly held joint commodity interventions aimed at stabilizing international oil markets. Strategic stocks were printed during the hostilities in the Persian Gulf in 1991, due to the hurricane Katrina - in 2005, due to the armed conflict in Libya - in 2011. Coordinated actions helped contain oil prices in the national economies of the IEA member countries, but also globally. Of course, it is much more difficult to manage the price dynamics of world markets for raw materials through commodity interventions than national ones. Nevertheless, attempts to create mechanisms for multilateral regulation of commodity markets through the use of stabilization stocks have been

repeatedly made at the global level. So, in 50-60 years. In the past century, several international commodity agreements were concluded for certain types of raw materials that provided for the creation of buffer stocks in order to stabilize prices. However, in the 80-90 years, almost all of them stopped their action. In 1976, within the framework of the UN Conference on Trade and Development, an "Integration Program for Commodities" was developed, the main goal of which was to stabilize international markets, as well as to regulate world prices for agricultural products and certain types of metals. To achieve this goal, the Common Fund for Commodities was established, of which 104 states became members. At the expense of the fund it was supposed to carry out commodity interventions, realizing raw materials from the created reserves or buying surplus, thus affecting the dynamics of market prices. However, the reluctance of many developed countries to participate in the financing of this program did not allow to achieve the desired results. FAO UN experts have repeatedly stated the need to create a unified system for the reservation of grain crops to reduce the severity of the food security problem on a global scale. It should be borne in mind that not all countries can find resources for stockpiling sufficient to ensure food security. It is especially difficult to solve this problem in third world countries. Of course, for the poorest countries, funds from public organizations, such as the International Monetary Fund (IMF), can be raised. As is known, the Buffer Stock Crediting Fund has been established with the IMF to assist countries creating strategic reserves. Moreover, since 1985, loans from the funds of this fund have not been provided. At present, it is advisable to form an international system of strategic stocks of raw materials for conducting large-scale commodity interventions. This will make it possible to more effectively influence the dynamics of international markets and thereby level the negative influence of the external environment on national economies. At the same time, a commodity receipt, the issuer of which will be a supranational structure, may acquire the status of a financial asset in demand at the world level. Through the issuance and placement of such a financial asset, it is possible to raise funds to create a single fund of stocks of food raw materials necessary for the implementation of commodity interventions to influence the price dynamics of international markets. In addition, an asset will be created to protect public funds from inflation. Investing in such funds will be beneficial, as the raw materials will be the basis for creating a tool to protect against the depreciation of state foreign exchange reserves. As is well known, in the conditions of instability in the global financial sphere, the preservation of capital is one of the main problems not only of the population and business, but also of the states. Such an asset as a commodity receipt, the security of which will be highly liquid stocks of raw materials, may be no less attractive than reserve currencies. Thus, problems of lack of funds to finance programs related to the stabilization of price movements in international commodity markets, as well as protection of foreign exchange reserves of countries from impairment in the context of global monetary and financial instability will be solved.

4. CONCLUSION

Given the continuing instability of the globalizing economy and the global monetary and financial system, in fact there is no effective means capable of protecting savings from impairment. Therefore, a commodity receipt, secured by highly liquid stocks of raw materials, will enjoy special confidence as a tool to preserve savings at all levels. Such an asset is more reliable than reserve currencies, stocks of companies, government bonds, gold and other precious metals. The acquisition of commodity receipts will be particularly beneficial in times of crisis, while limiting the number of reliable instruments for investment. In addition, it is precisely in a crisis that the expansion of raw material purchases, both at the state level and at the expense of international organizations, will provide support for the extractive industry and agriculture. The funds raised should be used not only to increase and maintain strategic reserves, but also to conduct interventions to ensure the stability of a new financial asset. Thus, through

the implementation of agreed commodity and currency interventions at the level of states and the international structure, it is possible to carry out effective regulation of the dynamics of prices for raw materials on international markets, as well as within national economies.

ABSTRACT

The paper focuses on the communication strategy proposal for the tourism development in the chosen Slovak National Museum at the given castle, Slovakia. Using the BCG matrix, we analysed the portfolio of the cultural events, education programs and specialized events offered by the museum. In generally, we used qualitative research with focus on the interview method for obtaining the data in the period 2016-2017. All these public events are strongly connected with the castle history and its environment generated by forest stands with historical admixture of sweet chestnut and yew trees by introduction from the 16th century. The main outputs of this paper lie in the proposal of the individual marketing communication tools to increase the interest of the general public in the cultural heritage of the given area, popularization of the museum activities and to attract lager number of tourists.

Keywords: *BCG matrix, communication, marketing, strategy, tourism*

1. INTRODUCTION

The development of a society, as also the new information technologies, bring changes to each area of our lives and the marketing and marketing communication as well should adapt to these changes (Labská et al., 2009; Oancea, 2015). The tourist trade is a phenomenon, which still grow. Over the past 50 years, the tourist trade has recorded a strong increase whereby the arrivals of international tourist trade overcame first time in history the limit of one billion travellers. The UNWTO (World Tourism Organization) prediction says that the global participation on the tourist trade will reach the level of 1.6 billion tourists by the 2020. The Europe will probably remain as the most visited destination of the global tourist trade. The travelling within the domestic region will apparently play the key role in the international tourist trade. The family vacations will stay as an important product on the market, it will grow the interest in vacations for pensioners and singles. The education, whistle-stop tour or visit of relatives will belong to the most powerful incentives¹. At the present, the trends in tourist trade in Slovakia notice an increase in recovery of traditions, rich folklore, rustic creativeness, discover of the spirit development, relax and entertainment, experiences and gastronomy. The core motive is to get to know the new experiences, new places, nature, countries, but also habits and traditions, in particular. The interaction of a modern lifestyle with something what is still authentic a have not went through rapid globalization is what the tourists mostly attract. The possibilities of individual museums, historic sights and culture organisations are influenced in area of marketing by the whole marketing of a country as a touristic destination as well as with

¹ www.sacr.sk

marketing of an individual counties, regions, towns where they occur (Mruškovič et al., 2005; Tölkes, 2018). The guarantee of the biggest share on the marketplace and the identification of its needs is the immediate goal and the marketing conception in cultural area (Dolnicar, Ring, 2014). It seeks to keep up or increase the number of visitors and to ensure the satisfaction of the focus group by the most effective way. However, the single numbers of visitors cannot override the aspect of the quality (Kesner, 2005). The Slovak museums, galleries and historic sights did a visible progress in the way of communication with the public. From this point of view, they have contributed to the tourism development in the country what has also a beneficial influence on economic indicators. It is the research area which is not devoted appropriate attention in Slovakia for instance Štefko et al. (2015). We take attention on a specialized museum with the scope of the whole country. Slovak national museum - the Museum on the castle realizes several events, programmes and activities they provide within the mentioned marketing philosophy. The article is focused on the assessment of individual activities of the museum portfolio. Using of the BCG matrix method we have pointed on areas they can contribute to the development of a museum as well as the tourist trade in generally.

2. METODOLOGY

We used qualitative research with focus on the interview method for obtaining the data in the period 2015-2017 (Silverman, 2006; Yin, 2003). The method of portfolio analysis was used to examine the public relations activities for tourists provided by the management of selected castle and its museum. Concretely, the BCG portfolio matrix was used to evaluate and compare individual cultural activities (Kotler, Keller, 2015). These method presents one of the most used portfolio matrices. It was used for the evaluation of the SBU attractiveness (strategic business units) they are in our case the cultural events (e.g. medieval day of the children, chestnut jubilee, hunting days, night of museums and galleries Christmas concert etc.), specialized shows (e.g. Eastern castle, ghosts and little lights on the castle, valentine's castle etc.) and educational programmes (e.g. touch the medieval, bite yourself into the history etc.). During the investigated period 2015-2017, the chosen Slovak national museum provided 11 cultural events, 8 specialized shows and 11 educational programmes. The analysis of entrepreneurial portfolio is the method focused for the purpose of investment decision-making into the individual business units. It serves as a baseline for determining of individual strategies for each business unit (Drábek, Halaj, 2010). The relative share of revenues (the strength of the SBU) was determined according to the following formula:

$$Relative\ share_n = \frac{revenues\ SBU_n}{total\ revenues_n} \times 100$$

where: $relative\ share_n$ - relative share of the SBU_n (strategic business unit) on the total revenues, $revenues\ SBU_n$ - sales revenue of the SBU_n of the analysed enterprise in the current year, $total\ revenues_i$ - the total revenues from the sale of all SBUs of the analysed enterprise in the current year

The growth index (the stability of the SBU) was calculated as follows:

$$i_n = \frac{revenues\ SBU_n\ current\ year}{revenues\ SBU_n\ previous\ year}$$

where: i_n - the growth index of the SBU_n , $revenues\ SBU_n\ current\ year$ - sales revenue of the SBU_n in the current year, $revenues\ SBU_n$ - sales revenue of the SBU_n in the previous year

The relative revenues share in the BCG matrix presents the horizontal axis (x). The average value of the achieved shares of SBUs in total revenues represents a limit between high and low relative shares. The vertical axis (y) is the revenue growth index, where average value is considered as the limit between high and low growth index. Based on the limit values of the relative revenues share and revenues growth index, the BCG matrix is divided into four quadrants: cash cows, dogs, question marks, and stars. In general, all SBUs placed in the quadrants cash cows and stars achieved positive cash flow and are perspective for the enterprise. On the other hand, the SBUs in the quadrants question marks and dogs require significant cash and may achieve low profits or even losses (Evans, Berman, 1990).

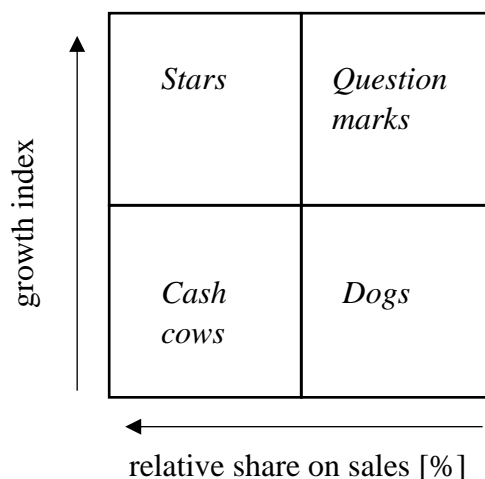

Figure 1: BCG matrix (Kotler, Keller, 2015)

3. RESULTS AND DISCUSSION

Within the portfolio analysis (Fig. 2), the cultural events strengthen their position in field of cash cows. They present significant part of the financial sources for the support of the other areas of cultural-educational activity of the museum and its further events. This matter is considered by the fact that cultural events in the museum's portfolio bring the most rate of sales every year a do not require high rate of investments. Additionally, some of them are co-organized also by other institutions. However, it is important to track their portfolio position, because their growth index and relative share on sales show moderate increasing tendency within the investigated period. This trend could be bettered by using proper marketing and communication techniques. The specialized shows shifted markedly from the field of question marks to dogs. This displacement is caused by markedly increase of their relative share on sales and decrease of their stability (growth index) on average value in the whole portfolio. Regarding the fact that only two activities were done in 2016, then newly five activities were realized in 2017 we can state that their attractivity by public is increasing by the time. They bring gradually biggest sales to the portfolio. Additionally, demand on new services and cultural experiences rises. Nevertheless, the specialized shows moved to the field of dogs. The main reason is that the financial revenues and the number of actions in comparison with the cultural events is very low. Regarding the increasing popularity of them, it would be not correct to exclude them from the portfolio. On the contrary, they should be supported in order to increase the public interest. Educational programmes kept their portfolio position in field of dogs. The main reason behind is the decrease of their stability in the portfolio, and the strengths of them in each years of investigation period in comparison with the SBU of cultural events. From the economic point of view, it is necessary to re-evaluate the setting of the marketing mix regarding with its position in the portfolio. Much more important is to realize that educational programmes bring cultural and educational values and build uncoverable part of museum activities they overtop the

generation of cash flow. They allow the students active learning. From this point of view is not possible to exclude them from the portfolio. Equally, is necessary to mention that educational programmes build markedly different form of programme as the culture events or specialized shows are. They are focused primary on children what has narrow connection to pricing or setting the entrance fee for this target group. The visit rate is given or determinate by the school possibilities, the necessity of interactive education or interest of children. In generally, from the view of portfolio strength, we can state that the heaviest share on the total sales have cultural events during the investigated period. Therefore, they are main financial source for the museum. It is very important to support them by marketing activities. Additionally, they serve to funding other business units in portfolio like specialized shows or educational programmes. Thus, we can state that portfolio of cultural-educational activities of the chosen museum is not very balanced. Because most of the activities are dependent from one kind of cultural events. They build almost 77% of the share on total sales, whereas educational programmes 12% and specialized shows only 11%.

Figure 2: Portfolio assessment of cultural events by BCG matrix

Our proposal of a communication mix consists of the push and pull marketing strategy. At the same time, it must be specialized on establishing of the positive image and growth of the popularity at the public. From the wide range of examples for each communication tool we introduce the most essential ones in Table 1.

Table following on the next page

Table 1: Proposals for the communication strategy of the selected museum

Communication tool	Proposal
<i>Advertisement</i>	Very effective is to address the target groups also by social network. For the next terms, seasons, we purpose to entitle the cycle repeated cultural events by the same name.
<i>Promotion</i>	We suggest establishing more forms of competitions for children or adults on individual events, to put more tombola into the programmes, to launch anniversary events with some amazement for visitors, to reward each hundredth visitor etc. We take also the tasting of co-organisers' products or stalls selling for the proper sales support.
<i>Personal sell</i>	By reason of undersized staff capacity, we see as the biggest rate of effectiveness the addressing the school gardens, schools by local volunteers before realizing of an event. The use of volunteers for the presentation of any cultural events directly on the streets in towns would be enough advance before they start.
<i>Direct marketing</i>	We devise to extend it also by address-less e-mailing and for all visitors to use possibilities of M-marketing which has better response than the classic direct mail.
<i>Visual identity</i>	The main goal is to create a uniform visual style that will be recognisable from the competitors.
<i>Internet</i>	We recommend using the possibility of start-up projects by Flag Day on social networks, web pages or also personally for the development of individual events, programmes and actions. This idea would be also useful by run over of the castle coffee bar.

Our proposed tools for the marketing communication, motivation activity and advisable orientation on selected target groups can ensure not only the development of the chosen museum but also increasing the interest in bordering touristic places, growing tourism competitiveness in region and better utilization of its potential. It can equally contribute to the new job opportunities in region, to support of the technical and social infrastructure progress, to develop some entrepreneurial subjects, investment possibilities, etc.

4. CONSLUSION

The competition in tourism grows stronger and it is hard to compete with advanced tourist destinations without any professional approach in the marketing communication (Maráková, 2016). The culture heritage builds uncoverable fortune of the state. It is a proof of history and development of society, science, technic, art and education. The museums play an important role in its presentation. They should be a source of increasing cultural and educational level and to satisfy spiritual needs of the customers (Mruškovič et al., 2005). The current customer in the tourism trade is more educated, informed, well-travelled and in the result more exacting. Tourist tries to maximize its benefits. In the process, marketing communication fill a significant mission (Maráková, 2016). The interest of the Slovak visitors focuses on ski centres, vacations in the mountains and by the water, stays at a health resort and wellness visits, see the historical sights and shopping tourism. For the main goal of tourists, we consider the fact that they visit given destinations to explore and get to know something new and there spend pleasant moments. Not only the marketing strategic of Slovakia goes from this trend but also the strategy of our investigated specialized museum. We concluded by comparison of these two courses that it is necessary to create an image of attractive destination and to positive influence the brand building.

We can state that the purpose of the communication strategy is to affect the target groups mainly by emotional level and so to capture and to attract the visitors. From the results of portfolio analysis, interpreted findings of qualitative inquiry and perceptions of the visitors of individual events, we can assess that the museum active uses the communication strategy supported by the tools. These tools must ensure the highest visit rate and visitors' satisfaction. The effectiveness of the public relations activity is possible to confirmed by cultural events. They are within the whole museum's portfolio of cultural-educational activity the most attractive for the public. Despite of positive use of communication strategy by the museum management, it is still possible to improve some spheres of marketing management. Mainly it concerns the educational programmes and specialized actions by proper combination of communication tools.

ABSTRACT

According to the Act on Public Procurement issued in the Czech Republic in 2016, the contracting authority specifies a set of economic qualification criteria and technical qualification criteria in order to establish human resources, technical resources and the expertise and experience necessary to perform the contract acceptable. For building construction project, meeting all qualification requirements does not yet represent protection of the contracting public authority to the potential business risks connected with the construction contract. At this moment, protective instruments in the contracts for works must be used to ensure the delivery of contract on time, cost and quality. The paper analyses the contracts for public works in the field of retirement homes for the elderly which were built in last six years in the Czech Republic. The aim is to determine the hedging of business risks and the most frequently used protective instruments applied to solve the potential business risks, how efficient they are and whether the frequency of the applied instruments contrasts with other types of construction contracts. A quantitative analysis of the currently used protective instruments in the contracts for public works is performed. The outcomes of the empirical study are compared with previous research of authors in the field of revitalization of school buildings and sewage facilities and equipment. Overall, the research paper identifies what protective instruments are currently employed, at what amounts and whether the instruments fulfil the functions required to protect both investors and contractors during the contract period and to ensure quality of public construction works contracts with the criteria of economy, efficiency and effectiveness.

Keywords: *bank guarantee, business risk, protective instrument, public works contract, standard contract for works*

1. INTRODUCTION

Effective risk management must be the aim of everyone involved in construction project (Klee, 2015, p. 2). The public purchaser identifies patterns and potential problems, variations, hazards and risks in order to manage them effectively. For building construction project, meeting all qualification requirements does not yet represent protection of the contracting public authority to the potential business risks connected with the construction contract. At this moment, protective instruments in the contract for works must be used to ensure the delivery of contract on time, cost and quality. Klee (2015, p. 18) mentioned, that in practice, an inefficient allocation of an unclear risk or of a risk that the party is not able to control will result in speculative claims, disputes, or even contractor bankruptcy. Furthermore, a contractor will allow for risk in their bid price via a 'risk surcharge'. Thus the investor pays for the transfer of risk in such a situation. Klee (2015) sets out the basic principles which should be stated in standard contract for works:

- Setting the contract price
- Responsibility of project's documentation
- Project Management

- Risk Management and its allocation – compensation
- Change Management in the project
- Time Management
- Quality Management
- Cooperation, prevention and Claim Management

The aim of this paper is to find out how the parties involved in public works contract - investor and contractor - can manage the potential business risks in the phase of negotiation the business conditions of standard contract for works and how they allocate risks via protective instruments - hedging in the final agreement - contract for works - in the Czech Republic. The aim is to identify the portfolio of hedging instruments in the specific field of construction retirement homes for the elderly projects, which instruments are currently employed in this field of public works contracts, at what amounts and whether the instruments fulfil the functions required. The outcomes of this data analysis are compared with previous researches of authors in the field of sewage facilities and equipment and in the field of revitalization of school buildings and compares the applied instruments in their frequency and amounts.

2. RISK MANAGEMENT AND PUBLIC WORKS CONTRACTS

Project risks are uncertainties that exposes a project to potential failure to achieve its goals. A project begins in uncertainty and risk. Identifying, evaluating and treating risks is an ongoing project management activity that seeks to improve project results by avoiding, reducing or transferring risks. Project risk management also provides stakeholders with visibility and clarifies accountability for accepted risks. Project risks are considered to be dynamic and therefore risk assessment should be a continuous process spanning all phases of construction (Smith et al, 2014). The key is to build risk management into the project as an integral part of all phases so that it rises to the importance level of cost and schedule. The phases of the process of project risk management are summarized by Chapman (1997):

- Define
- Focus
- Identify
- Structure
- Ownership
- Estimate
- Evaluate
- Plan
- Manage

Risk management aims to avoid, reduce, accept or transfer risk and exploit potential opportunities. A key task is to incorporate an identification of business risk as one of the important part of project risk in the phase of negotiating the contract. This is a future possibility that may prevent the contractors from achieving a business goal. The typical business risks facing are broad and include things that you can control such as your strategy and things beyond your control such as the global economy. ISO 31000:2018 provides guidelines on managing risk faced by organizations. The application of these guidelines can be customized to any organization and its context. It provides a common approach to managing any type of risk and is not industry or sector specific and can be used throughout the life of the organization and can be applied to any activity, including decision-making at all levels. There is a strong relationship between risk and reward. It's generally impossible to achieve business gains without taking on at least some risk. Therefore, the purpose of risk management isn't to completely eliminate risk.

In most cases, risk management seeks to optimize the risk-reward ratio within the bounds of the risk tolerance of business (Spacey, 2015). Three main phases can be distinguished in respect of handling risk:

1. hazard identification,
2. risk analysis and
3. anti-risk measures (Klee, 2015, p. 15).

Some risks can be secured during the procurement process of construction project as the employer's requirements and confirmed in the contractor's proposal.

2.1. Procurement and project risks

Procurement risk is the potential for failures of a procurement process designed to purchase services, products or resources. Common types of procurement risk include cost, fraud, quality and delivery risks. In many cases, procurement risks are also compliance risks as purchasing practices are typically government by anti-corruption laws, for examples see Table 1.

Table 1: Overview of Procurement risks (Spacey, 2015,
<https://simplicable.com/new/procurement-risk>)

Overview: Procurement risk	
Examples	<ul style="list-style-type: none"> • An executive grants a contract to a friend resulting in high costs and low quality results. • A government procurement agent is a former employee of a major supplier who has a conflict of interest resulting in high costs bids being accepted. • An employee is wined and dined by a supplier and feels obligated to choose their product or service.
Risk Treatments	Avoid, Reduce, Accept, Transfer

2.2. Public procurement in the Czech Republic

The Act on Public Procurement was adopted in response to the requirements of the EU directives and is therefore in compliance with the binding EU regulation. Also the other Czech legislation concerning public procurement is regularly harmonised with respect to the EU regulation (Public Procurement, Czech Republic, 2018). The Czech legislation on public procurement was codified in the Act. No. 134/2016 Coll., on Public Procurement. The Act covers the general legal framework for procurement threshold values, award procedures and provides for different types of procedures and differentiates. The national threshold values (excluding VAT) in public works contracts are:

- *Above-the-threshold public contract:* CZK 142,338,000 (approx. EUR 5,551,404, when exchange rate EUR/CZK is 25.64, 08.01.2019)
- *Below-the-threshold public contract:* > CZK 6,000,000 (approx. EUR 234,009)
- *Small-scale public contract:* ≤ CZK 6,000,000

For contracts above the threshold value, there are the following types of award procedures:

- open procedure,
- restricted procedure,
- negotiated procedure with prior publication,
- negotiated procedure without prior publication,
- competitive dialogue procedure,
- innovative partnership procedure,
- concession procedure,

- a procedure for awarding the public procurement in a simplified regime.

Further, for contracts below the threshold value, there is a simplified below-the-threshold procedure. For the public works contract the contracting authority mostly awards a below-threshold public contract of the procurement procedure under the below-the-threshold regime and small-scale public contracts, depending on the expected monetary obligation of the contracting authority.

2.3. Securities in construction projects

For a construction project, meeting all qualification requirements does not yet represent protection of the contracting authority to the potential business risks connected with the construction contract. Suitable and efficient portfolio of protective instruments in the contracts for works must be used to ensure the delivery of contract as required by investor. The frequently used risk protective instruments for public works contracts include the following:

- property insurance and insurance of liability for damages,
- contractual penalties,
- retention money,
- bank guarantees.

Insurance is recommended to protect the contracting parties against the financial implications of unexpected losses, damage or liability. The public investor requires of the contractor to be insured against risks in connection with his responsibilities in project. The bank guarantee is a financial instrument which allows both financial and the non-financial obligations. Klee (2015, p. 373-375) stated these types of bank guarantees:

1. Vadium / Tender Guarantee / Bid Bond
2. Advance Payment Guarantee / Down Payment Guarantee / Advance Payment Bond
3. Performance Guarantee / Final Guarantee / Performance Bond
4. Warranty Guarantee / Maintenance Guarantee / Maintenance Bond
5. Retention Guarantee / Retention Bond
6. Payment Guarantee / Payment Bond

Contractor guarantees are mainly for non-payment obligations to secure their performance. On the investor's side, there are payment guarantees securing the investor's duty to pay for the works, goods or services received. The retention money as a portion of the contract price the investor will 'retain' and pay to the contractor once the public works are taken over or in response to an interim invoice. The retention money secures fulfilment of the conditions of contract on the side of the contractor and to protect investor against the contractor's unwillingness, lack of will, or impossibility of remedying the defects within the defects notification period. The contractor and investor can agree on earlier payment which will favour the contractor (allowing them to improve their cash-flow because they will receive the retention earlier than they would be entitled to in accordance with the contract). This also helps to protect the contractor against the investor's lack of will or impossibility of paying that could emerge after the defects notification period expires. On the other side, the advantage for the public investor is that they have the option to request payment should the contractor fail to meet their obligations because of bankruptcy (Klee, 2015, p. 375-376). The Retention Money Guarantee and the Maintenance Retention Guarantee are also dealt with by the FIDIC forms. The latter is used in the Gold Book to cover events where the contractor does not properly meet their duties to remedy defects and maintain the work (Klee, 2015, p. 384). In the public sector, the contracting authority specifies a set of economic qualification criteria and technical qualification criteria in order to establish human resources, technical resources and the expertise

and experience necessary to perform the contract acceptable. For building construction project, meeting all qualification requirements does not yet represent protection of the contracting public authority to the potential business risks connected with the construction contract. The aim of this paper is to determine the hedging of business risks via the most frequently used protective instruments – insurance, contractual penalties, retention and bank guarantees –and to specify whether the frequency of the applied instruments contrasts with other types of construction contracts.

3. METHODOLOGY

In order to analyse the current situation in the Czech Republic a database of 31 contracts for works was created. A data analysis was carried out on a sample of 31 final contracts for public works in the field of retirement homes for the elderly which were built in last six years. The database of contracts for works was created by selecting the contracts for public works which were realized between years 2013 and 2018. This sample was selected from the large amount of public construction works under the following criteria:

- contracts were important from the public interest point of view and from the importance of hedging an public investor and money against the financial risks;
- contracts were important from the perspective of ensuring against additional works that can threaten compliance with budget approved municipality/region;
- selected public works contracts covered all regions in the Czech Republic (14 regions);
- public works contracts were realized in last six years.

Firstly, the database consisted of the public works contracts awarded in the certified contraction authority profile online on the website <http://www.vhodne-uverejneni.cz>. It is a certified electronic tool by the Ministry of Regional Development and it is developed in accordance with the Act on Public Procurement and is simplified for public investors for easier work within the procedure of tender. The public works contracts were chosen under CPV code 45000000-7 – Construction Works and keywords »senior« (the elderly). Secondly, the database of the chosen public works contracts was extended by searching the published final contracts for public works (as documents - mainly in .pdf format) which the Contracting Authority published on the contracting authority profile and in the Public Procurement Bulletin after tender's final decision. Thirdly, each of chosen documents (contracts for works) was analysed. Consequently, the main characteristics of each contract were observed and collected, e.g. the estimated value, the final contract price, the names of investor and contractor, the number of offers and mainly the hedging – the insurance, protective instruments and bank guarantees which were used in each contract for works.

3.1. Results and discussion

The research analysis employed the data during the period 2013-2018. The analysis contained 31 public works contracts awarded as the below-the-threshold procedure: open procedure (10 tenders), restricted procedure (2 tenders), negotiated procedure with prior publication (1 tender), simplified below-the-threshold procedure (8 tenders) and 10 public works contracts awarded as the small-scale procedure. For each procedure there were 4 offers on average. Total value of the awarded contracts reached CZK 405 million excluding VAT (EUR 15,796,000; exchange rate EUR/CZK 25.64, 08.01.2019). The average contract price was CZK 13 million (EUR 507,020). The highest contract price was CZK 93.8 million (EUR 3,658,000). The selected contracts were published mainly by municipalities/regions as the below-the-threshold public contracts or the small-scale public contracts. It was important to ensure these types of public works against risks in compliance with the quality of the works with regard to sustainability.

The total sample of 31 contracts for works required the five-year warranty period in minimum. The construction projects usually carry a standard 60 month-warranty, which is the requirement of grant within the project supported by the EU. The Czech Public Contracts Act was amended in 2012 and the amendment left out from the Act the investors' requirement to request the contractor to prove his financial and economic qualifications prerequisites. The requirement to arrange the insurance was included in qualifications prerequisites within the tender. The tenderer who passed the qualifications procedure had concluded the required insurance and it was not necessary to include this in the contract. The research data provided interesting characteristics of public works contracts. Prior to the launching of the procurement procedure or the award of a public contract, the contracting authority shall determine the estimated value of procurement. The comparison between the contract price and the estimated value for tenders in order by years is shown in Figure 1. The data provided the fact in this field of the construction works during period 2013-2018. The real contract prices reached on average 91% of the estimated value of tenders. The analysis of contracts has brought an interesting turn in the tendency of the difference between the estimated value and the contract price. The most of them were higher than the limit 70%. The comparison showed the tendency not to undervalue the tender's offers. In Figure 1 we can see only 13% contracts (4 out of 31, No. 9, 11, 12, 30) which were below 70% limit of the change between the estimated value and the contract price. Most of the contracts (95%) approached the 70% limit of the estimated value since 2015 and only one contract undervalued the estimated value and could be identified of Abnormally Low Bids and Proposals (see more The World Bank: Guide to the identification and treatment of Abnormally Low Bids and Proposals, 2016).

Figure 1: Comparison between the Contract Price and the Estimated Value according to order of tenders in years 2013 to 2018

The most frequently used risk protective instruments for public construction works contracts in a field of retirement homes for elderly included particularly:

- property insurance and insurance of liability for damages,
- contractual penalties
- retention money and
- bank guarantees (see Table 2 and Table 3).

The property insurance and insurance of liability for damages was found in 32% (10 out of 31 contracts) of the examined sample and it was minimally equal to contract price.

3.2. Comparisons with other fields of construction projects

Retention money belonged to traditional forms of business risk hedging in contracts for works until year 2013 in the Czech Republic (Korytářová et al., 2015). The research data have provided the fact that the retention still occurred. In comparison with a field of sewage facilities and equipment, this study in the field of the retirement homes for elderly not confirmed the analysis of Korytářová et al. (2015) in the field of sewage facilities and equipment, indicated that the use of retention in contracts for works started to decline which was caused by the financial sources of the EU funds in this field of construction projects. The occurrence of bank guarantees was raised from 2014. For example, in Germany, if the parties have agreed upon the application of the German Standard Building Contract Terms (VOB/B), the client has the right, following termination of the construction contract, to take advantage of the equipment, scaffolding, other installations, delivered materials and building components present on the site for the continuation of the work in exchange for reasonable compensation (Global Legal Group, 2017). The financial sources obviously have caused greater importance of bank guarantees for the contracting authorities in the Czech Republic, where the public construction contracts are mostly financed by the EU funds, and have lowered effect the use of retention. Public subsidies are not allowed to keep the part of investments grant in current assets after the completion of the construction works in general. Public subsidies have to be paid in the full amount of the cost eligibility, which probably caused the efficient transition of retention occurrence into using bank guarantees. The most frequent types of bank guarantees secure the duty to sign the contract by the contractor (Tender Guarantee/Vadium), contractor performance (Performance Guarantee), contractor duty to repair defects in the defects notification period (Warranty Guarantee) and the guarantee that is used in place of retention money (Retention Guarantee), see Table 2 and Table 3. It is worth mentioning that 55% of contracts was protected by some of bank guarantees. The Performance Guarantee occurred in 42% (13 out of 31), the Warranty Guarantee in 19% (6 out of 31) of contracts for works in the field retirement homes for elderly since 2013. In the field of school buildings the occurrence of the Performance Guarantee was recorded in 47% of contracts (9 out of 19) and the Warranty Guarantee in 21% (4 out of 19) of contracts since 2014, see Table 2.

Table 2: The occurrence of bank guarantees in contracts for works in specific fields

The occurrence of bank guarantees in contracts in specific field	School buildings (Andrlová, Korytářová, 2017)	Retirement homes for the elderly (this study)
Performance Guarantee	47%	42%
Warranty Guarantee	21%	19%

The contractual penalties which occurred most frequently are shown in Table 3. The comparison between the fields of sewage facilities and equipment, revitalization of school buildings and retirement homes for the elderly is shown in Table 3. This table shows the portfolio of protective instruments and their amounts which is recommended for Contract Management in negotiating the agreement for public works contract and dealing with the hedging of business risks among both parties – investor and contractor adequately.

Table following on the next page

Table 3: Protective instruments for public works contracts in the Czech Republic – comparisons the portfolios from contracts in the different fields of construction projects (Korytářová et al., 2015; Andrlová, Korytářová, 2017 and this study)

Risk protective instruments		Sewage facilities and equipment (Korytářová et al, 2015)	Revitalization of school buildings (Andrlová, Korytářová, 2017)	Retirement homes for the elderly (this study)
Insurance	Liability for damage and property	80 – 100% of the contract price	100 – 200%, in minimum the contract price	100%, in minimum the contract price
Contractual Penalties	Contractors delay in the construction completion day	0.10% of the contract price	0.05 – 0.3% Median 0.12%	CZK 1,000–7,000 0.1 – 0.3 of the contract price
	Exceeding deadline for elimination of defects and arrears of work	CZK 5,000 (EUR 195) per damage and every commenced day	CZK 1,000 – 10,000 Median CZK 5,000	CZK 5,000 (EUR 195) per damage and every commenced day
	Investor's delay in payment invoices	0.10% of outstanding amount	0.01 - 0.10% Median 0.05%	0,05% of every day of outstanding amount
	Failure in keeping the term of clearing the construction site	CZK 5,000 (EUR 195) per every commenced day	CZK 1,000 – 10,000 Median CZK 3,000	CZK 5,000 (EUR 195) per every commenced day
	Others	To select others useful penalty	To select others useful penalty	To select others useful penalty
Retention money		Not to apply		10%, applied in 1/3 of contracts
Bank Guarantees	Performance Guarantee	Not to apply	5 – 10% Median 10%	1 – 5%, occurred in 1/3 of contracts
	Warranty Guarantee	10% of the contract price	2.5 – 5.5% of the contract price	2 – 5% of the contract price
	Retention Guarantee	5% of the contract price	Not applied	Not applied

The comparisons of three fields confirmed firstly, the liability for damage and property was reached the limit 100% of the contract price (see Table 3). Secondly, the comparisons has shown that construction works contract with higher contract price such as sewage facilities and equipment in contract price limit CZK 24 mil. - 30 mil. (EUR 0.9 – 1.12 mil) contained higher parameters of the protective instruments than the field of revitalization of school buildings in average contract price limit CZK 7.5 million (EUR 0.3 mil.) and the retirement homes for elderly in average contract price limit CZK 13 million (see Table 3, for an example the contractual penalty for investor's delay in payment invoices, failure in keeping the term of clearing the site and warranty guarantee). Thirdly, retention money were applied in this study and retention guarantee were applied only in the field of sewage facilities and equipment what depends on financial sources (by the EU funds or other) for particular construction project. Finally, performance and warranty guarantee were occurred in almost half of contracts. Bank guarantees provide the investor a similar security as retention while offering the contractor many advantages.

4. CONCLUSION

The paper presents the data analysis of use of risk protective instruments employed in public construction contracts and on the assessment of a reasonable extent of their use in contracts for works.

The basis of research focuses on the quantitative analysis of occurrence of risk protective instruments, determination how they are used and are set up especially in the specific field of the retirement homes for the elderly. The research data is compared with the data acquired from previous studies in the fields of the sewage facilities and equipment and the revitalization of school buildings. The recommendation for the portfolio of the appropriate protective instruments and their parameters as contractual business conditions was set up. It helps the contracting parties to secure the public construction projects against the potential business risks and guard their assets. The purpose of the bank guarantees is to secure the performance of and the compliance with contract by and between investor and contractor. The financial sources have caused greater importance of bank guarantees for the public investors in the Czech Republic, where the public construction contracts are mostly financed by the EU funds, and have lowered effect the use of retention. In practice, using the efficient portfolio of hedging in public works requires that the risk and return characteristics of the protective instruments can be replicated in real standard contracts for works. It helps the contract managers in negotiating the agreement for public works contract and dealing with the hedging of business risks among both parties – investor and contractor adequately. The Nobel Memorial Prize in Economic Science has just been awarded to Oliver Hart and Bengt Holmström for building the foundations of contract theory in 2016. The contract theory studies the design of formal and informal agreements that motivate parties with conflicting interests to take mutually beneficial actions. In essence, contract theory is about giving each party the right incentives or motivations to work effectively together. In the Czech Republic nowadays is discussing the standardization of forms of construction contract agreement as standard sample forms adopted by FIDIC forms with aim to help the parties to understand terms of contract clearly. The hedging of public finances with the criteria of economy, efficiency and effectiveness and standardizing the contracts for works helps the parties to ensure the delivery of construction project of public works on time, cost and quality and meet the EU requirements.

ABSTRACT

In modern conditions of globalization and global competition clusters are a tool that ensures the sustainable development of the national economy. The last decade has shown that the formation of clusters is an important and integral part of the state policy in the field of regional development not only in Russia but also in all developed countries of the world. The analysis of the current state of research in the field of theories of territorial organization of production, concepts of competitiveness, laws of formation of cluster structures, the development of new methodological tools for the identification of clusters, cluster effects, the definition of criteria and performance indicators allow to update the direction of cluster policy, to propose strategies to improve the competitiveness of regions and the quality of life. Particular scientific and practical importance of research aimed at the development of a Toolkit to encourage clustering of regional economy, with the aim of enhancing their inclusion into the system of the modernization of relations. The cluster approach contributes to the development of production of products with high added value, as well as the activation of innovative processes in conditions of lack of natural and other resources. It stimulates the deepening of the processes of complex processing of raw materials and the use of resource-saving technologies combined with a high level of specialization and cooperation of various industries, helps to unite the efforts of neighboring and related enterprises for more effective interaction, ensures high competitiveness of jointly produced products and services in national and international markets. The result of the study: in this article the cluster approach is considered as a factor of innovative development and competitiveness of the national economy, the essence and types of clusters are analyzed, the essence of the concept of "sustainable development" in relation to the national economy is analyzed; the archetypes of the regions are identified, which allowed to offer a set of measures for sustainable development of the national economy, the mechanism of implementation of cluster policy to sustainable development of the national economy is presented. The theoretical and methodological basis of the study was the fundamental provisions of a number of scientific areas – the theory of national and regional competitiveness,

cluster economic theory, the concept of regional archetypes, theories of spatial proximity, the General theory of systems. The paper uses methods of analysis of socio-economic indicators, comparisons, groupings, tabular and graphical methods of data visualization.

Keywords: *cluster approach, competitiveness, national economy, sustainable development*

1. INTRODUCTION

The process of globalization of the world economy, which will have to work as a “unified system in real time and on a global scale” [5] has taken a significantly accelerated turn in recent decades. There is a sharp intensification of competition in the sales market, which, in turn, forces the producers of goods and services to switch to such business models that will be focused on the rapid and continuous updating of the range of goods and services, on increasing the price attractiveness, and as a result - to provide an outlet on fundamentally new consumer properties. Having such conditions, “Russia, as Vladimir Putin points out, must take the most significant place in the international division of labor not only as a supplier of raw materials and energy, but also as an owner of constantly updated advanced technologies ... To return to technological leadership, we need to select priorities carefully ” [9]. A review of a large number of scientific publications on economic and related disciplines over the past few years shows us that scientists all over the world are now actively studying and discussing the use of the cluster approach as a tool for regulating the socio-economic development of the economy not only at the regional but also at the national level. For the development of the economy of any country, it is necessary to increase competitiveness in all of its traditional and knowledge-intensive sectors. There is an urgent need to improve the quality of human capital and increase productivity. The solution of such difficult tasks requires the creation of a system of clear interaction between science and education, the state and business through the use of effective tools for innovative development, among which the cluster approach plays an important role. Using the cluster model as one of the main tools for modernizing the economy has no alternative at the moment when an economic crisis occurs and the traditional methods of diversification do not bring the result and the goals that were expected. The cluster approach can improve the competitiveness of not only the industry or region, but also the state as a whole. In most developed countries, the cluster approach has become the basic element of development strategies. The clustering of the economy forms a comprehensive view of state policy, improves labor productivity and competitiveness, expands opportunities for innovative development, optimizes interaction between various economic entities: the state, small, large and medium-sized businesses, the scientific and educational community and the public.

2. THE CONTENT OF CLUSTERS AND THE IMPORTANCE OF THE CLUSTER APPROACH IN THE DEVELOPMENT OF NATIONAL ECONOMY

Today clusters are the basis of the most successful economies. In the world as a whole, there are more than 2,000 cluster formations, mainly concentrated in the areas of the agro-industrial complex, the information and telecommunications industry, the automotive industry, bio- and nanotechnologies. In economics, the concept of the term “cluster”, its description, classification, as well as the evolution of the cluster approach is widely popular in the works of domestic and foreign researchers. Translated from the English "cluster" means a bunch, brush, and cluster [1]. Even to obtain "its" place in the economic thesaurus, this term was actively used in the exact and natural sciences: mathematics, physics, cybernetics, as well as astronomy chemistry and biology. It is considered that the concept of "cluster" in the economic theory was introduced by M. Porter. In his work “On Competition”, published in 1998, he defined the cluster as “a group of geographically neighbouring interconnected companies and related organizations operating in a particular area, characterized by common activity and complementary to each other” [8].

This definition of cluster given by M.Porter is by far the most quoted and in demand. A cluster can also be viewed as an economic category. G.P. Boush gives the following definition of a cluster: "... an economic cluster is a non-institutionalized association of independent economic entities for the joint implementation of activities, based on the proximity of territorial, sectoral, cultural; complementarity of the product, resource, process; interconnectedness with material, non-material, informational flows" [2]. It is important to note that the concept of "cluster" for designating clusters of enterprises in space starts in the 1970s in the works of such scientists as: A. Gorkin and L. Smirnyagin [4], K. Fredriksson and L. Lindmark [11], S. Chamansky and L. de Albas [12]. According to LS Markov, today there are about twenty different definitions of the cluster and related terms that "describe the local spatial economic agglomeration: industrial areas, territorial industrial complexes, new industrial sites, neo-Marshall sites, innovative environment, network areas , the poles of competitiveness, development blocks, learning regions, etc. "[6]. If we consider the definition of a cluster from the perspective of various economic schools and approaches, they are contained in the works of Marshall, Enright, Bergman and Fezer, Croc and Farrell, Prevezer and Swan, Schmitz, Egan, Elzner, Steiner and Hartman, Kofanov, Roelandt and Hertag, Yalova , Egorov, Raizberg and Lozovsky, Tretiak, Anderson, Van den Berg, Brown and Winden, etc. Representatives of some economic schools believe that the foundations of the cluster theory were laid by the British political economists when describing the benefits of specialization, i.e. when the production of homogeneous products was concentrated in independent industries, which are characterized by the simplest technological process, machinery and trained workers. A number of scientists agree that "the main theory, the "forerunner" of the cluster approach, is the "industrial areas" of A. Marshall [3]. Perhaps this concept of a cluster is one of the most well-known and closest in meaning concepts, which is most often used as a synonym for the word "cluster". Marshall's ideas were further developed in works devoted to the study of cluster formation, including post-Fordism (M. Agglieta, A. Lipetz, R. Buis), flexible specialization (M. Payor, and C. Sable) and new industrial areas (S. Brusco, B. Bekattini). Marshall's teaching was also the genesis of M. Porter's cluster concept, which is based on the idea of competitive advantages and the concept of the M. Enright regional cluster. It should be noted that clustering for quite a long time was considered as a natural process, and in economic theory there is still an opinion that clusters develop quite spontaneously. It should be highlighted on the basis of what criteria is the classification of clusters. First of all, this is the territorial affiliation of a cluster, where its location can be both a region and a region, and a country or several countries as a whole. The second criterion is the industry or direction in which the cluster operates (metallurgical, chemical, IT clusters, etc.). The third and final criterion is the cluster structure and the nature of the links within it (supplier-manufacturer). There are many classification features and cluster typologies, for example, according to the archetypes of the regions they are (retreating, spacious, balanced, dynamic, and cosmopolitan). Table 1 presents the types of clusters based on selected parameters by leading scientists and specialists.

Table following on the next page

Table 1: Cluster Classification

Classification parameters	Types	Author
1	2	3
Sectoral Affiliation	Industrial; agribusiness; scientific / innovative; service	M. Porter
Location factor	Local (dependent on natural resources); so-called trade clusters (free at the location)	M. Porter
The type of the relationship between the parties	Vertical; horizontal	M. Porter
Level of functioning and development	Stable, latent, potential, dependent on the state, strong	M. Enright
Function	Innovative; knowledge; functional corporate	S. Rosenfeld
Features of participating companies	"Marshallian"; "Hub and spokes"; cluster satellite; state enterprise clusters	E. Markusen
Organization of interfirm relations and localization of relations	Porter Cluster Cluster without local database Cluster associated with a specific resource Dispersed activity	A. Torr
Products specialization (type of products produced by the cluster)	Automotive, travel, telecommunications, furniture, in the field of education, film, etc.	K. Ketels
Number of workplaces	Megacluster, mesocluster, microcluster	C. Carlsson et al.
Size of components	Small / medium enterprises; large / small firms	D. Hanson
Coverage area	Local; regional; national; cross-border	I. Pilipenko
Priority of operation	Regional (territorial); vertical production chains; large-scale industrial associations	I. Skopina
Degree of maturity	Emerging clusters; formed clusters; clusters at the stage of decay (crisis)	E. Monastyrnyi
Depending on the industry characteristics of clustered companies	Geographic Type Horizontal type Vertical type Lateral type Technological type	V. Abashkin, L. Gokhberg, A. Shadrin

You can also select national and international clusters. In her work "Improving the competitiveness of a region based on cluster policy: theory and methodology" E. Stryabkova notes that "according to scientists," clusters are unique phenomena, and the conceptual elasticity of a cluster concept is positive, but it has acquired such a wide range of applications that it has generated many interpretations, and is perceived as "chaotic." There is no clear clarity on what level of complementary industries is included in the cluster, how strong the links between cluster members should be, what spatial scales and boundaries clustering processes (inter-company communications, competition, information transfer, social networks) operate on, and which interactions of companies define the cluster "[10]. Many scientists and specialists recognize that the difficulty in defining a cluster is that the boundaries of the cluster expand and change depending on the development of industries, economic integration, competition and the life cycles of companies.

Considering clusters on the architecture of the structure, we can distinguish micro-, meso-, macro-, hyper- and global structural level. This classification is presented in table 2.

Table 2: Characteristics of economic levels of clusters

Level	Main context
Micro- (Industry)	A cluster that is formed at an enterprise producing the development or production of a new or high-tech product, as well as providing services to support the innovation process.
Meso-	The cluster of the industry or sphere of economic activity, as well as large corporate structures that is concentrated within one state.
Macro-	A cluster that concentrates within one state or its part (state, region), the institutional basis of which is the national (state) innovation system.
Hyper-	Cluster of united national (state) systems or unions (EU, CIS, SCO, etc.), as well as transnational corporations.
Global	Cluster located in the global global systems by area of activity at the level of global formalized and non-formalized networks.

The advantage of the cluster approach in the context of the sustainable development of the national economy is that clusters are a tool for ensuring the sustainable development of any economy, which determines their active use in most countries of the world. According to the Centre for Strategic Research, “clusters are the most theoretically developed and experimentally tested way of self-organization” [7].

3. IMPLEMENTATION OF THE CLUSTER APPROACH IN THE DEVELOPMENT OF ECONOMIES IN DIFFERENT COUNTRIES OF THE WORLD

Sustainable development of the national economy is possible only if there is a certain balance between the market and government regulation. Ensuring a balance between economic efficiency and social justice is a necessary condition for sustainable economic development and one of the most important tasks of the state. Government intervention in the economy should not suppress competition, but on the contrary, should contribute to the development of a competitive environment. Competition is urgently needed in order to realize the potential of citizens, for economic growth, for social progress and for the welfare of the population. The state should raise the living standards of the population and ensure stable economic growth. The nature of competition and the role of geographic location in the formation of specific advantages of a country depend on the presence of clusters in the national economy. In turn, the absence of clusters of competitive industries is the centre of vulnerability for the national advantage of the country. Clusters are an essential link or engine in the overall economic development of both the region and the country as a whole. A key aspect of the cluster is its ability to be more innovative and productive, to bring huge benefits for the entire economy. Clusters help the public and private sector to adopt new approaches in the practice of economic policy, which is characterized by cooperation and joint actions with other economic agents. Efficient development based on the cluster mechanism constantly needs to identify such barriers that retard productivity growth and hinder innovation. To discover these limiting barriers, it is necessary to be part of the political process in order to influence it already at this level. Depending on the circumstances, all enterprises belonging to the cluster may be involved in this process as a basis for stimulating innovative activity on the part of the state, as a basis for a national industrial policy, as an interaction of large and small businesses. Taking into account the fact that modern competitive advantages are almost fully ensured due to advantages in production, management and promotion of goods, a favorable and successful development of the competitiveness of the economic system can be achieved only with the integrated use of the cluster approach and modern concepts of innovative development. By playing a major role

in competition, clusters can improve the efficiency of other institutions of a market economy. Modern economics proves the validity and credibility of cluster policy. In particular, internal competition allows improving the advantages of each cluster member, and their large concentration attracts personnel and customers. In practice, the construction of an effective and successful model does not work for all countries. Table 3 presents the TOP-5 countries by the number of successfully operating clusters.

Table 3: TOP-5 countries by the number of successfully operating clusters

Country	Number of clusters in the country	Specialization of the most successful clusters in the country	Characteristics of the most successful clusters of the country
France	96 clusters	pharmaceuticals and cosmetics, food production	Cosmetic Valley Cluster - 600 enterprises, a leader in the production of cosmetics worldwide. France is the world's first resource centre in the field of cosmetics and perfumes. The cluster, which is a unique source of knowledge and experience, also includes seven universities, large national research institutes and 200 private and public laboratories.
India	106 clusters	Computer technologies	In Bangalore, the Silicon Plateau is successfully operating. The turnover of the IT industry in India is 70 billion US dollars. The government of India provides significant tax breaks for high-tech companies.
The UK	168 clusters	biotechnology and bioresources	The government allocated \$ 30 million to create a fund that will finance innovative clusters, and identified areas around Edinburgh, Oxford and in South-East England as the main regions hosting biotech firms.
Italy	206 clusters	consumer goods and food production	Italy's industrial clusters account for 43% of the employment in the industry and more than 30% of national exports. Most clusters are single-industry (90%) and specialize in the production of consumer goods: fabrics, clothes, shoes, jewellery, accessories, as well as furniture, kitchen equipment, finishing materials and sanitary equipment. One of the most striking examples of individual industrial clusters in Italy - Sassuolo includes 220 enterprises, which employ an average of 100 people. Annually, this cluster produces more than 330 million square meters of ceramic tiles (almost every fourth tile in the world) for a total amount of more than 3 billion Euros. The export of this product brings the country almost 1.5% of total export earnings.
The USA	380 clusters	Computer technologies	In the United States, more than half of enterprises operate within clusters, and the share of GDP produced in them exceeds 60%. Perhaps the most famous and successful of them is Silicon (Silicon) Valley. This is a territory in the state of California, characterized by a high density of high-tech companies associated with the development and production of computers and their components. This is especially true of microprocessors, as well as software, mobile communication devices and biotechnologies. Despite the creation of a number of other innovation clusters, Silicon Valley remains the leading centre of its kind, receiving a third of all venture capital investments made in the United States.

Cluster economic policy is relevant in different countries of the world. In Europe, European cluster programs are being created that contribute to the development of regional clusters, their

intensification with a view to entering the markets of neighboring countries, and increasing interethnic interaction with producers from other countries. Such development programs are funded mainly by national budgets. Only one of the five development programs is funded by the budget of the structural funds of the European Union (EU). Structural funds of the European Union today carry 19% of financing for the development of clusters, which is already a significant contribution to the development of clusters (Fig. 1).

Figure 1: Sources of funding for cluster programs in European Union countries

4. CONSLUSION

The constant deviation of the economy from the equilibrium state is a consequence of the market mechanism of self-regulation. Under the influence of external and internal factors in the structure of the economy there are constant changes. Periodically occurring economic crises lead to instability of the economic system. Stabilization of economic growth and the development of balanced macroeconomic policies to achieve sustainable economic development can be identified as one of the national priorities of state regulation of many countries at the beginning of the new century. Only through the effectiveness of public administration is sustainable economic development achieved. Competent economic policy of the state has a positive effect on the growth rate of production factors and production capacity. In general, the cluster economy is attracting more and more attention around the world. The new type of industrial consortia is beneficial both to business structures and to states. Developed clusters are an economic enterprise that is efficient for a country — jobs, taxes, and a contribution to GDP. Clusters become the locomotive of economic development. To date, clustering has covered about 50% of the economies of the leading countries of the world.

ABSTRACT

Up to now, it has not yet been possible to build a universal normative body under contract law, each state having its own. The plurality of existing regulations often creates legal uncertainty, undermining the legitimate expectations of the parties. To minimize these problems the Rome I Regulation on the law applicable to contractual obligations provides that the law applicable to headquarters of international contracts. It enshrines the principle of the autonomy of the will of the parties, seeking that the solution be the same in all EU Member States. That legal text also indicates, by contract categories, which law is applicable in the event of lack of choice. The EU was aware of certain categories of contracts, in particular the consumer contract, for which it chose a special scheme. Our approach will be directed to the rules applicable to consumer contracts. We will highlight the need to protect the weaker party, taking into account the principle of more favorable treatment. The EU has continued to devote also to those contracts the possibility of the parties to choose the applicable law, but respecting some limits. We will review the European literature on the subject and try to interpret the law by highlighting its shortcomings, with reference to some jurisprudence of the CJEU. The Rome I Regulation on consumer contract seat establishes a minimum status, the application of the law of the consumer's habitual residence, imposing certain conditions. However, the legal system does not cover all consumers. We will try to show which consumers can invoke this law. Regulation protects only passive consumers, those for whom the trader directed its activity, does not apply to active consumers, moving to another state and then acquire products or services to a professional.

Keywords: *consumer; contract; european; law; professional*

1. INTRODUCTION

With the development of commercial relations and the phenomenon of globalization, we find that, more and more, legal relations develop in international contexts, connecting with more than a legal system. However, it has not yet been possible to build a universal contract law. In this context, we can not fail to mention the activity carried out by certain international organizations, especially the International Institute for the Unification of Private Law (UNIDROIT) and the United Nations Commission on International Trade Law (UNCITRAL). Both have sought to harmonize the discipline of international commercial contractual relations, contributing to greater predictability and security in this type of relationship. In addition to these non-binding contributions, we find that each State has its own disciplinary regime under contracts. The possibility of different legal regimes being applicable creates a great deal of uncertainty, undermining the legitimate expectations of the parties. Consider the case of a Portuguese company selling its products to an Azerbaijan company. Thus, we will be before two legal systems that demand the regulation of the contractual relationship.

If we also imagine the possibility of the parties granting, under the same contract, to establish relations with legal persons from other States, we easily find that the number of potentially applicable ordinances will increase. In order to avoid this multiplicity of regimes, various possibilities are drawn: through conflict rules, namely Regulation (EC) No 593/2008 of the European Parliament and of the Council of 17 June 2008 on the law applicable to contractual obligations (Rome I); by means of international conventions which have as their object a common contractual discipline, ratified by the respective acceding States, for example the 1980 Vienna Convention on the law applicable to the international sale and purchase of goods; and by means of Soft Law texts intended to harmonize the discipline of international commercial contracts. As a paradigm of the latter, we highlight UNIDROIT principles and their very important contribution to international trade. However, we can not fail to emphasize the operative character of both international conventions, given that the parties may refrain from applying them, or from the non-binding nature of Soft Law, in addition, it forms part of texts lacking the compulsory character, , but revealing great technicality and adequacy to transnational relations. Moreover, they impose themselves on clarity, flexibility and persuasiveness. We can not fail to mention that these regulatory bodies are not intended for consumers who purchase goods outside their professional activity. It is our intention to approach the technique of the conflict rule, especially in the Rome I Regulation and, as far as our study is concerned, the law applicable to the contract concluded between a consumer and a professional. Let us not forget that the option of the regulation technique has been implemented in the sense of linking all Member States and harmonizing the subjects they portray.

2. GENERAL CONSIDERATIONS

This Regulation establishes the conflictive normative framework for determining the law applicable to contractual obligations within the European Union, designing for certain normative categories special provisions, protecting the weaker party. We are talking about the transport contract, the consumer contract, the insurance contract and the employment contract. The present law underpins the principle of the freedom of the parties in the choice of law (principle of private autonomy), provided that, where such a choice does not operate a supplementary regime through clear and specific rules for the most varied contracts, in civil and commercial (Pinheiro, 2016). With this harmonization of conflict rules, the courts of the Member States will be able to determine, in the same way, the law applicable to an international contract, when the parties have not exercised the faculty conferred on them by this Regulation. It should be emphasized that with the entry into force of the Lisbon Treaty the communitarisation of Private International Law of the Member States was deepened, now moving towards a unified Private International Law system through Regulations, leaving only national legislators, in the context of transnational relations, a merely residual role (Masiá, 2016). The European Union therefore seeks to preserve its aims, including security, justice and the gradual attainment of an area of freedom. The Member States are therefore empowered to take action in the framework of judicial cooperation in civil matters with cross-border implications, always with a view to contributing to the proper functioning of the internal market, with all those measures favoring harmony and the compatibility of the rules applicable in the Member States with regard to conflicts of laws and jurisdictions. The purpose of the Rome I Regulation is to unify the conflict rules on civil and commercial disputes at European level, as was the case with its predecessor Rome Convention. Both diplomas provide similar legal solutions, and we find that the current regulation did not introduce any substantial changes, and in our view it is limited to updating some of the matters already covered by the Convention. It should be noted that the Regulation has a universal character, as its predecessor also established it, and the law designated under both instruments is applicable even in the case of a law of a non-contracting State.

With regard to the interpretation of both the 1968 Brussels Convention on Jurisdictional Jurisdiction and the Enforcement of Judgments in Civil and Commercial Matters and Council Regulation (EC) No 44/2001 of 22 December 2000 on recognition and enforcement of judgments in civil and commercial matters, which has replaced it, as well as the current Regulation (EU) n. No 1215/2012 of the European Parliament and of the Council of 12 December 2012 on jurisdiction and the recognition and enforcement of judgments in civil and commercial matters, which replaced the previous regulation, the Court of Justice of the European Union has defended the need for an autonomous interpretation of the legal categories evidenced by the regulations (Paredes, 2006). For this purpose, the national authorities have contributed a great deal to the question referred for a preliminary ruling by the national court.

3. CONSUMER CONTRACTS: THE LAW APPLICABLE

Article 6 of the Rome I Regulation establishes a special regime for the designation of the law applicable to the consumer contract. This precept takes into account the fragilities of the weaker party intending to protect the consumer. The application of the general scheme of Article 4 of the Regulation is removed from the outset. The Court of Justice of the European Union clarified the concept of consumer, stating that the protection applies to 'private final consumers' (Case 150/77, Bertrand). It subsequently concluded that the protection granted to consumers extends to contracts concluded exclusively by private individuals in order to meet consumer needs and can not cover undertakings or legal persons (Case C-269/95 Benincasa). This protection can be invoked only by the consumer himself and not by an applicant acting in the exercise of his professional activity to whom the consumer has transferred his rights (Case C-89/91, Shearson Lehmann Hutton). Finally, the Court held that the definition of a consumer must be interpreted autonomously and uniformly throughout the Union (C-508/12, Vapenik). The Court concluded that: 'Thus, the Court has already held that the rules of special jurisdiction over consumer contracts can not be applied to contracts between two persons engaged in commercial or professional activities (see, to that effect, Case C-89/91 Shearson Lehmann Hutton [1993] ECR I-139, paragraphs 11 and 24). 33 It must be stated that there is also no imbalance between the parties in a contractual relationship such as that at issue in the main proceedings, namely that between two persons not engaged in commercial or professional activities. Therefore, that relationship may not be subject to the system of special protection applicable to consumers contracting with persons engaged in commercial or professional activities' (paragraphs 32 and 33 of the case). When it is a legal relationship between a consumer and a professional (the one who carries out commercial activities) the law of the consumer's country applies. However, it is important to state that the application of the law of the consumer country presupposes, in order to be applied, that the commercial or professional activity of the person contracting with the consumer, the professional, develops in or to the consumer's country and that the contract is within the scope of its activities. The regime set out in Article 6 of the Regulation, formerly Article 5 of the Rome Convention, also presupposes that consumer goods are supplied as part of a professional activity. Some understand that only in this way can we face an inequality between the parties and, as such, the need to protect the weaker party (Pinheiro, 2015). However, this rule should apply even if the professional acts outside the scope of his activity and the consumer is unaware of this situation acting in good faith (Giuliano & Lagarde, 1980). It should be noted that the European legislature in this area has not failed to enshrine the possibility for the parties to elect the law regulating their contract. However, that choice can not deprive the consumer of the protection afforded him by the provisions which can not be derogated by agreement of the law, which, in the absence of choice, would apply to him under Article 6 (1) of the Rome I Regulation. The same is true of the law of habitual residence of the consumer, which provides the minimum standard of protection and presents itself as the law most closely connected with the weaker party (Pinheiro, 2006) (Ramos, 2016).

Thus, the autonomy of the will of the contracting parties will only be relevant to the extent that the law chosen manifests itself to the consumer (Ramos, 2016). It is therefore necessary to examine Article 6 (1) and (2) of the Rome I Regulation, starting with the letter of the law:

«1. Without prejudice to Articles 5 and 7, a contract concluded by a natural person for a purpose which can be regarded as being outside his trade or profession (the consumer) with another person acting in the exercise of his trade or profession (the professional) shall be governed by the law of the country where the consumer has his habitual residence, provided that the professional: (a) pursues his commercial or professional activities in the country where the consumer has his habitual residence, or (b) by any means, directs such activities to that country or to several countries including that country, and the contract falls within the scope of such activities.

2. Notwithstanding paragraph 1, the parties may choose the law applicable to a contract which fulfils the requirements of paragraph 1, in accordance with Article 3. Such a choice may not, however, have the result of depriving the consumer of the protection afforded to him by provisions that cannot be derogated from by agreement by virtue of the law which, in the absence of choice, would have been applicable on the basis of paragraph 1.».

This conflict rule, foreseen for consumer contracts, establishes two assumptions to be applied. On the one hand, it determines the material scope of the standard requiring that the protagonists of these contracts should be: a professional and a consumer. On the other, it delimits the territorial scope of application, prescribing only passive or sedentary consumers as receivers of the standard (Giuliano & Lagarde, 1980). As regards the material scope, Article 6 applies to any contract concluded between a natural person for a purpose which may be considered as being outside his trade or profession, the consumer, with another person acting in the course of his business activities or professionals, the professional. The legislator enshrined the theory of the impression of the recipient privileging only the behavior of the consumer that can be known by the professional. Hence the expression used by the legislature "for an end that may be considered as foreign to his commercial or professional activity". In short, the interpretative result of a particular statement must be in accordance with the recipient's theory of impression, that is, in the sense that a normal declarant placed in the position of the actual declarant could deduct from the declarant's behavior, in the light of the good faith and the circumstances in which the case may be considered. If, on the assumption that we are dealing with a dual-purpose contract, both personal and professional, we must take account of the position taken by the CJEU in Case C-464/01 (Johann Gruber v Bay Wa AG). Although the case concerns the 1968 Brussels Convention on Jurisdiction and the Enforcement of Judgments in Civil and Commercial Matters, the problem raised and the solution envisaged remain the same in the instruments that followed and have already been referred to by us. Consequently, "a person who has concluded a contract in respect of goods intended to be used in a manner which is partly occupational and which is partly outside his trade or profession may not rely on the special rules of competence laid down in Articles 13 to 15 of that Convention, unless the occupational use is marginal, to the point of having only a negligible role in the overall context of the operation in question, and in that respect it is irrelevant that the extra-professional aspect is dominant; - it is for the court seised of the action to decide whether the contract in question was concluded in order to satisfy the requirements arising from the professional activity of the person concerned or whether, on the contrary, professional use only plays an insignificant role; - for that purpose, that court must take into account all relevant facts which are objectively apparent from the file; on the other hand, the circumstances or elements which the contracting party might have known at the time of conclusion of the contract shall not be taken into account,

unless the person claiming to be a consumer behaved in such a way that he could legitimately cause to the other party to the contract the impression that he was acting for professional purposes. " Whenever the part of the contract, related to the acquirer's business activity, is of minimal significance, it will affect the entire contract and for this reason the acquirer can not invoke Article 6 of the Rome I Regulation. Regarding territorial scope, in the context of international or transnational trade relations, consumer protection must take into account the dichotomy between active consumer and passive consumer (Garcimartín, 2016). The passive consumer is anyone who purchases consumer goods in the market of his habitual residence. This implies that the professional acts within the market of the first, including there, to acts of publicity. (Garcimartin, 2016). In these circumstances the law of the habitual residence of the consumer should be applied. (Pinheiro, 2006). The emphasis of the internationality of the contract is placed on the professional's performance, he is the "responsible" for this situation. The active consumer is everyone who moves to the professional market. Imagine a Portuguese consumer who purchases a consumer good in another state from a professional. In this case, the legislature intended that the consumer can not invoke the application of the law of his habitual residence. The principle of the personality of the law is thus refuted. In short, the Rome I Regulation being the normative body capable of indicating the substantive law best placed to regulate a given international contract that falls within its material scope and having as procedural support Regulation (EU) no. No 1215/2012 of the European Parliament and of the Council of 12 December 2012 on jurisdiction and the recognition and enforcement of judgments in civil and commercial matters, account should be taken of Article 17 (1) (c) of the latter legal instrument that determines the following: "1. In matters relating to a contract concluded by a person, the consumer, for a purpose which can be regarded as being outside his trade or profession, jurisdiction shall be determined by this Section, without prejudice to Article 6 and point 5 of Article 7, if: c) in all other cases, the contract has been concluded with a person who pursues commercial or professional activities in the Member State of the consumer's domicile or, by any means, directs such activities to that Member State or to several States including that Member State, and the contract falls within the scope of such activities." In the light of the foregoing, two situations are outlined: the first, which is set out in Article 6 (1) (a) of the Rome I Regulation and which establishes the professional situation of the trader or trader in the country where the consumer resides habitual. The expression activities includes both the situation where the professional has a business establishment in the consumer's country, and the other one where the professional is temporarily in the consumer's country, by hypothesis, at a trade show booth (Garcimartín, 2016). The second situation is provided for in Article 6 (1) (b) of the Rome I Regulation and concerns the possibility for the trader, by any means, to direct his activities to the country of the habitual residence of the consumer or to several countries , including that country, ie the habitual residence of the consumer, and the contract falls within the scope of those activities. We find that the legislator pointed out the means that can be used to reach that consumer and disregarded the place where the contract is celebrated. We can see the adaptation of the regulation to the dynamics of commercial relations established via the internet. We can not fail to underline the importance of the term "targeted activities". It should be noted that consumer protection provided for in the Regulation on jurisdiction and the recognition and enforcement of judgments in civil and commercial matters, known as the Brussels I Regulation (currently Regulation (EU) No 1215/2012 of the European Parliament and of the Council of 12 December 2012) and the Rome I Regulation shall apply if the trader has "directed his activities" to the Member State of the consumer within the meaning of Article 17 (1) (c) of that Regulation and Article 6 (1) of the Rome I Regulation. In this regard, recital 24 of the Rome I Regulation refers to the consistency in the interpretation of the material scope between the rules of these two instruments with regard to the concept of "directing activities".

The Court has been providing guidance on how to interpret the concept of "directing activities" for a particular Member State. In *Pammer v Alpenhof* (Joined Cases C-585/08 and C-144/09) the Court had to decide whether access to a website was sufficient to consider whether a trader directed his activity to the Member State of domicile within the meaning of Article 15 (1) (c) of the Brussels I Regulation in the version applicable at the time. It has decided that mere accessibility to a website in a particular Member State is not sufficient to show that the trader has directed his activity to that Member State. On the contrary, in order to demonstrate this, it is necessary to establish whether, before the conclusion of the contract with the consumer, it is apparent from those websites and from the overall activity of the trader that he intended to establish business relations with consumers domiciled in one or more Member States, consumer's domicile. In *Mühlleitner* (C-190/11), the Court held that it is not necessary for the contract to be concluded from a distance, but that this element can be taken into account when analyzing all relevant factors necessary to determine whether the professional directs activities for a particular Member State. In *Emrek* (C-218/12), the Court held that Article 15 (1) (c) of the Brussels I Regulation, Article 17 (1) (c), version at the time, does not require a causal link between a website and the conclusion of the contract. However, that causal link is an indication of the connection of the contract to a commercial or professional activity directed at the Member State of the consumer's domicile. In short, in view of all the Court's guidelines, a list of criteria has been drawn up by the Court itself: "the international nature of the activity, the mention of routes from other Member States to the place where the use of a language or currency other than those normally used in the Member State of the trader, with the possibility of reserving and confirming the reservation / order in that language, the mention of telephone numbers with an international of expenditure on an Internet referral service to provide consumers in other Member States with access to a trader's site or a site of their intermediary, the use of a first-level domain name different from the Member State where the trader is established, and the mention of an international clientele constituted by customers domiciled in different Member States. However, the following elements do not constitute sufficient proof of that intention: the mere accessibility of the professional or intermediary's website in the Member State of the consumer's home, an e-mail address and other contact details, or the use of a language or currency which is commonly used in the Member State of the trader "(Practical Guide - Competence and Law applicable to international consumer contracts, 2018). In short, it is necessary that the web site invite the conclusion of distance contracts and that a distance contract has actually been concluded by any means (Pinheiro, 2015). Those interpretative criteria apply either under Regulation (EU) No 1215/2012 of the European Parliament and of the Council of 12 December 2012 on jurisdiction and the recognition and enforcement of judgments in civil and commercial matters, Article 17 and in the Rome I Regulation, Article 6 (1) (b). It should be noted that the legislator in Article 6 of the Rome I Regulation did not include transport and insurance contracts where one of the interveners is a consumer. This is enshrined in other provisions, namely Articles 5 and 7 of that Regulation.

4. CONTRACTS EXCLUDED

The legislator in Article 6 (4) excludes from the scope of paragraphs 1 and 2 of the same legal precept a list of situations that relate to several situations:

- a) A contract for the supply of services where the services are to be supplied to the consumer exclusively in a country other than that in which he has his habitual residence. It will be easy to understand the reason for the departure from the regime established by virtue of this type of contracts to show a very strong link with the country where the service is provided.
- b) A contract of carriage other than a contract relating to package travel within the meaning of Council Directive 90/314 / EEC of 13 June 1990 on package travel, package holidays and package tours. This exclusion finds its reason for being in the fact that the regulation had

laid down special rules for this for this typology of contracts, article 5. It should be noted that travel organized under Directive 2015/2302 of the European Parliament and of the Council of 25 November 2015 on package travel and related travel Regulation (EC) No 2006/2004 and Directive 2011/83 / EU of the European Parliament and of the Council and repealing Council Directive 90/314 / EEC.

- c) A contract relating to a right in rem in immovable property or a tenancy of immovable property other than a contract relating to the right to use immovable properties on a timeshare basis within the meaning of Directive 94/47 / EC. This exclusion covers mortgages or any other guarantee on real estate. This is due to the greater connection of the object of these contracts with the parents' law of the situation of the property even though one of the parties is a consumer. It is concerned with the principle of effectiveness in its two strands, principle of greater proximity and principle of the feasibility of decisions. Also known as the principle of closer connection.
- d) Rights and obligations which constitute a financial instrument and rights and obligations constituting the terms and conditions governing the issuance or offer to the public and public take-over bids of transferable securities, and the subscription and redemption of units in collective investment undertakings in so far as these activities do not constitute provision of a financial service.

Financial contracts, contracts entered into by private investors in connection with a public offer for the sale of securities or a public offer for the acquisition of securities are excluded. Participation in collective investment undertakings is also excluded. These may take the form of Investment Funds or Investment Companies, aiming at the collective investment of capital obtained from the public, whose operation is subject to the principle of risk sharing and the pursuit of the exclusive interest of the participants. All investment vehicles are appropriate for raising the savings of an indefinite number of small investors (also called retail investors) and channeling them to the economy with a minimum of risk and with assured liquidity. Thus, all the transactions referred to in Article 6 (4) (d) naturally require a uniform legal regime for the determination of the applicable law, preventing the application of different schemes by virtue of the habitual residence of the investor (recital 28 of the Regulation). In this way, we intend to instill predictability and security in this type of relationship. Finally, the legislature has withdrawn the contracts (e) (...) concluded within the scope of Article 4 (1) (h). According to recital 28, the application of a plurality of laws to which Article 6 (1) and (2) may lead is not in line with financial instruments as standardized products (Fernandes 2010). It is intended that the law of the country of habitual residence of the consumer does not call into question the "regulatory unit" (Fernandes, 2010). To retain:

- Regulation (EU) No 1215/20121 and Regulation (EC) No 593/20082 include special provisions to determine: the Member State or States whose courts have jurisdiction to hear disputes relating to consumer contracts and the applicable law to these contracts.
- Such special provisions may derogate from the general principles of jurisdiction and applicable law, with the aim of protecting the consumer as a weaker party to the contractual relationship.
- Generally allow the protected party may only be sued in the courts of your residence, but give it the competence choice option when this part is on the claimant quality.

5. CONCLUSIONS

1. The Rome I Regulation enshrines the principle of autonomy of will in private international law, ie the possibility for the parties to designate the law applicable to their international contract;

2. However, this law may not deprive the consumer of the protection afforded him by the law of his habitual residence, observing the requirements of article 6, numbers 1 and 2;
3. Article 19 of that regulation does not indicate what we are to understand by the habitual residence of natural persons; consequently, we must delimit that concept independently from the circumstances in casu;
4. Article 6 protects only passive consumers, those who purchase consumer goods in the market of their habitual residence.
5. If the consumer moves to the country of the professional he must be treated as a consumer of that country.
6. The application of the law of the habitual residence of the consumer will depend on the verification of one of the subparagraphs contained in article 6 n° 1 of the Rome I Regulation: situation in which the professional has a commercial establishment in the country of the consumer, like the other one in which the professional is temporarily in the consumer's country; the possibility of the professional, through any means, to direct his activities to the country of habitual residence of the consumer or to several countries, including that country, that is the habitual residence of the consumer, and the contract falls within the scope of those activities.
7. With regard to the concept of targeted activity, it is important to bear in mind the positions of the Court of Justice of the European Union and the criteria provided by it.

ABSTRACT

Main purpose while analyzing mutual relations between World Trade Organization (WTO) law and human rights is to emphasize the protection of human rights in the same line with commercial reforms. One of the main issues that brought up in WTO Public Forum by experts regarding trade and human rights was about it to be manifested in international trade system, also in WTO dispute settlement mechanism, generally in trade policy. Difference of opinions between these two fields occurs when one state supposes that the other state does not fulfill its obligations undertaken in frames of WTO, for example, customs, taxes or dues. Negative effect of politics on realization of human rights in trade sphere happens when farmer subsidies in developed countries has a negative effect on right to food in developing countries, or intellectual property right in trade sphere negatively affects the right to health. Also, negative effects such as the effect of speculation on food products, or the effect of liberalization of services on customs, the effect of licenses on the price of the medicine, and its effect on right to health do exist. For a long time, human rights issue was not amongst the emphasized issues in WTO dispute settlement mechanism. Nowadays, during dispute settlement process, documents regarding human rights are widely used as a source while researching the interpretation and proof materials. The problem of accessibility of medicine in developing countries keeps remaining as one of the main problems in frames of WTO regarding the protection of intellectual property right. Several documents were adopted in order to solve this issue: TRIPS agreement and public health, WTO decision on implementation of paragraph 6 of the Doha Declaration on the TRIPS agreement and public health, The Protocol Amending the TRIPS Agreement. Doha Declaration declares the priority of public health on economic and commercial interests. After summarizing everything that happened as the result of all of these processes, we can come to conclusion that:

- International law norms and norms related to human rights should be taken into consideration during interpretation and implementation of WTO norms;*
- In dispute settlement process in frames of WTO, documents regarding human rights should be widely used as a source while researching the interpretation and proof materials;*

In practice of different states, the effect of trade principals on human rights should be analyzed – for example, The Canada–Colombia Free Trade Agreement.

Keywords: *Doha Declaration, Doha Round, human rights, right to health, trade law, TRIPS, TRIPS agreement and public health, World Trade Organization*

1. INTRODUCTION

Nowadays, the mutual relations between trade and human rights turned into serious research object. Although, trade is a leading force in economic progress and development process that are very important in fight against poverty, in some cases, it can turn into danger for human

rights. Everyone has right to food, health, water and development. Joint report of UN High Commissioner and UN Development Program states: "Trade agreements, of course, besides affecting the rights of consumers, residents, workers, people who are living in poverty and other groups of people, they also affect the capacity of state to governing its population and protecting their rights. But besides this, while concluding trade agreements, their effect on right to health, education, water, food and work is not taken into consideration." Main purpose while analyzing mutual relations between World Trade Organization (WTO) law and human rights is to emphasize the protection of human rights in the same line with commercial reforms. One of the main issues that brought up in WTO Public Forum by experts regarding trade and human rights was about it to be manifested in international trade system, also in WTO dispute settlement mechanism, generally in trade policy. Difference of opinions between these two fields occurs when one state supposes that the other state does not fulfill its obligations undertaken in frames of WTO, for example, customs, taxes or dues. Negative effect of politics on realization of human rights in trade sphere happens when farmer subsidies in developed countries has a negative effect on right to food in developing countries, or intellectual property right in trade sphere negatively affects the right to health. Also, negative effects such as the effect of speculation on food products, or the effect of liberalization of services on customs, the effect of licenses on the price of the medicine, and its effect on right to health do exist.

2. WTO LAW AND HUMAN RIGHTS

The mutual relation between two important fields of international law – WTO law and human rights makes the analysis of the relations of legal norms unavoidable. These two important fields cross regarding different issues: subject of regulation, vertical regulation of relations, purposes etc. Both fields are fields of international law, establishment, development process happens in frames of international law, but ultimately, in hierarchy of normative acts that regulate the relations of natural and legal persons, it stands in first rows. By putting liability on states, it affects the legal regulation of relations between natural and legal persons in very important manner. In the Human rights concepts- in the base of natural law theory, social contract theory stands universality, dignity, freedom, justice, equality (legal, social, political, economical), cooperation between humans and solidarity and other rights and freedoms. These rights are reflected also in the 1948 Universal Declaration of Human Rights [16]. International regulation of regulation of trade and business on human life and human rights is one of the most important issues. It is Guidelines for Business and Human Rights adopted by the UN Human Rights Council in June 2011 [10, p. 327]. "Protection, Respect and Solution" Framework Agreement for these Guidelines consists of three key points:

- State duty to protect human rights;
- corporate responsibility to respect human rights;
- Solutions on reimbursement of losses of persons associated with the business;

The "Protection, Respect and Decision" framework agreement adopted by the United Nations High Commissioner for Human Rights, established a new and accurate criterion and entered an important stage in the development of human rights in society and in the expectations of a human rights business. This is the first important step to solving problems and getting effective answers [12, p. 216]. The basic principles and rights set forth in the International Bill of Human Rights and the Declaration of the International Labor Organization were reflected in the relevant principles [4, p. 5]. Commitment to respecting human rights requires:

- a) prevent or minimize negative impacts on human rights as a result of their actions or eliminate such consequences when they occur;
- b) avoid or minimize the consequences of negative human rights that are directly related to their business relationships, products or services, even if they did not cause these effects.

The main objectives of WTO law and the field of human rights are to achieve economic and social well-being. Trade rules are based on the same values as human rights: rights and freedoms, non-discrimination, the rule of law, economy, efficiency, economic well-being, and so on. Among the freedoms set forth in the WTO, the right of exporters to the free use of property, freedom of contract, non-discrimination in industry and other fields, free circulation of goods and services, etc. are included. In the field of human rights there are more freedoms. The freedoms set forth in the WTO are based on the freedoms set forth in human rights. In the context of economic globalization, the promotion of property rights beyond the WTO rights within the WTO is aimed at ensuring operations and protection of foreign investors, rather than on the human rights enjoyed by everyone, regardless of economic benefits [6]. The right to freedom of goods and services under the WTO is not related right to freedom in the field of human rights [11]. Human rights are related to individuals and some groups: it would not be right to include economic goods here. During the discussion of thoughts between Petersmann and Philip Altson happened in 2002, the conflict over the merits of trade law caused great debates. [13] WTO has a great role in development of trade law in international sphere. When WTO panels were held, "Main goals that GATT/WTO was focused on were creating market condition that would allow the development of individual activity (trade and business)". [17] But unfortunately, norms related to human rights are not directly detected in trade norms. Despite the fact that, mentioned human rights are detected in many international documents, in WTO documents, these rights are not directly, individually detected. Member states exercise trade relations not directly, but indirectly by the natural (merchant, businessman) and legal persons (transnational corporations) that are related to them. Since the WTO norms indirectly manifest themselves in individuals, Human rights norms are also incorporated into them in one form or another [6]. For a long time, human rights issue was not one of the leading issues in framework of WTO dispute settlement system. But nowadays, while dispute resolution is going on, implementation of documents relating to human rights is widely spread. Focus on human rights in framework of WTO happened after the case of 39 pharmaceutical companies against Republic of South Africa. So that, in 1997 due to sharp increase in number of the people who were infected by AIDS (4.2 million), Republic of South Africa even without the permission of the license owner, let the use of licensed medicines, means – importers could avoid patent law, and bring the medicines that are produced in third world countries to the country; in the borders of the state it was allowed to produce medicine with licensed technology. In 2001, due to very negative pressure from the society, pharmaceutical companies had to withdraw their claims.

3. RIGHT TO HEALTH

What is the right to health protection? UN Committee on Economic, Social and Cultural Rights includes following to the main elements of right to health protection:

- Medical care;
- Preventive measures;
- Treatment and supervision over the treatment;

Main guarantee element of this right is the easy access to quality medical means and necessary medicines. Adoption of the Doha Declaration is related with exactly this case – widely spreading of AIDS in African countries. Doha Round of WTO, as it is seen from the name was held in capital city of Qatar, Doha in 2001. Provisions of this round were so important for the development of international trade that it is called "round of Millennium". Main document that was adopted during the "round of Millennium" was Doha Declaration. Doha Declaration was providing compromise between developed and developing countries. Doha Declaration contains 9 directions in it:

1. Agriculture;

2. Services;
3. Non-agricultural products;
4. Legal norms;
5. Helping trade;
6. Intellectual property;
7. Dispute regulation mechanism;
8. Trade and environment;
9. Special distinguished regime; [14]

First time that Doha Declaration was used in court as a source was in case Thailand against the fund of medicines against AIDS pharmaceutical company Bristol-Myers Squibb. [3]

4. TRIPS

If we look at the practice of Western African country Kana, we can see that countries who are parties of the Doha Declaration use the provisions of TRIPS agreement for the protection of public health in following cases. Removing the medicines from the list of products that need to be licensed. In fact, direct interpretation of TRIPS agreement prohibits it, but in case of correct justification of such kind of actions, it states that it is allowed. In legislation of Kana, government could remove the medicines from the list of licensed discoveries until 2003, and after according to conditions of TRIPS agreement it was abolished. According to WTO legal norms, such kind of actions are considered as unsuccessful. During obligatory licensing, defining the competences of the entrepreneurs, the amount of "suitable compensation" [2, article 31 (h)] is not directly defined. It has pros and cons. Committee that was founded in Kana, in order to define the scope of competences suggested payment of license payment in amount of 1 % of retail selling price of the medicine. Canada made the licensing of medicine obligatory in order to export medicine to developing countries. In this country, according to value for importer country in UN Human Development Index, payment in amount from 4 % to 0,02 % for medicines is defined. On condition of exhaustion of intellectual property right, implementation of parallel import. Kana legislation allows the parallel import of less valuable medicines that are produced by implementing patent right. In this case, the rights of right owner is protected [9]. General Council Decision on the Implementation of Paragraph 6 of the Doha Declaration on the TRIPS Agreement and Public Health was adopted of 30 August 2003. According to this Decision, WTO members are allowed to issue compulsory licenses [15] to export medicines to countries with insufficient or no manufacturing capacity in the pharmaceutical sector. Thereby the parallel import right of Developing Countries was consolidated and the issue related the compliance of ZAR legislation to TRIPS norms found its solution. However, Decision sets the terms for implementation of parallel import [7, b.2a]. This state must be Developing Country (the country must have insufficient or no manufacturing power and capacity) or declare the willingness to import certain medicines in advance. The type of medicine and its amount must be declared in advance. The mechanism of compulsory licensing must be strengthened within this country. Additionally, pursuant to General Council Decision on the Implementation of Paragraph 6 of the Doha Declaration on the TRIPS Agreement and Public Health, State that declares the willingness to produce and export certain medicines carries extra obligations [7, b.2a, 2c]. Implementation of compulsory licensing within their territory and giving information about the company that produces medicines. Special distinguishable packaging of medicines and production of needed amount. Publishing of information about the amount of products supplied, awards that are paid to patent owner by trade organizations considering the value of medicine in importing country [7, b.3]. By the year of 2005, states like Canada, Norway and Netherlands made amendments in their legislations which would satisfy the instructions that were set forth for the exporting states.

According to the Resolution that is mentioned, importing states as well must prevent the exportation of relevant medical products for the second time. Other participants of the Contract, in turn, shall exercise necessary actions. Re-importation is permitted, in accordance to the organizational rules that was established amongst regional economical associations. As it seems, the Doha Declaration reflects the priority of social protection of health over economic and trade interests. In practice, the impact of trade principles of various countries over implementing the human rights began to be analyzed. As an example to that, we can show signing of the additional Contract to the Contract on Free Trade that was signed between Canada and Columbia in 21 November 2008 (came to power in 15 August 2011), which was strictly demanding the preparation of reports on the effect of trade in both states over human right issues. This is the first analyzing effort of states on that sphere. According to the disposal of the President of the Republic of Azerbaijan in 2006 August 2 “The Plan of Actions on Synchronization of legislation of Azerbaijan Republic on the process of being member with World Trade Organization to the Requirements of World Trade Organizations” was ratified. For that reason, the broad research of WTO law plays a critical role for legal school of Azerbaijan.

5. CONCLUSION

Generalizing everything that was occurred as a result of these processes we could conclude that:

- During research, interpretation process of WTO norms, international law norms and the norms relating to human right shall be considered simultaneously.
- During the solving of disputes and investigation of evidential materials, within the sources, the ones that contain crucial points about human rights shall be given detailed attention
- The effects of trade principles over human rights in different countries shall be analyzed – for ex. The Contract on Free Trade and Addition to it, between Canada and Columbia.
- WTO regulates the trade relations that occur throughout the world and serves the fair division of profit acquired from circulation. The level of economic development is a direct sign of effectiveness of realization of human rights at any state. Because financial welfare is root to the acquisition and realization of perfect progressive conditions on the sphere of human rights.

THE DETERMINANTS OF MENTAL HEALTH IN ENFORCED WORK REQUIREMENTS

Dinka Caha

*Faculty of Law Osijek, Croatia
dcaha@pravos.hr*

ABSTRACT

Welfare reforms during the last few decades shifted towards implementing many variants of enforced labor market participation, condition- and obligation-based benefits intended to promote employability, individual responsibility and activation of the unemployed workers, particularly welfare clients. Typical elements of such reforms are »welfare to work« programs, mandatory community activities, training programs, individual action plans and job placements. An ongoing debate follows this conversion whether such conditionality is advancing inclusion by bringing marginalized groups into economy and society or emphasizing project of commodification by marketizing citizenship (Brodkin, 2015). While debate and research about the advantages and disadvantages of introducing mandated activities are ongoing, trend of conditioning benefits is increasingly common. The success of reforms is dependent on highly variable policy design of activational dimensions and policy implementation. Due to potentially adverse outcomes, it is necessary to explore the possibilities to enhance determinants of mental health in mandated components of activating labor market policy and to set guidelines for attentive design of such welfare policies. While not considering ethical nature of such policy decisions, this paper explores determinants that foster wellbeing in enforced work requirements. By paralleling determinants of mental health to workfare programs we can foster wellbeing of welfare clients, create more inclusive practice and set more appropriate measurable outcomes. Consequently, this research keeps pace with trends that emphasize the need to redefine policy efficiency and intervention effect by focusing away from economic measures towards psychosocial goals (Coutts, Stuckler & Cann, 2014). Paper suggests further direction of planning workfare and enabling policies in order to enhance activation, quality of life, mental health and employability of welfare clients.

Keywords: *activation, inclusion, mental health, policy, workfare*

1. INTRODUCTION

Long established direction of welfare reforms comprises strict eligibility criteria based on principle of subsidiarity. In order to receive social assistance benefits an unemployed must accept conditioned work requirements. Such a direction has replaced rights-based social assistance benefits that were granted based on need, legal right or family status and normalize the idea of conditioning social assistance benefits (Brodkin, 2015). Justification for such instrumental behaviorism is drawn from a perspective that unemployed individuals are able and responsible for their employability. Dingeldey (2007) distinguishes two dimensions of activating labor market policies that mutually pervade: workfare dimension relates to a strict eligibility criteria and obligations that welfare clients must carry out in order to access social assistance entitlement. This dimension also includes cuts in unemployment benefit and creating individual plans that contain obligations for welfare client. Through strengthening enforced work requirements government intends to improve their employability. The second is the 'enabling' dimension that promotes employability of those hard-to-employ and helps them to adjust to labor market requirements (Dingeldey, 2007). Enabling elements include training programs, placement services, transportation subsidies, convergence with family policy like childcare, parental leave, part-time jobs. As work compensation for accessing benefits is increasing, an ongoing critics and debate follow over whether such conditionality is advancing

inclusion by bringing marginalized groups into economy and society or emphasizing project of commodification by marketizing citizenship (Brodkin, 2015). The ability to combine all these elements indicates that effectiveness of welfare reforms is dependent on a policy design. Upon this, other factors such as quality of implementation, personal characteristics of welfare clients surely affect its effectiveness. Systematic support and structured work on improving and preserving mental health are initiated over the last decades. Example of such work is Mental health in all policies approach (Joint Action on Mental Health and Wellbeing, 2016) which encourages and reinforces the responsibility of public policies to impact determinants of mental health and seeks to reduce inequalities in mental health. Important contributors to a mental health of individuals according to Wilkinson and Marmot (2003) are community interventions that improve social environment and encourage social interactions through which people feel valued and supported. Vulnerable group like welfare clients through social support has access to emotional resources (e.g., encouragement in a job finding process) and practical resources (e.g., information about job openings) that they need. Social institutions like religion, family are common sources of power, domination and social control and they are incorrectly presented as a social support through which they want to achieve compliance (Bourdieu, 1990; referenced by Peillon, 1998). Continuing Bourdieu's logic there is a need to explore workfare ability to use or misuse formal social norms to influence behavioral and psychological pathways and create change. This paper explores determinants that relate to wellbeing in enforced work requirements. Consequently, this research keeps pace with trends that emphasize the need to redefine policy efficiency and intervention effect by focusing away from economic measures towards psychosocial goals (Coutts, Stuckler and Cann, 2014).

2. HOW TO MAKE WORKFARE A POSITIVE EXPERIENCE?

The World Health Organization (2004) as well as some authors like Jahoda (1982) highlight the importance of contributing to community, fulfilling their own potentials, having valued, productive work. As a consequence, they all contribute to a positive mental health. Jahoda (1982) argues that employment is psychologically supportive due to its latent benefits: employment gives people daily routine, provides regularly shared experiences and contacts with people outside the nuclear family, enforces activity, links individuals to a goals and purposes that transcend their own, and defines their status and identity. Loss of these latent benefits has a negative impact on the individual's well-being and, if the unemployed do not find an adequate replacement, unemployed will be psychologically deprived, which will negatively reflect on their mental health. In this context, workfare has a capability to provide some of latent benefits of paid work to welfare clients. Cohen (2004) highlights the potential of social support to indirectly buffer behavior that damages health and contributes to a various aspect of wellbeing. Because of this it is possible to question whether workfare has a capacity to support felling of social connectedness. A research on how workfare relates to employability and wellbeing has mixed evidence. Chiefly, justification for workfare requirements policy designers find in a higher employment prospects and support to some aspects of wellbeing (Hohmeyer, 2012; Hohmeyer & Wolff, 2012; Knabe, Schöb & Weimann, 2017). Hohmeyer and Wolff (2012) found that such mandated activities were effective for some vulnerable groups, those long-term unemployed welfare clients and for clients who were older than 24. Wulfgramm (2011) and Knabe et al. (2016) showed that life satisfaction of workfare clients was higher that of unemployed, but not as high as that of regularly employed. Also, Knabe et al. (2016) founds that emotional wellbeing of workfare clients was higher than regularly employed and unemployed due to workfare partially restore some psychosocial, latent functions of work. Author explains that welfare clients feel good while participating in workfare due to it partially restored identity that they derived from work and because it moved them from daily routines when they were unemployed.

Mead (2008, p.69) highlights the empowering effect of workfare and state that those disadvantaged are unlikely to regular work unless they are required to as a condition of support by society and states. Also, among the justifications for workfare, we can find ideas that workfare keeps generic skills, communication skills, work habits of welfare clients, reinforces appropriate attitude toward work (Friedli & Stearn, 2015). Other authors like Warburton and Smith (2003) emphasize that workfare disempowers welfare clients, disrupts their sense of autonomy due the lack of choice. Tisch and Wolff (2014) hold an opinion that workfare participation did not improve indicators of positive functioning such as self-efficacy. Crisp and Flecher (2008) reported that workfare did not provide participants skills and experience needed to gain employment nor support which clients with multiple barriers needed. Due to little evidence whether workfare increases employment rate, different forms of symbolically-paid jobs are created, and the conditions remained strict (Crisp & Flecher, 2008). Workfare is planned and implemented within the social welfare system. Many variations in designing and implementation of workfare make harder to make conclusion what works and under what condition it works. Review of the literature gives some indicators that can guide those implementing workfare requirements. Hohmeyer and Wolff (2012) showed that workfare activation can be effective on the employment prospects for participants who have been jobless for several years but ineffective for participants who were recently employed and younger than 24 years. That is why countries tend to mandate activation through workfare programs after welfare clients receive benefits for a certain period. Also, vulnerable group are those long-term unemployed and older adults because of isolation detrimentally effects their health (Holt-Lunstad, Smith and Layton, 2010). For this reason, workfare might be beneficial for these vulnerable groups. Kampen and Tonkens (2018) claims that without finding a paid job previous empowering effect vanishes after some time. Such evidence can be easily applied to design of welfare policy and selection of participants. Welfare clients who help others or work for common good expect a reward and their effort to be valued over the time. Similar, Hohmeyer (2012) such adverse effect of time explains in regard to time restrictions for job search and motivation. Design of workfare policies should consider such clients' changing needs, expectations and later deleterious effect (Kampen & Tonkens, 2018). As seen, orientation on individual responsibility does not solve lock-in problems of welfare clients, which is why the focus should shift towards solving structural problems of unemployment. Equally important as design of welfare policies is an implementation of certain policy in practice. Through experiences of sixty-six workfare, clients Kampen and Tonkens (2018) concluded that quality interaction between workfare client and caseworker can have an empowering impact. Relevant characteristics that affect the quality are following: a caseworker is respectful, takes time to look at clients' previous experience and violated life stories in order to accordingly propose appropriate workfare activities. Workfare activities that are in collision with job search activities, care for dependent family members, household production or activities in the shadow economy, may erode possible enabling and integrating elements of workfare (Hohmeyer and Wolff, 2012). Also, it is important that the welfare clients consider workfare suitable to match their personal skills. It is therefore important that caseworker and workfare clients have the discretion to decide together which intensity is beneficial to workfare client. Various workfare activities that caseworker can offer to welfare client can also help in tailoring and softening mandated requirements. When workfare activities include helping others and promoting social justice, workfare has a potential to produce positive impact on welfare clients (Reinders & Youniss, 2006). Also, according to Warburton and Smith (2003) mandated community service can be less fulfilling because participants do not experience personal or social benefits from their involvement. In the empowerment process co-creation and engagement with clients are prerequisite and therefore it is necessarily to include welfare clients with his present emotions and problems in planning and selecting workfare activities that are meaningful for them.

Brodkin (2015) states that in order to foster enabling elements of workfare it is necessary to determine how those who execute written policy are implementing its regulations. Guidelines that favor processing efficiency and production of employees systematically foster practices that emphasize commodifying elements and undermined the supportive ones (Brodkin 2015). Simplification and ritualization of complex job tasks and reductive adaptation are common strategies through which those implementing workfare enhance their processing efficiency. Such strategies often harm screening for adequate services and other tasks that aim at supporting welfare clients. Strandh (2001) and Wulfrgramm (2011) show that positive effects on wellbeing obtain activation interventions where welfare clients gain work experience, interventions that provide a connection with employed and real workplace roles and those interventions that contribute to feel of sustainable progress, employment chances and a sense of control. Workfare often encompasses temporary work jobs that must be in public interest and that are not carried through regular employment. However, many activities are not related to a regularly employed. Examples of such activities are helping in food banks, public kitchens, reading to elderly, young children, accompanying teams on trips, snow clearance, painting fences, grass mowing. Yet all of them are valuable activities and as Kampen and Tonkens (2018) such meaningful activities can have positive effect on mental health. More evidence can be found in research among adolescent who were engaged in compulsory community service. Henderson, Pancer and Brown (2014) discovered that positive evaluation of community service requirements is generated through flexible time schedule, if adolescents perceive positive effect of community service on their development. Gaining communication skills, organizing skills and leadership skills can help adolescents' careers to develop. Also, it was important to adolescents to feel that they were doing something fulfilling, making a difference in the lives of other individuals and community, while feeling fun and appreciated. Logistical problems, difficult and overwhelming tasks were important factors for evaluation of community service. Workfare also can have positive impact on self-respect if welfare clients feel respected through their status, if they are enjoying in mandated but meaningful activities, if working environment is less strict (Kampen & Tonkens, 2018). With careful planning and implementation workfare client can be enrolled in activities of shared values and interest and work toward individual and common goals. Seeking to improve quality of experience for those mandated to perform workfare, we should consider what makes workfare rewarding and enjoyable experience. This paper accents aspects conditions and factors that can help foster mental health and wellbeing of workfare clients which those designing and implementing workfare programs should consider. By paralleling the elements that foster inclusion, self-enrichment and employability workfare experience should be designed in a way that offers welfare clients sense of accomplishment and reduces social and health disparities. Although previous evidence has led to important insights, the next logical and necessary step is to organize them. While planning and implementing social policy as well as measuring its' effectiveness, welfare reforms could benefit from having practice framework or theory that offers guidelines. Social quality theory is an example of theory that offers broad framework through which holistic and quality policy initiatives can develop. Social quality model (Figure 1.) distinguishes four interactive conditions that provide context necessary in order to have good health and wellbeing and for people to realize themselves as human beings (Holman and Walker, 2018).

Figure following on the next page

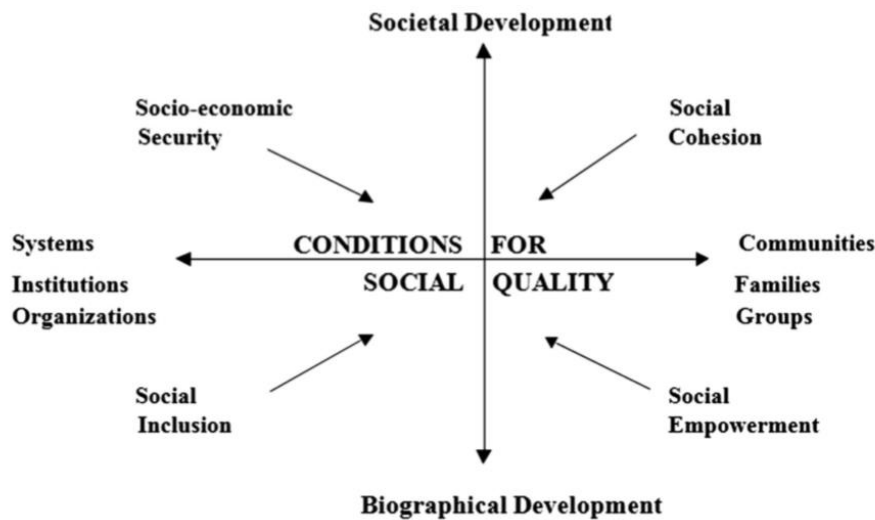

Figure 1: Social quality model (Holman and Walker, 2018, p. 248)

Economic security means that people have access to a various material resources and services for decent life. With sufficient and regular income, equal employment prospects, good housing and working conditions and carefully covered network of quality services it is reasonable to expect health improvement and wellbeing. Social inclusion encompasses to what extent people feel accepted and integrated in institutions and social systems. In this context a quality policy would be one that strives to ensure a high level of human rights, which undertakes specific interventions to fight oppression and condemn the perception of welfare clients as scroungers. Social cohesion related to the degree of socially binding trust within society which is an outcome of shared and accepted values and norms. Idea of having community that accepts different, vulnerable groups, community that promotes shared values mutual obligations through concrete actions can form a base for welfare clients to feel valued and have trust in their environment. Social empowerment encompasses availability of structural and individual support mechanisms enable people to develop their capabilities and participate in society. Aside to its primary function to evaluate the quality of society, such a model can be a starting point to help national and local government to make policy choices that value health and wellbeing, to implement practices and evaluate effectiveness of various activation measures.

3. CONSLUSION

While workfare obligations are continually imposed, there is a need to take care of implementation and provide quality (material and social) support to welfare clients. Responsibility is largely on the side of workfare participants and based on this it is expected from them to work on their own employability, to be job ready, have right mindset and pursue any kind of employment. This should be accompanied by the same quality protection – higher household income and increased availability of real paid work. Alongside individual responsibility, it is important to take in consideration and focus on responsibility of systems and structures to take more responsibility and actions in order to deal with poverty and quality service.

ABSTRACT

The meaning of Goodwill is not the same in the world but generally is considered to be an integral part of the company's value and company assets mainly intangible assets. The authors' definitions differ. In the world, for example, they are J. M. Yang, D. C. Mueller, H. P. Hughes. In the Czech environment, it is Zelenka, Kincl, Foret and Kulil. The authors refer to the definition of Kulil, according to which the authors will continue to work. Goodwill is related to the implemented marketing strategy in all cases. This connection is done consciously or the management of the company does not even realize it. This whole process takes place independently of his will. There is a direct link between Binding Goodwill and marketing strategies in the internal external environment of the enterprise. A key issue for a business asset is the valuation method or more accurately assessing the present value of goodwill. There is also a need for an annual review of goodwill valuation to capture its development in the context of marketing strategies, from its growth to the decline and emergence of badwill. The prevailing valuation through book value is inappropriate. The description of the current situation in the Czech Republic is complicated by the fact that goodwill expresses itself as the difference between the accounting and the market price. It can be used and recorded only in cases when the company was acquired. With regard to goodwill and implemented marketing strategies, this is a poor condition. The link between the value of goodwill and the marketing strategy should be captured in the valuation methodology. The existing methodology allows the use of a number of methods. Comparing these methods leads to recommendations that optimally meet the requirements to capture the nature of development and the value of goodwill.

Keywords: *Goodwill, Marketing strategy, Problematics, Value*

1. INTRODUCTION

The notion of goodwill is not new, it has already appeared in the 16th century as a good will. Goodwill was used to capitalize future revenue from intangible assets (Kulil, 2014, p. 19). Already in the 19th century, the phenomenon of goodwill evoked extensive discussions especially among the professional public. We can consider it a legal, economic and accounting issue as well. The result of extensive discussions with the professional public since the 19th century is considered goodwill as a legal (Justia.com"US Courts of Appeals Cases. Dostupné z <http://law.justia.com/cases/federalúappellatecourts/F2/551/1057/44098>), economic and accounting concept.

In the 20th and 21st centuries, the issue has deepened and many other definitions are testified. For example, the Merriam-Webster Dictionary provides three different definitions or concepts of goodwill:

1. „In attitude of freindless or kidness: BENEVOLENCE
2. Cheerful acquiescence or willingness.
3. A good relationship, as of a business with its customers or country with other counties“.
(Merriam-Webster dictionary, 1997, s. 539).

Within the economic concept of goodwill, there are a number of different concepts and definitions of each other. For example, J. M. Yang, in his book *Goodwill and Other Intangibles* of 1927, defines goodwill as follows: "Goodwill represents the present value or capitalized value of the estimated future profits of an established enterprise, in addition to the level of the normal results that could be reasonably assumed to be realized by a similar newly created company" (Zelenka, 2006, p. 19). D.C.Mueller states that goodwill and brand capital are routinely solved by analysts in the area of business and marketing, due to the measurement of the value of assets, in particular the name of a company or brand, and then between accounting and business analysts, but is little used by the economist (quotation of WEB https). HPHughes in the historical accounting encyclopedia characterizes goodwill as: The difference in one company's ability to generate a profit compared to another or an average firm (HPHughes 1982, with 18) and also states that the name is derived from the originally good feeling or some goodwill of the entrepreneur customer. It defines its basic characteristics as immateriality, belonging to a business entity, independence of acquisition costs, differential and monopolistic advantage, instability of value, or technical uselessness (H.P.Hughes 1982, p. 19). Kulil V. clearly explains: According to established international customs, however, this is a good name for a business that brings about improved economic results, primarily due to good business policy, and is the result of customer relations, advertising and advertising (Kulil, 2014, p.14). The authors lean toward Kulil's concept and continue to follow. Despite the unequivocal expression, goodwill is part of the company's intangible assets and brings positive economic effects. The issue of accounting concept or expression of goodwill should be divided into two areas. The first is represented by internal accounting. It is not governed by laws or regulations and is guided by the firm so that the economic reality and specifics of the company are captured as close as possible to its real economic image. So the company can capture, appreciate and track the development of its goodwill. Goodwill expresses as an intangible asset which may increase or decrease to negative goodwill, which is referred to as badwill. Accounting concepts in the form of internal accounting correspond to the specifics and needs of the firm but are not available to external entities. The second area provides double-entry financial accounting. Expression, valuation and charging of goodwill are not uniform. It depends on the accounting methodology used in the country or the entity (IFRS, US GAAP, national adjustments). The method of capture, valuation, classification and billing is not uniform, based on the relevant methodology used by the firm. Incomprehensibility occurs in the items of the financial statements, even at the amount of the goodwill item. Generely goodwill can be viewed as intangible asset only if it is acquired in a business combination. Goodwill cannot be capitalized because it is not identifiable therefore intangibles that are not identifiable are recognized as part of goodwill (SFAS 142.s.39, 2007): 'Acquired identifiable assets in a business combination are valued at their fair values². The remaining value after the identification of all tangible and intangible assets is than assigned to goodwill. '3

The problem increase because in accounting goodwill is intangible long-term asset that is not included in the business accounts and arises when a company acquires another entire business.

Goodwill is recorded when a company purchases another company and the purchase price is greater than the combination of: the fair value of the identifiable tangible and intangible assets acquired, and the liabilities that were assumed. Goodwill is reported on the balance sheet as a noncurrent asset and the amount is subject to impairment test at least once per year.

1.1. Recognition of goodwill

Sets goodwill as the difference between the cost of the acquisition over net fair value of the identifiable assets, liabilities and contingent liabilities.

1.1.1. IFRS

In short words goodwill represents future economic benefits from assets that do not meet the criteria for recognition. Recognition is important. After the recognition goodwill should be tested for impairment annually. On acquisition day, goodwill has to be valued to cash-generating units IFRS (IFRS 3. 2007 p.51.). The biggest change in IFRS is in the negative goodwill, newly named as discount on acquisition: "It occurs when the acquirer's interest in the net fair value of acquiree's identifiable assets, liabilities and contingent liabilities exceeds the cost of acquisition. Discount on acquisition according to the new standard is now immediately recognized in the income statement for the period (IFRS 3. , 2007, p.56). This also represents a significant change as amended in the new.

1.1.2. US GAAP

According the US GAAP goodwill is recorded as the excess of the cost of an acquisition price over the fair value of acquired net assets. In short words goodwill is recorded only when the carrying amount of goodwill exceeds its implied fair value (SFAS 141., 2007, p.43.). According the Research paper Accounting Treatment of Goodwill in IFRS and US GAAP (JERMAN, MANZIN, 2018, p. 6): "To test goodwill for impairment, companies must first assign purchased goodwill to reporting units. Companies assign goodwill to reporting units by comparing the estimated fair value of the reporting unit with the fair values of the unit's identifiable net assets. Two-step impairment shall be used to identify potential goodwill impairment and measure the amount of the impairment loss to be recognized (if any). Those two steps are:
Estimating the fair value of the companies reporting unit comparing with its carrying amount
Comparing the implied fair value of the reporting unit goodwill with the carrying amount of that goodwill. According to (SFAS 142, 2007, p. 18)

1.1.3. Czech Republic

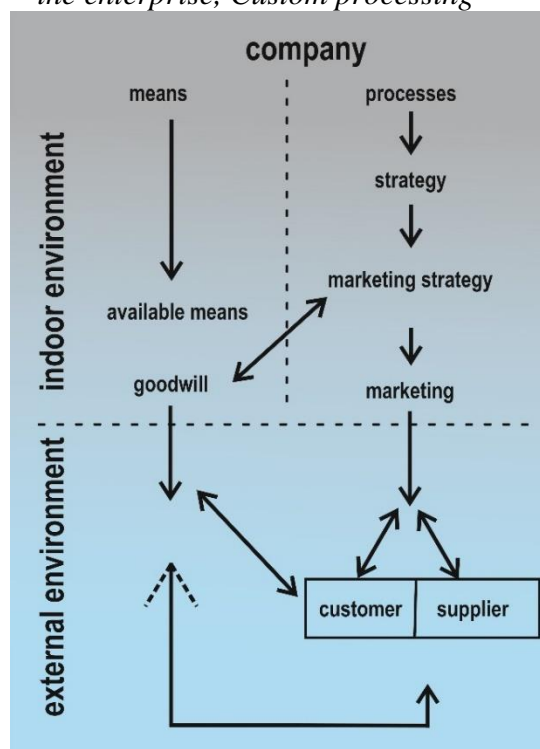

The issue of goodwill is addressed by the Czech Accounting Standard for Entrepreneurs No. 011, part of the operation with the enterprise. Pursuant to Act 563/1992 Coll. §24 para. 3 (b) adjustments may be made for individual asset items as set out in the Act on Accounting in §25 or apply the method according to Decree 500/2002 Coll. §61a para 1; ie the difference between the purchase price and the net book value is recorded and recognized as intangible fixed assets - goodwill taking into account §6 para. 1 and para 3 (d) Decree 500/2002 Coll. The National Accounting Board has already responded to the case of different book values and tax bases in the case of an asset that was not acquired by transfer or transfer and by the issuance of Interpretation I-1 Transitional differences in the initial valuation of assets. The need for this interpretation was triggered in 2005 by a special provision of the Czech Income Tax Act which limited the tax deductibility of the purchase price of a passenger car to CZK 900,000 and a year later to CZK 1,500,000. Because the car is massively used for tangible fixed assets, the professional public has greatly welcomed this interpretation. The Interpretation states that the acquisition assets whose initial carrying amount differs from the input tax base cause a temporary difference.

The impact of such a temporary difference in the form of deferred tax should be recognized in accordance with the nature of the transaction, i.e. as part of the cost of the purchase asset. Include deferred tax in the purchase price. From different definitions, respectively. expression of Goodwill, the authors consider his economic expression in V.Kulil's concept as objective because the legal concept and the concept of the accounting system is a subsystem in terms of system concept. These subsystems of economic conception are determined and fully subject to the discipline in which this term is used. For the needs of the company, the legal concept is specific, implies and is influenced by both national and international legislation. The authors see a general agreement between Goodwill's economic, legal, and accounting interpretations in that it is part of the company's intangible asset that brings it to economic, positive and negative effects. It should have been captured, valued and accounted for by its changes at least at the level of intercompany accounting. This will create at least a minimal prerequisite for monitoring and influencing it.

2. THE IMPACT OF MARKETING STRATEGY ON THE VALUE OF GOODWILL

The following figure shows that goodwill affects internal processes in the company and external processes, especially in relation to customers and suppliers. It is also influenced by both positive and negative concepts. There is a direct link between marketing strategy and goodwill because marketing strategy, as part of the company's strategy, affects goodwill so as to influence the behavior and access of both customers and suppliers. This is an objective value that is an integral part of the company's intangible assets, as well as the company's know-how or the results of its own research or development activities.

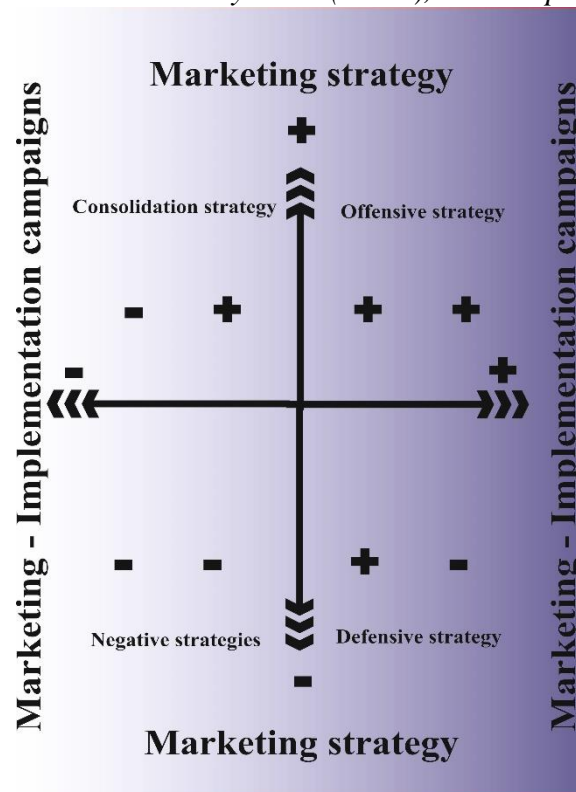

Figure 1: Binding Goodwill and marketing strategies in the internal external environment of the enterprise, Custom processing

2.1. The impact of marketing strategy on the development of goodwill

When marketing is understood as the process of marketing strategy implementation, it is done through marketing campaigns that affect the development of goodwill. In general, development can be simplified as shown in Figure 2.

Figure 2: General scheme of marketing strategy implementation and their possible impacts on goodwill and money / cost (M / C), Custom processing

where:

- M / C = money / cost
- MA = marketing activities
- MS = marketing strategy
- G = goodwill

For simplicity, the campaign can be expressed as a decrease in money expressed in money form. So as a cost (COST) (money / cost) = M / C. M / C will refer to money or costs. Expressing goodwill in accounting. The problem between the expression of the purchase price and the company's accounting price. They can never coincide. The accountant is the synergy of the company's methodology and strategy in capturing (expose) assets / liabilities cost / BVA income vs. historical cost and tax base optimization. Market price - DEFINITION is immediate and expresses buyer's strength (weakness), location, taste (necessity) of the seller. Based on this comparison, goodwill arises, but it is not goodwill.

2.2. Valuation by the Brand Value Added (BVA) method

This is a classical economic analysis complemented by a survey of factors that greatly influence the demand for business and brand performance. The survey requires a broad sample of respondents and conducting surveys at different levels. Especially: between two different brands, between two different time periods, between two target subsegment groups, between two product classes (Slabý, 2014). To ensure transparency, objectivity and re-use, we need to identify ten key indicators that are the factors behind the brandbeta™ method. Different attributes such as market time, distribution, market share, sales growth rate, price surcharge, price elasticity, marketing costs, advertising, and brand are awarded a score of 0-10 points. Depending on the point value, the company gets into groups which are in Table 1. BB and lower ratings represent a weak goodwill.

Table 1: Point scores of β brand β etaTM

Body	91-100	81-90	71-80	61-70	51-60	41-50	31-40	21-30	11-20	0-10
Zařazení	AAA	AA	A	BBB	BB	B	CCC	CC	C	D

Source: in Haigh, 2002, p. 27, Custom processing

For comparison, the average rating is represented by the BBB rating. Rating B and lower represents a weak mark. The resulting discount rate is obtained after the sum of the risk surcharges and risk-free discount rates.

$$Y_n = r_f + RP$$

where:

$$RP = r_f * (n-1) * (100 - \beta\beta / 100)$$

Y_n – discount rate

r_f – risk-free discount rate

RP - risk premium

(n - 1) – coefficient of risk premium

$\beta\beta$ - the number of points obtained during the β brand β etaTM analysis.

Following is the calculation of the brand value, which is based on the added economic value for each year, multiplied by the BVA index. The calculated value is then taxed and discounted to the current value. The value of the tag is calculated by summing these values as chosen period (Haigh, 2002).

2.3. Valuation by point rating

It is based on the evaluation of the fulfillment of these criteria in particular. Originality, ease of rememberability, simplicity, aesthetic appearance, length of protection, product quality, country-wide coverage, country use, profitability, relationship to business name or origin, percentage of export. This method deals primarily with the company brand, but can also be used for goodwill valuation. The weakness of this method is mostly an expert gathering of information. This is a "soft" method based primarily on the evaluator's experience.

2.4. The goodwill method

This is an accounting statement of the value of the goodwill of the company. To build goodwill affects almost everything the company does. It builds on quality products and services, public relations, stakeholders, long-term social responsibility, and above all marketing strategy, its implementation, and other marketing activities. From the accounting point of view, goodwill is a part of the Company's assets. Goodwill is usually part of the Company's financial statements. If this is the case, goodwill must be based on thorough analysis and analysis. In the Czech Republic, the concept of goodwill has been known in accounting since 2003. Jeho stanovení je rozdílem mezi hodnotou nabyté jednotky minus čistá aktiva jednotky v přeceněných hodnotách aktiv.

$$\text{Goodwill} = HJ - CAp,$$

where:

HJ = value of the acquired unit

CAp= net assets of the acquired unit

Goodwill is a decree to the Accounting Act characterized as a "positive" or "negative" difference between the valuation of a business or its part within the meaning of the Commercial Code acquired principally by the purchase, deposit or appraisal of assets and liabilities as part of the company's transformations and by sum of its individually revalued assets less committed commitments. Goodwill is depreciated on a straight-line basis within 60 months of the acquisition of a business or part thereof in the cost, and, in the event of a company's change, goodwill is depreciated over the effective date of the change. Negative goodwill is amortized evenly for five years from the acquisition of a business or part thereof in income, and, in the event of a company's change, goodwill is depreciated to income from the date of the decisive change. An entity may decide on a goodwill or negative goodwill depreciation period of more than 60 months; the entity shall justify this in the notes to the financial statements. The eventual change in the purchase price of an enterprise or its part will adjust the value of goodwill or negative goodwill, without changing the depreciation period (Daněk, 2015, p. 18). With regard to the above methods, it can be stated that none of them complies with the concept of goodwill defined by Kulilem. To determine the value of goodwill, it is necessary to accept the need to set criteria and their score so that these criteria, whatever the "soft" group, are based on goodwill, and are also valued by a weighting factor that adds or takes weight to the points achieved. Allotment of the same point value to the criteria is considered by the authors to be correct because it is the general parameters of goodwill. Weight is then a matter of business and enterprise size.

3. CONCLUSION

We proceed from the fact that, in the case of economic concepts of goodwill, the authors more or less agree that it is an intangible asset. We assume that in the case of economic concepts of goodwill, the authors agree more or less that it is intangible property. In particular, the expression of goodwill as the difference between accounting and market value is discriminatory, since it can be used only if the acquisition has taken place. The essence of the β brand β ™ method is that it captures the parameters by which goodwill is valued. Also, how to score and then sort in groups, see tab. No 1 is methodically consistent with the goodwill specifications. However, the determination of individual items (criteria) is less suited to the characteristics of goodwill. There is also a lack of criteria that is clearly different for different business and globalized markets. For valuation using point ratings, criteria that are more likely to reflect brand value than goodwill appear in the rating criteria. In addition, an expert assessment - expressing the level of the individual criteria is based only on the evaluator's experience and not on the basis of objective research by groups of suppliers, customers, competitors. There is no public rating that is not included in the above groups and represents a general population whose brand awareness should also be tested. There should be a suitable, if possible, objective way of determining goodwill. This method should be generally acceptable. If there is persistence and appreciation of goodwill on a subjective business approach, which is certainly the way possible, the outcome of the valuation then depends entirely on the firm's approach and can not be compared with other business entities in the field. This situation makes it difficult to include goodwill in decision-making processes such as procurement procedures, credit granting, bank guarantees, investor interest, investor input into the company, etc. Developing the methodology appropriate for goodwill valuation is considered by the authors to be a key problem of its inclusion in the company's assets and value- within the marketing strategy.

ABSTRACT

Consolidations, which are radical changes, lead to profound identity changes, which can take positive or negative forms from the point of view of the university's development. Positive changes in organizational identity lead to identification with a new, consolidated university and a sense of satisfaction with its development and faith in the possibilities of self-realization in this organization. Negative ones lead to a crisis of collective identity, cultural confusion and passive employee attitudes. At the level of individual identity, mergers can lead to identification with a new organization and a sense of self-fulfillment, or they can turn towards rejecting change and frustration of employees. University merger research, adopting the perspective of social identity, indicates that the key factor affecting willingness and, consequently, the pace of integration is the perception of prestige and the resulting degree of identification with the merger. Therefore, the key question is whether university employees will benefit from the status of a merger. If we are dealing with a strategic combination of two prestigious organizations, which is intended to enter the "world university league", there is a chance to increase the status of individual and collective organization's stakeholders. Similarly in the case of other types of mergers, if the weaker university is absorbed by a stronger one, then there is a chance of increasing the prestige. I.H. Gleibs and others confirm the existence of discrepancies in the expectations and actual results of university fusion, based on identity and prestige. The aim of this article is to identify the issues of organizational identity in the processes of university merger. The article discusses the complexity of the organizational identity of universities merger processes. The research methodology was based on qualitative research - case studies of universities in Europe.

Keywords: *university mergers, organizational identity, university management, mergers and acquisitions, higher education sector*

1. INTRODUCTION

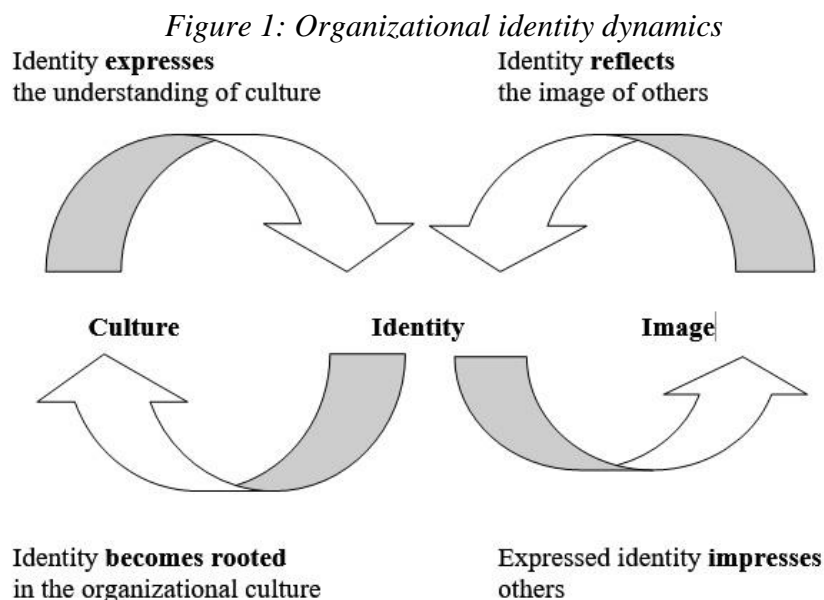

In most countries, the consolidation of the universities is a bottom-up process, but the tendencies to connect universities at the central level are beginning to be reflected in public policies. In some countries, top-down consolidations, which are more controversial, are also conducted, for example in South Africa, Russia, China and Norway (Karodia, Shaikh, Soni, 2015). The objectives of mergers are therefore diverse and may include: entering the league of "world class universities", rationalization of education and research networks, as well as restructuring aimed at increasing the efficiency of the education process (Cai, 2016, pp. 7–24). The specific objective pursued through mergers may be to increase the access and quality of higher education addressed to disadvantaged groups (Sułkowski, Seliga, Woźniak, 2017).

Such was the idea of consolidation and transformation of higher education in South Africa. Interesting examples of institutional consolidation are entities from the education sector, which is subject to significant state regulation in most countries (Sułkowski, 2018). On the one hand, we deal with the market processes of consolidation of private (non-public) universities in many educational systems. On the other hand, there are consolidations of public universities, which are often stimulated by central or regional authorities and form part of public policy. An important observation is that the implementation of these mergers is the effect of various motivations. This is, of course, an attempt to rationalize the functioning of the higher education and science system. Autonomous development of institutions of higher education and science, which is devoid of strong coordination, creates a certain scope of redundancy of education programs and irrationality of resource management, which can be partly resolved by state intervention. In terminology related to combining organizations, the following terms are used: mergers and acquisitions, consolidation processes, buyouts (Kaczyński, 2013, pp. 95–111). Usually, the terms mergers, acquisitions and buyouts refer to the organizational level, whereas consolidation may refer to both the organization and the larger system, e.g. higher education. The concept of mergers and acquisitions (M&A), is most common in English bibliography. In English, in which the literature on mergers and acquisitions is the most extensive, besides mergers & acquisitions, terms such as takeover, consolidation or buyout are also used (Frąckowiak, Lewandowski, 2009, p. 24). In Polish literature, following the English and French terminology, the terms akwizycja (acquisition) and mariaż (merger) are also used. In the scientific literature, a merger is understood as a combination of two or more economic entities in a new organism as a consequence of the agreement between these organizations. The acquisition may be defined as the purchase of one economic entity by another, the acquired organization is absorbed into the structure of the parent organization or functions as a dependent organization (Łopacińska, 2014, pp. 583–594). Thus, mergers and acquisitions are two basic types of consolidation of legal entities. The merger of the organizations refers to cases in which two (or more) independent legal entities are transformed into one. A process in which a legal entity is one of the merging organizations is called incorporation.

2. MERGER PROCESS AND ORGANIZATIONAL IDENTITY

Another important area of cultural analysis is the transformation of organizational and individual identity of academic employees in merger processes. Consolidations, which are changes of radical nature, lead to profound identity changes, which can take positive or negative forms from the point of view of the university's development (Ylijoki, Ursin, 2013, pp. 1135–1149). Positive changes in organizational identity lead to identification with a new, consolidated university and a sense of satisfaction with its development and faith in the possibilities of self-realization in this organization. Negative ones lead to a crisis of collective identity, cultural confusion and passive employee attitudes. At the level of individual identity, mergers can lead to identification with a new organization and a sense of self-fulfillment, or they can turn towards rejecting change and frustration of employees. University merger research, adopting the perspective of social identity, indicates that the key factor affecting the willingness and, consequently, the pace of integration is the perception of prestige and the resulting degree of identification with the merger. Therefore, the key question is whether university employees will benefit from the status of a merger. If we are dealing with a strategic combination of two prestigious organizations, which is intended to enter the league of "world class universities", there is a chance to increase the status of individual and collective stakeholders of the organization. Similarly in the case of other types of mergers, if the weaker university is absorbed by a stronger one, then there is a chance of increasing the prestige. I.H. Gleibs and others confirm the existence of discrepancies in the expectations and actual results of university merger, based on identity and prestige.

Employees of a university with a lower status in the United Kingdom showed a higher degree of support and identification with the merger, expecting a more equal representation in the management of the consolidated university. The staff of higher education institutions preferred the incorporation model and identified less with the merger and consolidated university (Gleibs, Tauber, Viki, Giessner, 2013, pp. 177–190). Considerations on relatively persistent and key values that distinguish the organization refer not only to the concept of organizational identity, but also to mission, vision, organizational culture and image. These four areas are engaged in the organizing processes and undergo significant transformations during the merger (Seliga, Sułkowski, Woźniak, 2019). The mission and vision of the organization are concepts taken from strategic management, and have a cultural aspect related to the projection of the most important values. L.W. Rue and P.G. Holland note that the mission determines the essence and sense of the organization's existence by formulating the most general goals and domains of activity (Rue, Holland, 1989, pp. 7–8). J. Brilman describes the vision as a short formula specifying the main vocation and goals of the organization (Brilman, 2002, p. 79). The mission of the organization should be based on the culture and identity of the organization, although it must only consist of such values that have been recognized as worth disseminating and contributing to the positive image of the organization. The vision is usually created by managers, but it does not have to be disseminated. It plays the role of an idea of the development of an organization in the future based on achieving the defined goals and values. One can see the interdependence relation between the mission of the organization and its identity and culture. Organizational culture and identity are based on key values and arise through the interdependence of spontaneous and intentional collective actions. M.J. Hatch and M. Schultz clearly differentiate the culture, identity and image of the organization, at the same time indicating their mutual dependence (Sułkowski, 2012). "The organizational identity is neither completely culturally conditioned nor fully resulting from the image of the organization, it is rather created by the interdependence of these two areas" (Figure 1) (Hatch, Schultz, 2000, pp. 24–25).

The relationships between organizational culture, identity and image are reflected in the four processes taking place between these spheres. The first process reflects the images of the company created by other people in its identity (mirroring). This reflection links the image of the organization that was created in the environment with its identity.

The second process is the rooting of identity in the organizational culture (reflecting). Identity affects the norms and values in the organization and is confirmed in the organizational culture. Culture can be expressed by identity (expressing). Identity can impress others through image (impressing) (Hatch, Schultz, 2004, p. 379). This model should be supplemented with mission and vision, which are types of an ideal image of the organization and its future, with the difference that they arise for the organization's own purposes. They can be used to manage the meanings, along with the image of the organization (Sułkowski, 2012). In the university merger processes a link should be made between: identity (Ylijoki, Ursin, pp. 1135–1149), organizational culture, mission and vision, and the image of the merging universities. The consolidation of universities is a strategic (mission and vision), cultural (identity and culture) and at the same time organizational and managerial process. For the implementation of merger, it is necessary to coordinate strategies, structures and organizational systems in all functional aspects. Such cultural interdependence can be metaphorically represented in the form of the Möbius strip.

Figure 2: Identity strip in the process of merging two universities

Source: author's elaboration.

Figure 2 illustrates metaphorically the development of a new identity, which takes place at the individual, organizational and social level. Employees who identify themselves with the consolidated university and merger, interpret the ongoing cultural change. Organizing merger processes, the university, builds identity on the values associated with the merger, such as: entrepreneurship, competitiveness, innovation. The university identity is reflected in its mission and vision, organizational structures and organizational culture.

3. CASE STUDY – UNIVERSITÉ GRENOBLE ALPES (UGA)

The University of Grenoble was founded in the 14th century (1339) and survived, undergoing several transformations, until 1968. The introduction of a reform strengthening the autonomy of research and teaching centers has led to the division of the university into four specialized sister universities, following the former departmental division. The beginning of the 21st century brought "Shanghai shock" in France, which was associated with the weak positions of French universities in emerging and increasingly important international rankings. Positive consolidation experiences in higher education in many countries encouraged the universities of Grenoble to undertake the pioneering task of joining the university, which began with the creation of a strategic alliance. In 2002, a cooperation was established under the name Grenoble Universités, which covered all four public universities in Grenoble.

In the negotiation process, the University of Technology decided not to move towards the consolidation, while the other three institutions planned, communicated and effectively implemented the merger. The Grenoble Universités consortium became an umbrella that enabled the development of cooperation as well as consolidation. In 2009, as part of the implementation of the PRES (research and higher education centers) ministerial program, the merger of Grenoble universities was announced, which was supposed to start from January 1, 2016. A negotiation and integration team was established, in which representatives of all universities as well as central and local authorities and external stakeholders participated. Consolidation received strong financial and substantive support from the French Ministry of Higher Education. As a result of strategic analyses, studies and negotiations, the following were agreed: the strategy and stages of the merger, the structure of the consolidated university, the new name and the authorities of the consolidated university. A wide consultation process was also carried out, followed by communication, both among the employees as well as the students and other stakeholder groups. It is worth noting that the merger was preceded not only by a long period of close and formalized cooperation, but also by a six-year planning and preparation process for the implementation at the strategic and operational level. In 2015, the decree on the merger of three universities in Grenoble was signed and entered into force on January 1, 2016 (Decree No 2015-1132). By virtue of the decree, the Université Grenoble Alpes was created, which merged the three Grenoble universities into one. After the consolidation, 24 units in the forms faculties, schools and institutes have been separated in the organizational structure. As part of the matrix structure, 6 large disciplinary research units were also identified. The organizational structure of didactic and research units was made more flexible in the consolidation process by adding elements of matrix structures, but the changes were not radical. Deeper structural changes were introduced in university-wide service units, which cover various functional areas, such as finance and accounting, human resources, international cooperation, education and university life, research and innovation, information systems, logistics, cooperation with the environment and others (L'organigramme., 2017). On the basis of the interviews it was found that the most important barriers to the merger included psychological, social, organizational and legal constraints. Since the beginning of the process of formalized cooperation, the concerns of the academic staff and administration arose that consolidation may worsen working conditions or lead to weakening of influence. The way to dispel these fears was communication, consultation and providing the employees with such working conditions that were not worse compared to those before the merger. The staff participated in the preparation of the merger for several years through systematic meetings within inter-university integration teams. The involvement of the employees in the merger was quite high due to the "Shanghai shock", the chances of using central programs and the sense of creating a valuable and to some extent pioneering organizational solution in France. A certain social barrier was the formation of groups that were concerned about the merger and the conservative attitude of trade unions. Long negotiations, which allowed for a compromise, were necessary. The first, positive effects of the consolidation create the perspective of achieving the strategic goals of the consolidation in the coming years. UGA implements mechanisms that dynamize scientific activity, which has led to the improvement of its position in national and international rankings in the last two years. It cost a lot of work for the employees to adapt to the new situation, which means that the results of scientific and didactic activities should improve year by year. The interviews indicate the improvement of consolidated university management through: more effective strategic management, real emphasis on international cooperation and cooperation with the environment, effective marketing communication and more advanced financial management and accounting.

4. CONCLUSION

The degree of university integration depends primarily on the type of the merger, as well as on the consolidation process itself, attitudes of stakeholders, merger effects and other factors (Frølich, 2016, pp. 231–248; Cai, 2016, pp. 7–24; Yang, 2015, pp. 123–144; Sutela, Cai, 2016, pp. 161–178). Unification mergers lead to a high degree of integration of the consolidated university, while federal mergers allow looser connections. The process of strategic management in a consolidated university should be subordinated to one strategy, but it is possible that there is an entity in the structure that creates its own internal strategies. The consolidation of private universities, based on the acquisition of universities or their founders, often leads to the formation of educational holdings or conglomerates, which are characterized by low autonomy, but high strategic independence. Low autonomy results from the dependence on the "mother university" or "founding company" and duplication of standardized organizational and management solutions, e.g. IT systems, division structures, quality systems etc. Strategic independence results from the differentiation of strategies in different markets on which they branches or faculties of the consolidated university operate. The conclusions from many studies of consolidation processes of universities in the world clearly indicate the primary role of cultural factors. Joining organizational cultures is a difficult process that only partially undergoes managerial control. The premise for the success of a cultural merger is to conduct an analysis that takes into account organizational identity, status and prestige. The social identity approach indicates that university employees who gain prestige on the university merger will find it easier to accept and will strive for the consolidation on partner terms. The university staff with greater prestige and stronger culture will probably be more skeptical about the consolidation and it will be more often perceived as the process of incorporation of a less prestigious university (Gleibs, Tauber, Viki, Giessner, 2013). The analysis of potential tensions and knowledge about the possibilities of solving them in communication and negotiation processes allows to manage the merger more effectively.

EMPIRICAL ANALYSIS OF THE IMPACT OF 2008-2009 ECONOMIC CRISIS ON IMMIGRATION TENDENCIES: CASE OF OECD COUNTRIES

Ahliman Abbasov

Azerbaijan State University of Economics

ABSTRACT

As it happened with international trade and investment flows, global financial crisis also negatively influenced the international immigration tendencies. Immigrants are usually employed in sectors that are more sensitive to crises with more temporary and part-time jobs. These are mostly less skilled occupations where immigrants usually face discriminative treatment in hiring and layoffs. That is why, following the onset of global recession the migration to the economically advanced regions decreased immediately. During the first period of global economic crisis governments in different countries also implemented a set of policies to prevent the inflow of new migrants and force the existing immigrants to leave in order to provide more job opportunities for their citizens. This paper investigates how the changes of economic structure, policies and public opinion in most of the advanced countries have affected on global immigration since the global financial crisis. The work provides an empirical estimation of the impact of different crisis related factors on international migration since 2008-2009 for OECD countries.

Keywords: *financial crisis, globalization, international immigration*

1. INTRODUCTION

2008-2009 global financial crisis (GFC) is frequently compared with the Great Depression because of its catastrophic economic and social consequences. Financial crisis not only caused the fall of global production and rise of unemployment in many countries, but also downgraded different components of international economic integration. In 2009 world trade declined in real or volume terms by 12.2 per cent. In the OECD area volumes of exports and imports was down by respectively 15.7 and 15.3% in the first quarter of 2009. This had been the largest decline of the global trade turnover in the last four decades. The global financial crisis also ended the rise of international capital movement that had lasted for some decades. In 2008 global FDI flows dropped by 16 per cent and in 2009 it decreased further 40 per cent. Global financial crisis had also negative influence on international migration flows. This research conducts an empirical analysis of the aspects and extent of the negative effect of 2008-2009 crisis on immigration level in 27 OECD countries' case. Financial crisis caused the rise of unemployment almost in every OECD country (except Germany). Besides this, budget deficit increased in many countries, particularly in European countries, and in some countries caused to a more serious public debt crisis. Countries with problems in government finances cut down the social transfers and public expenditures which further deepened social impacts of crisis both on nationals and migrants. Worsening economic conditions and life standards sometimes triggered racist tendencies and made xenophobic groups more active. In some countries governments tightened immigration controls as a response to the economic calamity. This all resulted with decreased amount of immigrants in OECD countries during the crisis. The extent of the impact of the crisis on immigration level has been different in various OECD countries. During the early period of the crisis some researches were conducted to determine the level of this impact in OECD countries and give some predictions. This research contributes to the existing literature by providing more precise post factum analysis about this influence and also presents how the immigration level has recovered in 27 member countries since the crisis. This work also provides an empirically estimation which reflects the role of unemployment rate on

the rise and fall of immigration level during 2007-2016 in 27 OECD countries. The rest of the paper is organized as follows. In the next section the effect of past crises in 20th century on immigration level has been summarized and analyzed. Then a detailed analysis of the influence of 2008-2009 crisis on immigration level in OECD countries has been presented. In 3rd section the empirical methodology and data have been discussed to estimate the panel VAR model of the immigration level. Results of this estimated model is discussed in the last section.

2. HOW DID THE PAST CRISES AFFECT MIGRATION TENDENCIES: RETROSPECTIVE ANALYSIS

To understand the nature and duration of the impact of crises on the international flow of migrants it can be worthwhile to look through different historical cases. Castles (2009) states that the impact of recessions on international migration is complicated and sometimes can be unpredictable. Past experiences also show that the relationship between immigration and economic recession is not simple and easy to understand. Characteristics of the crises, behavior of different migrant communities and governments approaches during those crisis have been important on this relationship. But generally immigrants are vulnerable during economic recessions for various reason. In recent decades, economic cycles have been influential to determine the trends of migration flows in many OECD countries (OECD, 2000a). Economic downturns usually creates pressure on governments to adapt restrictive immigration policies (OECD, 2009). Immigrants are also more likely to concentrate in the industries that are more sensitive to economic crises. They are usually hired with more temporary contracts with less-skilled jobs, possibly face discriminative attitudes by the employers during recruitment and layoffs (OECD, 2009). Businesses that are owned by the immigrants have been more prone to encounter financial problems or even bankruptcy. The Great Depression caused the pace of international labor movement to decrease that had accelerated since 1918 (Koser, 2009). Castles (2009) also indicates the negative impact of the 1929-1932 crisis, but also claims restrictive policies that had been implemented during the WW1 were also partly responsible for the reduction of amount migrant during those years. During the Great Recession years (from 1928 to 1933) immigrants to Canada decreased from 166,783 to 14,382 (Koser, 2009). Koser (2009) indicates that 450,000 originally Mexican migrants had been forced to leave US from 1929 to 1937. As a result of the rising unemployment and xenophobia tens of thousands immigrants from Puerto Rico had to leave to their island as well. Significant amount of foreign nationals also faced deportation in France during those years, which had caused foreign population to decrease by half a million by 1936 (Koser, 2009). Castles (2009) states that the recession of 1970s in Europe also changed the environment for immigrants in Europe, as the “guest worker migration” was replaced by more permanent migration tendencies. Although some migrants from Spain and Portugal preferred to go back, the 1973 crisis in Europe did not cause the significant number of immigrants to flee their home countries (Sward, 2009). This was mainly because the origin countries for many migrants in Western Europe had also been influenced by the recessions and the welfare system was more efficient at destination countries than their countries of origin (Koser, 2009). The Oil Crisis of 1970s was also accompanied by the implementation of severe restrictions on the movement of labor, which continued to emerge during 1980s and 1990s. As a result of this illegal migration, human trafficking and migrant smuggling had developed. The impact of Asian financial crisis on migration had been relatively modest (Beets, Willekens, 2009). Koser (2009) also states that except for South Korea, Malaysia and Indonesia the Asian financial crisis did not significantly influence the overall level of migrants in the region countries. Russian financial crisis in 1998 caused the amount of migrants to decrease significantly. The departure of migrants had increased by 18 per cent after 4 months since the onset of financial crisis in Russia. Historical analysis reflects that in different periods and regions economic downturns had diverse influence on migration tendencies.

Normally an initial change in the level of international migration due to the business cycles has been likely to disappear during previous cases. Crises of 20th century had not caused long-lasting impacts on the movement of labor.

3. CHANGES IN IMMIGRATION SINCE THE GLOBAL FINANCIAL CRISIS

The range of the impact of 2008-2009 financial crisis on international migration in various OECD countries has been different. Amount of immigration decreased in 25 OECD member countries (from 27 analyzed countries) during 2008-2009. This reduction in immigration levels during the economic recession had been much more severe in countries as Czech Republic, Ireland, Iceland and Spain. And in each of these countries amount of arrived migrants has been well below the pre-crisis period in every subsequent years till 2016. For instance, number of arrived immigrants in Czech Republic decreased by 25 per cent in 2008, again 50 per cent in 2009, and in 2016 number of arrived migrants has been 66 per cent lower than in 2007. In 2008 number of arrived migrants decreased by 38 per cent in Spain and further decreased by 35 per cent in 2009. In 2016 number of arrived migrants was 61 per cent lower than it was in 2007 in Spain. Amount of migration inflow in 2016 has been 48 per cent lower in Italy and 55 per cent lower in Ireland compared with 2007. Slovenia and Slovakia are also OECD countries that accepted lower amount of migrants in 2016 than pre-crisis period. In Slovakia number of arrived migrants had decreased every year between 2008 and 2014.

Figure 1: Very heavily influenced countries

Data: OECD

There were not observed any reduction of the number of arrived migrants in Australia, Canada, Estonia, Germany, Greece, Israel, Mexico, Netherlands, Sweden and USA during 2008-2009. But the amount of migration inflow has started to decrease in each of these countries in following years, except in Germany, Netherlands, Israel. In this countries amount of migration arrival mainly started to decrease in 2010 or 2011. Germany and Netherlands (except in 2012) are the two countries where migrant arrival increased annually since the onset of global financial crisis until 2015. Britain, Austria, Belgium, Poland, Norway, France were the countries that the impact of crisis on immigration levels had been modest. Immigration level started to increase in 2010 and by 2016 all these countries received more immigrants than before the crisis. Although the number of arrived immigrants decreased in 2008 and 2009 in Chile, more immigrants were accepted in following years (except 2014) until 2016. But in Austria amount of migrant arrival has increased consistently from 2010 to 2015.

Figure 2. Countries with mild migration contraction during the GFC

Data: OECD

As it mentioned above, the effect of 2008-2009 global crisis on the amount of immigration has been observed with different duration and scale in OECD area. Negative effect of the recession on the immigration in countries as Czech Republic, Iceland, Ireland, Portugal, Spain, Italy, Slovakia, Slovenia has been much more durable than the countries as France, Denmark, Japan, South Korea, Switzerland. In the latter group of countries, including Luxembourg, New Zealand, Finland, migration arrivals recovered rapidly after the crisis and almost in every country surpassed the pre-crisis level. It should be noted that, although the yearly OECD average of immigration arrival fall during the crisis years, then it quickly started to increase and by 2014 average amount of migration arrival outnumbered the pre-crisis level. Perhaps year-by-year rise of migration in post-crisis period to Germany and Netherlands has contributed on quick recover of OECD average. Rapid development of immigration level since 2009 caused Germany to surpass US and become the biggest migrant receiving country. Mild impact of GFC on the general economy, continuous reduction of unemployment rate during 2009-2016, attitudes of political leadership and destabilization in Middle East can be considered among the factors that explain dramatic increase of immigration in Germany.

Data: OECD

4. METHODOLOGY AND DATA

4.1. Econometric Methodology

In this work panel vector autoregressive model (PVAR) is built to estimate the factors that have affected immigration during 2007-2016. This technique combines the traditional VAR approach, which treats all the variables in the system as endogenous, with the panel-data approach, which allows for unobserved individual heterogeneity (Love, Zicchino, 2006). Generally a PVAR model for country i at time t with $i = 1, \dots, N$ and $t = 1, \dots, T$ is given by

$$y_{it} = A_{i1}Y_{t-1} + A_{i2}Y_{t-2} + \dots + A_{iP} Y_{t-P} + u_{it}, (I)$$

where $Y_{t-1} = (y'_{1t-1}, \dots, y'_{Nt-1})'$ and y_{it} denotes a vector of dimension $[G \times 1]$. The number of variables is defined as G . All A_{ip} have dimension $[G \times NG]$ for lag $p = 1, \dots, P$. The index i denotes that the matrices are country specific for country i . The u_{it} are uncorrelated over time and normally distributed with mean zero and covariance matrix Σ_{ii} . The covariance matrix between errors of different countries is defined as $E(u_{it}u'_{jt}) = \Sigma_{ij} \forall i \neq j$ with dimension $[G \times G]$. The PVAR model for all N countries can then be written as

$$Y_t = A_1Y_{t-1} + A_2Y_{t-2} + \dots + A_P Y_{t-P} + U_t$$

Canova and Ciccarelli (2013) summarize three specific features of panel VAR models: dynamic interdependencies, static interdependencies and cross sectional heterogeneity. Dynamic interdependencies means that lags of all endogenous variables of all units enter the model for unit i . Static interdependencies means that u_{it} are generally correlated across i . According to “cross sectional heterogeneity” feature, the intercept, the slope and the variance of the shocks u_{lit} may be unit specific.

4.2. Data

In this work, impact of unemployment and crisis dummy variable on immigration during 2007-2016 in 27 OECD member countries is estimated by using PVAR analysis. Number of immigration, unemployment rate and dummy variable are included to the regression model. Data for amount of immigration and unemployment rate during 2007-2016 in 27 OECD member countries has been obtained from OECD database. As the appropriate data is missing for rest of the OECD countries they have been excluded from the analysis.

5. RESULTS AND DISCUSSION

Unit root tests for data sets of immigration and unemployment indicate that both of the variables are non-stationary, but their first differences become stationary. As both variables are integrated with the same order Johansen Fisher Panel Cointegration test has been conducted to examine long run cointegration between them. As a result of the Johansen Fisher test, it has been determined that there is not cointegration between immigration and unemployment (Table 1).

Table 1: Johansen Fisher Panel Cointegration test

Hypothesized No. of CE(s)	Fisher stat. (from trace test)	Prob.	Fisher stat. (max-eigen test)	Prob.
None	1198.	0.0000	628.0	0.0000
At most 1	136.6	0.0000	136.6	0.0000

Taking into account the outcome of cointegration test, VAR model is considered to be the more appropriate model to test the impact of unemployment on immigration level in post crisis period. According to the econometric literature, if cointegration between the variables was observed, vector error correction model (VECM) would be considered the appropriated model. Dummy crisis variable has also been included to the VAR estimation as a exogenous variable, to see the statistical impact of other crisis related factors besides increased unemployment. According to outcome of the lag order selection criterias (Table 2) VAR model is estimated with 2 lags.

Table 2: VAR Lag Order Selection Criteria

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-3631.964	NA	1.43e+12	33.66633	33.72884	33.69159
1	-2986.433	1267.155	3.77e+09	27.72623	27.85124	27.77673
2	-2935.103	99.80727*	2.43e+09*	27.28799*	27.47551*	27.36375*

**indicates lag order selected by the criterion*

Results of the estimated equation of VAR model indicate that unemployment rate with one lag has statistically significant influence on amount of immigration with 1 per cent significance level during 2007-2016. According the estimation output, 1 percentage point increase of past year's unemployment rate has caused yearly amount of arrived migrants to decrease by 9548 during 2007-2016. The coefficient of crisis dummy variable is also statistically significant with 5 per cent significance level. The regression output presents that the crisis related factors (other than increased unemployment) has caused the number of yearly immigration to decrease by 29847 during 2008-2009. Results also show that one unit of increase of past year's immigration has had statistically significant effect on the following year's immigration level.

$$\text{Equation: Immigration} = C(1) * \text{Immigration}(-1) + C(2) * \text{Immigration}(-2) + C(3) * \text{Unemployment}(-1) + C(4) * \text{Unemployment}(-2) + C(5) + C(6) * \text{Crisis}$$

Table 3: VAR estimation output

	Coefficient	t-statistic	Prob.
C(1)	1.036707	14.34682	0.0000
C(2)	-0.000660	-0.008427	0.9933
C(3)	-9548.930	-2.704959	0.0071
C(4)	8373.676	2.371402	0.0182
C(5)	13761.71	1.338190	0.1816
C(6)	-29847.31	-2.356345	0.0189
R-squared	0.961342	Adj.R-squared	0.960421

6. CONCLUSION

In many OECD countries economic cycles have affected the amount of migration flows recent decades. Immigrants are vulnerable during economic recessions for various reasons. Economic downturns usually creates pressure on governments to adapt restrictive immigration policies (OECD, 2009). Immigrants are also more likely to concentrate in the industries that are more sensitive to economic crises. They are usually hired with temporary contracts and frequently face discrimination during hiring and layoffs by the employers (OECD, 2009). Businesses of immigrants are also more likely to encounter financial problems during crises. The influence of global financial crisis on international migration in OECD countries has been different. Amount of annual migrant arrival decreased in 25 OECD member countries during 2008-2009. The reduction in immigration levels during the economic recession had been much more severe in countries as Czech Republic, Ireland, Iceland and Spain. In Australia, Canada, Estonia, Germany, Greece, Israel, Mexico, Netherlands, Sweden and USA level of immigration did not fall during 2008-2009, but it started to decrease during 2010-2011. Germany and Netherlands (except in 2012) have been the two countries where immigration level increased annually since the onset of global financial crisis until 2015. The negative effect of crisis on immigration level had been modest in Britain, Austria, Belgium, Poland, Norway and France. Migrant arrival in these countries started to increase in 2010 and by 2016 all these countries received more immigrants than pre-crisis period. Although the yearly OECD average of immigration fall during the crisis years, then it quickly started to increase and by 2014 average amount of migration arrival outnumbered the pre-crisis level.

Results of the estimated immigration model indicate that 1 percentage increase of past year's unemployment rate has caused yearly amount of arrived migrants to decrease by 9548 during 2007-2016. The analysis concludes that one reason of the immigration decrease in certain OECD countries during the financial crisis has been particularly the increase of unemployment rate. Countries with severe unemployment increase during 2008-2009 experienced a sharp drop of immigration level. The negative coefficient of crisis dummy variable is also statistically significant with 5 per cent significance level. This outcome indicates that the rise of unemployment rate has not been the only factor during the financial crisis that caused immigration level to decrease. The regression output presents that the other crisis induced factors (e.g. increased xenophobia and rise of ultra-right politics, decreased social security spending and other austerity measures, relatively mild impact of crisis in origin countries than destinations) can explain decrease of yearly immigration by 29847 during 2008-2009.

ABSTRACT

The main purpose of this study is to analyze the role of transportations in arising the ecological problems and its importance. The analysis of international researches has been conducted in the similar fields show that it is possible to encounter with the correlation between the increase in the volume of transportation in transport sector and some indicators characterizing the pollution of environment. As it is known transport sector has rapidly developed for the last 10 years. So, the volume of transportations of the goods have increased to 226.4 million tons in 2017. But this development has also been impacting the ecological problem and giving the negative "contribution" to it. It is known that the transportations have significantly importance in Gross Domestic Product of Azerbaijan. In this study it is considered to investigate the relationships between the transportations and ecological pollutions through econometric modelling. Nevertheless, there are a lot of analyses and research in these fields, just definitely the estimation of the influence of transportations in the transport sector to the ecological pollutions have been investigated less in Azerbaijan. From this point of view, the subject of research is considered the problem of to-day and the matter of great urgency.

Keywords: *Ecological pollution, Goods transportation, Passenger transportation, Transport sector*

1. INTRODUCTION

The transport sector is particularly important in the development of society, as well as in the expansion of the state's regional and global relationships and the improvement of people's living conditions. The development of other sectors of the economy has also been achieved through revenues from the oil sector of the Republic of Azerbaijan. Since the end of the twentieth century, the progress in the transport sector has influenced indirectly to the other areas of the economy. According to the Transport Law of the Republic of Azerbaijan, transport terminology includes transportation of state-registered goods and people in the Republic of Azerbaijan. Railroad, automobile, sea, inland water, air, urban and suburban electricity, subway (underground), as well as the main pipelines in the territory of the Republic of Azerbaijan are regarded as types of transport (http://www.e-qanun.az/alpdata/framework/data/15/c_f_15171.htm). According to the State Statistical Committee, cargo transportation is divided into transport and non-transport sectors. Based on the statistical figures, 222 461 thousand tons and 22 941 thousand tons of cargo were carried in the transport and non-transport sectors respectively in 2016. In the transport sector, 15 479 thousand tons of goods were transported by rail, 5 807 thousand by sea, 160 thousand by air transport, 59 556 thousand tons by pipeline and 141 459 thousand tons were carried by automobile. In the non-transport sector, 15 020 thousand tons of cargo were transported by automobile, 4 129 thousand tons through oil pipelines, 3 792 thousand tons were delivered via railway transport (Statistical Yearbook of

Azerbaijan 2017, pp.599; <http://www.stat.gov.az/>). Over the last few years, there has been a tendency for freight and passenger transportation to increase. Toxic gases emitted during transportation in the transport industry lead to atmospheric pollution, water pollution, and other complications. It in its turn leads to environmental pollution. The pollution of the environment is one of the global issues of humanity. This is a problem that is directly linked to the population's future demographic and economic growth. Naturally, the formation of healthy future generations is an important issue for everyone to consider. (Dr. Jean-Paul Rodrigue) note that the growth of personal and freight mobility in recent decades have expanded the role of transportation as a source of emission of pollutants and their multiple impacts on the environment. (J. Mikayilov, V. Shukurov and S. Yusifov, 2017) investigated the impacts of the social and economic factors on atmospheric pollutants from road transports in Azerbaijan during 1990-2014 years. Azerbaijan joined to the Sustainable Development Summit of United Nation for 2016-2030 held in September 25-27, 2015. In 2012 "Azerbaijan 2020: Look into the future" concept of development was approved (President.az, http://www.president.az/files/future_en.pdf). Strategy Road Map was written on the perspectives of national economy of Azerbaijan Republic approved by President of the Republic of Azerbaijan on based of Decree dated December 6, 2016. In accordance with the Sustainable Development Purposes of UNO, "Azerbaijan will be faithful to the commitments related with fulfillment of urgent, courageous and transformative measures making the world to be sustainable and stronger" (President.az, <http://president.az/articles/21993>). Note once more that protection of natural environment and solution of ecological problems assume a great importance for attaining the Sustainable Development Purposes. It means that protection of natural environment and solution of ecological problems have become an actual problem at a global and national levels. At present the positions of the countries are being assessed in protection of environment. That is to say depending on the results of noted measurement it may be taken a certain measure for the countries contributing the planet's ecological equilibrium. By the way, in the report of 2018 on the (EPI) environmental performance index characterizing the ecological equilibrium Azerbaijan took the 59-th place (<https://epi.envirocenter.yale.edu/2018/report/category/hlt>) After investigating the impact of transportation on the environmental pollution in the transport sector, the main factors determining key environmental indicators were emissions of pollutants from automobiles to air, carbon dioxide, water pollution index, growth index in atmosphere pollution. Similarly, passenger and cargo transportation in the transport and non-transport sector, as well as the volume of Gross Domestic Product were used as an explanatory variables and relevant econometric assessments were made. It should be noted that, while studying scientific literature, what I realized is that no research work related to the assessment of the impact of freight and passenger transport on environmental pollution in the transport sector has been conducted. Therefore, I hope that, the proposed article will be the first research paper within scientific sources in Azerbaijan.

2. RESEARCH DATABASE AND PROCESSING

Using the data from the State Statistical Committee of the Republic of Azerbaijan, the relationships between the indicators will be evaluated with the assistance of the econometric modeling method based on timeline data of the indicators given in Table 1. Using the final indicators of 1997-2017 for observation, the following Table 1 has been drawn and econometric models have been set up.

Table following on the next page

Table 1: Statistical basis of models

Year	CTTS (1000 tons)	GDP (mln. AZN)	CO ₂ (1000 tons)	PT (1000 unit)	EDPEFAT (1000 tons)
1	2	3	4	5	6
1997	46348	3158.30		780810	459.4
1998	55029	3440.60		85070	313.4

The descriptions of abbreviations used in table 1 have been given in the following appendix. Table shows that ingredient of removal of pollutants from vehicle transport to atmospheric air is increased equally with the increase of passenger transportation and cargo transportation in the transport sector.

3. SPECIFICATION AND IMPLEMENTATION OF ECONOMETRIC MODELS

3.1. Evaluation of dependence of pollutants emitted from automobile transport on GDP and passenger transportation

GDP and passenger transportation are contributing factors to the increase of pollutants from automobile transport to air. Quantitative characteristics of these factors on the extent to which the impact of ingredients on the volume of pollutants emitted from automobile transport to atmospheric air were assessed based on the data given in Table 1. For the purpose of evaluation of dependence of pollutants emitted from automobile transport on GDP and passenger transportation according to factors (ingredients), the specificity of the regression equation of the logarithmic-linear model has been considered as follows. (Gujarati, 1995, Asteriou, 2016, Hasanli, 2008). It should be noted that the assessment was carried out through EViews 9.0 software package:

$$\text{LOG(EDPEFAT)} = C(1) + C(2)*\text{LOG(GDP)} + C(3)*\text{LOG(PT)} \quad (1)$$

Here, LOG(EDPEFAT) represents the natural logarithm of pollutants emitted from automobile transport to atmospheric air, while LOG(GDP) reflects the natural logarithm of the volume of gross domestic product, and LOG(PT) represents natural logarithm of the passenger transportation. C(1), C(2) and C(3) are the variables and characterize the impact of the appropriate explanatory variables on the EDPEFAT, the resultant (detected) indicator. More precisely, C(1) is a constant boundary and C(2) and C(3) show the semi-elasticity coefficients. Let's note that the coefficients of the factor (or explanatory variables) in logarithmic-linear regression equations indicate the elasticity ratios of the result (or description) of that factor (Eliseeva, I.I. 2014). The results obtained from the evaluation of model (1) are given in Table 2. The extent to which these results are reflected, how reliable these figures are, and other issues should be checked with the implementation of Student T distribution, normal distribution, residual stabilization, heteroskedasticity and other tests. The following results were obtained from the computer implementation through the application software package, based on Table 1 of the Regression Equation (1) EViews 9.0:

Table 2: Parameters on Econometric evaluation, their reliability tests. The main statistical characteristics of the econometric model of GDP and PT variables on EDPEFAT

Dependent Variable: LOG(EDPEFAT)				
Method: Least Squares				
Date: 01/05/19 Time: 23:43				
Sample (adjusted): 2000 2017				
Included observations: 18 after adjustments				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-6.373619	0.592493	-10.75730	0.0000
LOG(GDP)	0.109188	0.016257	6.716537	0.0000
LOG(PT)	0.833948	0.052889	15.76775	0.0000
R-squared	0.996462	Mean dependent var	6.461150	
Adjusted R-squared	0.995990	S.D. dependent var	0.352360	
S.E. of regression	0.022313	Akaike info criterion	-4.616261	
Sum squared resid	0.007468	Schwarz criterion	-4.467866	
Log likelihood	44.54635	Hannan-Quinn criter.	-4.595799	
F-statistic	2112.168	Durbin-Watson stat	1.288389	
Prob(F-statistic)	0.000000			

The evaluation of the main statistical characteristics of the econometric model (1) in Table 2 and the corresponding tests show that the model is adequate. Here, it turns out that the estimated parameters are unbiased and effective.

3.2. Evaluation of dependence of carbon dioxide (CO₂) on GDP and passenger transportation

Passenger and cargo transportation in the transport sector are the contributing factors to the amount of carbon dioxide in the air. The quantitative characteristic of the effects of these factors on the volume of carbon dioxide is estimated econometrically based on the data in Table 1. Specificity of the regression equation of the econometric logarithmic-line model to evaluate the dependence of carbon dioxide (CO₂) on passenger and freight transport in the transport sector is as follows (Gujarati, 1995, Asteriou, 2016, Hasanli, 2008).

$$\text{LOG}(\text{CO}_2) = \text{C}(1) + \text{C}(2) * \text{LOG}(\text{PT}) + \text{C}(3) * \text{LOG}(\text{CTTS}) + [\text{AR}(3) = \text{C}(4), \text{AR}(6) = \text{C}(5), \text{UNCOND}]$$

(2)

Here, the LOG (CO₂) variable represents the natural logarithm of carbon, LOG(PT) reflects natural logarithm of passenger transportation, while the LOG(CTTS) represents natural logarithm of freight transportation. C(1), C(2), C(3) are parameters and describe the effect of the corresponding explanatory variables on the CO₂, which is the resultant (explanatory) indicator. Results of model (2) based on information in Table 1 in EViews 9.0 are the following:

Table 3: Parameters on Econometric evaluation, their reliability tests. The main statistical characteristics of the econometric model of PT and CTTS variables on CO₂

Dependent Variable: LOG(CO ₂)					
Method: ARMA Maximum Likelihood (OPG - BHHH)					
Date: 01/07/19 Time: 21:18					
Sample: 2001 2017					
Included observations: 17					
Convergence achieved after 17 iterations					
Coefficient covariance computed using outer product of gradients					
Variable	Coefficient		Std. Error	t-Statistic	Prob.
C	-9.599080		0.140837	-68.15730	0.0000
LOG(PT)	0.638146		0.048669	13.11193	0.0000
LOG(CTTS)	0.561141		0.047425	11.83222	0.0000
AR(3)	-0.733700		0.208575	-3.517687	0.0048
AR(6)	-0.893703		0.088861	-10.05734	0.0000
SIGMASQ	9.72E-05		6.86E-05	1.417363	0.1841
R-squared					
	0.999177	Mean dependent var			6.142430
Adjusted R-squared					
	0.998803	S.D. dependent var			0.354163
S.E. of regression					
	0.012254	Akaike info criterion			-5.100849
Sum squared resid					
	0.001652	Schwarz criterion			-4.806774
Log likelihood					
	49.35721	Hannan-Quinn criter.			-5.071617
F-statistic					
	2670.664	Durbin-Watson stat			2.099053
Prob(F-statistic)					
	0.000000				
Inverted AR Roots					
	.78+.60i	.78-.60i		.13-.97i	.13+.97i
	-.91-.37i	-.91+.37i			

Note that, in order to get adequacy in model (2), AR(3) and AR(6) (3th and 6th order autoregression) factors are included to model and those ones caused to the elimination of heteroscedasticity (residual dispersion variation) and created homoscedasticity (White Heteroskedasticity Test). One of the important conditions in econometric modeling is stationarity of Residuals. The main statistical characteristics of econometric Model (2) shown in Table 2 indicates that the model is adequate. Therefore, estimated parameters are unbiasedness and effective.

4. RESULTS OF THE ECONOMETRIC MODELS

$$\text{LOG(EDPEFAT)} = -6.37361855 + 0.109188120237 * \text{LOG(GDP)} + 0.83394811823 * \text{LOG(PT)} \quad (3)$$

The result of the Model (3) shows that when Gross Domestic Product (GDP) and Passenger Transportation (PT) increase by 1%, according to factors (ingredients) the rate of emissions of pollutants from vehicle transport into the atmosphere (EDPEFAT) rise by 0.109% and 0.834%, respectively.

$$\text{LOG(CO}_2\text{)} = -9.59907987844 + 0.638145874222 * \text{LOG(PT)} + 0.561141352797 * \text{LOG(CTTS)} + [\text{AR}(3) = -0.733700147012, \text{AR}(6) = -0.893702883647, \text{UNCOND}] \quad (4)$$

The result of model 4 shows that 1% rise in passenger transport (PT) and freight transport (CTTS) results in the increase of the amount of carbon oxide by 0.638% and 0.561%, respectively.

5. CONCLUSION

The estimated econometric models show that the elasticity ratio of the amount of pollutants emitted from vehicles into the atmospheric air compared to that of Gross Domestic Product's volume is greater than the elasticity ratio compared to passenger transport. This means that the increase in the volume of production is more likely to affect air pollution than in the transport of passengers. On the other hand, the coefficient of elasticity of carbon dioxide compared to that of passenger transportation's volume is greater than the elasticity ratio compared to freight transportation. Therefore, the effect of passenger transportation is higher on the increase of the amount of carbon dioxide released into atmosphere than that of freight transportation.

ABSTRACT

In contemporary period, the EU’s current concern is to reduce dependency on Russian gas that its whole gas supply and over the region increases political and economic threats for member countries. The EU’s concern about Russia’s dominance in its gas market make consider non-Russian gas projects through Turkey - the closest neighbor after Russia. The EU sees Turkey as a crucial partner to diversify routes for the EU’s energy security. From this perspective, the purpose of this paper is to define possibility and geopolitical reasons behind changing EU’s shifting priorities from Russian to Turkish dependence for gas supply.

Keywords: *Energy security, EU, TANAP, TAP, Turkey, Russia*

1. INTRODUCTION

Energy security is the key issue in contemporary period for the highly industrialized countries. The risk of energy markets depends mainly on cheap, reliable and consistent energy supplies. Within union, a situation becomes even more difficult because of many players having different interests on energy issues that complicate decision-making process to sign a common agreement. As a union of many developed countries, the European Union (EU) has high dependence on external energy supply, especially gas supply. However, the EU also is well aware that a new supply will not be as cheap as Russian gas to diversify its gas supply by signing several agreements with different countries. On the other hand, EU tries to maintain its diversification of the energy sources by initiating several projects including South Stream, Nord Stream 2, TANAP & TAP. From this perspective, the paper will define the economic efficiency, financial-supply risk and chances on the EU’s risk diversification strategy on the gas supply.

2. EU’S INCREASING DEMAND ON GAS

The EU’s main source of the energy supply is provided by Russia. However, this is not same and common for all member states of the EU. According to the Gazprom’s statistics after Ukraine crisis in comparison with 2013, there was 15 billion cubic meter reduction in the volumes of exported natural gas from Russia to Europe in 2014 (in 2013-162 bcm, in 2014-147.2 bcm). This is approximately 10 percent reduction of the gas supply to Europe. This combination means, that the small and medium sized entrepreneurs, also in some cases the big companies will suffer on the increasing prices of gas in EU’s energy market by any other crisis on transfer country like Ukraine. On the other hand, the increasing energy costs will increase also the product costs and electricity costs in each part of the economy and especially in

households (Mammadova, 2015, pp. 34-39). The German Federal Institute for Geosciences and Natural Resources (Die Bundesanstalt für Geowissenschaften und Rohstoffe – BGR) has in one of own research published about the countries with largest natural gas resources on the world. Figure 1 shows the capacity of the countries with gas resources billion cubic meters. In Top 8 of the graphic, Russia is on the first place. Turkmenistan and Iran are the nearest alternative gas resources to EU for each country with amount of 15.000 bcm and 10.000 bcm gas capacity. USA and Brazil are also the future partners of EU for liquid natural gas. However, current conditions the transport cost for LNG from the USA and Brazil is high in long term projects (BGR Energiestudie, 2017, p.130).

Figure 6: The Countries with Largest Natural gas Resources. (Statista.de)

The condition of the dependence of gas in EU lets categorize the countries into three type of the Member States for supply-risk:

1. First, some member states do not import Russian gas through Ukraine. They have either their own resources, or they import gas from other gas sources such as Netherlands, Norway.
2. Second group of countries are more secure in terms of Russian supply through Ukraine. This security mainly is related to different arguments, including economic alliance with neighbor countries of EU, having quite diversified energy supply-risk system in case of unexpected occasion.
3. Third group of countries are heavily and/or completely dependent on Russian gas supply through Ukraine. These countries do not have enough storage capacity as well. Therefore, they might be called as “financial risk regions of any gas supply reduction” in terms of financial risks on the market (Chyong, 2015).

According to the BP’s “Statistical Review of the World Energy 2018” from 2010 till 2016 European gas consumption changes roughly between 470-520 bcm in year. The maximal consumption of gas in EU from 1980 to 2016 was in 2010 (BP, 2018, p.29).

Figure following on the next page

Figure 7: Gas Consumption of Western European countries
 (Gazprom Annual Report 2017)

Gazprom Annual Report in 2017, company supplied a total of 194.4 billion cubic meters of gas to European Union, 192.2 bcm being supplied under Gazprom export contracts. Western European countries accounted for approximately 81% of the company's exports from Russia through Ukraine as transit country for supply, while Central European states took 19%. (Gas supplies Europe, 2017). Figure 2 and Figure 3 indicate each country's consumption of Russian gas in 2017 per percentage.

Figure 8: Gas consumption of Eastern & Central European countries
 (Gazprom Annual report 2017)

Zeyno Baran, the director of the Center for Eurasian Policy at the Hudson Institute in Washington, considers that, Russia, the European Union's main oil and gas provider, has taken advantage on the EU's energy market and the increasing demand of the European countries on gas increases Russian supplies. Moscow aims to have a good relationship with member states. The diversification of the energy supplies to European countries is the main point for energy security in EU's gas supply. EU wants to construct transport routes for Caspian and Central Asian oil and gas to minimize the risk of supply according to diversification (Baran, 2007, pp. 131-144). According to the IEA's 2014 report, Russian gas supply will be the largest portion of the EU market for at least a few decades from now on. Figure 4 precisely shows that Russia was the largest supplier of natural gas to the EU in 2016 and 2017. "The EU is set to be dependent on Russian gas for some time and that's the reality" says, IEA executive director Maria van der Hoeven (Energy Policies of IEA Countries, 2014). One of the projects proposed by the EU for the diversification of the gas supply was Nabucco gas project. The Nabucco gas pipeline is one of the central infrastructure projects for the diversification of Europe's natural gas supplies (Davidovic, 2009).

Figure 4: EU imports of natural gas 2016 – 2017 (Eurostat 2017)

In terms of the EU and Caspian Region relations, energy issues are stable and the countries on the Caspian Region, especially Azerbaijan seems a key partner for future cooperation. Energy is one of the key interest in the Economic relations of the both Regions. Also, Turkey seems as the future partner to diversify of the routes for the EU’s energy security due to TANAP project. Given its strategic location as transit country in the region, Turkey is one of the future partners for Europe’s risk diversifications strategy for energy security (EU and Turkey strengthen energy ties, 2016). To define financial and geopolitical reasons behind the EU’s risk diversification to Caspian and Central Asian Region for gas supply, the following chapter will discuss 3 hypotheses:

1. Due to the Projects TANAP and TAP, the Caspian and Central Asian Countries has been more reliable partner, because of its intention of the countries on the region to have a good relation to the EU and the lower costs than the the other big projects like Nabucco.
2. Turkey can play “bridge” role to transport Central Asian gas through direct pipelines Caspian Sea-Azerbaijan-Turkey-Italy for potential projects like TAP. Transit Country will earn by transport of the gas.
3. Azerbaijan, Shah Deniz II, plays one of the main roles on the projects TANAP & TAP. Because, Azerbaijan starts the Project and is the first supplier to EU on the Project. It is expected, that Iran and Turkmenistan will also join to the Project after some period of time.

On the figure 5, according to the statistical information of the Statista.de it Is easy to determine the cost and capacity of the pipeline projects for the gas supply to EU. The capacity of the South Stream is 63 bcm per year, but the costs 20 billion euros. TANAP & TAP projects have together the gas capacity in amount of 26 bcm, but the cost of the both projects is in amount of 6,5 billion euros. Nabucco has a capacity of 31 bcm per year but the cost basis of the project is 7,9 billion of euros. Reality is that, the TANAP and TAP project have the chances to increase the supply to EU on 90 bcm per year. On these conditions, the most attractive project for future gas supply-risk diversification for EU’s energy security are the TANAP and TAP projects.

Pipeline and Consortium	Capacity in billion cubic meters	Costs in billion euro
South Stream	63	20
Nabucco	31	7,9
TANAP	16	5
TAP	10	1,5

Table 1: Pipeline projects for gas supply to EU

3. DISCUSSION

Depending on energy imports, predominantly of oil and gas causes policy concerns relating to the security of energy supplies. There are two main sources of the energy insecurity of the EU faces: (a) gaps in the integration of the EU energy market; and (b) import disruptions (Chyong, 2015). In response to the possible import disruptions, the EU has fortified its supply law with the adoption of the new Security of Gas Supply Regulation in 2017. (New Security of Gas Supply Regulation, 2017). Russia is main supplier of the crude oil and gas to the European countries. To reduce the risk factor on gas supply, the EU seeks new alternative sources for diversification of the supply-risk:

1. Russian gas will not be able to satisfy both internal and external needs for oil and gas in the long-run. Demand in Non-EU energy market also own demand of Russia and Post-Soviet-Countries increases day by day.
2. As major exporter, Russia takes the high supply-risk on oil and gas business by supplying to the EU in the EU's energy market and Non-EU energy markets. That's why the oil and gas companies of Russia takes part also on the other supply projects to EU.

Finding alternative sources might seem realistic for the EU; however, the EU needs to solve several economic challenges to import gas from following alternative sources:

- Import from the Middle East and North Africa;
- The Southern Gas Corridor, this project will supply in first period the Azerbaijani gas and the expectations are Turkmenistan and Kazakhstan also Iran and Iraq will join on the gas supply through this pipeline in future.
- Import LNG from the U.S, Australia, and Eastern Africa (Chyong, 2015).

Azerbaijan might play significant role on this issue to become route of the major pipeline projects to Europe and reliable political and economic partnership with the EU. The efforts to get the gas from Middle and Central Eastern countries through Azerbaijan is realistic and beneficial. Security is the key issue on the any energy projects of EU. The Middle East and Caspian and Central Asian countries with massive oil and gas resources might be considered as a potential supplier for EU. Azerbaijan as a very important regional country has implemented successful energy policy by securing immense volumes of hydrocarbons and attracting large number of investments to the prospective energy and energy transportation projects of the region. Let's remember that "Shah Deniz II" in Azerbaijan is the birth-place of the TANAP and TAP projects. However, the Azerbaijani and Central Asian gas transportation have the importance. To improve the security and diversity for the supply-risk of EU's energy market, the Southern Gas Corridor is being built on the combination of three pipelines:

- South Caucasus Pipeline (SCP) – Azerbaijan, Georgia
- Trans Anatolian Pipeline (TANAP) – Turkey
- Trans Adriatic Pipeline (TAP) – Greece, Albania, Italy (Mammadova, 2015, pp.34-39).

The corridor is intended to bring natural gas from Caspian Sea (Azerbaijan) to Europe. The overall length of corridor is 3.500 km which 1.850 km of the pipeline go through Turkey (Why TANAP). This is the possible shortest route from Caspian to Europe in existing conditions. In this project, Azerbaijan's location plays an important role in EU's energy security. The possibility of supply of Turkmenistan gas in the future increases the importance of the Southern Gas Corridor and involved countries. These three Projects have the total project value in 45 billion dollars and through the pipelines will get the EU's energy market at first only the Azerbaijani gas (Gas from Azerbaijan for Europe, 2016). The participants which invested in this project are the big companies such as SOCAR – State Oil Company of Azerbaijan Republic, BP, Total, Statoil, Botas, E.ON, EGL and others.

Expectations of the EU on this Project is to meet 10 to 20 percent of the demand, it means 45 to 90 bcm per year. And this big amount helps to reduce the risk on energy supply to EU (Stefan, 2014, p.3). Secondly, gas transportation from any country is not main subject for the EU, as long as it is cheap (DG Energy, 2015). It seems that Russian gas will lead on the energy market of the EU for the long time. The EU wants to involve Ukraine in energy politics because of the geography. Ukraine gets 2 billion USD annually for the transiting gas from Russia to Europe (Pinchuk, 2014). The gas transit contract between Ukraine and Gazprom also very important for the supply. Gazprom & Ukraine's contract depends also on the approval of Nord Stream-2. The new transit contracts will increase Gazprom's market share on European gas supply and distribution. Obviously, the European Union are mutually interested in routing the Azerbaijani gas to Europe through Turkey and Italy as an alternative. Though that, Azerbaijan has a big gas capacity, indeed it plays an important role in the EU's diversification efforts and is rather realistic partner among others. Among other alternatives, even though the Northern Iraq fields and Iran have potential gas reserves, both seem fairly unrealistic today, because of security issues, internal and external threats. After lifting sanction, Iran would become another important source for energy supply of the EU. However, today Iran is not interested in the South Gas Corridor. Because, Iran does not want to be dependent on Azerbaijan or any other country for gas transit and plans to sell its gas as LNG. The production of LNG is costly and Iran still prefers this option as the total production cost of Iranian gas is cheap since the gas fields are onshore. It seems, the EU's all efforts to find other sources of oil and gas supply clearly indicate that it aims for the diversification of the gas supply-risk for the EU's gas market. Briefly it includes increase in supply from Central Asia and Azerbaijan through Southern Gas Corridor, EU's diplomatic initiatives in the Middle East region to create stable, as well as secure environment for gas projects that runs through Azerbaijan to Europe. On the other hand, the EU states have several times showed their high interest in the Central Asian fields to encapsulate this reduction in natural gas import. Cooperation with other regional states, particularly with Turkmenistan through Southern Gas Corridor might be less costly for Europe. However, several political factors say that Turkmenistan's presence in the European energy market through Southern Gas Corridor will give high benefits on gas supply to EU.

4. CONCLUSION

To sum up, significantly diversifying the gas supply-risk to EU is the important part of the EU's energy strategy. The projects like TANAP and TAP increases the importance of the Caspian and Central Asian countries as the supplier. The birthplace of TANAP and TAP Projects, Shah Deniz II locates in Azerbaijan. Also, Azerbaijan has an importance as the future's transit country of the Iran and Turkmenistan gas. However, Azerbaijan is the energy security partner of EU in the region. The energy demand of the European countries increases day by day. At the end of 2018 the one of the biggest European cruise company Aida presented its first cruise with gas engine in Germany. We have to take in account that, Germany has the biggest gas market in EU and gas to produces much more environment-friendly energy as the other conventional energy sources. It is imaginable that the start-point of the diversification on the risk of the gas supply of EU's strategy for the energy security is Azerbaijan, with the Projects TANAP & TAP & SCPX. Dr. Stefan Meister, on his publication in 2014 searched also about the enormous potential in the Caspian Region and Middle East for gas supply. EU's Nabucco project are extremely great projects with higher risk factor on it. Therefore, the projects like SCP, TANAP and TAP have been chosen by the participants. Caspian region has huge energy potential for the EU, because of the gas capacity of Iran, Iraq and Caspian gas (DGAP).

ABSTRACT

Globalization has been transforming contemporary world for the last 30-40 years. Almost in all countries offices of globally-operated banks wedged in national banking systems, grabbed a significant part of local clients pretending to a dominant position and, importantly, having enough resources to fulfil these plans. Digitalization process of the last several years has strengthened competition even more. It created new rivals for banks in the form of fintech companies (FinTechs). FinTechs are substituting banks in many traditional markets, including payment services, assets management and financial consulting. They suggest clients to interact with them in a very cheap and convenient way. But at the same time FinTechs bring with them new risks for consumers because these non-bank institutions are not regulated with full-fledged tools which are used by central banks to secure stability in the banking system. Digitalization requires from banks to be on the edge of innovation and to give an adequate response to new challenges. Smart-offices of banks with a seamless technology of serving clients, broad qualification of staff and other special features is one of the means in the fight of real banks with quasi-banks or shadow banks with digital nature. Another challenge for all but especially for banks in a digital epoch is a cyber security. If banks do not pay sufficient attention to the protection of financial and personal data of their clients, they pose a serious risk to consumers. Online theft of money from digital wallets and credit cards, money laundering through digital channels and many other crimes are inherent satellites of digital convenience and prosperity.
Keywords: *Digitalization, Digital Wallets, Fintech, Shadow Banks, Smart-Offices, Letter of Credit (L/C)*

1. INTRODUCTION

In modern economic realities, financial globalization has become the defining vector of transformation processes in national banking systems. The essence of this phenomenon is the development of new financial instruments and products, the inter-penetration of capital and digital technologies, deregulation of domestic financial markets, the development of international banks, strengthening ties and integration between the financial sectors of national economies, global financial centers and institutions. As a result, there is an occurrence and formation of a new configuration of the international banking business (IBB) in the global financial architecture (McCauley, McGuire, Von Peter, 2010, p. 29). In many countries offices of globally-operated banks held key positions in the list of top 10 biggest banks and grabbed a palpable part of local clients. Nowadays affiliates of international banks work under brands of their parent organisations or under the name of acquired local bank after an M&A (mergers and acquisitions) deal. Thus, the globalisation process has visible and invisible sides, and strengthening competition is the main backwash for domestic banks and the main benefit for clients in host countries.

Another manifestation of the process of financial globalization, its innovative component is the increasing role of digitalization of financial markets, in particular, the banking sector. It becomes the most important condition for achieving the competitive advantage of commercial banks in the global financial market, where domestic credit institutions in most cases are inferior in competitiveness to foreign ones. It should be noted that the digital economy creates favourable conditions for the innovative development of the IBB. However, this influence has not been studied enough and requires further research, taking into account the objective function of this type of activity, the transformation of the principles and models of the strategy of entry of domestic credit institutions to foreign markets, their adequate interpretation in scientific research in international finance. The digitization of economic processes is becoming a comprehensive trend, covering all areas of economic activity. The model of digital transformation of the banking sector should cover all the interrelated functional blocks of its activities, including the subunit of international business. The growth of the market associated with the international banking activity, the formation of its new look in accordance with international standards in recent years objectively require the subsequent activation of its digital component. The close interplay of the latter with the financial and external economic environment is considered to be a feature revealing the phenomenon of the "new economy". In this regard, the processes of digitalization must be considered in conjunction with the changes in the international banking business and its regulation. The main attention should be focused on those of them that contribute to the improvement of its stability and competitiveness in the face of volatility of market process. Among them are the following: digital platforms that create new markets for financial transactions; blockchain technology which offers step-by-step improvement in transaction efficiency and security; artificial intelligence that enhances the human ability in making decisions on cross-border financing; electronic maintenance of documentary operations on foreign economic activity, etc. Banks do not have monopoly on digital technologies. At any time, they can be outflanked by fintech-companies, which are more flexible having less operational costs. Banks have to spend money on keeping physical offices with a big staff of tellers, customer service representatives, bookkeepers, accounting clerks, loan officers and managers. Salaries, property taxes, requirements to create plenty of reserves, they are all a tremendous burden upon bank budgets. Banks should head a digital revolution, if they don't want to lag behind. And they try to do their best. Smart-offices of banks with convenient seamless electronic technologies and small staff with broad qualification of employers as well as online and mobile banking are among means in the fight for a client.

2. WHAT DIGITALIZATION BRINGS WITH IT FOR INTERNATIONAL BANKING

In the coming years, many of the new technologies will increase the effectiveness of cross-border operations, accelerate the growth of global capital flows. One of the examples of digital platforms in the financial markets is credit platforms for companies. Although the financial flows carried out by the platforms make up today only a small fraction of the total global financial flows, their potential is enormous. As practice shows, it is much more profitable than the services of traditional correspondent banks in terms of price, speed and efficiency (Denecker et al, 2016, p. 5). The digitalization of the trade finance by global banks lagged behind digitization in other segments of the IBB. However, the mutual influence of a number of factors, including the development of correct technical capabilities, an almost general shift in trade on open account and broader decision-making with the support of information technologies, have now created a certain impetus for the development of this vector of digitalization (Digital trade and trade financing, 2016, pp. 14-15). Trade finance solutions are increasingly being developed using the basic blockchain platforms, which is very attractive for trade finance, given that it has traditionally been ineffective, open to fraud and characterized by having too much documentation.

The blockchain technology has great potential to make global cross-border financial operations faster, cheaper and safer. For example, McKinsey estimates that the implementation of the clearing and settlements on the basis of this technology will save 50-60 billion dollars in expenses for interbank transactions between businesses (Botta, Digiacomio, Ritter, 2016, pp. 3-4). Blockchain can also provide credit from card to card, both nationally and internationally. Along with this, the use of an artificial intelligence will improve foreign operations and reduce the prevalent information asymmetries when working in other countries. All this testifies to the growing role of digital technologies in the context of the implementation of the imperatives of a new wave of financial globalization. The analysis of the important activities of the IBB – banking services for foreign economic activity and, in particular, one of its main tools – L/C forms of settlement, revealed a downward trend in their use since 2014 (Murshudli, 2013, pp. 256-259). Thus, according to the annual report on the Revaluation of Trade Finance Finance), conducted by the International Chamber of Commerce (ICC), in 2016, the volume of issuance of documentary letters of credit showed the third annual decline, although the percentage decline of 2.81% is the lowest since 2010 (2011 – 2.44%, 2014 – 2.50%, 2015 – 3.76%) (Rethinking Trade&Finance, 2017, p. 89). This is accompanied by a decrease in the average cost of a letter of credit (from \$643 thousand in 2014 to \$315 thousand in 2015 and \$463 thousand in 2016) (Rethinking Trade&Finance, 2017, p. 24; 2016, p. 52). As a result, in the field of international trade there is a decrease in the share of documentary letter of credit as the main instrument of trade financing. Among the reasons for the current situation with the use of letters of credit, specialists call for, among other things, the slowness and high cost of this way of doing international business for entrepreneurs, the length of time they settle documentary issues on payment and transportation. At the same time, there is a tendency of unmet demand for trade financing in the world: according to ICC, 61% of banks (vs. 53% in 2014) believe that there is a global deficit in trade financing instruments (that is, the demand for them is more than the supply), and letters of credit will continue to be important for 10% of enterprises involved in world trade in goods, which is a significant indicator in the total volume of trade (Rethinking Trade&Finance, 2016, pp. 70-71). All this necessitates the development of proposals for the digitization of documents for a letter of credit, contributing to the acceleration of the implementation of this form of bank settlements. This is of particular relevance for countries in which the commodity sector predominates in foreign trade (in particular, for Azerbaijan and Russia), since it is here that a significant part of the activity is carried out on the terms of the form of credit. Foreign economic activity is moving steadily towards the electronic presentation of documents on a letter of credit. In our opinion, banks and their customers cannot ignore the advantages of using them. Thus, according to the UN, the cost of processing paper documentation increases the cost of goods in foreign trade by 5-10%. Today there is a UN project on the introduction of electronic trade documents (UNeDocs). The general idea of the project is to create a unified solution for data storage and management. Further dissemination of the UNeDocs model of electronic trade documents will simplify the process of transition from the “paper” to the “paperless” working environment. There are also a number of specialized programs for documentary operations. However, they all differ from each other, are quite expensive and require technical support and information and consulting services, which leads to significant additional costs. Therefore, only the emergence of such a software product that would take into account all the requirements for the electronic system would be convenient and affordable and ensure its smooth functioning, will allow banks and subjects of foreign economic activity to rationally and effectively combine information and financial resources, as well as ensure effective organization and successful implementation contracts involving payments for letters of credit (Murshudli, 2018, pp. 192-193). Among the issues that, in our opinion, need to be addressed when creating an electronic system, are the following:

- Determination of the authenticity of the electronic signature on the documents provided by

the beneficiary in electronic form. It is necessary to summarize the existing developments in this area and adapt them to the electronic system for carrying out operations on letters of credit.

- Identification of the person who owns this electronic signature and who is authorized to sign the corresponding document. This requires the smooth interpretation of such a signature by all participants of the letter of credit operation, for which it is important to ensure the implementation of the rapid identification of the signature and its reliable protection against use by third parties.
- The ability to verify documents for compliance with the terms of the letter of credit. For the user of the system, the implementation of such verification should be convenient. This concerns the format of documents, their display on the screen, etc.
- Ensuring the reliability and confidence that the document has not been made illegal changes or corrections. The electronic system should exclude the possibility of making changes to the documents that are required under the terms of the letter of credit, an unauthorized person, and to warn about illegal corrections.
- Unification of the form of messages between the client and the bank, acceptable and convenient for both parties. The electronic system, in our opinion, should provide for the possibility of creating, developing, implementing or using certain templates for such messages.
- Compliance with formats for unified documents (transport, insurance, etc.), clearly defined by international (in some cases, national) practice. The electronic system must accept all the parameters set.
- Ensuring a high degree of protection of the electronic system from encroachments and the penetration of unauthorized persons into it. Participants of a letter of credit operation must be completely confident in the reliability of this system, the neglect of which can lead to significant losses, both from banks and their customers.
- Minimize damage to documents during their transfer through the system. The integrity of the documents avoids duplication.
- The absence in some countries of legislation recognizing electronic documents, electronic signatures and electronic identification techniques, and the traditional use of paper media as documents.

As an alternative for the further development of international banking operations, it is proposed to use such digital innovation as a blockchain platform. As is well known, in trade financing, due to a conservative approach to the problem and the presence of established processes, digital technologies are still being slowly introduced, although the technological process is inexorably progressing. As a result, fintech companies can come to the aid in the development of trade finance, which in the future will become competitors and a threat to classical banks, since their technical capabilities and technologies are ahead of the practice of commercial financing. This is indeed possible, given the traditional nature of trade finance, which entails a significant amount of paper and human labor associated with the timely execution of transactions, and the presence of numerous cases of fraud that are associated with the manipulation of trade documents. Since any transaction in classic trade finance is a complex operation involving a large number of parties (importer, beneficiary, issuing bank, executing bank, advising bank, confirming bank, etc.), therefore the availability of digitization of these processes will significantly reduce document the amount of information without loss of information and reduce the time of the payment. Given the potential of blockchain to enhance the role of trade finance in international trade, a number of foreign banks (Standard Chartered Bank, DVS Bank and Infocomm Development Authority of Singapore) have developed a common concept for the trading platform based on this technology.

This is the first such application by banking institutions for blockchain trade finance, which allows you to track invoices, convert them into digital assets, maintain loans to suppliers, reduce the risk of duplicate invoices and maintain customer confidentiality. This platform is considered as an open ecosystem in which neutral third parties can participate and verify the authenticity of funded trade documents. In the future, the assembly of all documentation and processing steps related to the transaction in trade finance may occur and be fully reflected in the blockchain technology. This technology will allow transferring paper documents and the letter of credit itself to the blockchain (Shapiro, 2017, pp. 43-44). Smart contracts based on blockchain technology, providing a single, consistent, trade transaction report confirmed by all parties, can be considered a key innovation for trade finance. The financial and technological research consortium R3 CEV LLC (headquartered in New York), which brings together more than 200 firms engaged in research and development on the use of blockchain in the financial system and other commercial areas, also recently announced testing LC accounts and transactions. Participants include 80 leading global financial institutions, such as Barclays, BBVA, BNP Paribas, Commonwealth Bank of Australia, Danske Bank, ING Bank, NSVC, Intesa Sanpaolo, Natixis, Nordea, Scotiabank, UBS, Unicredit, US Bank, Wells Fargo and others. Banks have developed and used smart contracts for the blockchain platform Corda (Hearn, 2016; Brown, 2018), distributed for the processing of transactions in transactions with receivables and LC-transactions (DiCaprio, Jessel, 2018, pp. 2, 6, 8; DiCaprio, Malaket, 2018, pp. 10). In April 2018, Finastra – is the third largest Fintech company in the world – launched the first live application on Corda R3. Fusion LenderComm: this blockchain-based platform for syndicated loans became commercially available after it was successfully tested by seven international banks, including BNP Paribas, BNY Mellon, HSBC, ING, Natixis and State Street (Wass, 2018). The introduction of blockchain will enhance the role of trade finance in international trade in the future, and also help simplify the manual processing of import/export documentation, increase security by reducing errors, make working capital of companies more predictable and increase convenience for all parties through mobile interaction.

3. BANKS AND THEIR DIGITAL RIVALS. HOW TO WIN IN DIGITALIZATION EPOC?

Digital solutions transform global finance (Manyika, Lund et al, 2016, pp. 31-43). Convenient applications and online services offered by digital platforms are beginning to break the banks' monopoly on customers, and clients have an access to services on any device at any time, receive personalized offers and make instant decisions. Banks compete with companies of a fintech industry and this competition is increasing in many spheres. Fintech-companies carry out individual banking operations, but they don't need to comply with all banking requirements according to a banking act or directives of a central bank. There is no adequacy in a banking regulation and a regulation of electronic quasi-banks. That's why the latter doesn't need to have a big capital and to make large reserves. That is their competitive advantage. Fintech-companies appeared as bank assistants, but now they are self-sufficient and moreover are replacing banks in their traditional markets. Fintech-business includes a broad set of services and technologies such as an artificial intelligence, biometric data processing, data encoding with help of cryptoalgorithms, cloud computing and convenient payments. Investment in fintech-industry soared from \$9 billion in 2010 to more than \$25 billion in 2016 and their market value became 4 times more in the last decade (Griffoli, 2017, p. 27). According to KPMG estimates, by the middle of 2018, global investments in fintech companies reached \$57.9 billion and exceeded the figures for 2017 (\$38.1 billion) by almost 52.0% (Pollari, Ruddenklau, 2017). China is a world leader who invests over \$7 billion in a fintech-industry followed by the USA (over \$5 billion), the UK (near \$2 billion), Germany (\$0.6 billion) and Japan (\$0.5 billion). Banks need to invest in IT not less than fintech-companies in order to keep up and succeed in future.

And they do it. The biggest banks annually spend \$3-5 billion on electronic systems. The second biggest bank of Russia VTB bank spend near \$1 billion on IT a year. At this inflection point there is a fundamental transformation of a traditional offices into the new ones. Physical offices of banks will hardly get off the stage and will unlikely be replaced entirely by their electronic branches. According to a McKinsey's overview a quarter of all bank clients in Italy and Sweden prefer to make all banking operations remotely, but we'll find only 14% customers like that in Germany and the UK (Dallerup, 2018, p. 1). 46 per cent of Italians come to banking offices or use ATM because they see no alternative (Figure 1). A direct contact with a bank employee or a bank equipment is a safer method of managing money and accounts as these clients see it. That's why banking offices are transforming rather than disappearing. They are being equipped with interactive teller machines with remote tellers as well as interactive digital walls and special service terminals which can accept applications for new products and give these products out (e.g., credit cards). The space in banking office is changing too. The self-service area is increasing, and the assisted sales and servicing zone is significantly decreasing. Those customers who need more complicated products like mortgages or letters of guarantee will be able to ask questions in a special video conferencing room. The consultations are accessible there at all hours. Banking products in smart-branches are becoming more personalized. In such offices the dividing line between VIP and standard bank servicing became less and less distinct. It opens the door to flexible pricing for banking products.

Figure 1: Share of bank clients who prefer remote electronic interaction with a bank
(Dallerup, 2018, p. 1)

Operations of smart-offices are the middle ground between online and offline banking and threats they create is a result of their dual nature. There is a risks of the full shift to a digital identification of a client which can be compromised by criminals and restored with difficulty. There is also a high risk of a universal employee bribery because a new generation of bank employees are very valuable for criminals as they have a full access to all bank services, technologies and full information about any client. Criminals can use such employers and client information in money laundering schemes (e.g., on the layering stage) (Shadow Economy All Over the World, 2018, p. 8).

4. COUNTRIES' UNREADINESS TO ACT AND INTERACT EFFECTIVELY FIGHTING DIGITAL FINANCIAL THREATS

Besides competition challenges and electronic document circulation problems global banking industry as well as other industries met with serious digital crimes and can't answer them without help of state authorities. Cybercrime scale throughout the world is enormous and is growing year by year. According to the US FBI's Internet Crime Complaint Center 1,42 million Internet crimes were committed (received complaints) across the globe over the last five years with a total reported loss of \$5.52 billion (Internet Crime Report, 2017). In 2017 the biggest losses were made by business email compromise (over \$675 million), confidence fraud and online criminal romance (over \$211 million), non-payment or non-delivery of goods (over \$141 million). In 2017 the Russian banks alone lost Rub1,35 billion (equal to \$22 million) because of electronic hacking into bank accounts and other online crimes (REGNUM Information Agency, 2018). The fight with this evil has just started. Many countries haven't adopted special anti-cybercrime laws yet. Legal procedures and evidences of internet crimes differ from country to country. One of the complicated juridical problems is an evidence of connection between particular computers, files, notes, pictures, data with criminal content and a particular person who used them in his crime. The traditional investigation and search of exhibits often are not usable in electronic crime case. A number of South-East Asian countries use "a time approach". It means a particular user of a computer in time of a cybercrime is a criminal. At the same time there are some electronic crimes which can't be investigated by this method. Punishments for cybercrimes in different countries also vary from a fine to a death penalty. So, we can state that there are low readiness and lack of unification of legal and technical tools which are used by national law-enforcement bodies and supervision authorities in their fight with cybercrimes especially when they are cross-border. Another international problem of countering cybercrime is lack of trust and practical interaction between law-enforcement bodies of different countries. Distrust of countries is an excellent ground for cybercriminals to escape justice. The insufficient financial knowledge of common people and even business community in most countries also make difficult the fight with cybercrime, and vice versa, it makes life of light-fingered gentry easier. The counteraction of digital crimes requires special explanations, because one can receive an unnecessary financial service, lose money, give personal information by a rash click of a computer mouse. The Russian Ministry of Finance has been carrying out a program of increasing financial literacy including the so-called Saving Weeks. However, the level of knowledges, especially among the old generation, stays extremely low. Protecting customer data and money is a great challenge for banks. There is no 100% guaranty that all electronic banking systems are safe. Criminals have learned to crack two-factor authentication and insensibly steal money holding a special NFC-gadget near an unaware man's bag with credit cards.

5. CONSLUSION

Global banking industry is among leaders of digitalization and electronic business, but banks are not alone in the market of digital technologies and products. Fintech-companies are their main rivals and competitors who want and try to seize the initiative away. They are not burdened with common banking costs and bank reserve requirements. But at the same time banks are "old-timers" in the financial market. They are deeply embedded in international flows of capital and cross-border transfer of money. Fintech-companies have not yet substituted banks in the market of banking guarantees or letters of credit as the main tools of international trade and will hardly do it. In line with the spirit of our digital time banks are actively fostering new forms of client servicing and new types of banking offices. Smart-branches of banks with a seamless technology, universal qualification of staff and other special features is an answer of banks to digital challenges and strengthening competition in digital sphere.

Digitalization brings with it numerous cybercrimes, and banks will not be able to cope with them without help of state. Banks and their clients lose millions of dollars meeting with online hacking, non-payment and other digital crimes. Unfortunately, governments are not ready to act effectively and interact with each other on the international level fighting digital financial threats. The absence of single national standards in the fight of cybercrimes, lack of trust between law-enforcement bodies of different countries, insufficient financial and digital literacy of common people just aggravate digital threats to banks.

ABSTRACT

Our paper investigates foreign banks impact on financial stability in transition countries during the boom-bust cycles, especially their contribution to the evolution and realization of systemic risk. The purpose of this study is to carry out theoretical pros and cons of foreign banks presence in post-soviet countries based on empirical evidence from their activity and risk profiles under different economic conditions and regulatory regimes. A comprehensive retrospective study of global bank capital entries into transition economies, reasons of foreign capital outflows and the dynamics of banks key financial indicators was carried out, as well as a comparative analysis of foreign versus local bank groups due to systemic financial sustainability. The results of this study indicate that foreign banks appeared more solvent during economic crises in transition countries in comparison with local private banks, despite great financial losses and required capitalization. The differences in default levels and response to the crisis among foreign and local banks were found. Instead of cross-border contagion channel strengthening, foreign banks presence, higher customer loyalty and capital support from parent institutions reduced deposit outflows and smoothed the potential impact of financial instability during the crises. On the contrary, the need of modern early warning monitoring system of foreign banking still exists because of possible rise of concentration and potential non-financial risks related to geopolitical motives and strengthening of compliance requirements. Main findings of empirical analysis contribute to a deeper understanding of the ownership influence on the systemic risk formation in the CEE and post-soviet banking sectors during the previous booms and crises. Grounded on the empirical data analysis, important patterns in cross-border funding and systemic risk channels were found. It allows to forecast properly future benefits and risks of foreign bank presence in transition countries for regulatory and business purposes.

Keywords: *foreign banks, financial stability, systemic risk, bank crisis, transition economies*

1. INTRODUCTION

Foreign banks appearance in 1990s and further activity during 21st century became an important indicators of economic and social development in transition countries while developing effective global-oriented market economy, which more generally have to be reflected in implementation of such core elements as rule of law, protection of private property and democratic values. But newly formed post-crisis financial landscape in Central Eastern Europe (CEE) and CIS region during 2nd decade of 21st century continues to be subject to challenging

researches in comparison with previous well studied period of massive foreign capital expansion in CEE and post-soviet economies, caused by liberalization combined with new M&A wave and Great Moderation in the parent western countries during 1990-2007. After the global financial crisis in 2007-2009, European sovereign debt crisis in 2010-2012 and series of more recent local recessions and financial turmoils in CEE and CIS, rise of neo-protectionism policy the national banking markets have suffered not only from lower financial performance, higher non-performing loans (NPLs) and more severe regulations, but also from strategic interests decreasing of international financial holdings. Therefore, previous trend of foreign banks expansion turned into opposite way in the wide range of transition countries, while some economies remains open, successfully enhancing external financial capital inflows with the help of upward recovery direction of global markets in 2015-2017. Impressive changes of the national banking systems ownership structures and volatile financial performance became a source of new wave of academic and policy discussion about the role of foreign banks in financial sustainability of transition economies. Thus, this study raises following questions: What is the difference between the levels of foreign banks presence in CEE and post-soviet countries? What are the main tendencies of foreign capital movement in the transition banking systems based on empirical evidence during the last decade? What are the results of foreign bank penetration and external capital outflows in terms of financial sustainability of banking sectors in SEE, CE, Baltic, EE and CCA regional clusters? The research determines the level of foreign bank presence in CEE and post-soviet countries banking system over the period 2007-2017. The next step is testing the relationship between foreign bank penetration trends and financial stability in transition countries. Our study based on complex panel dataset with transition banking system performance and soundness indicators not included on consolidated basis in the previous literature on foreign bank activity in the region. Last, but not least, we also find that new phase of transition countries' banking sectors development is characterized by strengthen the state's share in the general ownership structures through the reduction of local private banks' share or even shortening the foreign banks presence, which distinguishes recent "post-crisis recovery period" from the previous "Great Moderation" stage of foreign banks penetration. The paper itself is structured as follows. Section 2 starts with a literature overview of the main field of studies on the foreign banking in CEE and CIS countries. Section 3 provides a description of the construction of the database, main variables and research method. Section 4 examines the empirical results about the importance of foreign banks in the host countries banking systems, main tendencies of foreign bank activity in the selected macro-regions, and also some evidence on the relationship between foreign bank expansion and banking sector development during the financial crisis and recovery times. Section 7 concludes.

2. LITERATURE REVIEW

Numerous researches on foreign banks activity showed a positive relationship between the presence of foreign banks and the stability of the banking system (Levine, 2001, p. 690), close correlation between foreign banks and competition level (Claessens and Laeven, 2004; Cull, Peria, 2007), and also that a large foreign banks share in the capital of the banking system increases total operational efficiency (Caprio, Honohan, 2000). Works investigating important role of foreign banks in the "cream-skimming" strategy (Sarma & Prasad, 2014), stimulating dollarization (De Nicoló et al, 2003) or more credit reduction during the global crisis compared to domestic banks, except when foreign banks dominated the host banking systems (Claessens, van Horen, 2014; Brown, De Haas, 2010) are of particular interest. At the same time, the national peculiarities of the studied region were reflected in a number of studies on the expansion of foreign banks into CEE markets (Raiffeisen, 2017; Arakelyan, 2018; Bongini et al, 2017; De Haas, Korniyenko et al, 2012) and the CIS (Nabiyev et al, 2016) and, in particular, Azerbaijan (Murshudli, 2013, 2018), Ukraine (Korniyuk, 2018, 2018), Russia (Vernova,

2018), Poland (Havrylchuk, 2006), Serbia (Gnjatović et al, 2011) etc. In general, there were discovered both positive and negative aspects of foreign banks presence in the host banking systems in transition economies. Among the positive externalities, the following should be highlighted: a) import of modern banking technologies and financial innovations; b) enhancing economy of scale and market consolidation; c) competition increasing; d) FDI attracting; e) facilitating the inflow and diversification of the financial capital sources; e) financial markets development and efficient infrastructure. Critics of the foreign banks penetration delivered following arguments: a) the strengthening of external geopolitical control over the redistribution of assets in host countries; b) the risk of inconsistency between the goals of foreign banks and the objectives of the economic policies of host countries (for example, import supporting activities from the parent countries instead of export or social projects financing); c) cross-border “export of instability” during the crisis in the parent country; d) problems of regulatory arbitration and consolidated supervision. We believe that the study of the volatile 2007-2017 period in transition economies provides an opportunity to more accurately assess the pros and cons of foreign banks on the basis of extensive empirical material, which is currently not yet sufficiently discovered. This paper contributes to the literature on foreign banking in two ways. It introduces a new and comprehensive database on foreign bank share in assets, covering 24 countries from 2007 to 2017. And, using this extensive database, it provides salient facts on trends in foreign ownership, compares dynamics of foreign and state bank shares in systems, and analyzes the relationship between foreign bank presence and financial development and the impact of foreign banks on financial stability during the “Post-Great Moderation” period, which contains global, regional and a lot of local crises, following by recovery phases.

3. METHODOLOGY

3.1. Data

Our data consist of panel annual data for 2007-2017 period on different parameters of foreign and state bank shares in banking sectors assets and financial soundness indicators for each among 11 CEE and 13 Post-soviet countries. Some countries are excluded due to lack of sufficient data and lack of developed banking system in terms of total assets volume. In building the database, many sources were used, including IMF, World Bank, Global Financial Development Database, FRED, EBF, ECB, individual central banks’ annual reports and financial stability reports, The Banker, CEIC etc. This allowed us to cover many more countries than many past papers have and to cross-verify information.

3.2. Research Methods and Categorization of Countries

The research methodology was based on a retrospective comparative graphical data analysis on the dynamics of both foreign and state banks share in total assets, as well as a number of key indicators of banking sector financial sustainability in transition economies from CEE and the post-Soviet area. With the aim of more correct comparative analysis of countries from different experiences of implementing market reforms, varying degrees of financial liberalization, and distinguishing trajectories of economic development, the authors propose the following classification of the studied countries in terms of their historical and geographical similarity (table 1).

Table following on the next page

Table 1: Categorization of selected countries (based on IMF, Raiffeisen, etc)

Region	Sub-region	Selected countries
CEE	SEE (Southeastern Europe)	Albania (AL), Bulgaria (BG), Bosnia and Herzegovina (BA), Romania (RO), Serbia (RS), Croatia (HR)
	CE (Central Europe)	Poland (PL), Slovakia (SK), Slovenia (SI), Hungary (HU), Czechia (CZ)
Post-soviet	BALT (Baltic region)	Estonia (EE), Latvia (LV), Lithuania (LT)
	EE (Eastern Europe)	Belarus (BY), Moldova (MD), Russia (RU), Ukraine (UA)
	CCA (Caucasus & Central Asia)	Azerbaijan (AZ), Armenia (AM), Georgia (GE), Kazakhstan (KZ), Kyrgyzstan (KG), Uzbekistan (UZ)

3.3. Variables

The level of foreign bank presence in our study is determined by calculating the total share of foreign banks in the total assets of the national banking system. At the same time, we considered a foreign bank as a bank, 50 percent or more of which is controlled by a foreign beneficiary. If possible, we tried to exclude the so-called pseudo- and quasi-foreign banks from the analysis. That final set of indicators used in identifying the financial stability of studied countries is given in Table 2.

Table 2: Selected variables (Bankografo, 2019)

Variable	Formulae	Description
Capital Adequacy	Equity / [Risk-weighted] Assets	Capital Adequacy – traditional solvency ratio, which ensure the efficiency and stability of banking system
ROA	Net Profit / Assets	Return on assets – standard profitability ratio
ROE	Net Profit / Equity	Return on equity – standard profitability ratio
NPL ratio	NPLs / Gross Loans	Total NPL ratio reflects asset quality of banking system
Bank assets to GDP ratio	Bank Assets/GDP	Assets to GDP ratio – a proxy for financial inclusion, credit availability and the share of banking in economy

4. EMPIRICAL FINDINGS

4.1. Foreign bank presence in transition economies

According to our research, most of the CEE countries, with the exception of Slovenia, Poland and Hungary, are characterized by high market share of foreign banks in assets at over 75% as of December 31, 2017. While in post-Soviet countries foreign capital is distributed more unevenly, with two distinct groups of countries in terms of the role of foreign banks. Figures 1 and 3 show the shares of foreign banks in assets of CEE and the post-Soviet region countries, respectively, of at the beginning of the study period on December 31, 2007 in green bars, and the red dots as of December 31, 2017.

4.1.1. CEE countries

The maximum level of foreign banks activity is observed at Czech and Croatian markets - more than 90%. Relatively high market share of non-residents (over 75%) persists in most countries of the SEE subregion. While Central European economies of Poland, Hungary and Slovenia have average indicators of foreign control over the banking system.

Figure following on the next page

Figure 1: CEE countries in 2007 vs 2017: Foreign Banks Assets MkS (IMF, CBs)

Figure 2: CEE countries: Foreign banks assets MkS as of 01.01.2018 (IMF, CBs)

4.1.2. Post-soviet countries

The average level of foreign banks presence in post-Soviet economies is substantially lower in comparison with the previous group, although there is a significant heterogeneity of studied countries sample. One of the possible reasons of such difference could be de-facto liberal or protectionist path of economic development, that creates favorable or unfavorable investment environment.

Figure 3: Post-soviet countries in 2007 vs 2017: Foreign banks assets MkS (IMF, FRED, web sites of central banks)

Figure following on the next page

Figure 4: Post-soviet: Foreign banks assets Mks as of 01.01.2018 (IMF, FRED, web sites of central banks)

It should be also indicated that in most CIS countries quasi- (with a minority share of non-residents less than 50%) and pseudo-foreign banks (controlled by residents hidden behind offshore nominal owners) often prevail. This leads to a distortion of statistics on the aggregate foreign capital share and the market share of the de-facto foreign banks.

4.1.3. Foreign vs state bank ownership in transition economies

The graphs show the relationship between the shares of foreign and state-owned banks by countries as of December 31, 2007 (fig.5) and December 31, 2017 (fig.6). The downward concave nature of the relationship of these two indicators in 2007 was due to the significant share of private local banks that left the market as a result of insolvency and regulatory cleansing policies of central banks in Ukraine and Russia, as well as state capital strengthening in Slovenia and Uzbekistan. As a result of these processes, a more direct line of interdependence of the market shares of foreign and state banks has been formed.

Figure 5: Foreign banks vs state banks market shares in 2007 (IMF, FRED, web sites of central banks)

Figure 6: Foreign banks vs state banks market shares in 2017 (IMF, FRED, web sites of central banks)

Thus, CEE and CIS countries are experiencing redistribution of banking market shares in favour of national governments and international participants, with marginalization of local private owners. Despite positive impact on related-party lending problems, this new tendency of financial development can imply increasing of systemic risk related to shortening competition and moral hazard externalities. Traditional operational inefficiency of state-owned financial institutions and propensity topreferential regulations are the main source of doubts about future market discipline and effectiveness of solving crisis challenges.

4.2. Trends in foreign bank ownership during 2007-2017

After the global crisis of 2007-2009 the historically high level of foreign capital in CEE and the Baltic countries began to decrease gradually, reversing the previous trend, caused by the European integration of the countries (fig.7). Eastern Europe, the Caucasus and Central Asia after the intensification of the foreign capital inflow are experiencing a period of slow reduction. But the dynamics of the share of foreign banks was multidirectional both in time and across countries.

Figure 7: Foreign banks average share dynamics by sub-regions, 2007-2017 (IMF, FRED, web sites of central banks)

Figure 8: Foreign banks market share as of 01.01.2018 (IMF, FRED, web sites of central banks)

4.2.1. Southeastern Europe (SEE)

Compared to other subregions, the Balkan countries are characterized by the maximum presence of foreign banks throughout the entire study period, despite a slight decrease (fig. 7, 8), caused primarily by a reduction in the market share of non-residents by 7-10 pp. in Albania, Romania, Bosnia and Herzegovina. At the same time, the level of non-residential control in Serbia and Croatia is relatively stable, having increased by 1 pp.

4.2.2. Central Europe (CE)

The Central Europe region, which previously, with the exception of Slovenia, was totally absorbed by foreign banks, after the global crisis, is experiencing a period of more substantial comparing with Balkans reduction in the foreign banking capital share due to substitution by the state-owned banks, which is especially characteristic of Poland. The government has launched a new financial strategy for the development of foreign banking sector from around 60 percent to 46 percent. The median value of the market share of foreign banks in CEE fell from 75 to 63%. For 2007-2017 the share of foreign capital also decreased in Hungary, the Czech Republic, and Slovakia, while in Slovenia increased from 38 to 46% (Fig.1).

4.2.3. Baltic region (BALT)

The Baltic countries demonstrate a slight decrease in the share of foreign capital comparable to that of the SEE region. It should be noted that Estonia (-12 pp) and Latvia (-7 pp) acted as the driver of the process, reducing market share of non-residents for 87 % and 58% respectively. In Lithuania, the value of the indicator remained almost unchanged in the range of 91-92%. The presence of subsidiaries and branches mainly from the Scandinavian region (SEB, Swedbank, Nordea etc) in Lithuania and Estonia stays at a high level.

4.2.4. Eastern Europe (EE)

The countries of the post-Soviet region are characterized by heterogeneity of foreign banks participation, which is on average less significant than in the CEE countries integrated in the EU. Foreign banks reduced their presence in the Eastern European economies of Ukraine, Moldova, Russia during 2009-2017, despite the high level of defaults in the segment of local private banks that were most affected by the cleansing regulation policy. The voluntary and civilized exit of certain foreign banks from Eastern Europe was primarily associated with chronic crises and the need to cut operating expenses due to the high sovereign risks. The exit of foreign capital from Russian Federation continues, aggravated by international sanctions, while in Ukraine the foreign banks that have survived practically stopped and have strong financial positions after successful capitalization. During the cleansing period in 2014-2016, foreign banks, strategically interested in the presence in Ukraine, began to recover previously lost positions and turned out to be better prepared for the next stage of banking market development.

4.2.5. The Caucasus and Central Asia (CCA)

In the CCA region, there are two clusters of countries: with a high (60-80%) and low (0-20%) foreign bank market shares in the assets of the banking system. The latter, at this stage of development, declare the irreadiness and openness for foreign investors to enter the banking market, with whom they pin their hopes on additional capitalization and solving the problem of the low efficiency of dominant state or private banks. Neighboring CCA countries with a high proportion of foreign capital did not suffer from a possible out flow of capital during the crisis period, but rather contributed to the stability and better penetration of financial services, while European subsidiary banks practically did not go bankrupt.

4.3. Foreign banks and banking sector stability

Given the wide discussion about the impact of foreign banks on the financial sustainability of host countries, we have attempted to study the soundness indicators and the share of non-residents in the banking sector. We did not focused on of macro-financial stability aspect, only considering key indicators of solvency, profitability, asset quality and bank assets-to-GDP ratio, since the influence of foreign capitalism noticeable at the level of the banking system in comparison with macroeconomics.

4.3.1. Capital adequacy and foreign bank presence in transition economies

It should be noted that there is the absence of a linear relationship between the share of foreign capital and solvency. A more influential factor for the value of the capital adequacy ratio is regional affiliation (with the exception of CCA, where higher levels of CAR correspond to higher levels of foreign capital). So, the Balkan countries are leading in this indicator. While the Baltic countries, despite the high proportion of foreign capital, demonstrate borderline values (about 10%).

Figure 9: Foreign banks share vs capital adequacy in 2017(IMF, web sites of central banks)

4.3.2. Profitability and foreign bank presence

As in the case of the previous indicator, we do not observe a clear relationship between the profitability and foreign bank presence as of 12/31/2017 (Fig.10). At the same time, the historical volatility of the indicator, expressed by the standard deviation of ROA, is minimal in predominantly countries with a high proportion of non-residents (Fig.11). This partially confirms the hypothesis about the positive impact of foreign control on the level of stability and efficiency of national banking markets.

Figure 10: Foreign banks share vs ROA in 2017 (IMF, web sites of central banks)

Figure 11: Foreign banks share vs ROA standard deviation, 2007-2017 (IMF, CBs)

4.3.3. Assets quality and foreign bank presence

There is a moderate inverse relationship between the level of presence of foreign capital and the share of non-performing loans in the banking system. Most of the countries of the post-Soviet region with low level of foreign banks influence have an NPL ratio of more than 10%, while this is an exception for countries with a high foreign share (mainly CEE and part of CCA).

Figure 12: Foreign banks share vs NPL ratio in 2017(IMF, web sites of central banks)

Ukrainian case indicates possible manipulations with the assignment of de-facto problem loans to the NPLs, with their intentional reduction in order to minimize declared credit risk exposures and loan loss provisions. Taking this into account, for countries in the post-Soviet region with low standards of reporting, the actual inverse relationship between the studied indicators of NPL ratio and foreign bank presence may be stronger.

4.3.4. The role of foreign banks in access to credit and financial inclusion

The results of the study indicate that the activities of foreign banks have a positive effect on access to credit and financial inclusion, in particular, expressed by the traditional bank assets-GDP ratio. This confirms the findings of previous works, which link the highest level of financial sector development with easier access to external financial resources from parent company, Eurobonds issues and syndicated loans.

Figure 13: Foreign banks M&S in assets vs total bank assets/GDP in 2017 (IMF, CBs)

5. CONCLUSION

According to the results of the study, the apogee of the foreign capital expansion in countries with transitional economies was passed in 2008. After the global crisis, the previous trend changed to a tendency of the foreign banks market share reduction due to state-owned bank capital replacement.

On the other hand, some countries with initially low foreign presence, such as Slovenia or Serbia, have become somewhat more dependent on foreign banking capital. A higher level of operational efficiency, asset quality and availability of external sources of additional capitalization of foreign banks, combined with their higher share in assets, are translated into better aggregate financial sustainability indicators of the host banking systems. Post-Soviet countries with insufficient levels of foreign capital during the study period more often had problems with state-owned and private local banks due to high volatility of profitability and increase in the toxicity of loan portfolios because of related-party lending. The results of these processes were transformed into negative economic consequences due to the growth of moral hazard and violation of market discipline. At the same time, changes in the foreign banks share in assets and reformatting the ownership structure require increased attention to the compliance risks of foreign beneficiaries of the ever-growing financial institutions in transitional banking systems, as well as strengthening the ability of regulators to the consolidated supervision of cross-border financial groups.

ABSTRACT

Information Technology has emerged as an integral part of globalization, where it is not only used in e-commerce, e-business and R&D but is also a crucial part of complex data mining used in developing digital currencies and valuating them. These currencies have become popular in the last decade and people around the world have started investing in them, blindly. Even after having high volatility, decentralization and complexity in price determination using cryptography, digital currency has been attracted by many investors who may be trapped by investor biases.. The current paper focuses on exploring the behavioral biases on investment decision making of digital currency/crypto currency by employing qualitative measures and interviewing Pakistani individuals who have purchased crypto currency. It is established from the results that due to complexity of price determination and profit attractiveness, investors become a victim of biases and heuristics when they are investing in digital currencies.

Keywords: *Digital Currency, Crypto Currency, Investment decisions, Investor biases, behavioral finance*

1. INTRODUCTION

Bitcoin is digit peer-to-peer currency that is traded on public exchanges which was first introduced in 2008. It can be easily transferred between people anywhere around the globe more quickly and at a far lower cost than traditional financial system without any financial institution intermediation. (Dibrova 2016). Digital currencies have no central authority and are decentralized systems which use cryptography to control the transactions by ensuring fraud prevention and are referred as cryptocurrencies. (Gandal 2014). The term cryptocurrencies is used for bitcoin and other similar digital currencies because the algorithm underlying in such currencies are related to digital cryptographic algorithms. Records of these currency trades are recorded on a publicly available data base known as block chain where each bitcoin has been assigned with an address and transaction involves trade of bitcoin from one address to the other one. There is no independent existence of bitcoin without block chain. In order to add new transactions miners solve a computational problem and they compete with one another to add next chain to the block chain. To add on recent transaction, transaction fees serves as an incentive for miners moreover, they also receive new bitcoins. Each increment of block chain includes information about new transactions and bitcoin received by miner. Bitcoin works on hash functions i.e. $h = H(M)$ where hash function produces the hash value h by taking a message M of arbitrary length. This hash value is restricted to be equal to or less than some value which posed a difficulty in solving computational problem for miners as target of having an increment to block chain is 10 minutes and with increasing mining amount h value is reduced and difficulty is increased. (Dwyer 2015). In order to own or make a transaction in bitcoin, individuals are required to either run a program on their computers on which bitcoin protocol is implemented or they can create an account on a website which operates bitcoin client for users of digital currency. (Grinberg 2012). In order to keep track of their balances holders of bitcoins use wallets which is a spreadsheet program that keeps a track of balance, public key known as addresses and the private key. A specific address is associated to every bitcoin which is the public key in bitcoin transactions which keeps track of the balance held by a bitcoin holder.

In a bitcoin transaction recipient's public key is the address to which bitcoins are sent and private key is the sender's digital signature for encryption which is unencrypted using the sender's public key through which sender is verified and recipient's address is known. (Dwyer 2015). Reasons why digital currencies have become the center of interest include reduced transaction fees for online purchases i.e. through payment card networks which these currencies offer, secondly as compared to credit cards digital currencies guarantee more anonymity. Decentralized design of bitcoin and elimination of financial institutions intermediation protects against inflation as compared to traditional currencies which rely on financial institutions to regulate the circulation of money when needed. (Moore 2013) However, the complex issues in such currencies are on supply side i.e. how it is created? How much revenue the digital currency would generate and who will receive it? Such issues are resolved by Bitcoins through peer to peer network which operates through an open source software which is similar to a client server model in which server receives and responds to the requests from clients. It is arranged as a set of nodes into a self-organized connected network, where nodes act as both clients and servers. (Dwyer 2015). Overall algorithm of bitcoin protects against currency counterfeiting, however they are vulnerable to theft. Users of bitcoin hold private keys to their bitcoins and make transaction through wallets which can be stolen hence posing a risk to theft. (Gandal 2014). One hurdle which bitcoin is facing to become a popular medium of exchange is the difficulty of procuring new bitcoins. Beside successful bitcoin miners, a person must source bitcoin through online exchanges and dealers and such purchases require the buyer to make a bank transfer or link existing bank account to exchange which have low liquidity, bid-ask spreads and custody risk. Moreover, requirement of procuring good and services from a merchant before possessing bitcoins can't be bypassed as compared to the credit financing which is done mostly in retail markets where customers frequently buy with consumer credit financed by the merchant or a third-party credit card vendor, an option that is not available for bitcoin (Yermack 2015). Since these currencies are complex in nature, not everyone is ready to invest in them, unless people know who have invested and what are the gains/losses they have incurred. Many studies have found herding behavior while investing in crypto currencies, which is a reason why their price is so volatile. The current study attempts to investigate the role of herding in digital currencies by qualitatively exploring the behavior of Pakistani investors.

2. DATA

Data was collected through conducting interviews from buyers of crypto currencies. The most common crypto currency in Pakistan is Bitcoin, due to its anonymity, data collection was a challenge so sampling was based on convenience sampling. Initially one known investor was asked to give an interview and then other investors were reached through his contact. And on the basis of this a total of 15 individuals were reached out of which 7 interviews were taken in detail. All the interviews were taken separately to insure reliability in the data and especially since a comment of one could affect the answer of other, the discussion from one investor was kept highly confidential. Each interview last around 30 minutes. Investors were asked about the demographics, drivers of investment, types of investments they have done in their lives, their experiences on their investments and their style of investment. All the interviews were then transcribed and coded using NVivo. Nodes were created on the basis of the transcripts.

Figure following on the next page

Figure 1: Coding Scheme for analysis

3. ANALYSIS

The following sections were made after analyzing the transcripts to make a proper analysis of the behavioral aspect involved in investment decision making of Pakistani investors.

3.1. Risk Taking Attitude

Risk taking attitude of the investors was asked as it is the determinant of their willingness to take risk. It was observed that only 20% of the investors were risk takers and 80% investors showed risk averse attitude or they would prefer secure investments even if they are offered low returns.

3.2. Investment decision

People were asked about the types of investment they have made in their past. 2/3 rd of the total sample interviewed had invested in real estate. "I have invested in real estate as it is secure and more rewarding, I don't believe in investing in stock market or any other commodity" (I2). Another interviewee said, "In Pakistan Real estate gives you good returns, so I buy plots and keep them for some time and then I sell them, I am usually able to make 25-30% profit out of it, and I am happy with it" (I5). Since this was regarding their past investments there was no investor who has purchased or invested in crypto currency before last 5 years.

3.3. Decision making criteria

What factors do investors take into account when making a decision regarding investment? This was asked to find out if there is an influence of what kind of investment is trending while they are making investment or do they do their own homework before making any decision. The response was varied many investors said they don't follow a proper procedure other said they do. "First I save some money and out of my savings I have always kept a 50% investment ratio, so I invest 50% and keep the rest with me, after I have made an investment, the return I get from my investment I take 50% out and reinvest the rest 50%. I do ask my friends around and discuss new investment opportunities available with my colleagues too. But I always do my homework by asking around and reading about secure investments" (I7). "My investment decision works as a group, we are five friends and we pool in money and invest, I am not really good at the investment analysis so I blindly follow one of my friends who is very well informed and with him I have always gained on my investments, I don't have so much time for the homework."(I3). "Whenever I have to make an investment, I ask my colleague, he is a very reliable person, I usually invest where he invests and that way I am satisfied"(I1).

“My elder brother is investment geek, I seek his help” (I9). “I follow the trend, so whatever people are investing in these days, I will invest there, it has always helped me” (I12). “I make my own decision, I don’t follow blindly” (I15).

3.4. Investment experience

Investors can have different investment experiences from what they expected. To know about their investment experiences they were asked questions related their previous experiences. It was observed that the experiences vary from one person to another and their satisfaction level also varied from one to another. Overall risk takers were observed to have less satisfaction levels as compared to risk averse individuals.

3.5. Knowledge about crypto currency

How investors got to know about the digital currencies available in market and their knowledge about how they work was asked and it was concluded that most of individuals got to know about digital currency from their family and friends living abroad. "A friend of mine in UK visited me 2 years back and he told me that he invests in bitcoins and from the return he has able to make, I was very impressed. That was the time I took all information from him and how do these work. I got to know that from the pooled in money, the miners invest that money into different global exchanges and the return then received is updated on daily basis"

3.6. Investment in crypto currency

Since in Pakistan the concept of investing in crypos is not very old so investors were asked about how have they decided to invest in crptos if they have ever invested in cryptos. The answers were more tilted towards theirs peers, coleagues, friends and family influencing them to invest. "When my friend asked me to invest, i asked hwo much have you gained from it and after knowing his rate of return, i decided to invest in it". "Cryptos are not very common in Pakistan, so there are usually people abroad who influence«.

3.7. Herding influence

If the individuals have made their investment by counting on their friends investment, they would intend to withdraw if their influence withdraws investment. So they were asked about their reaction, "In Pakistan very few people know about cryptos and we have a group, we pool in money together and similarly withdraw together, and this pattern is followed majorly in this type of investment". "Yes i am very much influenced, whenever i know the price is dropping i fear people are withdrawing so whatever is gone is gone, i withdraw my investment without taking a moment.«.

3.8. Overall experience

People had very varying opinions regarding it.

- "I enjoy it a lot watching prices go up and down"
- "I fear a lot it such a volatile currency, can give you shocks"
- "I have mixed opinions, it has given me good profits but i have incurred loses as well"
- "The worst part was i asked my inlaws to invest and when they invested, it dropped suddenly which was so embarassing"

4. CONSLUSION

This paper attempts to investigate the role of behavioral aspects of investors investing in digital currenices. Since they are very complex to understand and people are not well aware of them, what factors influence them to decide to invest in a market that is rare, volatile and complex was why this research was conducted.

It was observed that investors have a great influence from the people they know when are investing in a new choices (Vidal-Tomás, 2018) .The cultural factors are also important as Pakistan is a collective culture, people prefer to invest in groups and trust their family and friends. It was also seen that the over all experience of Paksitani investors in digital currency has been good and they are satisfied. In future more inividuals can be interviewes with more detail in personality types and styles that make them go for risky investments.

ABSTRACT

Taking into account the frequent changes in the global economic market conjuncture in recent years, it is worth paying particular attention to the factors preconditioning the effectiveness of audit procedures for the purpose of taking them into consideration when integrating audit into corporate practices. The article builds up its structure starting with conceptual substance and theoretical facets of corporate audit practice. The theoretical part puts up the conceptual basis of audit in the order of understandability. Definitions, tasks and functions that were introduced first are followed by conceptual differentiation of internal and external audit and their scope and purposes. With determination of auditor's competencies control over corporate activities, methods and means of applying those controls are explained after which factors of effectiveness of audit were revealed. Based on these factors the practical part interviewed the practitioners in the practice. The thesis aims to assess important factors that impact the audit quality through comparative analysis of regulatory requirements and industry practices prevalent in corporate audit. The thesis directly applies comparative analysis methodology to the case using auditing standards (US vs. Europe) from qualitative standpoint and does not occupy quantitative (regression or any statistical methods) approach due to the fact that factors affecting audit quality are analyzed and compared in the regulatory framework of existing auditing standards and confirmed through interviews with real practitioners, and then synthesized to build an evidence-based record of the suitability of the methodology used. In the end, the thesis makes grounded conclusions with respect to the aims and goals of the research in theoretical and practical dimensions.

Keywords: *auditing, assurance, qualitative audit, combined risk assessment, control environment*

1. INTRODUCTION

Frequent changes in the global economic market conjuncture, makes it worth paying particular attention to factors preconditioning the effectiveness of audit procedures when integrating audit into corporate practices. The thesis builds up its structure with conceptual substance of corporate audit practice. The theoretical part puts up the conceptual basis of audit in the order of understandability.

Definitions, tasks and functions that were introduced first are followed by conceptual differentiation of internal and external audit and their scope and purposes. With determination of auditor's competencies control over corporate activities, methods and means of applying those controls are explained after which factors of effectiveness of audit were revealed. Based on these factors the practical part interviewed many practitioners. The thesis aims to assess important factors that impact the audit quality through comparative analysis of regulatory requirements and industry practices prevalent in corporate audit. The thesis directly applies comparative analysis methodology to the case using auditing standards (US vs. Europe) from qualitative standpoint and does not occupy quantitative (regression or any statistical methods) approach due to the fact that factors affecting audit quality are analyzed and compared in the regulatory framework of existing auditing standards and confirmed through interviews with real practitioners, and then synthesized to build an evidence-based record of the suitability of the methodology used. In the end, the thesis makes grounded conclusions with respect to the aims and goals of the research in theoretical and practical dimensions. Based on the information processed for writing this thesis, comprehensive conclusions will be drawn, and recommendations will be provided to the investigated entity for improving its audit practices, and thus for achieving the overall higher results on its target market.

2. THEORETICAL PART - DEFINITION, FUNCTIONS AND TASKS OF AUDIT

The performance of audit procedures is a key task for any company to succeed on the market, as such procedures and their results largely predefine the interest of investors in providing the respective entity with funding. The materials taken for audit include all internal accounting and management documentation used by a company for running its activities, its organizational structure and the documental confirmation of the distribution of powers and liabilities within the entity, and the financial statements prepared by the company for public disclosure. Namely, among such financial statements, the most prominent role is played by the Balance Sheet disclosing the respective company's structure of assets, liabilities and equity, the Profit and Loss Account disclosing its income, expenses, and profit or loss in the reporting period, and the Cash Flow Statement showing the sources of formation of the entity's cash flows used for generating profits (Kimbell, 2002, pp. 9-11). The users of audit information can be divided into internal and external. Internal users are the respective company's managers and employees. For them, such information is indispensable for making grounded managerial and operating decisions, and thus for improving the company's performance in terms of the financial results achieved. External users include investors and the public authorities of countries. For investors, audit information allows understanding the respective company's actual financial condition, market positions, and the opportunities for the subsequent market development. For the public authorities, reliable financial data provided by companies are essential for evaluating the taxation base and monitoring the effective charging of taxes from the corporate sector, which is a key prerequisite for ensuring high market competition (Kagermann, 2008, pp. 21-22). Taking into account the definition and purposes of audit, the following main functions of audit procedures can be pointed out:

1. Attest function. An audit project is aimed to provide a reasonable assurance about the fairness of financial statement, relevance and reliability of financial information, thus serves the attest function. Although the word "attest" is generally applicable to any audit work, it is specifically used for agreed-upon procedures (attesting on a specific line item, ex: inventories, A/R etc.) rather than full scope audit engagements in practice¹.
2. Control function. Audit is required for companies to effectively supervise² the use of their resources and a team of auditors, whether internal or external, and to compare the actual

¹ SSAE 10, 11, 12, 14; Attest Engagements AT Section 101, AICPA

² AICPA Generally Accepted Auditing Standards, SAS 77

outcomes of their business activities with their planned results and whether a discontinuity and going concern is probable. Namely, audit helps reveal where overspending of resources exist, and thus provides valuable information for the management of companies to track which business units or employees do not show the required level of effective performance.

3. Analytical function. Audit helps reveal the discrepancies existing between such planned and actual indicators, and find those fields where improvements could be made for improving the respective entity's financial indicators, and thus market positions. The analysis of the data provided by audit is helpful for understanding the current drawbacks in the respective company's activities, and thus for undertaking measures to eliminate them.
4. Consulting function. In addition to simply providing data which can help reveal the reserves for improving a company's market results, audit also performs the function of consulting, as auditors not only analyze the financial statements, but also provide their grounded conclusions to the reasons and outcomes of the lack of effective compliance with the internal corporate procedures and the legislation in force on the national and international levels.
5. Forecasting function. The data revealed in the course of audit help build grounded forecasts for the possible changes in the respective company's key market indicators in the near future. As a result, businesses get an opportunity to make amendments to their planned indicators, and the policies implemented on the market for reaching them (Pickett, 2006, pp. 14-19).

3. COMPETENCIES OF THE AUDITOR

For the purpose of effectively running audit checks, the respective auditors needs to have deep knowledge in this specific field, and have skills sufficient for effectively tracking, revealing and reporting the investigated drawbacks and advantages in the respective company's business activities. All such knowledge and skills together form the auditor's competencies. Overall, the competencies of all auditors, regardless of the country in which they perform their audit procedures, and regardless of the particular entity analyzed, can be grouped into the following:

1. Communication skills. Each auditor needs to easily contact other people. This is a key prerequisite for running effective audit checks, as in the course of such audits, the auditor has to communicate with those charged managers and employees and if needed with governance of the respective entity under independent audit. Without such communication, the auditor would be unable to get the full information required for drawing the conclusions in line with the aim of the audit, face scope limitation that may result in GAAS (generally accepted auditing standards) related qualified opinion if the limitation has material effect or even disclaimer of opinion if the limitation has very substantial effect on reasonably assuring the fairness of the statement as a whole. In such circumstances this would make such audit ineffective for the aim and goals pursued by the audited company's management (Phillips, 2009, pp. 11-12);
2. Organizational skills. The auditor needs to be able to effectively organize the work of the audit team, distribute the powers and responsibilities of all team members, set the goals to be reached, and assign particular tasks to all other persons involved in the audit. Also, the auditor is required to effectively use time management for fulfilling all the goals of the audit within the time frames set with that aim;
3. Professional skepticism. The auditor should be able to plan the audit and perform it with utmost professional skepticism. With professional skepticism the auditor recognizes that circumstances misstating financial statement may exist. For that auditors must be alert for any evidence that contradicts with audit evidence obtained, information that questions the reliability of documents prepared by client and responses to audit inquiries that was made by the auditor and any condition that may render possible fraud.

4. Ethical Requirements. The auditor must be independent in both, fact and appearance. In general ethical requirements include the rules stated in the code of professional conduct and the rules of applicable regulatory agencies together with other professional rules, usually those rules that are more restrictive prevail.
5. Professional judgment. Planning and performing the audit must be exercised with professional judgment. In audit engagements professional judgment is exercised when making decisions about audit risks, sufficiency of audit evidence obtained, materiality, the scope, nature, extent and timing of audit procedures.
6. Analytical skills. The auditor needs to be able to deeply analyze the information drawn from the audited entity's financial statements and accounting reports. For this purpose, he is required to investigate the core of the corporate processes, and to be able to establish the causal relationships in those processes³. Also, the auditor is required to apply his deductive thinking for drawing comprehensive conclusions on the analyzed subjects, and to develop practical recommendations to be implemented by the audited entity's management in the company's business practice. Without this ability, the auditor would be unable to draw valuable auditor's reports (Kagermann, 2008, pp. 53-56);
7. Conflict resolution skills. In the course of the audit, there may be different conflict situations due to the audited entity's management's or employees' will not to share the required data or information, or due to any possible misunderstandings whatsoever. The auditor needs to be able to avoid such situations or to effectively resolve them, as otherwise this may lead to the lack of common understanding between the auditor and the audited company, and thus to the lack of opportunity to fulfill the aim and goals of the audit. Conflict situations with respect to GAAS or GAAP related issues must be first communicated with company management and if no results are reached to solve such issues then the external auditor should choose to communicate with those charged with governance of the company being audited;
8. Stress resistance. The auditor needs to be able to effectively withstand all possible stresses along the phases of audit engagement. This is required in order to achieve the required results of the audit. Without being able to cope with all stresses, the auditor would be unable to reach the goals of the audit procedures (Gray, & Manson, 2008, pp. 17-19).

When effectively combining all those competencies, the auditor would be able to maximize the added value of the conclusions and recommendations drawn by him based on the results of the audit.

4. CONTROL OVER CORPORATE AUDIT ACTIVITIES

Control over corporate audit activities require risk assessment procedures to ensure that entity's objectives are achieved⁴. For that, the entity's risk assessment should involve the identification, analysis and management of business risks relevant to the fairness of financial statements that are prepared in accordance with generally accepted accounting principles. Corporate audit activities are also risk assessed through external and internal events that may negatively affect the entity to initiate, record, process and report financial information. One of the best ways to ensure that management directives are realized is to assess whether relevant control activities exist in the entity:

- Pre-numbering documents would assure that all transactions are recorded and no transaction is recorded more than once. This would also help assert that information about transactions is complete.

³ Power, M. (1997). *The audit society*. Oxford [England]: Oxford University Press.

⁴ Wilson, A. (2002). *The marketing audit handbook*. London: Kogan Page 2.

- Documentation would provide evidence and basis to record and execute transactions, also to check during retrospective controls of supporting documents⁵.
- Transactions should also be authorized before resources are used.
- Conducting third party confirmations such as review of bank reconciliations, comparison of physical stock takes to perpetual inventory method and checking subsidiary accounts to control subsidiary records.

Besides the control activities stated above the auditor should also compare budgets to actual performance. Thus, the auditor with all the comprehensive control, review and analysis of corporate control environment often obtains knowledge about internal control and judges whether additional knowledge is needed for corporate control of internal activities. Let's now look at some examples of design deficiencies of internal controls that are prevalent in practice:

- Lack of needed controls over segregation of duties;
- Inadequate IT controls;
- Inefficient design of monitoring controls;
- Wrong documentation of internal control;

Examples of operational deficiencies of internal controls may be due to:

- Misrepresented information by client;
- Bias information (lack of objectiveness)
- Deviation of financial figures that are higher than expected by the auditor;

Thus, these deficiencies are key characteristics of inefficient internal control over financial reporting that the auditor whether internal or external must look for. After all, the internal auditor's objective is to make sure that internal control system is put in place and functions as needed, whereas external auditor's objective is to express an opinion on the effectiveness of the internal control. It is important to note that the communication of any type (oral or written) due to the weaknesses of internal control or deficiencies in the internal control system is treated differently around the globe. When compared to US Auditing Standards, ISAs (International Standards on Auditing) do not require certain written communication as part of control over corporate audit activities. They are given below as such: "In accordance with ISA 265⁶ the auditor is not required to describe the definition of either significant or material weaknesses (International Federation of Accountants) during communication with those charged with governance." Thus, the American parent company may not realize that under ISAs the definition of deficiency and material weaknesses is not going to be communicated with those charged with governance. In another circumstance the parent may not pay attention to the fact that ISAs do not require an explicit explanation as to the fact that the auditor is not expressing an opinion on the effectiveness of internal control. Another factor strengthening the hypothesis 1 would be the omission of an explanation that auditor's consideration of internal control was not designed to determine all deficiencies in internal control and that might be significant weaknesses.

5. FACTORS PREDEFINING THE EFFECTIVENESS OF AUDIT

Effectiveness can be described as competence, set of procedures, supervision and execution of procedures and the quality of work done⁷.

⁵ Nick A. Dauber, Marc H. Levine. Wiley, The complete guide to auditing standards and other professional standards for accountants 2009, p.5

⁶ International Standard on Auditing (ISA) 265, "Communicating Deficiencies in Internal Control to Those Charged with Governance and Management"

⁷ AICPA Generally Accepted Auditing Standards, AU Section 150

This practical understanding of the effectiveness cannot be measured unless the audit ends and it becomes clear that the audit was not an effective one. As a general rule the character of ineffectiveness is given to an audit if a material misstatement becomes undetected during the audit and detected after the audit ends. From this standpoint it would be more accurate to understand which mistakes and disarrangements (whether of audit processes or auditors) create ineffectiveness and how best to technically recognize effective approaches and processes. Effectiveness and efficiency are not always in positive relationship. It looks more complicated in practice because there might be circumstances where the auditing firm or an internal auditor (for internal audit) would need to examine more transactions to make sure that the practitioner meets professional responsibilities. An effective audit requires an auditor to:

1. Obtain the information and knowledge on client's business activities;
2. Develop the audit strategy - The auditor should always be ready to revise the audit strategy;
3. Develop the audit plan - The auditor should always be ready to revise the audit plan.⁸
4. Employ risk assessment procedures to understand the entity's environment and internal control.

Obtaining the information and knowledge on client's business activities suggests some factors that proactively affect the effectiveness of an audit. One of such factors stems from the lack of auditor's entity and industry knowledge⁹. The auditor should also understand the accounting methodology put in place of the entity. Understanding accounting methodologies used is another important factor in determining the effectiveness of an audit. The auditor would be required to understand how accounting information is gathered and processed, whether this process is outsourced to third parties or administered by the very company management. One of them could be considered as the scope factor of the audit contract¹⁰. Characteristics that form the scope of an audit include industry-specific reporting requirements, reporting framework and currency, the size and complexity of the audit, outsourcing of services for processing by service organizations and also the effect of information technology. Another factor that predefines the effectiveness could be related to the timing, objective and communications of the audit. For instance an audit report is not prepared timely and does not meet the deadlines for investors could be valued as ineffective. Other factors that predefine the effectiveness of the audit could relate to the audit plan¹¹. Audit plan dive more into the audit procedures that help minimize material misstatements but also include procedures necessary to conduct internal control related tests (also known as tests of controls) and substantive procedures (also known as tests of details). An audit plan as a predefining factor of effectiveness must employ financial statement assertions when conducting tests of details and substantive procedures. If tests of internal control of the company is not enough for the effectiveness of the audit then, tests of details and substantive analytical procedures should be given priority in factoring out probabilities of material misstatements in transaction class or account balance levels. The thesis uses two hypotheses in determining factors affecting audit quality:

- Hypothesis one (H1) implies that external factors such as the particular business environment in which the audit procedures are implemented play a higher role for the overall effectiveness of such audit as compared with the internal factors. This section of the thesis demonstrated that business environment is an inherent category that requires both auditors, internal and external, to obtain the industry-specific understanding, regulatory rules and accounting practices of the audit work, thereby confirmed H1.

⁸ Pickett, K. (2006). *Audit planning*. Hoboken, N.J.: Wiley. ISBN 9780471784319. 240.

⁹ Patrick R. Delaney. Wiley CPA Exam Review 2010, Auditing and Attestation p. 91

¹⁰ Henning Kagermann, William Kinney, Karlheinz Küting 2007. *Internal Audit Handbook: Management with the SAP®-Audit Roadmap* p. 189-192

¹¹ Kagermann, H. (2008). *Internal audit handbook*. Berlin: Springer

- Hypothesis two (H2) says that in current conditions of globalization, external factors play an ever-growing role in the scope to which they predetermine the success of audit, and those tendencies will be likely to further develop in the future.

It is important to bring attention to the fact that all the previous sections along with the outline of the thesis also provide that globalization and external factors play a prevailing role in the success of an audit or a successful audit, simply put. Yet, one should also note that today the global accounting practice is converging by putting identical principles in place for US GAAP and IFRS. Moreover, the conceptual framework, on the other hand, is generally coherent with some minor differences. For example, under US GAAP companies are not allowed to use conceptual framework for any accounting issues in case if there is a lack of an accounting standard or principle. Whereas, under IFRS companies can refer to the conceptual framework and apply it in the absence of a specific accounting standard. Apart from it, consequences of accounting scandals together with financial and economic crises of past decades enforced standard setters to put more strict acts and rules in place (ex: SOX, revised IAS, etc). These changes leave less room to cross-border investors and entities to bypass successful audit practices and partially weakens the postulate of the H2. Thus, the thesis generally agrees with H2 by only disapproving it to a minor extent.

6. PRACTICAL PART - INTERPRETATION OF RESULTS: FACTORS AFFECTING AUDIT QUALITY IN AUDIT FIRMS

The practical part of the thesis looked at types of audit engaged by audit firms and interviewed select directors of audit firms in EU to identify major factors affecting audit quality. One of the most frequently mentioned factor by directors was an audit that was performed in accordance with GAAS. The director said that if performed in accordance with GAAS a quality audit may have achieved regardless of the opinion produced. This is partly because GAAS includes all the qualitative factors as an authoritative source of law. For example, auditor's professional skepticism, its due diligence, independence, industry knowledge, proper and adequate training¹² that we mentioned in the theoretical part of the thesis (competencies of the auditor, control over corporate audit activities) are all included in GAAS. Another response by the director to the factors of audit quality was that a quality audit should be achieved with fairly stated financial statements in all material respects. The theoretical part of the thesis has numerously touched this opinion related aspect of a corporate audit. When responding to questions the director mentioned that the complexity of industry, its lack of internal environment is a major cause for quality distortion in audit engagements. Interviewed directors also brought a consensus that an audit should be well-planned. Directors mentioned the quality factor by emphasizing competent and well-trained auditors. They said that the industry knowledge play an import role as a quality factor for successful audit. This emphasis is also confirmed in the theoretical part of the thesis. Wrapping up the types of factors affecting the audit quality in firms it was clarified through both, theoretical and practical, analysis that a quality audit is achieved by having competent auditors who can develop a strategy and plan of the audit, understand the scope (industry-specific reporting requirements, reporting framework and currency, the size and complexity of the audit), timing, objective and communications of the audit.

7. CONCLUSION

In theoretical part the thesis puts two hypotheses both of which generally agree with this the findings of the thesis only the second hypothesis has minor differences with the outcome of the thesis.

¹² AICPA Generally Accepted Auditing Standards, AU Section 150

Hypothesis one mentions that external factors such as the particular business environment in which the audit procedures are implemented play a higher role for the overall effectiveness of the audit compared to internal factors. Hypothesis two accents that in the current conditions of globalization, external factors play an ever-growing role in the scope to which they predetermine the success of audit, and those tendencies will be likely to further develop in the future. The findings of the thesis generally agrees with hypothesis two by only disapproving it to a minor extent due to the fact that accounting principles and conceptual framework have been converging and external factors are not the only ones for the success of the audit. The analysis and study of the audit work done by audit firms across helped identify major factors affecting audit quality in the firm and confirmed the importance of auditing standards and suitability of both hypotheses. Indeed, external factors directly affect the overall effectiveness of an audit and in the conditions of globalization it reasonably challenge the success of an audit. It was concluded through the interview with the director of the firm that if performed in accordance with GAAS a quality audit may have achieved regardless of the opinion produced. It was verified through practice partly because GAAS includes all the qualitative factors as an authoritative source of law. Examples of such characteristics that are covered by GAAS are auditor's professional skepticism, its due diligence, independence¹³, industry knowledge and its proper and adequate training. Another practical finding is that if an audit engagement is conducted such that it fairly states financial statements in all material respects then the audit practice may consider that a quality audit is achieved. Responding to questions the director mentioned that the complexity of industry, the lack of internal environment in complex industries are major causes for quality distortion in audit engagements. A well-planned audit was mentioned as a true predefining factor of quality that affects the audit practice in audit firms. The theoretical part of the thesis has had the audit plan as a factor of quality as well. Finalizing the types of factors affecting the audit quality in audit firms it was identified that a quality audit is achieved by having competent auditors who can develop a strategy and plan of the audit, understand the scope (industry-specific reporting requirements, reporting framework and currency, the size and complexity of the audit), timing, objective and communications of the audit.

SOCIAL BALANCE AS ONE OF THE KEY CHALLENGES ON THE WAY TO SUSTAINABLE DEVELOPMENT

Gunay Piriyeva

*Azerbaijan State University of Economics (UNEC), Azerbaijan
gunay75piriyeva@gmail.com*

ABSTRACT

A whole range of socio-political conflicts and economic problems of modernity unfolds between such extremes as unequal access to resources and rewards, wealth and poverty. Excessive differences in financial means and vital opportunities have a direct negative impact on the development of human potential, initiating long-range requirements that set incentives and direction of economic development. The article discusses the role of the middle class as an active economic entity, which is an engine of economic growth, as well as a guarantee of the stability of the entire social system. The middle class acts as a motivation for the innovative development of modern society because it is the foundation and social base of civil society. The availability of a powerful middle class in the social hierarchy of modern societies is an important indicator of reducing inequality, increasing the level and quality of life, and ultimately sustainable development. The process of creation and development of the middle class is one of the basic social processes in transformational economies. That is why it is necessary to create a social structure within the limits of which people would be able to establish their abilities and develop them to the full extent in order to strengthen the position of the middle class. The basis of social policy for sustainable development implies a fundamentally new system of values. Under this policy, the state shall maintain a balance of interests between social groups, which in turn will ensure the balanced and sustainable development of the entire social system.

Keywords: *development, sustainability, inequality, social structure, human capital, middle class*

1. INTRODUCTION

The idea of progressive development of human society was dominant for quite a long historical period. Belief in endless social progress, as a movement towards perfection, has accompanied humanity for centuries, even when it was criticized. No doubt, that modern civilization has reached incredible heights in the development of machinery and technologies, the dreams of mankind began to be realized owing to scientific discoveries, new inventions, and organization of labor in all spheres of human activity. However, along with the benefits, this development has caused many complex and dangerous problems. Amidst all these achievements, today, diametrically opposite trends are observed in the world, such as environmental degradation, economic imbalance, increasing social polarization as well as the gap in living standards of people, poverty, racial and ethnic conflicts, political instability, etc. Under such conditions, it becomes unavoidably obvious that transition to a qualitatively new level of development, namely to sustainable development, ensuring a global balance between resolving social and economic problems and preserving the environment, is vital for modern civilization. The report of World Commission on Environment and Development "Our Common Future" (1987) defines sustainable development as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (United Nations, 1987). It is a non-regressive type of evolution that reduces to an acceptable level any negative effects on an object with the purpose of preserving it, such as economic growth that does not cause environmental degradation while being accompanied by addressing the social problems, in particular, inequality and poverty.

Transition to sustainable development involves the creation of a balanced system that combines environmental safety, economic efficiency and social justice, preservation and gradual restoration of natural ecosystems up to a level that ensures environmental sustainability at which there appears to be a real possibility for the existence of future generations and for meeting their vital needs and interests.

2. INEQUALITY AS A THREAT TO THE SUSTAINABILITY

At Sustainable Development Summit (New York, Sept.25,2015) United Nations, 193 member states adopted the Sustainable Development Agenda till 2030, consisting of 17 Sustainable Development Goals (SDGs), which call for eradicating poverty, combating inequality and injustice as well as addressing climate change issues. Reducing inequality is one of the most important SDGs, as the inequality existing in the modern world in all of its forms, is an indicator of social regression, has become critical in recent decades and threatens overall global stability. In its turn, achieving sustainable development both globally and locally is impossible if people are deprived of the opportunities and conditions for building a better life. All the variety of forms of inequality can be observed in almost every particular society. This is quite natural considering that people differ in their individual capabilities, interests, life preferences, value-based orientations, etc. In every society, there are the poor and the rich, the learned and the unlearned, enterprising and unenterprising, high-powered and disempowered people. In this regard, R. Dahrendorf notes that: "Even in the affluent society, it remains, a stubborn and remarkable fact that men are unequally placed....Of course, such differences are no longer directly sustained by the force of legal sanction, which upholds the system of privilege in a caste or estate society. Nevertheless, our society - quite apart from the cruder gradations of property and income, prestige and power - is characterized by a multitude of differences of rank so subtle and yet so penetrating that one cannot but be skeptical of the claim one sometimes hears that a leveling process has caused all inequalities to disappear"(Dahrendorf, 1969,p.16). In the broadest strokes, inequality means that people live in conditions in which they have unequal access to limited resources of material and spiritual consumption, are at different levels of the vertical social hierarchy, and have unequal life opportunities. The problem of social inequality is a consequence of social and economic dissimilarity of labor, which is the reason for getting the power, prestige, and property by some people and the absence of these categories among representatives of other social groups. Affecting poverty reduction and depriving people of the feeling of satisfaction and self-sufficiency, inequality is often the cause of many problems in modern society. The problem of social inequality, its origin, attitude to it and ways of its elimination rings true through the present. It causes many questions such as: "Whether the inequality is an integral part of society's life?", "What impact it has on human development?", "Are there mechanisms for its eradication or at least smoothing?", "Is it possible to achieve social balance?".

2.1. Social stratification: main approaches to the definition

Crucial importance in formation of theoretical approaches to studying the essence, the form and the functions of social inequality is given to the classics of the world sociological theory K. Marx and M. Weber. Marx's concept of classes points to economic inequality, which is an objective factor of social structure. Class affiliation is defined not by people's vision of their social position, but by objective conditions allowing some groups to get preferential (compared to others) access to material benefits. According to Karl Marx, a class is a group of people with the same relation to the means of production by dint of which they ensure their existence. "Our epoch, the epoch of the bourgeoisie, possesses, however, this distinct feature: it has simplified class antagonisms.

Society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other — Bourgeoisie and Proletariat”(Marx, Engels, 2012, p.35). Thus in an industrial society, there are two main classes:

- Those who own the means of production - bourgeoisie
- Those earn a living by selling their own labor power - proletariat.

To Marx, the classes form and vie in virtue of different social positions and different roles of the individuals in the production structure of society. In turn, M. Weber has a bit different approach to this issue. Without denying Karl Marx’s assertions about the connection of a class with objective economic conditions, Weber believes that such factors as power and prestige also influence the formation of a class. Consequently, there are three interacting factors at the heart of the hierarchical structure of any society - power, wealth and prestige. To Weber, the possession of power, that is the possibility of influencing others, permeates all spheres of social being. The differences in wealth forms economic classes, and the economic status, in its turn, makes it possible (or not possible) to dispose of goods and qualifications with the purpose of getting income within a particular economic system. Differences in relation to the power engender large groups of people, called parties, and prestige differences form groups of people depending on status (Weber, 1968,p.169-183). The sociologist P. Sorokin pointed out that the differentiation of some given throng of people into classes in their hierarchical rank, driven by uneven distribution of rights and privileges, responsibilities and duties, the presence or absence of power and influence, social values is embodied in the social stratification, which in its turn determines the presence of the higher and lower classes in society (Sorokin,1959,p.11). According to defenders of the functional approach in sociology (C. Davis, U. Moore), the distribution of individuals by social strata depends on the importance of their professional activities and the contribution they make with their labor in achieving the goals of society. Despite the diversity of existent various models of social stratification, the typology of classes proposed by L. Warner in the 40th years of XX century can be rightfully considered as a classic one. In the course of an empirical sociological study, Warner identified social classes based on people's subjective self-assessments regarding their social position by parameters like “occupation”, “source of income”, “house type”, “dwelling area”, “amount of income” and “education” (Warner, et al., 1949, pp.163-164). Each of the three classes marked by Warner (*upper, middle, and lower*) (Warner, et al., 1949, pp.35-37) then further subdivided into an “upper” and “lower” segment as follows:

- Upper-upper class. “Old money”. People who have been born into and raised with wealth; mostly consists of old, noble, or prestigious families.
- Lower-upper class. “New money”. Individuals who have become rich within their own lifetimes (entrepreneurs, movie stars, as well as some prominent professionals).
- Upper-middle class. High-salaried professionals (doctors, lawyers, higher rung (were in the corporate market, yet left for a reason such as family time) professors, corporate executives).
- Lower-middle class. Lower-paid professionals, but not manual laborers (police officers, non-management office workers, small business owners).
- Upper-lower class. Blue-collar workers and manual laborers. Also known as the “working class”.
- Lower-lower class. The homeless and permanently unemployed, as well as the “working poor”.

As can be seen from the above, Warner puts a completely different content into the concept of social class, stating that social class enters into almost every aspect of our lives and is an

important determinant of personality, skills, abilities, and intelligence and patterns of consumption. (Warner et al. 1949: 5-6)

3. WHY MIDDLE CLASS?

The practice of modern developed societies shows that there is one answer to the question “which social class is the driving force of the modernization of society, the key to its stability and sustainable development” – that is the middle class. And this is quite understandable, since bridging a gap between the stinking rich and the extremely poor and reducing the limits of social inequality is possible only if a strong, numerous middle class is formed in the social structure of society. As early as in the age of antiquity, the great Aristotle directly linked the stability of the state with the presence and predominance in it of the middle strata of society. In “Politics” he noted that “the best political community is formed by citizens of the middle class, and that those states are likely to be well-administered in which the middle class is large, and stronger if possible than both the other classes, or at any rate either singly; for the addition of middle class turns the scale, and prevents either of the extremes from being dominant” (Aristotle, 1999, p.96). In each particular society the middle class has its own specificity, but in various countries, the similar stratification criteria are used to measure it. It should be noted that these criteria are most peculiar to the social structure of a developed industrial society, and new ones related to other non-material values are still being tried out by social practice. To identify the middle class, L.Grigoirev and A. Salmina highlight the followings as the main criteria, which are presented in Figure 1.

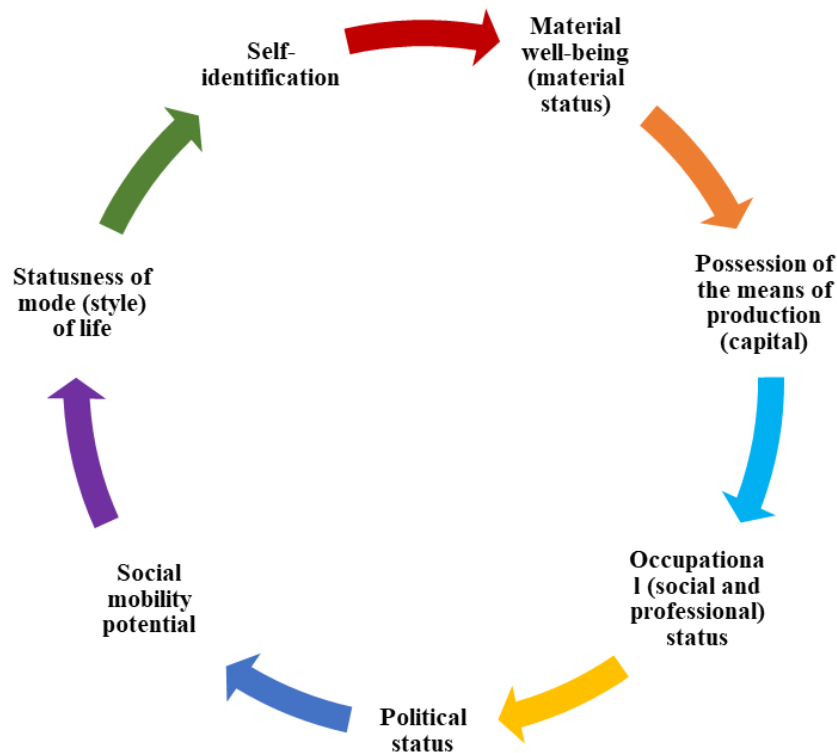

Figure 1: Criteria of identifying middle class (Grigoirev, Salmina, 2000, p.46-48)

Income is not the ultimate goal, but only a means for expanding people's opportunities in the field of economics, social activities, education, and health care, that is a means for achieving higher and more sustainable living standards. In this context, A. Marshall directly linked the accumulation of wealth with human development, synthesizing many ideas about the role of

man in the economy: "The production of wealth is but a means to the sustenance of man; to the satisfaction of his wants; and to the development of his activities, physical, mental, and moral. But the man himself is the chief means of the production of that wealth of which he is the ultimate aim"(Marshall,2009,p.144). Due to their vocational education and qualification, middle-class representatives occupy a position that provides great material and cultural advantages, allowing them to significantly improve the quality of life and provide access to a variety of benefits. It is representatives of this category of the population that form a request for modernization transformations on the one hand, and guarantee stability rejecting political violence on the other hand. It is quite obvious that the middle class, acting as an economically independent social subject is a foundation of both economic development and transition to an innovative development path.

3.1. Azerbaijan realities

Guarantee of dynamic social balance focused on the development of society and strengthening its stability and cohesion is a key task of the state. An important factor in addressing social problems, including fighting poverty and social inequality in the Republic of Azerbaijan, was state activity in the field of human development. The economic development of the country is a means of ensuring security and solving existing social problems. The development concept "Azerbaijan 2020: A Look into the Future" covers the main strategic goals of development policy in all spheres of the country's life, and it is currently being implemented through targeted state programs. One of the key issues of the Development Concept "Azerbaijan 2020: look into the Future"(2012) is the provision on the necessity to steadily expand the share of the middle class in the country and strengthen its role. Reports of international organizations suggest that in a relatively short period of independent development the Republic of Azerbaijan has achieved significant progress in this direction. Thus, according to the World Bank's classification by total national income per capita, Azerbaijan has been included in the category of countries with "high average incomes" earlier than other CIS countries (Azerbaijan 2020: look into the future,2012). Along with this, according to the report of the United Nations Development Program (UNDP) on Human Development for 2010, Azerbaijan left the group of countries with "average human development" and entered the group of countries with "high human development"(Azerbaijan 2020: look into the future,2012). The social development policy, as part of the overall development strategy of the country, has ensured a significant improvement in the social indicators of Azerbaijan over the past fifteen years. In accordance with international standards, measure levels of inequality and the success of social policy is determined by special indicators, among which the Gini Coefficient and Quintile Index are the most common and widely used ones. In terms of the Gini coefficient and the Quintile coefficient, in recent years Azerbaijan has a head start on most of the G-20 and G-7 countries (Alakbarov,2018, pp.153-155). These indicators show that in the near future, the middle class in Azerbaijan has the prospect of expansion.

Figure following on the next page

Figure 2: Analysis of social policy in the OECD countries and Azerbaijan Republic: Quintile ratio (HDR, 2016) (Alakbarov,2018,p.155).

Figure 2: Analysis of social policy in the countries of G7 and Azerbaijan Republic: Gini index (HDR, 2016) (Alakbarov,2018,p.153).

4. CONSLUSION

As it is known, in developed countries, the driving force of democratic change is considered to be the middle class, which must fulfil three main socio-economic functions. Namely, to stabilize the society (ensuring equal opportunities for living for all), to be a source of purchasing power of the society, as well as a resource for employment (entrepreneurship). In the advanced countries of the world, the middle class is considered as the carrier of the main social processes. The experience of America and Europe shows that the formation of the middle class is not a matter of one decade. The further growth and development of the middle class directly depend on the level of development of the country's economy and the measures taken by the state since the implementation of large state projects and the modernization of society is impossible without the participation of a highly educated, qualified middle class. The expansion of this social stratum, of course, allows ensuring the social stability and is a symbol of overcoming a

number of deep-seated economic and social problems. A significant increase in the number of the middle class, accumulated in the framework of conscious state policy, can become the basis for a new turn towards the sustainable development of the country. Proof of this is a global experience because it is countries with a strong middle class that are more sustainable in political, economic, social and other aspects and have higher development potential.

ABSTRACT

When an R&D project is launched, there are explicit and tacit aspirations as an attempt to achieve those results along which we evaluate the project as successful. Based on experience from previous projects, we can articulate all these aspirations with an extended vocabulary to present the expectations and intentions. This process can be supported by a Knowledge Engineer, who ensures the acquisition of all knowledge elements and who can help put them into the Knowledge Base of an Expert System. To reduce these attributes to the most informative ones, an AI-based Expert System can be used as a suitable tool, because when we have a few dozen cases in the domain, the result of case-based reasoning will show the most relevant aspirations. These expectations will describe both the limits and abilities of the project by which the decision maker can identify core competencies or even unsubstantiated dependencies on external resources. These insights can be key elements of strategic planning in the future. In this problem-solving process, we examine the question of which aspirations developers use in high-tech R&D projects, and the logical relationships between them. Since Popper's Tentative Solutions can be the adequate method for seeking answers in case of complex problems, we made semi-structured qualitative interviews with project managers and decision makers to build knowledge bases based on their experience and systematize their knowledge. The result of our research a) will show the set of those aspirations for which the same sensemaking will be given by different decision makers, and b) contributes a potential value to the validation of R&D projects.

Keywords: *R&D projects, decision support, project evaluation, Expert Systems*

1. INTRODUCTION

In this paper we would like to demonstrate the path to the results of an R&D laboratory as a potential source of innovation instead of giving a new interpretation of innovation, creativity or other difficult to define notions. Nevertheless, we think there is good sense in defining how to understand innovation from the point of view of our research. According to Drucker: "Innovation is the specific function of entrepreneurship, whether in an existing business, a public service institution, or a new venture started by a lone individual in the family kitchen. It is the means by which the entrepreneur either creates new wealth-producing resources or endows existing resources with enhanced potential for creating wealth." (Drucker, 2002) But in Christensen's studies there are two kinds of innovation (Christensen, 1997): sustaining

innovation which “targets demanding, high-end customers with better performance than what was previously available. Some sustaining innovations are the incremental year-by-year improvements that all good companies grind out. Other sustaining innovations are breakthrough, leapfrog-beyond-the-competition products. It doesn’t matter how technologically difficult the innovation is, however: The established competitors almost always win the battles of sustaining technology” and disruptive innovation which leads to create new markets or value networks by eventually disrupting a current market and value network. As Christensen explains in Harvard Business Review: “Disruption” describes a process whereby a smaller company with fewer resources is able to successfully challenge established incumbent businesses. Specifically, as incumbents focus on improving their products and services for their most demanding (and usually most profitable) customers, they exceed the needs of some segments and ignore the needs of others.” (Christensen, 2015) A key point of comparing the two kinds of innovation is that, disruptive innovation does not care about existing competitors. In our research we investigate the results of sustaining innovative projects. But if we would like to understand the conceptual framework of these projects even we can borrow Prahalad’s thought (Prahalad and Krishnan, 2008) “Successful innovations seamlessly connect concepts and ideas to their operational manifestations. We do not present a “charismatic leader” approach to innovation. Neither do we focus on big breakthroughs. We believe that the changing dynamic of markets driven by ubiquitous connectivity, technology, industry convergence (as in computing, communications, consumer electronics, and content), and consumer activism and involvement will create a need for continuous change—not just episodic big breakthroughs.” But Peter Drucker, as one of the most influential authors of innovation, emphasizes with his approach when he says: “Most innovation, however, especially the successful ones, result from a conscious, purposeful search for innovation opportunities, which are found only in a few situations. Four such areas of opportunity exist within a company or industry: unexpected occurrences, incongruities, process needs, and industry and market changes.” (Drucker, 2002). According to the explanation above, these R&D projects are the management of the manifestation of continuous change in turbulent times, and as such, it also means managing the unexpected. As Weick says in this regard: “If you want to manage the unexpected, you have to understand, first, how expectations work and, second, how to engage them mindfully....The basic argument is that expectations are built into organizational roles, routines, and strategies. These expectations create the orderliness and predictability that we count on when we organize. Expectations, however, are a mixed blessing because they create blind spots. Blind spots sometimes take the form of belated recognition of unexpected.” (Weick, 2007) As these projects were semi-structured or ill-structured processes with regards to their problem definition, it was interesting to understand the expectations, and to examine the aspiration levels from the perspective of the participants. Aspiration level is one of the ways of looking at the optimal ambition problem if we accept that “Individuals and organizations form aspirations, goals, targets, or ambitions for achievement. These ambitions are usually assumed to be connected to outcomes in at least two ways: they affect search (either directly or through some variable like motivation) and thereby performance; they affect (jointly with performance) satisfaction” (March and Simon, 1958).

2. RESEARCH METHODOLOGY

Our research was based on evaluation of the results of closed R&D projects from a ‘soft’ aspect instead of detailed numerical data analysis, as it is discussed above, and we selected a tool which can handle the term of the experts. But a bit more precisely it was a Knowledge Engineering process supported by a Knowledge-Based System. “The term knowledge-based decision support refers to using software tools called knowledge-based systems (KBS), expert systems (ES), or knowledge-based expert systems – as they utilize knowledge bases and are

expected to perform at the level of a human expert.” (Velencei et. al, 2014) During this process according to Chua (Chua et. al, 2012) “a knowledge engineer must represent acquired knowledge in such a way that a human can understand it and a computer system can process it.” Therefore Knowledge Acquisition occurred while knowledge engineers attempt to acquire the project managers’ explicit and tacit knowledge (Polanyi, 1958). In this research we use the Doctus Knowledge-Based System which is for systematizing prior knowledge and experience and it can transform them into symbols to develop models for different scenarios. This knowledge management software is advocated to be used for several different reasons such as a) it is able to ensure consistency of thinking by the “if...then“ rules, b) it reinforces human knowledge with the method of machine learning, and c) it effectively performs deductive and inductive reasoning in one. Nevertheless, it is just a tool in the knowledge engineer’s hand to support the process: “the Doctus KBS belongs to the area of symbolic systems, meaning that the knowledge representation it uses is based on symbolic logic in the form of “if... then” rules. A knowledge-based system, such as Doctus KBS, consists of two main parts: the software tool called the shell, which contains the inference engine but is empty in terms of the content and the knowledge base, which is the representation of the expert knowledge.” (Velencei et. al, 2014) But as it published in a relevant study “knowledge representation is not simply a translation of acquired knowledge to a knowledge representation. Instead, it is an iterative process of selective querying of acquired knowledge, and continuous refinement of a model leveraging, not only on acquired knowledge from domain experts, but also from the knowledge engineer” (Chua et. al, 2012) Thereby, this IT tool is for systematizing prior knowledge and experience of the experts and it can transform them into symbols to develop models for different scenarios while two or more alternatives are compared based on rules or cases. Depending on base of the reasoning we can distinguish rule-based reasoning or case-based reasoning. In some previous studies, Doctus KBS was used for rule-based reasoning when there was a need for making a complex business decision (Tóth-Haász, 2017) or even reductive reasoning when informal learning was examined in an organizational environment (Velencei, et. al, 2014) Thus there is empirical evidence that KBSs can be appropriate tools to recognize and exploit common cognitive patterns by Knowledge Representation. In our research we built several knowledge-bases from the projects as cases and we tried to get findings in recognizing the most informative aspirations by case-based reasoning.

3. PROPOSITION

As defined by Hakim, our qualitative research provides the ““individuals’ own accounts of their attitudes, motivations and behavior. It offers richly descriptive reports of individuals’ perceptions, attitudes, beliefs, views and feelings, the meanings and interpretations given to events and things, as well as their behavior; displays how these are put together, more or less coherently and consciously, into frameworks which make sense of their experiences; and illuminates the motivations which connect attitudes and behavior, the discontinuities, or even contradictions between attitudes and behavior, or how conflicting attitudes and motivations are resolved in particular choices made.” (Hakim, 1987) According to the classical distinctions of qualitative data collection methods – as observation, participant observation, interviewing, focus groups and case studies – our research is based on interviewing since these knowledge bases were built up with the help of project managers based on their experience by semi-structured, qualitative, in-depth individual interviews. This form ensures a greatly expanded process of data collection and the depth of gathered information “which encourages the interviewee to share rich descriptions of phenomena while leaving the interpretation or analysis to the investigators. The purpose of the qualitative research interview is to contribute to a body of knowledge that is conceptual and theoretical and is based on the meanings that life experiences hold for the interviewees” as it is published in the findings of a study (DiCicco-

Bloom & Crabtree, 2006). In these processes, in order to understand the conceptual framework, or, as we can say more easily, to see the big picture, the terms which are used should have the same connotation for us and for the decision makers. This part of the work was a very interesting fine tuning process, during which the system of expectations was refined step by step with each interview. As it was published in James March's very often cited book on organizational decision making, people can remember and recall colorful stories and information more easily than data of statistics. (March, 1991) Probably, this can explain the importance of story-telling and social narratives in complex decisions. Due to this our interviews were, actually, semi-directed story-telling about the projects through the same questions. These stories helped us understand those circumstances among which the projects and project managers exist and the mindset of the participants which determined their thinking. The first few narrated stories provided the initial set of attributes and related values and we tested them during each next occasion from the aspect of whether they are really familiar to the current interviewee. Nevertheless, we had to be careful because on the one hand we definitely wanted to avoid a situation where they start to use phrases which were told to them instead of their own ones, but on the other hand it was necessary to ensure that all of them keep the essence of the same terminology. This is a typical and crucial endeavor of the Knowledge Engineering process since Knowledge Acquisition (KA) is not about sharing ideas or conceptions of the gurus of the field (but undoubtedly, knowledge engineers need to know them to the right orientation during the process) and it should not be about the practitioner directly telling common sense, but it is about finding the most adequate system of the preference orderings the practitioner can think of. The proposed KA techniques were presented by Boose three decades ago (Boose, 1989). Wagner recently examined the trends of this long period (Wagner 2017) based on Boose's influential study in the field of KA and his findings meet with our approach concerning Knowledge Engineering and modeling. In accordance with the facts discussed above, there is a need for explicit and consistent relating of the preferences, as they get into the individuals' mindset in a distinct but complete form. After this a model is built based on collected data from the cases with the method of induction since the set of individual cases is used to find generalized logical rules. According to Popper's best known formula of problem solving, the sequence of events are as follows:

$$P \rightarrow TS \rightarrow EE \rightarrow P$$

where 'P' is for problem, 'TS' is for tentative solutions, 'EE' is for error-elimination. But this sequence is not a closed cycle because in the second stage, the problem is usually different from the previous (we can say that the problem has been shifted) since it is another situation which has emerged, partially as a consequence of the tentative solutions which have been tried out, and the error-elimination which regulates it. Therefore, the above schema has to be rewritten as follows:

$$P1 \rightarrow TS \rightarrow EE \rightarrow P2$$

This theory was published in Popper's work as: "the traditional philosophical problem of induction" (Popper, 1972). We determined aspiration levels for each step of the R&D project process and the responses, based on the interviews, were analyzed by KBS based on the ID3 machine learning algorithm. Several perspectives have been outlined in previous studies (Wagner, 2017)(Zarató and Liu, 2016)(Hung et.al, 2008) about the advances and future applications of similar systems.

4. EMPIRICAL RESEARCH

Generally, the systematized evaluation of cases (or we can say that making a complex business decision in connection with them) requires the obtaining of at least 15-20 relevant criteria as a set of well-ordered preferences and at least 3-4 different values must be assigned to each. In a case where there are too few attributes in the knowledge-base, we cannot state that the system of expectations is sufficiently sophisticated, but at the same time there is a chance that the individual's cognitive biases can significantly impact the outcome of the process. As it is illustrated in Figure 1 in our research, 16 attributes were acquired in the end, some of them in connection with the human relationships within the projects, for example "Relationship between the project manager and customer", and others about general characteristics, like "aim of the project" for instance. We have to note that, no attributes are included among the expectations that could be derived from financial data. Only one value refers to any kind of financial information: first value of the (project) RESULT is "according to the agreement" which means that the project was closed in time with the expected income. This value is treated abstractly, without facts supported by specific financial statements, because we assume that an experienced project manager, like our interviewees, is able to estimate the success of the project without measurement, just based on the patterns of thoughts as cognitive schemata in their mind. So all these aspects are that kind of 'soft' information which can be acquired only from the project managers' mind but from nowhere else.

Name
RESULT
project manager's experience in coordination
project manager's character
project manager's experience in the domain/topic
constitution of the developer team
aim of the project
the team leader's relationship to the topic
the team leader's capacity
project manager - team leader communication
relationship between project manager and customer
customer
problem definition
source of the idea
prior knowledge
timeframe
project manager change

Figure 1: Attributes of the knowledge-base

But it was also interesting to observe the evolution of the final set of attributes, as some attributes have been removed from the knowledge base due to the fact that after a few interviews it turned out to be irrelevant to the evaluation, while others were inserted into it. For example, originally, there were two attributes as "Project manager's character" and another as the "Professional leader's relationship to topic". However, both of them had a little bit different values and meaning, and as it became clear that in most cases the professional leader and the project manager were the same person, the second attribute seemed unnecessary. As an opposite example, at the start "Project manager change" had not been among the criteria but during the second interview a detailed story was told about a completely transformed project during which the project manager was changed for certain reasons. At this point we had to insert this new attribute with three values, furthermore, the first attribute as (project) "RESULT" had to be added as new value as "Transformed".

This value is used for those projects that were prolonged by a legal act, or conditions of the related contract were significantly modified by the parties. However, this case is one of the authoritative and adequate examples of why the role of knowledge engineer is decisive and why it is important to be competent in the field in which the process is supported. The interviewee started the story of the project from the point of view that it was a failed project. But as the story began to unfold, it turned out that it just seemed to be his own personal perception, since the project was not realized as it had originally been planned: the scope was significantly changed, the time frame was extended to an indefinite duration and some key team members were changed including the project manager – but the parties of the contract (including the customer) have never declared it a failed project. The project manager’s personal dissatisfaction caused his cognitive bias in the judgment of the result. Finally however, after we discussed the issue from a broader perspective, he accepted the opinion that it was a “transformed” project instead of a “failed” one. Each of the attributes has been assigned to 3 or 4 values, in one case to 5 values as it is illustrated in Figure 2. During the fine tuning process, some values had to be replaced because their original meaning proved too pejorative. For example, the first value of the “project manager’s character” originally was “careerist” but it seemed too negative for the interviewees and they were reluctant to choose it, so later it was replaced with “career-driven” which has a bit more positive connotation, since it refers to someone who is very self-conscious in their career. Immediately after we replaced it some interviewees were open to choosing it.

Name	Value 1	Value 2	Value 3	Value 4	Value 5
RESULT	☑ according to the agreement	financially failed	over time	it did not even start	transformed
project manager’s experience in coordination	☑ beginner	advanced	master	nothing	
project manager’s character	☑ career driven	passionate	does the job	not in good mood	
project manager’s experience in the domain/topic	☑ beginner	intermediate	advanced	master	
constitution of the developer team	☑ external workers	internal workers	both		
aim of the project	☑ technological adaptation	development	testing	problem-solving	
the team leader’s relationship to the topic	☑ annoyance	accepted	enthusiastic		
the team leader’s capacity	☑ free	on average	overwhelmed		
project manager - team leader communication	☑ convincing	senseless	irrelevant		
relationship between project manager and customer	☑ frequent knowledge sharing	official	stormy		
customer	☑ one	more	transferable anywhere		
problem definition	☑ well-structured	semi-structured	pseudo	changed the scope	
source of the idea	☑ manufacturing	developers of the customer	outsider	researcher	
prior knowledge	☑ we have experience	we have knowledge but no experience	we know who to ask	there is no one to ask	
timeframe	☑ unreal	fits to the resources	with resource expansion		
project manager was changed	☑ no	after partial results	because of incompetence		

Figure 2: Attributes with their values

There were some particularly interesting values, for instance, values of “Prior knowledge” were articulated as “we have experience” which means that objectives of the project were known to the participants at the start and they just had to adapt to a new project. The second value was “We have knowledge but no experience” which means theoretical knowledge without practice and justification. The third one was “We know who to ask” which means only the knowledge of the problem space, it was that case when members of the project team knew who are the most influential researchers in the field, whose results or studies have to be read in order to solve the problem. And finally, a value was defined for a situation when there is no prior knowledge in fact as “there is no one to ask”. After creating the initial attribute set and their values, the interviewees selected the relevant values for each project, if it was already there in the correct form. When we found that none of the available values were suitable for that particular situation, then we rearranged the current value set a bit to insert the new one. The outcome of this process resulted in the knowledge base from which the case-based reasoning will be started.

5. CONCLUSION

The goal of this paper is to lay out an approach to evaluate R&D projects in cases where lack of knowledge can lead to the emergence of a Knowledge Engineering process instead of analyzing financial results. Outcomes of this examination can be used as a promising starting point of future strategies in project planning and we assume that it will open the door for the use of Knowledge-Based Systems in project evaluation more widely. This approach can be used in any kind of project evaluation when knowledge management happens in a redefined complexity, or organizational learning and knowledge creation is required based on results and the experience of team members and project managers. Doctus KBS had been utilized to formalize this explicit and tacit knowledge, thus it may also be suitable to identify core competences of the R&D laboratory that need further examination, because, according to Prahalad and Hamel, these competencies fulfill three requirements: “(1) they provide potential access to a wide variety of markets; (2) they significantly contribute to the customer benefits of the end-product; and (3) they should be difficult for competitors to imitate.” (Prahalad & Hamel, 1990). This paper describes partial results of an ongoing research project. In this phase we examined the question of how to build a consistent knowledge base from the 7 or 8 interviewees’ mindsets, which finally will give the same sensemaking for all of them. Accomplishing this is a key point of knowledge creation because in reference to Weick’s novel approach to redefinition of learning, “individual learning occurs when people give a different response to the same stimulus, but organizational learning occurs when groups of people give the same response to different stimuli” (Weick, 1991). Our first observation is that individuals can only think through certain concepts or terms if they understand them, or, we can say, when it became part of their personal knowledge. In a case where the words are put into their mouths and they just accept them without any real conviction, their personal knowledge growth is not ensured. During these interviews, the second finding was that each of the participants has their own stories with different issues and their used phrases were a bit diverse, but it could be definitely felt that they were socialized in the same terminology. The initial results can already be seen from these 16 element number samples, but in order to identify beyond doubt the most informative attribute which evidently influences the successfulness of the projects, at we need to at least double the number of evaluated projects in the knowledge base.

ANALYSIS OF LOGISTICS SECTOR IN THE EUROPEAN UNION

Evgeni Genchev

Trakia University, Bulgaria

evg_gen2000@abv.bg

ABSTRACT

The logistics sector is one of the European Union's rapidly evolving sectors of the economy. Data of the period between 2011-2016, reveals that there is a 9% growth in the number of companies in the logistics sector with a turnover increase of 16.3%. The market structure consists mainly of micro-companies (the relative share of companies with 1-9 person is about 58-59%, and those with 2-9 persons employed- 31-32%), resulting in a total share of between 90 and 91%. Moreover, the overall share of the leading 5 countries (Germany, United Kingdom, France, Italy, and Spain) in gross value added in the sector is extremely high and reaches its peak in 2014-15 to 70.9%. The industrial dynamics in the sector are also examined through the difference between the share of entry and exit rates of the enterprises. For the first two years, this difference is negative; however, starting in 2014, we see positive increase, reaching its peak of 3.3% in 2016.

Keywords: *logistics sector, market structure, industrial dynamics, European Union*

1. INTRODUCTION

If a country's economy is looked at as a human organism, then its gross domestic product can be considered as the "heart", because any boost to the production, based on a previous period, causes growth in it. Logically, the logistics sector is the "blood circulatory system" as it connects all sectors of the economy, provides the necessary raw materials and allows for smooth operation. The purpose of this report is to reveal the main features of the logistics sector in the European Union. Particular attention will be paid to the market structure, growth, leading countries in the industry. Firm entry and exit are important to the functioning of every sector of the economy, including logistics. For this reason, we track the relative share of entering and exiting enterprises in the industry. The scope of the study includes the countries of the European Union for the period 2011-2016. The main source of information is the publications of the Statistical Office of the European Communities in sections: "Structural Business Statistics" and "business demography" where all data are broken down by activity according to the NACE classification.

2. METHODOLOGICAL ISSUES RELATED TO THE ANALYSIS OF THE LOGISTICS SECTOR

We will use the variables: turnover and turnover growth when examining trends and growth in the sector and its individual sub-sectors. First of all, turnover is defined as the sum of the remuneration for rendering services to customers and the sales of merchandise, and gross income from other activities. To determine the contribution of individual countries in the industry, we apply the value-added indicator, as a percent of total value added. Value added is figured as the sum of production value less the purchase of goods and services (for other goods and services than those purchased for a resale) and special public taxes, and corrected for changes in stocks of raw materials and consumer goods. To determine each country's contribution, we apply the "Value Added" indicator, as a percent of total value added in the industry. It is a popular indicator that is used in almost all studies of this type. There are several ways to analyze industrial dynamics. Standard variables used by Eurostat are as follows:

- A number of active enterprises, which is the number of registered legal or natural persons who have had turnover or employees, i.e. they were active during the reference year (t).

- Birth rates and death rates are calculated as a proportion of entries and exits of enterprises during the reference year to the mean number of active enterprises in the reference year (in percent). The difference between these two ratios (net entry rate) gives the real dynamics in enterprises population in a given year¹. Market sum (churn) rates are defined as the sum of birth and death rates expressed as a percentage of the total number of active firms in industry².

In examining this problem, Haltiwanger et al. (Haltiwanger, J., Jarmin, Ron S. and Miranda, J., 2009, p.1). think that it is possible to measure: establishment openings and closings, firm startups, job creation and destruction by firm size, age, and industrial sectors. Doan et al. (Doan, T., Devine, H., Nunns, P., & Stevens, P., 2012, p.12) believe that net entry rate declining during an economic crisis.

3. RESULTS

3.1. Analysis of growth and market structure in the logistics sector

The “Logistics sector” (as labelled in this study) has been classified into five sub-sectors: “NACE Division 49, Land transport and transport via pipelines”, “NACE Division 50, Water transport”, “NACE Division 51, Air transport”, “NACE Division 52, Warehousing and support activities for transportation” and “NACE Division 53, Postal and courier activities.”³ The logistics industry has generated nearly 8% of total value in the non-financial business economy for the period 2011-2015 (see Figure 1).

Figure 1: Contributions of the logistics sector to total EU business economy, except financial and insurance activities, 2011-2015

This share remains relatively stable, as is confirmed by Satta et al., (Satta G., Parola F., Lee SW 2011, p. 9). Market structure of the logistics sector in the European Union is determined by the number and size of its companies, and its growth depends on the volume of sales made.

Figure 2: Growth in the number of enterprises in the sector compared to 2011

Logistics sector is one of the European Union's rapidly evolving sectors of the economy. The first two years of the analysis (Figure 2) show a nearly 2% drop in the number of enterprises in the industry. Since 2014 there has been a constant growth and for the whole period 2011-2016 there was an 8.1% growth in the number of companies in the sector. If we turn our attention to the distribution of logistics companies, based on their size (Table 1) we will find that about 91% of them are small enterprises of 1-9 employees. This trend is constant over the whole studied period (2012-2016). Companies with 50 or more employees are extremely rare and their relative share is within the range of 1.7-1.8%.

Table 1: The transportation and storage sector by employment size class, 2012-2016 (Source: Annual enterprise statistics by size class for special aggregates of activities⁴ (NACE Rev. 2) and own calculations)

Enterprise size/ year	2012	2013	2014	2015	2016
<i>From 0 to 9 persons employed</i>	90,7	90,7	90,8	90,6	90,7
<i>From 10 to 19 persons employed</i>	4,6	4,6	4,5	4,6	4,6
<i>From 20 to 49 persons employed</i>	3,0	3,0	2,9	3,0	3,0
<i>From 50 to 249 persons employed</i>	1,4	1,4	1,4	1,4	1,5
<i>250 persons employed or more</i>	0,3	0,3	0,3	0,3	0,3

Figure following on the next page

⁴ http://appsso.eurostat.ec.europa.eu/nui/show.do?dataset=sbs_sc_sca_r2&lang=en

Figure 3: Share of enterprises by sub-sector, 2012-2016
 (Source: Eurostat⁵ and own calculations)

The highest share is that of enterprises (Figure 3) in the "Land transport and transport via pipelines" sub-sector, which in two consecutive years 2012-13, was over 80% and reached its lowest level - 78.7% in 2016. The total share of companies in the „Water and air transport” sub-sectors is within 2%. Overall, the market structure of the companies, by the type of their economic activity is stable. The only slight trend that can be observed is the slight growth of enterprises in the “Warehousing and support activities for transportation“ and “Postal and Courier activities“, respectively, with a growth of 0.7% and 1.6%, respectively.

Table 2: Turnover levels (in a million euro) and growth rates in EU logistics sector
 (Source: Eurostat⁶ and own calculations)

Subsectors		2011	2016	Total growth (in %)
EU-28		1320000	1500000	+13,64
Land transport and transport via pipelines		500000	577000	+15,4
Water transport		112313,3	111444	-0,1
Air transport		126807,6	145200,1	+15,2
Warehousing and support activities for transportation		460000	539683,7	+17,3
Postal and courier activities.		106812,1	126778,4	+18,7
The best performing countries	N1 Ireland	17749,5	25076,3	+41,3
	N2 Romania	11642,4	16181,7	+39
The worst performing countries	N1 Estonia	4727,8	4585,8	-3
	N2 Sweden	47762,8	47507,4	-0,5

⁵ http://appsso.eurostat.ec.europa.eu/nui/show.do?dataset=sbs_na_1a_se_r2&lang=en

⁶ http://appsso.eurostat.ec.europa.eu/nui/show.do?dataset=sbs_na_1a_se_r2&lang=en

In all countries in the European Union, a decline in sales in their logistics sectors (Table 2) is observed only in Estonia and Sweden, by 3% and 0.5%, respectively. The overall growth in the sector is 13.64%, with Ireland and Romania being the most well-performing countries, with an increase of 41.3% and 39% over 5 years. The only exceptions are the companies in a sub-sector “Water transport”, where turnover levels are stagnant. All other 4 sub-sectors recorded growth, the most notable being with the „Warehousing and support activities for transportation“ and „Postal and courier activities“ with 17.3% and 18.7% respectively.

3.2. Key players in the logistics sector of the European Union

Let me point out that the focus of this study will be given to individual countries and not to individual companies. Is the activity in the logistics sector controlled by several countries or distributed more evenly? To give a reasoned answer to this question, it is necessary to analyze the contribution of individual countries, for example with regard to gross value added (Figure 4).

Figure 4: Share of five leading countries of gross value added, 2011-2016
 (Source: Eurostat⁷ and own calculations)

Germany occupies the first place in the ranking of contributions in the sector (Figure 4) with a share within 18,4-19,8%. The second and third places are reserved for the UK and France, which changed their positions in 2013. Obviously, the total share of the top 5 countries in the European Union is extremely high and reaching its peak of 70,9% in 2014-15.

3.3. General business dynamics in the logistics sector

One of the objectives of this study is to determine the birth and death rates of enterprises in the individual sub-sectors of the European Union's logistics sector for the period 2012-2016 and to establish their overall dynamics. These two indicators, which we mentioned, are one of the most important in measuring industrial dynamics. Such a methodology is also used in the business demography survey of Polish enterprises by Ptak-Chmielewska⁸ (Ptak-Chmielewska, 2011, p.70).

⁷ Annual detailed enterprise statistics for services (NACE Rev. 2 H-N and S95)

⁸ Ptak-Chmielewska, Aneta. "BUSINESS DEMOGRAPHY ISSUES AND EMPIRICAL RESEARCH ON DYNAMICS OF ENTERPRISES' POPULATION IN POLAND." ACTA SCIENTIARUM POLONORUM (2011): p. 69-81

Unfortunately, Eurostat does not have information on Cyprus and Malta for several years, and on Greece for 2 years, but considering their insignificant size, we believe that this will not affect our final conclusions.

Table 3: Firm birth/death rates as a percentage of active firms in the logistics sector in EU, 2012-2016 (Source: Eurostat⁹ and own calculations)

	2012 birth/death rates	2013 birth/death rates	2014 birth/death rates	2015 birth/death rates	2016 birth/death rates	Average 2012-2016
<i>Land transport and transport via pipelines</i>	9,7/10,4	10,1/10	11,8/9,3	13,2/10,7	12,6/8,8	11,5/9,8
<i>Water transport</i>	9,1/9,8	8,8/8,9	9,6/10,4	9,4/9,3	9,5/10,6	9,3/9,8
<i>Air transport</i>	11,5/10	9,9/9,4	8,4/9,3	9,2/9,3	9,6/8,3	9,7/9,3
<i>Warehousing and support activities for transportation</i>	8,4/8,2	8,6/7,8	9,3/7,5	10,3/7,8	13,8/6,8	10,1/7,6
<i>Postal and courier activities.</i>	16,5/14,5	16,5/13,2	17,3/12,8	19,0/14,2	19,5/12,6	17,8/13,5

Apparently, the highest average rate of entering enterprises is in the "Postal and courier activities" sub-sector. One of the probable reasons for this is the low barriers to entry into the industry. In 3 of the rest 4 sub-sectors, the average values vary within 9.7-11.5%. And conversely, the share of start-up enterprises in the "Water Transport sub-sector" is the lowest, with a mere 9.3%. The smallest percentage is that of enterprises leaving the market in the "Warehousing and support activities for transport" sub-sector, only 7.6%. In 3 of the rest 4 types of activities, we observe values between 9.3 and 9.8%. The Postal and courier activities sub-sector marks the highest rate of "leaving" enterprises averaging 13.5%. It is even better to use different derivatives of the above-mentioned two indices. According to some authors¹⁰ "the sum (churn) of birth and death rates of enterprises, provides a measure of how frequently new firms are created and existing enterprises close down. The indicator reflects industry's degree of "creative destruction". Burke et al. (Burke, Andrew E., Holger Görg, and Aoife Hanley, 2005, p. 1) claim that „dynamic markets as markets where the rate of churn (firm entry plus exit) of firms is high and static markets are characterized by a low churn rate and where price competition is more important." In this way, the processes of industrial dynamics can be traced both by years and by sub-sectors. What basic conclusions can be drawn from this analysis (table 4)?

Table following on the next page

⁹ Employer business demography by size class (from 2004 onwards, NACE Rev. 2)

¹⁰ OECD (2017), Entrepreneurship at a Glance 2017, OECD Publishing, Paris, https://doi.org/10.1787/entrepreneur_aag-2017-en, p.84

Table 4: Firm birth/death rates as a sum (churn) and a difference in the logistics sector in EU, 2012-2016 (Source: own calculations)

	2012	2013	2014	2015	2016	Average 2012-2016 sum	Average 2012-2016 difference
Land transport and transport via pipelines	20,1	20,1	21,1	23,9	21,4	21,3	1,6
Water transport"	18,9	17,7	20	18,7	20,1	19,1	-0,5
Air transport	21,5	19,3	17,7	18,5	17,9	19,0	0,4
Warehousing and support activities for transportation	16,6	16,4	16,8	18,1	20,6	17,7	2,5
Postal and courier activities.	31	29,7	30,1	33,2	32,1	31,2	4,3
Average Birth and death rates sum (churn) for logistic sector	21,62	20,64	21,14	22,48	22,42	-	-
Average Birth and death rates difference for logistic sector	0,4	0,9	1,4	2,0	3,6	-	-

- First: We have a much more dynamic subsector than the rest in the face of "Postal and courier activities", where the average quantity of entry and exit companies is over 30% per year. For the remaining 4 sub-sectors, the rate of churn stays fairly constant at around 17,7 or 21,3 percent.
- Second: The rate of dynamics over the past two years has increased and while the sum in 2012 was 21.62% in 2015 and 2016 it reached 22.48% and 22.42%, respectively.
- Third: The logistics sector has become more and more attractive over the past two years, with the highest difference between entering and exiting enterprises was 3,6% in 2016.

4. CONCLUSION

The report summarizes some economic trends that affected the development of the EU logistics sector for the period 2011-2016. Of course, the topic is too broad and cannot be covered in detail within the limited volume given. A comparison between the cost-effectiveness of enterprises of varying sizes or of different sub-sectors would be of interest in future studies.

As a result, some important conclusions can be made:

- The average representative of an enterprise in the sector is a small company with 1-9 employees (91% probability). Large companies with over 50 staff are rare – less than 2%.
- European Union's logistics sector is dominated by several countries and the share of the top five in gross value added reached its peak of 70.9% in 2014-15.
- Despite the domination of the leading countries: Germany, Great Britain, and France, the threat to them comes from several rapidly growing logistics markets. Based on our analysis for the period 2011-2016, the highest growth is observed in Ireland, followed by Romania and Bulgaria. Therefore, Eastern Europe is becoming more and more important also as a location and thus has the greatest potential for logistics service providers.

ABSTRACT

*Based on the official data set of the State Examination Center of the Republic of Azerbaijan, authors analysed the normality of distribution of applicants' admission exam scores with the means of Pearson's chi-squared test (χ^2). It was found that admission scores do not follow the normal distribution. Based on the dynamic series, the analysis was conducted, and average score attained by applicants, deviation from the average score (σ -standard error), as well as variation coefficient was calculated and level of homogeneity of attained scores were identified.
Keywords: examination point, chi-square, distribution, normal, statistical analysis*

1. INTRODUCTION

Development of the non-oil sector is noted as one of the main objectives in "Azerbaijan 2020: Looking to the Future" development concept ("AZERBAIJAN 2020: LOOKING TO THE FUTURE" DEVELOPMENT CONCEPT, 29 December 2012, https://president.az/files/future_en.pdf). Knowledge economy plays a big role in shaping the new economic system. Knowledge economy requires increasing the quality of science and education. Transition process from traditional economy to knowledge economy first originates in schools and for this transition it is imperative that admission to high education institutions is conducted in accordance with modern requirements. Since 1992, the State Examination Center of the Republic of Azerbaijan (formerly named State Student Admission Commission (SSAC)) (SEC) is enrolling students into higher education institutions. For example, in 2017 SEC carried out examination on 54 universities and 160 speciality. There were 43,000 planned places, of which 14,000 were in Group I, 12,500 were in Group II, 10,000 in Group III, 300 in IV Groups and 3200 in Group V. But the universities could not fulfil the plan. However, some of the private universities could fill only 11 percent of the plan.

In general, the admission plan for higher education institutions in Azerbaijan are rising year after year, but the number of applicants for admission declines sharply (<https://azvision.az/news/119130/-ali-mekteblere-kecid-ballari-asagi-alinacak-ekspert.html>). It should be noted that in previous years, the SEC decreased the pass score for a pre-determined competition because the applicants did not meet requirements of the contest conditions. Even though the transitional score was 250 in 2016, it was postponed to 150. (<http://www.tqdk.gov.az/>). Also, it is negative phenomenon that there are technical specialties among the vacant plan places. As you can see, there are certain problems in terms of the quality of teaching in secondary schools and planning abuturent admissions to higher schools. Research on these issues is scientifically relevant.

2. THE QUALITY OF EDUCATION AND ITS ROLE IN ECONOMIC GROWTH

The positive impact of increasing the quality of education on economic growth, science, social and cultural development is undeniable and there are quite a number of sources in this area. Prior to the 1990s, predominantly quantitative indicators of education were given preference for economic growth and human capital formation. From this point of view, the level of literacy of the population, the level of secondary education and, finally, the stages of education were considered. Data from this category are reflected in the statistical offices of many countries. Relevant information on Azerbaijan is provided on the official website of SSCRA (<https://www.azstat.org/> [Retrieved Date 02.11.2018]), as well as in statistical journals published by the Committee (Education, Science and Culture in Azerbaijan. Statistical Yearbook, 2018, 2017, 2016, 2015). After the 1990s, quality indicators were also involved in the economic sciences. A review of quality factors affecting economic growth was given by Hanushek (2007). One of the important conclusions drawn from this review is that when a graduate of secondary school finishes high school grading, a standard deviation from the mathematics subject is higher than the national average, his annual income is 12% higher than the average. The quality factors affecting the economic growth should be specifically mentioned:

1. The median value in the admissions exams;
2. Capacity of the population to adopt new knowledge, technology and habits;
3. Computer and internet skills;
4. Foreign language skills.

It is obvious that among these factors foreign language skills play a key role in developing other factors. Another approach that can determine the quality of education in the country is to conduct international comparisons. For example, among the 15-year-olds there is a PISA competition (<http://www.oecd.org/pisa>), held once every three years since 2000. Here, the knowledge, skills and habits of adolescents are checked in 3 ways: reading mastering, natural science and mathematics. Rating scopes are set up, allowing for international scores to be scored for each country in each of the three directions. This allow advanced countries in the field of education to be identified. Note that, according to the results of 2015, Singapore was the first in all three directions (<http://www.oecd.org/pisa/PISA-2015-singapore.pdf>). Its transformation “from third world to first” in one generation is one of Asia’s great success stories. Naturally, the best practice in international education should be the model for development. Science and education have an exceptional role in the development of the country's economy. Costs incurred to develop these areas are of great importance. In economically developed countries, the share of science in GDP is fairly high. For example, for OECD countries (Bulatov, 2017, p.266) the average value of this indicator is 1.92%. For neighboring Russia this figure is 1.1%, Kazakhstan - 0.68%. The share of education expenditures in GDP is 6.1% for the OECD countries in 2011 (Bulatov, 2017, p. 268), 5.1% for Japan, 7.6% for South Korea and 7.3% for Israel.

In Russia, the corresponding expenditure is 4.6% of GDP. For Azerbaijan this indicator was 2.46%. On the other hand, the share of higher education in GDP in 2014 was 1.6% for OECD countries, 2.8% for Canada, 2.7% for USA, 2.6% for South Korea, 1.9% for Finland, 1.3% for Germany and 1.4% for Russia. For Azerbaijan this indicator is 0.85% in 2017. (Explanation on the draft law of the Republic of Azerbaijan "On the 2017 State Budget of the Republic of Azerbaijan" (2017), p.20). One of the key elements in raising the positive impact of education on economic development is to improve the quality of secondary education. Based on the experience of developed countries in this regard, we can see that the high school duration, the average score collected in the final exams or in the admission exams and its standard departure (subject to the normal distribution law), high proportion of those studying in the specialty and the share of students enrolled in higher education are one of the main factors.

3. DATA BASE OF RESEARCH, ITS PROCESSING AND STATISTICAL ANALYSIS

Table 1 represents several indicators showing the student admission to high education institutions during 1996-2017 in Azerbaijan.

Table 1: Some statistical characteristics of students' scores collected in admission to universities in Azerbaijan in 1996-2017

Source: Information from SEC, <http://www.tqdk.gov.az/> and calculations of authors

Figure 1 is the graphical representation of the dynamics showed in the Table 1. Figure 1 shows the number of student applicants, average score in exam for high education institutions and standard deviation from average score.

Figure 1: Graphical representation of number of student applicants, average score in exam for high education institutions and standard deviation from average score

As it is shown in Figure 1, the average admission exam score attained by applicants is higher than the standard deviation of average score, however the difference in between them is not significant. This can be considered as one of the signs of a sharp violation of the homogeneity of the level of education among applicants and secondary schools. Let's calculate the ratio of the standard deviation to the mean, that is, the coefficient of variation: (Hasanli Y, 2014, p. 69)

$$V = \frac{\sigma}{\bar{x}} * 100\% \quad (1)$$

The lower the coefficient of variation is, the greater the homogeneity of the property value will be in the sample. At this time, the mean value becomes the typical property of the sample. The higher the coefficient of variation is, the greater the heterogeneity of the property value will be in the sample. The coefficient of variation shows change in the intensity of the property as well as the homogeneity of the sample. The higher V is, the higher the dispersion of the property around the mean value and the greater the heterogeneity will be in the sample. There is a scale of sample homogeneity depending on the value of the coefficient of variation.

Table 2: Levels of the coefficients of variation

V, in %	The level of sample
Up to 30 %	Homogeneous
30 %-60 %	Middle
60 % and more	Heterogeneous

Let us calculate the coefficients of variation on the basis of the data given in the Table1 (Table3).

Table 3: The dynamics of the coefficients of variation for 1996-2017 years

Years	Azerbaijan section	Russian section	General
1996	71.3	61.7	69.4
1997	74.1	65.3	72.5
1998	80.2	61.1	77.1
1999	70.8	51.4	68.5
2000	78.5	61.0	76.5
2001	69.8	59.8	68.7
2002	82.4	66.0	80.3
2003	81.6	65.6	80.9
2004	84.0	64.6	82.3
2005	80.8	64.9	79.3
2006	83.6	70.7	82.3
2007	80.9	53.2	78.6
2008	78.0	58.7	76.1
2009	84.0	61.5	81.7
2010	82.9	61.4	80.9
2011	84.5	62.7	82.5
2012	87.8	64.9	85.6
2013	90.3	68.9	88.4
2014	91.7	71.7	89.8
2015	84.3	66.6	82.8
2016	79.6	65.3	78.4
2017	72.1	63.4	71.3

The graphic image of the coefficients of variation given in the Table 3 is shown on the Figure 2. As we can see from the Figure 2, that the homogeneity of the level of education in the Azerbaijani and Russian sections of secondary schools differ sharply and is heterogeneous across the country (with the exception of the Russian section for several years). The level of homogeneity of the coefficient of variation of education in the Russian section of secondary schools in 1999, 2001, 2007, 2008 was average. We should note that, this is due to the fact that the absolute majority of Russian schools are located in the capital of the state, Baku.

Figure 2: The graphic image of the coefficients of variation for 1996-2017 years

4. TESTING OF THE DISTRIBUTION OF ADMISSION SCORES TO UNIVERSITIES IN AZERBAIJAN

For example we will test the admission scores for the 2012/2013 academic year on the basis of official data of SEC, by Pearson's χ^2 criterion, to find out if the admission scores are distributed normally. For this we will make the table 4.

Table 4: Distribution of admission scores for 2012/2013 academic year

Score interval	Applicants' size	Cumulative sum	Empirical frequency	Theoretical frequency	EmpFre-TheorFre	(EmpFre-TheorFre) ²	(EmpFre-TheorFre) ² /TheorFre
0-60	27692	27692	0,286	0,001	0,285	0,081	62,486

Conclusion: The applicants' scores have not been normal distributed.						Chi-square critical	Chy-square evaluated

Source: Calculations of authors based on official SEC data

Based on the Stercens formula [2], the number of intervals is $1 + \log 2700 = 1 + 9,45 = 10,45$. We took the number of intervals 12 and calculated the intervals by 60 points, dividing 0-700 points into equal portions. Note that theoretical frequency is based on standard regular distribution tables. Then $k = n - 1 - r$, with the criterion based on the Chi-square [2] criterion, $\alpha = 0.05$ with $n = 12$, $r = 2$ (two parameters in normal distribution: mean and standard deviation), and $k = n - 1 - r = 12 - 1 - 2 = 9$. Therefore

$$\chi_{kritik}^2(0,05;9) = 16,92 \quad (2)$$

$$\chi_{evaluated}^2 = \sum ((EmpiricalFrequency - TheoreticalFrequency)^2 / TheoreticalFrequency) = 63,60 \quad (3)$$

and because of the calculated value is larger than the critical value, the distribution is not subject to normal law. In other words, this differs from the normal distribution law described in Figure 3.

Figure following on the next page

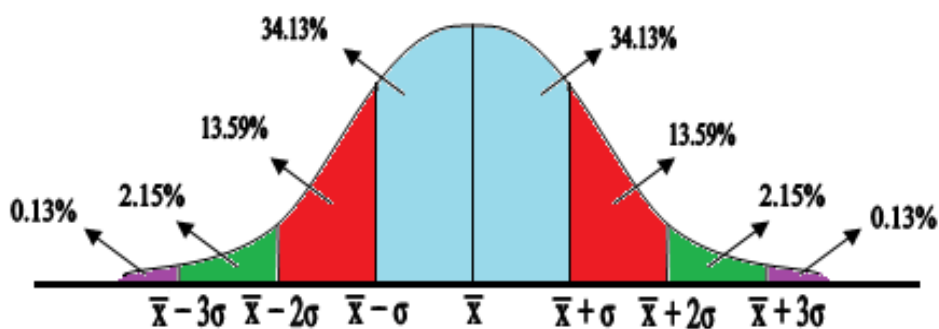

Figure 3: Curve of normal distribution. Three Sigma Rule

Empirical image of the distribution of admission scores for 2012/2013 academic year based on table 5 is given in Figure 4.

Figure 4: The distribution of the applicants by the admission scores intervals for 2012/2013 academic year. Here, on the abscissa, the intervals of admission scores and on the ordinate, the number of applicants are shown.

As we can see from the Figure 4, the empirical distribution of the admission scores to the universities, significantly differ from the normal distribution. One of the reasons of this phenomenon can be the heterogeneity of the quality of education at secondary schools.

5. RESULTS

Despite the fact that the average score gained by applicants in the entrance exams is more than the standard deviation, this difference is quite small. The value of the coefficient of variation showed that the homogeneity of the level of education in the Azerbaijani and Russian sections of secondary schools differ sharply and is heterogeneous across the country (with the exception of the Russian section for several years). The level of homogeneity of the coefficient of variation of education in the Russian section of secondary schools in 1999, 2001, 2007, 2008 was average. According to the official data of the SEC, distribution of the admission scores were tested by Pearson's χ^2 criterion and it was found out that admission scores were not distributed normally.

6. CONCLUSIONS

Heterogeneity of admission scores scored by applicant during entry exams can be explained by the fact that the quality of education differs sharply between schools or applicants.

The reason that the level of homogeneity of admission scores in the Russian section is relatively high and average in 1999, 2001, 2007 and 2008 is the fact that the absolute majority of Russian schools are located in the capital of the state, Baku. In other years, this level was heterogeneous. The reason of the fact that admission scores were not distributed normally as well as heterogeneity of admission scores can be explained by the strong difference in the level of education and knowledge of students.

ABSTRACT

This paper deals with the investigation of the Slovak public relation to the advertising of the consumer goods and services. Marketing research was realized via qualitative research method using structured questionnaire on the chosen sample of respondents by purposeful sampling (n=1067). We focused mainly on the public perception of the commercials, their intensity and necessity, preferred advertisement, consideration of the advertising, as well as the interest in commercials and the impact of the advertisement on the public behavior. In the first place, the evaluation of the qualitative research was realized by one-dimensional descriptive statistics what points at the frequency of the individual preferred opinions. Secondly, selected questions were evaluated by two-dimensional statistics to find some statistic relevant relations among qualitative characters using Pearson Chi-square test. The findings reveal that the advertising is necessary for the Slovak public, but its intensity is too high, which lead in some cases to public annoyance. The statistical relevant influence on the respondent's attitudes to the advertising had their status and education. Other conclusions are related to the public requirements on preferred characters for advertising to those mostly were matched attributes like truthful, modest, comprehensible, humorous and original.

Keywords: *advertising, inquiry, marketing, questionnaire, respondent*

1. INTRODUCTION

The advertising is for the enterprises still the most attractive and used form of communication with their customers. The companies are willing to invest considerable financial resources into its preparation, presentation or into the marketing research. The advertising effectiveness and efficiency are the main indicators tracked by marketing assessment of advertising (Mian et al. 2018; Chen and Waters, 2017). The advertising is the unthinkable part of the communication with the customers. However, approved marketing tools of communication as for instance television, print, radio etc. are gradually being more overshadow. This fact could be caused by overloading of the traditional communication channels by advertising. Customers still more prefer online communication as e-mails, social networks, software applications on mobile devices were tools like viral, online and mobile marketing are much more useful (Martins et al. 2019; Alalwan, 2018; Chang, Wang, 2019; Lin, Fu, 2018). On the other side, the importance of public relations starts to grow repeatedly due to interest of increase the companies' credit (Pressgrove et al. 2018). The number of advertising tools grow constantly and the marketers still look for new means of expression for the formulation of their advertising ideas. The range of these tools will spread and improve depending up the scientific-technical progress. Nevertheless, the ethics of advertising could restrict or exclude the use of some of them. (Prachár, 1993; Mpinganjira, Maduku, 2019). Since 2014, the investments for buying the

advertising space in media have been growing continual in Slovakia. The total investments for advertising achieved in average 366 million € in 2018. The growth of advertising was supported mainly by expenditures into the online marketing at the global level. However, the advertising also grew in the television broadcasting on the Slovak market. The television is still the powerful media with highest credit in Slovakia. Approximately 45% of the total investments for advertising are placed in the Slovak television¹. The mobile providers put the most investments into the advertising of their campaigns focused on different telecommunication services. They are followed by providers of bank products, cars, drugs and retail channels. In Slovakia, the total share of digital advertising rised up to 32% including companies Facebook, Google, Search, Direct in 2018. The global average according the Zenith agency oscilated from 36% to 40%. The telecommunication, financial and motorsport companies invest the most in the internet advertising. The fourth place belongs to different services they include the advertisement on estate services, education or political advertising. The advertising of food products is on the fifth place. The legal regulation of the advertising did not exist in Slovakia by the year 1996. The advertising was included in several acts, namely in direct or indirect form, e.g. in the act about the radio and television broadcasting, press law, commercial code, civil code, but also in penal code. The acceptance of the act of advertisement No. 147/2001 body of laws did not mean the complex solution of the given problem in one law. The legal regulation of advertising stays henceforward wide-spectrum because it concerns as public law so civil law. The committee for advertising is responsible for the process of so called self-regulation in Slovakia. The main goal of this committee is to ensure and enforce the broadening of a fair, proper, decent, legal and truly advertising. Since 1995, the committee for advertising has been a member of EASA (The European Advertising Standards Alliance)². In the same year, the committee published the document "Ethical principles of the advertising praxis in Slovakia" also called as "Advertising Codex". From the reason of very little scientific knowledge about the public opinion on ways of advertising in Slovakia, requirements on advertising features etc., the main goal of this marketing research is the assessment of public preferences on advertising.

2. METODOLOGY

The methods of qualitative statistics were used for examining the opinions of the chosen respondents on reviewing their relation to the advertising in the Slovak conditions (Wackerly et al., 2007; Yin, 2003). The structured questionnaire with closed questions and measure scales was used as a tool of the qualitative approach (Silverman, 1996). First, the questionnaire was tested by so called pre-test on the sample of 30 respondents to avoid the intelligibility of selected questions. After some corrections related to the pre-test, the questionnaire was adapted to electronic version via google docs. The respondents were obtained by purposeful sampling. The frequency of respondents' opinions on individual questions was first analyzed by one-dimensional statistical method. Subsequently, determined null hypothesis were tested using two-dimensional statistical methods as follows:

- Hypothesis 1 (H1): The assessment of the advertising does not hang on the culture of the public
- Hypothesis 2 (H2): Disposable income has not the impact on purchasing of goods or services forced by advertising
- Hypothesis 3 (H3): The realization of the purchases based on advertising does not depend on the culture of the public
- Hypothesis 4 (H4): Culture of public does not influence the trust in advertised data in media

¹ <https://medialne.etrend.sk/marketing/rok-2018-z-pohladu-medialnych-agentur-aky-predpovedaju-vyvoj-na-trhu.html>

² <http://www.rpr.sk/en/about-rpr>

Under the term “culture of the public” we understand the two social indicators as education and status (Cannon, 1982). The size of the respondents’ sample was calculated according to the formula:

$$n \geq \frac{(z^2 \times p \times q)}{\Delta^2}$$

where:

n – minimum number of respondents, z - reliability coefficient by the value 1.96 at the probability of the 95.4 %, p and q - the percentages of respondents knowing and unknowing the topic which was set up on 50 % x 50 % what represents the highest rate of entropy, and Δ – the maximum admissible error set up on the 3 %. The size of selected sample by following the chosen values represents:

$$n \geq \frac{(1.96^2 \times 0.5 \times 0.5)}{0.03^2} \geq 1067 \text{ respondents}$$

Pearson Chi-square test (χ^2), or Cramer contingency coefficient (V) was used for testing the hypothesis which is the most suitable rate for the association between the two categorical variables and it reaches the values from 0 – non-relation to 1 – ideal relation (Rimarčík, 2007):

$$\chi^2 = \sum_{i=1}^n \frac{(O_i - E_i)^2}{E_i} = N \sum_{i=1}^n \frac{(O_i/N - p_i)^2}{p_i}$$

where: χ^2 - Pearson's cumulative test statistic, which asymptotically approaches a χ^2 distribution, O_i - the number of observations of type i , N - total number of observations, $E_i = Np_i$ - the expected (theoretical) count of type i , asserted by the null hypothesis that the fraction of type i in the population is p_i , n - the number of cells in the table

$$V = \sqrt{\frac{\chi^2/n}{\min(R, C) - 1}}; \text{whereby } \chi^2 = \sum_{i=1}^R \sum_{j=1}^C \frac{(n_{ij} - E_{ij})^2}{E_{ij}} \text{ and } E_{ij} = \frac{n_i n_j}{n}$$

where: n – file size, R – number of rows (categories of row variable), C – number of columns (categories of column variable), n_{ij} – frequency in i -row and j -column, E_{ij} – expected frequency in i -row and j -column, n_i – sum of the frequencies in i -row, n_j – sum of the frequencies in j -column

The scale by Cohen (1988) was used for the interpretation of the contingency coefficient or correlation coefficient (Rimarčík, 2007): < 0.1 trivial, 0.1 – 0.29 small, 0.3 – 0.49 middle, 0.5 – 0.69 strong, 0.7 – 0.89 very strong and > 0.9 is almost ideal dependency. The confidential interval (CI) was calculated by chosen questions for the share of the qualitative character on the main file of characters for the binomial distribution following the formula (Šmelko, 1995):

$$95\% \text{ CI} = w \pm 1.96 \sqrt{\frac{w(1-w)}{n}}$$

where:

w – value of the qualitative character, 1.96 – reliability coefficient for the probability of 95.4 %, n – file size.

3. RESULTS AND DISCUSSION

3.1. One-dimensional statistical results

Following the Figure 1, we can figure out that the most preferred medium by men part of the investigated public is the internet. Further, it is followed by newspapers and magazines. On the other side, television has the leading role by women perception with another communication tools like newspapers, internet and magazines with leaflets.

Figure 1: The overview of the preferred communication tools by public

The survey found out that on average (men and women opinions) 70 % of investigated public consider the intensity of the advertising for high and another 30% for middle intensive (Fig. 2). Everybody from asked respondents considered that advertising has not the low intensity in the wide scale of media. As we can see the men and women opinions are quite similar, however women are more sensitive on advertising intensity.

Figure 2: Advertising intensity in the media by public opinion

As a further remarkable result is to be release that 69 % of investigated respondents are annoyed by advertising in the media (Fig. 3) what is also proved by Bell and Buchner (2018). Only 31% expressed they stay not disturbed by advertising. As this question has binomial distribution (answers in form: yes or no) we calculated also the confidential interval for the share of the qualitative character on the main file of characters. At the probability of the 95% we can expect that 88% - 98% of public share will be annoyed by advertising in the media.

Figure 3: Binomial distribution of the public opinion on the annoyance by advertising

Figure 4: Binomial distribution of the public opinion on the trust to advertised data

By the following research we detected that 57% of the investigated public do believe in advertised data. However, almost another half of respondents distrust in such data (Fig. 4). Following the confidential interval for the share of the qualitative character we can expect with the 95% probability that 55.65% - 74.35% of public will still trust the advertised data in media.

Figure 5: Required features for advertising by public

It emerges from presented results (Fig. 5) that the main required feature of advertising is truthfulness (15%). Further, the most essential features are modest, intelligible and humorous. On the other hand, the visual and artistic level of advertising are the least asked by the Slovak public.

Figure 6: Assessment of goods and services purchased by their advertising

The most purchased subject forced by advertising is the drugstore (26%) by women and electronics (20%) by men (Fig. 6). Within the gender comparison, the biggest differences were detected by purchasing of electronics, sport goods, drugstore, foodstuff and housewares.

3.2. Two-dimensional statistical results

H1:

Testing the first hypothesis by p-value (chi-square statistic), where perception of the need for advertising depends not on a) public education, and b) public status, reached values a) $0.00011 < 0.05$ and b) $0.03673 < 0.05$. Therefore, the null hypothesis was rejected, and the alternative hypothesis can be accepted. The p-value was lower than defined significance level 0.05 in both cases. The obtained difference in the sample was statistically significant. We can state that the public perception of the need for advertising is derived from the public culture, thus a) education and b) status. Cramer contingency coefficient (V) gained the values a) 0.462233 defined by middle dependency between the public perception of the need for advertising and public education and b) 0.2964135 indicated the lower dependency the public perception of the need for advertising and public status.

H2:

By testing the second hypothesis we got the p-value of chi-square test $0.02643 < 0.05$. Consequently, we can state that the null hypothesis can be rejected, and the alternative hypothesis accepted. Thus, disposable income has statistically significant impact on purchasing of goods or services forced by advertising. According to the Cramer contingency coefficient (V) with the value 0.4064694 and following the Cohen scale we can say that dependency between disposable income and on purchasing of goods or services forced by advertising is at the middle level.

H3:

Testing the third hypothesis by chi-square test the p-value reached 0.01287 (dependency of purchases from the education) and 0.00015 (dependency of purchases from the status). Hence, the p-value was lower than defined significance level 0.05 in both cases. We rejected the null hypothesis and accepted the alternative one which means that purchasing forced by advertising depends on the culture (education and status) of the public. The Cramer value of the contingency coefficient (V) by both statistical dependencies is middle (0.4410900 a 0.5063525).

H4:

The p-value of chi-square test between the public culture (education and status) and trust in advertised date in media reached a) 0.00023 and b) 0.00002. Both values are lower than defined significance level 0.05 which documents by both cases that public culture statistically significant influence their perception of trust in advertised date in media. Therefore, we rejected the null hypothesis and accepted the alternative one. Cramer contingency coefficient (V) by both statistical dependencies reached middle values 0.4404575 (education) and 0.4965473 (status).

4. CONSLUSION

The presented research revealed some statistically significant findings which are agreed with the global trends of requirements on the way of advertising the goods and services (Wu et al., 2016; Popa, Petrovici, 2014). The culture has the enormous influence on the perception of advertising goods and services by the Slovak public and its behavior. Under the term "culture" we understand the level of education and the social status (Cannon, 1982) as mentioned before. The investigated public is now tired from the amount of advertisement in the Slovak media. Therefore, the advertising producers must fix their effort more on the quality not the quantity of advertised data and listen more carefully feedback from the potential customers. Therefore, all these gained information should be considered by producers of advertising, in case they want to positive influence the purchasing manner of the Slovak public with emphasis on marketing and advertising ethics (Laczniaak, Murphy, 2019; Higgins, 2008; Fisher 2007). It means that marketers are responsible for indicating truly information about the price, quality, and amount of advertised goods or services.

ABSTRACT

Opportunism, as a form of behavioral model, is inherent to all economic systems without exception. But, the fact remains undeniable that it is in countries with a “transitive” economy opportunistic behavior takes the most diverse forms and significantly affects economic trends in general. To the full extent manifestations of opportunism in “transitive” economies are related to financial intermediation. Moreover, the opportunistic model of strategic development in financial sector of “transitive” economy can be fully sufficiently, to spread over time to a large number of participants. Within this content, the issue arises regarding the possibilities of state influence on these processes. It is obvious that successful implementation of opportunistic strategies in the short term perspective has a positive effect on the effectiveness of financial intermediation. In this case, it is important to talk exclusively about increasing of economic benefits of final beneficiaries. On the other hand, a number of strategic problems arise, without the solution of which the further development of the financial sector is impossible. In the context of identified problems’ solving, the state should pay attention to three aspects: firstly, the formation of institutional environment that will make opportunistic behavior economically unprofitable; secondly, increase financial literacy of financial services’ consumers; thirdly, changing the format of competition in the financial sector, taking into account the maximum transparency of financial institutions.

Keywords: *economic opportunism, “transitive” economy, financial intermediation, financial sector*

1. INTRODUCTION

One of the key characteristics of modern economy is the galloping increase of quantitative indicators of the financial market. Not the last roles in these processes play financial intermediaries. Moreover, their economic potential for many years already significantly exceeds that of the real sector. Modern financial intermediation very quickly turned into a large-scale industry, within which millions of participants function. Each of them, from an individual (as a consumer of financial services) to a large institutional investor, has its own strategy of behavior. These strategies usually lead to the formation of numerous conflicts as at the level of "financial intermediaries - the rest of the financial market participants", and at the level of "financial intermediaries - the state". Obviously, the conflict of business strategies is an objective phenomenon that fully characterizes the complexity of the modern economy in general and financial markets in particular. But if a few decades ago, an approach based only on rational behavior of economic agents dominated in economics, then the possibility of irrational actions and opportunistic behavior is usually now analyzed. The problem of economic opportunism is characteristic for all sectors of economy, without exception, but it is particularly acute in the financial sector.

Not least, this is due to the nature of financial intermediaries, whose main activity is accumulation of savings and their subsequent investment (in fact, we are dealing with agency conflict). In addition, we must take into account the scale of the modern financial market. Thus, irrational business strategies and opportunism in financial sector priori pose a significant threat to many participants, both in the financial market and in real sector. In general, as will be shown below, opportunism can even threaten the existence of certain segments of the financial market. In countries with «transitive» economies, there are various restrictions (primarily institutional) that directly or indirectly stimulate rational behavior of financial intermediaries. In turn, in countries with “transitive” economies, the influence of institutional factors is not enough, which makes economic opportunism quite attractive. This situation significantly slows down the development of financial sector of countries with “transitive” economies, which makes it important to find ways of overcoming the problems associated with opportunism of financial intermediaries.

2. ECONOMIC OPPORTUNISM: CAUSES OF EMERGENCE AND PECULIARITIES OF MANIFESTATION IN THE FINANCIAL SECTOR

Despite of its relative "youth" (the first works can be attributed to the XX-th century), the analysis of opportunistic behavior as a direction of economic science already now has sufficiently reasoned methodology and significant results. But, as will be shown below, most scientists consider economic opportunism irrespective of specific sectors and spheres of economic activity. It is more about general provisions that do not take into account sector specifics and number of other factors. This fully applies to addressing the problems of opportunism in the financial sphere. As part of this work, we consider the most reasoned approaches to the substantive characteristics of opportunism and extrapolate them further to the activities of financial intermediaries. Among modern scientists, the founder of this trend is O. Williamson, who described opportunism as “... pursuit of one’s own interest, reaching for treachery” (Williamson, 1985). This rather simple at first glance conclusion is strikingly different from those prerequisites that dominated in many theories - economic agents fulfill their obligations because another model of behavior is not capable to increase their well-being. Let us point out one more important note: most types of opportunistic behavior are based on information asymmetry. That is, under conditions of even distribution of information, the prerequisites for opportunism, if not disappear at all, their destructive influence will decrease significantly. These processes are analyzed in the work of J. Akerlof (Akerlof, 1970). In his approach, opportunism increases the possibility of “unfavorable” choice, the “good” goods are being forced out by “bad” ones, and in the end even the disappearance of individual markets is possible. In turn, P. Milgrom and J. Roberts describe opportunistic behavior as egoistic behavior, which is not constrained by moral reasoning (Milgrom, Roberts, 2001). At first glance, this approach to the characterization of opportunism is difficult to apply to economic activity. But actually it is not. One should not forget that in every society various traditions, stereotypes, etc. are historically shaped in behavior. It is quite clear that all of them can and do influence the economic activities of individuals, corporations, and, finally, the state. Thus, it should be recognized that evaluation of such influence is extremely difficult task, but it is wrong to deny its existence. Economic opportunism is most often viewed in the context of employment relationship between employer and employee/manager (Biliak, 2013), as well as through the prism of the principal-agent relationship (Nelson, 1981). Obviously, the first and the second aspect of opportunistic behavior can be analyzed from the point of the organization, including the financial corporation. In the first case, we are talking about the employee’s failure to comply with the terms of the contract using various methods. The second is about the possibility of top managers to make decisions aimed at increasing their own well-being, rather than economic benefits for the owners of the company.

In any of these options there are significant difficulties in exercising control over the actions of employees and managers. Some papers emphasize that "... necessary condition for considering certain behavior as opportunistic is the redistribution of wealth" (Odintsova, 2008). Summarizing the interim results of theoretical statements' analysis concerning economic opportunism, we present the most common prerequisites for its emergence: the presence of "contractual" holes; difference in the economic interests of the contract parties; information asymmetry; market uncertainty; specific nature of the assets at the disposal of the contract parties. It is clear that these are the most significant influencing factors that lead to opportunism, but not all. Since the forms of manifestation of opportunistic behavior are also very variable. At the same time, opportunism can exist in both explicit and latent forms, which only complicates the problems of its evaluation. As already mentioned, opportunism, as a form of economic behavior, is also characteristic for financial intermediaries. In our opinion, the forms of manifestation of opportunism depend on the level of relations between the financial institution and other economic agents. The most obviously economic opportunism is manifested in the relations of financial intermediaries with: consumers of financial services, other financial intermediaries, with employees, with managers, with various counterparties. The importance of the issue of economic opportunism of financial intermediaries is determined by their place in modern economy. Opportunism in financial sector accumulates additional risks for the entire economy, creates significant threats from the point of view of prospects for economic growth and prosperity. Arguments listed above make it possible to conclude that the objective nature of opportunism in the financial sector is more likely to indicate the need to use a whole range of measures aimed at eliminating its causes and consequences. At the same time, one cannot deny that solution to the problem of opportunism of financial intermediaries largely depends on the "maturity" of the financial market.

3. PROBLEMS OF OPPORTUNISM OF FINANCIAL INTERMEDIARIES IN THE COUNTRIES WITH "TRANSITIVE" ECONOMY

It is obvious that the most acute problems of opportunistic behavior of financial intermediaries are manifested at the markets of countries with "transitive" economy. The financial sector of the post-soviet countries is no exception. For the further analysis, we used data from the Ukrainian financial market, but we can safely say that the trends and examples described below are typical for other markets with similar characteristics. In general, it is worth noting significant progress in certain segments of financial market of Ukraine, incl. - for financial intermediaries. But this growth is noticeable if we compare the current state of Ukrainian financial sector with data of the beginning of 2000. In comparison with other markets and in assessments of potential growth (at the time of independence), the indicators look rather modest. The key unresolved issues for Ukraine's financial sector are:

1. A significant bias towards banks, as key financial intermediaries (bank assets account for about 90% of the assets of all Ukrainian financial institutions).
2. The actual absence of specialized services market in the sphere of non-state pension provision. For example, pension contributions of individuals to non-state pension funds amount to only 5.5 million dollars. USA.
3. Difficulties in the interaction of non-bank financial institutions with individuals as consumers of financial services. Neither life insurance companies, nor investment funds, nor credit unions at the present stage can offer this group of consumers conditions that would allow them to attract individual savings in the financial sector.
4. Lack of efficiency of the stock exchange securities market, which is dominated by government bonds, and the total share of corporate securities fluctuates around 10%.
5. The presence at the market of a significant number of "captive" financial intermediaries that operate within the framework of leading financial-industrial groups and, as a rule, can

implement an irrational business strategy. Such financial institutions are quite common in the insurance market (they help to reduce corporate income tax payments by of “faulse insurance”); venture capital investment institutions (functioning with similar tasks); securities traders (used for price manipulation in the securities market), etc.

Thus, current problems remain quite significant, and some of them have not been solved for decades. One of these problems is the business strategy of Ukrainian financial intermediaries, which we conditionally designated as “rational economic opportunism”. What is it and what criteria define its "rationality"? Analysis of Ukrainian financial sector shows that the answers to questions raised above are following:

- institutional immaturity of Ukrainian financial sector quite often makes it precisely opportunistic behavior that is most beneficial for financial intermediaries. Moreover, in some cases, opportunism is the main opportunity to increase the competitiveness of financial institution. Example is Ukrainian banking sector. Ukrainian legislation provides for allocation of so-called "systemically important banks" (the Law of Ukraine "On Banks and Banking Activities"), whose functioning affects the stability of banking system of Ukraine. At first glance, based on the significance of such banks and their role in the financial sector, banking supervision should eliminate as much as possible reasons for opportunistic behavior for their management. On the other hand, over the past 10 years, Ukraine has experienced two systemic economic crises, and it was a number of systemically important banks that were catalysts for the crisis in the financial sector and the economy as a whole. For example, if in 2015 the National Bank of Ukraine allocated 8 such banks, in 2016-2017 - only 3 institutions. And it was OJSC Privatbank that became the real apple of discord when the state was forced to nationalize it at the expense of budget resources in order to prevent panic in the banking sector.
- existing model of regulation of financial sector in Ukraine not only does not prevent the opportunistic behavior of financial intermediaries, but also stimulates it to some extent. We can give an example of the deposit services market, which in the segment of banks is regulated by National Bank of Ukraine, in the segment of credit unions - National Commission, which carries out state regulation in the sphere of financial services markets. Differences in regulation are very significant and generate a fundamental difference between the level of consumer protection. Moreover, they directly make the depository market of credit unions an extremely “toxic” environment for both depositors and financial institutions themselves.
- in Ukraine, the reputational component of the financial sector development is at the minimum level. In some cases, we can talk about the punishment of managers of banks, insurance, financial companies, which actually negates the role of their contractual obligations. Moreover, in Ukrainian practice it is not at all difficult to imagine the struggle of financial institutions functioning for attracting a compromised manager to their governing bodies. Formed at the level of legislation requirements for managers of financial corporations are largely formal and do not fulfill their role in developed economies;
- merging of business and politics is one of the key factors that stimulates the opportunism of financial intermediaries. The overt lobbying of large players in individual markets quite often caused the occurrence of such significant flaws in the legislative field that it is the opportunistic model of behavior that was most beneficial for financial intermediaries. Moreover, the lack of meaningful progress in the field of judicial reform often does not allow protect the interests of consumers of financial services and the state, even if opportunism takes obvious forms.

We emphasize in particular that opportunism of financial intermediaries is typical for all components of Ukrainian financial sector, without exception. In the most acute forms, it is characteristic for insurance market. For example, according to the regulator of insurance services market of Ukraine, the share of complaints from consumers on the actions of insurers (mainly, it is question of refusals to pay insurance compensation and/or a significant underreporting) over the past few years has fluctuated within 70-75% of total amount. In fact, we are dealing with the existence of a cluster of insurance companies on the market, which use a wide range of methods to avoid paying insurance compensation payments or its minimizing. At the same time, other subjects of insurance market - appraisers, car dealers, etc. take an active part in such schemes. No less acute is the problem on the market of credit unions services. Its severity subsided relatively recently and only on the basis of the collapse in the consumer lending market in 2013-2015. A large number of Ukrainian credit unions built their development strategy at the beginning of the XXI century on two basic principles: first, the irrational overvaluation of deposit rates; secondly; maximization of lending rates and the number of collateral payments of loans, and as a rule, they were hidden. As a result, there is a massive refusal of credit unions to fulfill their obligations under deposit agreements, an increase of the number of problem contracts, a significant decrease in credit unions confidence and other credit institutions. This analysis can be continued further, because it is difficult to bring even the only segment of the financial sector of Ukraine, in which there are no manifestations of opportunism.

4. STATE AND BUSINESS STRATEGIES OF FINANCIAL INTERMEDIARIES IN UKRAINE

Mentioned above raises a number of complex issues related primarily with the necessity to develop and use various methods of restricting opportunistic behavior in the financial sector, as well as reducing its negative impact on the development of financial intermediaries. In this context, the issue of state regulation requires additional attention. At the same time, we do not exclude the fact that the state itself implements the behavioral line, which clearly has signs of opportunism. In the literature in this regard, autocratic opportunism is analyzed (Haber, Perotti, 2008). I.e. using available tools to influence economic processes (including regulation), the state can not only significantly change the competitive environment in the financial sector for the worse, but also make decisions that can be unambiguously evaluated as opportunistic. As a rule, such an approach is typical for countries with a "transitive" economy, based on a high level of business and political mergers. In the history of Ukrainian financial market there were a lot of examples in this context:

- the special practice of nationalization of individual banking institutions that was already mentioned in this work, which increased the debt burden on the state budget;
- privatization of the state insurance company (in this case, it can be argued that all Ukrainian society was negatively affected by the opportunism of the state);
- forming at the legislation level "special" conditions for fulfilling obligations to depositors by banking institution that is in a crisis state (we are talking about depositors of the Mikhailovsky Bank);
- selective approach to the implementation of anti-crisis package of measures in the financial market, in the center of which was usually the banking sector to the detriment of other financial institutions;
- functioning of financial corporations that are under state control (in this case, it is primarily a matter of state-owned banks). In the Ukrainian reality, the activities of state bank are often accompanied by high level of politicization;

- realization/rejection of the implementation of tough measures to financial intermediaries who refuse to fulfill obligations, depending on the level of political influence of their final beneficiaries.
- What is common to all cases without exception? In our opinion, the key principles are the distribution of economic (and political) benefits as a result of state actions. Consider this on the example of processes in banking sector, because here there is an excellent base for comparison - the experience of supporting financial institutions in developed countries during crisis. In our opinion, comparing the anti-crisis support of banks in Ukraine and in developed countries, it is possible to identify fundamental differences:
 - a) experience of crisis management and support of banks threatened with bankruptcy is no way connected with reputational risks for bank management, especially with the threat of criminal prosecution, even in cases where the obvious opportunism of bank managers has led to the bankruptcy of a financial institution;
 - b) the level and forms of support were largely depended on subjective factors, incl. - from the owners of financial corporations;
 - c) the effectiveness of such support was extremely low, and often suspiciously low.

In general, it can be concluded that the practice of autocratic opportunism is common to countries with a “transitive” economy and weak democratic institutions.

5. KEY ASPECTS OF OVERCOMING THE OPPORTUNISTIC MODEL OF BEHAVIOUR IN THE FINANCIAL SECTOR

It is obvious that the solution of the problems of opportunistic behavior of financial intermediaries involves the use of integrated approach aimed primarily at eliminating the prerequisites that make the opportunistic strategy of financial intermediaries development more advantageous than other forms of economic behavior. In this regard, for the Ukrainian financial sector, along with other “transitive” economies, the most important tasks are the following:

- overall increase in the level of transparency in the activities of financial intermediaries.
- improving the efficiency of contract execution in the economy at whole and in the financial sector.
- leveling the influence of political factors on the functioning of financial sector through changes in its regulatory model.
- improving the financial literacy of consumers of financial services.
- development of package of anti-crisis measures that will be applied in the case of a crisis in the financial sector applies to all types of financial intermediaries without exception.
- forming an approach to the reputation of a financial institution, its owners and managers as a special form of intangible assets.

6. CONCLUSION

The impact and consequences of economic opportunism in the financial sector in particular forms manifest themselves in countries with a “transitional” economy. The weakness of institutional environment, coupled with the underdevelopment of democracy, catalyze the threats of opportunism and can lead to a crisis throughout the economy. As a result, there is a need to implement a set of measures aimed at addressing the root causes of opportunism. It should be kept in mind that these measures should be introduced both at the level of government regulation and at the level of inter-firm relations, as well as at the level of relations between financial intermediaries and consumers of their services.

ABSTRACT

The paper devoted to the analysis of the main principals of green investments as the alternative recourse to finance the achievement of the Sustainable Developments Goals 2030. Besides, the obtained result of the analysis of green investments dynamic proved the snowballing effect of green finance market developing in the world. The results of analysed showed: that emerging and developed countries influence on climate with different power; had unequal financial potential to achieve Sustainable Development Goals. In the paper, the authors tried to check hypotheses: linking between the country's contribution to the international commitment on climate-related expending, the volume of climate finance (as a type of green investments) and the country's rating on the Sustainable Development Index. The objects of the investigation were European and developing countries in the period 2015-2017 years. Under this research, the authors used the dataset from World Data Bank, Eurostat, Reports of OECD, European Investment Bank, Climate Bonds Initiative, Sustainable Development Index. The findings showed the correlation between the volume of green investments (for two types: international commitment on climate-related expending, the volume of climate finance) and country's efficiency on the way to achieve the SDGs 2030. Thus, the country with the higher volume of green investments occupied the higher position on the Sustainable Development Index. On the basis of the findings and results of the analysis of the EU experience, the authors allocated the most attractive direction to develop green investments market for emerging countries.

Keywords: *investments, green economy, expenditure, green bonds*

1. INTRODUCTION

All world leader countries have already accepted and started to implement activities for achieving the Sustainable Developments Goals 2030 (SDGs 2030). Noticed, that the SDGs 2030 is a logical continuation of "Millennium Declaration" for 200–2015 years. So, new action plan consists of 17 goals (comparison with previous 8 goals) and 169 tasks which contribute the huge financial recourses and supporting. Thus, in most countries especially developing countries, this process isn't so quickly as the community and the experts wished. Firstly, it is connected with the lack of financing. The developing countries don't have a sufficient volume of financing and they have to attract additional financial resources which are corresponding to the ongoing features of market economy functioning. So, in this case, is necessary to analyse the modern financial resources which could be directed for achieving the SDGs goals.

2. LITERATURE REVIEWER

The results of the EU and the USA experience the most effective way to attract additional financing to the green goals implementation is to develop and to activate the green investment market. Thus, (Chan et al., 2018) proved that green investment is a catalyst promoting of a clean environment for future generation. In this direction, the first steps have already been done by the EU countries. Thus, they accepted the "Action Plan: Financing Sustainable Growth" (European, 2018) which are explained the finance strategy for the EU counties in the framework of achieving the indicated SDGs 2030. Noticed, that the experts suggested that existence is not enough for achieving SDGs 2030. According to the "Action Plan: Financing Sustainable Growth" annual financial gap between existence and necessary green investment is 180 billion EUR. From the other side, the experts from European investment bank estimated such gaps as 270 billion EUR. Thus, the boosting of green investment market is actually at the ongoing level of economic development. It should be highlighted, that the main restrict factors of green investment market is a misunderstanding among investors what is mean green investment and green activities. Besides, the main principles, calcification, universal account system haven't been developed yet. According to the "Action Plan: Financing Sustainable Growth" the experts defined green investment as a sustainable investment and supposed that they relate on sustainable activities (from energy efficient project to the education activities on green growth). According to the EU declaration Sustainable finance consists of a strong green finance component that aims to support economic growth while:

- decreasing negative impact on the environment;
- decreasing greenhouse gas emissions and the volume of pollution;
- minimising waste and increasing efficiency of natural resources using (Sustainable, 2018).

The similar assumption made the scientists from Cambridge Institute for Sustainability Leadership indicating that green investment is a capital which invests in 'green' assets (the funds, the companies, the infrastructures, the projects and etc.) for solving environmental problems. Walter Kahlenborn (2018) indicated that no clear-cut definition of green investment and understandable selection criteria of green assets remain the developing of the green investment market. The authors in the paper (Martinez-Oviedo, Medda, 2018) also made the conclusion that it is no standard definition of green investment and green assets which remain the developing of the green investment market. In their paper, the scientists Martinez-Oviedo and Medda defined green investment as follows: capital which invests in low carbon and climate resilient initiatives, clean technologies, renewable energy, or natural capital that can be considered environmentally beneficial (Martinez-Oviedo, Medda, 2018). The scientists in the paper (Adeel-Farooq et al., 2018) allocated the greenfield investment and associated it with the capital which finances the green projects. The authors Eyraud L., Clements B., Wane A., Martin P. and Moser D. in the papers (Eyraud et al., 2013; Martin, Moser, 2016) analysed green investment as the investment which direct to the decreasing of CO₂ emission. The authors in the paper (Hagspiel et al., 2018) analysed green investment as an investment in renewable energy. Mielke, J., and Steudle, G. A. (2018) analysed green investment as capital in technologies and projects for climate change mitigation. Thus, the main difficulty is to determine and to identify the green assets. The EU commission in the "Action Plan: Financing Sustainable Growth" declared the creation of the EU system of sustainable classification activities as a first step by the end of 2019. Noticed, that the experts in the document (European, 2018) supposed that sustainable finance should base on two milestones: increasing volume of financing in sustainable and inclusive growth through the funding society's need in long-term period; achieving the financial stability through the consolidation environmental, social and governance (ESG) factors into investment decision-making (European, 2018). Therefore, in the paper (Eyraud et al., 2013) green investments were classified by the authors into three groups:

investment to provide low-emission energy supply; investment to provide the increasing of energy efficiency; investment to provide the changes in the forest and agricultural management (Eyraud et al., 2013). Noticed that the authors focused on renewable or green technologies excluding the investment in green education, green actions, carbon sequestration and etc. They explained such chosen by the lack of dataset and difficult to estimate. The authors in the investigation (Martinez-Oviedo, Medda, 2018) classified green investment into two groups relate on tangibles of assets: real (green technologies, green product and etc.) and non-real green investment (property rights for green technologies and product, green stocks and green bonds). The results of the analysis of the scientific papers justified that green investment's classification isn't so different from the traditional approach to classifying the general investment. In the report (Inderst, 2012) the experts underlined, that green investment is closely connected with the type of investing and allocate investment approaches which shown in table 1.

Table 1: Approaches to classifying the green investment (Compiled by the authors on the basis (Inderst et al., 2012))

APPROACHES	TYPES
Green investing	eco-friendly, carbon, climate change investing and etc.
The E in ESG	environmental, social and governance investing.
Thematic investing	in green sectors or themes such as water, agriculture
SRI	socially or sustainable responsible investing
Impact investing (including microfinance)	which provide a positive impact on the environment
Long-term investing	which oriented not for the short-term profit, so orient on stable profit and long-term results.
Universal ownership concept	Investment in the wide range of green asset classes distributed among economic sectors that the organization effectively owns a slice of the broad economy.
Double or triple-bottom-line investing	During making decisions on green investing considering not only economic but social and ecological goals; based on the sustainable development concept.

From the other side, the authors in the works (Vyshnickaya, 2013; Kvaktun, 2014; Heinkel, 2003) highlighted that green investment involves all abovementioned investments in table 1 and these are types of green investment. So, as the universal definition of green investment isn't accepted the universal classification of green investment hasn't existed yet. The results of the analysis of the scientific papers (Inderst et al., 2012) showed that green bond is the most popular type of green investment. Besides, the experts from UBS Wealth Management assumed that 93% from investors who invest in green economy sure that green investment is more profitable than traditional (Yiu, Choi, 2018). From the other side, the stereotype that green investment is non-profitable still exist. Firstly, it is the consequences of that such investments have the huge payback period which negative influence on making decision invest or not. Thus, the boosting of green investment market contributes to overcoming some barriers as follows:

- develop the fundamental theory of green investment market with allocation the main players and their role and duties;
- develop the legislative base of green investment market;
- develop a universal system of accounting green investment;
- develop the policy to support the green investors with indicating the advantages and perspectives of green investment.

The authors in the paper (Adeel-Farooq et al., 2018) proved the correlation between greenfield investment and the country's environmental performance which is a basis of the sustainable economic growth. The authors used the Environmental Performance Index as an indicator of the country's environmental performance. The Chinese scientists in the work (Wang et al., 2018) proved the positive relationship between government policy and green investment. In the paper (Eyraud et al., 2013) the scientists proved the linking between economic growth, interest rates, fuel prices and volume of green investment. Therefore, they made the conclusion that economic growth, low-interest rates, and high fuel prices have a positive impact on green investment market. The authors in the works (Azhgaliyeva et al., 2018) investigated the correlation between green investment and fiscal policy to support renewable energy. The findings showed that feed-in tariff and loans had a positive effect on private green investment, so the grants, subsidies, taxes and government spending on R&D have not a significant impact on private green investment. In the paper (Afni et al., 2018) the scientists proved that green investment had a positive influence on the disclosure of carbon emissions. In their work Green investment was analysed through the Social Responsible Investing Index. Besides, they assumed that green investment could come from the additional investing or from green Foreign Direct Investment as a source of private sector financing and transfer of technology between countries (Afni et al., 2018). In this case, according to the traditional economic theory, the volume of foreign direct investment could be higher if country demonstrated the stable economic growth and had the positive and stable investment climate which could be characterized by the special indexes. In the framework of the sustainable development concept and green investing, the green investing climate could be characterized by the indexes as follows: Environmental Performance Index, Social Responsible Investing Index, Sustainable Development Goals Index, Global Sustainable Competitiveness Index. Therefore, the Sustainable Development Goals Index (SDGs Index) and Global Sustainable Competitiveness Index (GSCI) described the country's positions on the way for achieving the SDGs 2030. The main goal of this paper is analysing the linking between the country's contribution to the international commitment on climate-related expending, the volume of climate finance (as a type of green investments) and the country's rating on the GSCI as the indicator of achieving the SDGs 2030.

3. METHODOLOGY

Under this research for analysis, the authors used the software Stata 14.0. As a type of green investment used the country's contribution to the international commitment to climate-related expending and volume of climate finance. The dataset of GSCI was obtained from the official reports. GSCI consists of 111 indicators obtained from reliable sources, such as the World Bank, the IMF, and different UN agencies. All indicators are grouped into 5 sub-indexes:

- Natural Capital;
- Resource Efficiency & Intensity;
- Intellectual Capital;
- Governance Efficiency
- Social Cohesion.

Thus, in the paper the authors checked hypotheses:

- H1: linking between the country's contribution to the international commitment on climate-related expending (CM) and the country's rating on the GSCI;
- H2: linking the volume of climate finance (GFI) and the country's rating on the GSCI.

At the first step authors of the analysis, the cluster analyses were used which based on Ward's agglomerative hierarchical clustering procedure (which based on the principal component analysis).

With the purpose to check the correlation between indicators, the authors proposed to use regression analysis. The authors used a matrix of Pearson's correlation coefficients (r) (formula 1).

$$r = \frac{n(\sum xy) - (\sum x)(\sum y)}{\sqrt{[n\sum x^2 - (\sum x)^2][n\sum y^2 - (\sum y)^2]}} \quad (1)$$

For checking abovementioned hypothesis, the authors used the databases as follows: World Data Bank, Eurostat, Reports of OECD, Reports of European Investment Bank, Reports of Climate Bonds Initiative, Sustainable Development Index. For the analysis, the European countries were chosen. The dataset of CM was taken from Eurostat, the climate finance was estimated through indicator which characterised the value of greenfield investment on green projects which obtained from UNCTAD (2018).

4. RESULTS

The results of the analysis showed that emerging and developed countries influence on climate with different power. Thus, the world-leader countries on GNI per capita have higher CO2 emission than countries with less GNI. The classifications of the country are presented in table 2.

*Table 2: Classification of the countries according to the World Data Indicators
(World Bank, 2018)*

GROUP OF COUNTRIES	GNI PER CAPITA IN 2017
High-income	\$12,056 or more
Upper-middle-income	\$3,896 and \$12,055
Lower-middle-income	\$996 and \$3,895
Low-income	\$995 or less

Figure 1 showed that high-income countries have been producing a huge volume of CO2 emission compared with Low-income countries. From the other side, the tendency of CO2 emissions in high-income countries could be described as decreasing. Thus, in 2014 the CO2 emissions were less compared with the 1990 year. Besides, the decreasing of CO2 emissions has started in 2007 among high impact countries. On the other hand, the world tendency of CO2 emissions has been continuing to increase compared with the 1990 year. Firstly, it was a consequence of the rapid developing of upper-middle-income countries. Therefore, the low income and low middle-income countries haven't declined the volume of CO2 emissions yet. The results of comparative analysis of CO2 emission showed (figure 2) that compared to the 1990 year in 2016 the emissions in the world-leader countries increased by 100–300%, particularly China by 353% in 2016 compared to 1990, the USA – 101%, India – 287%. From the other side, in 2016 some countries have already decreased their CO2 emission to the environment: Moldova – by 74%, Ukraine by 70%, Lithuania and Latvia 60%, Romania – 58%, United Kingdom – 36% and etc.

Figure following on the next page

Figure 1: CO2 emissions under the country's group (metric tons per capita) (World Bank, 2018)

Figure 2: The changing of share in the world CO2 emissions among analysed countries (compare to 1990) (developed by authors on the basis of Fossil CO2, 2017)

Noticed, that at the 21st Conference of the Parties the developed-country declared to increase their level of financial support, providing USD 100 billion annually by 2020 with a concrete roadmap to achieve the SDGs (European Environment, 2018). The results analysis of spending from budget among EU countries proved the positive growth of green finance volume in 2016 compared with 2014 and 2015 years. Thus, the leader in contribution to the international 100bn USD commitment for climate finance among EU countries is Denmark, Germany, France, United Kingdom. The abovementioned results of analysis proved that decreasing of CO2 emissions contribute the additional financial recourses. Thus, countries with high GNI have more financial recourses to decline the negative impact on the environment. At the same time, low-income countries don't have significance financial recourses to finance the greening of the economy. In this case, we received the vicious cycle: low-income countries produced less CO2 emissions, but CO2 emissions tendency has been still increasing and these countries don't have enough financing to decline this tendency. Thus, for low-income countries is more actual to attract additional green investment. The main indexes which characterized the country's efficiency on achieving of SDGs are SDG Index and Global Sustainable Competitiveness Index (GSCI). Thus, according to the official report SDG Index (Sachs et al., 2018), the first ten positions was also occupied by the high-income countries: Denmark, Germany. Besides, according to the dataset in table 3, the countries in the first position on SDG Index made a higher contribution to the international commitment on climate-related expending.

According to the report of GSCI (The Sustainable, 2017), the countries form high-income group have a high ranking on GSCI. The experts proved the correlation between Sustainable Competitiveness score and GDP per capita or income levels (The Sustainable, 2017). With the purpose to estimate the sufficient level of green investing in achieving the SDG, the cluster analysis was done. At the first step, the results of the cluster analysis showed that dividing into four clusters wasn't adequate, because in two clusters only by one country was (table 3): cluster 3 – France and cluster 4 – Germany.

Table 3: The findings of cluster analyses (four clusters) (the authors' calculations)

Cluster	CM	GFI	GSCI
1	464.0129	8613.711	51.92429
2	25.578	2505.653	50.792
3	3334.84	14119.66	51.78
4	8534.08	13617.44	52.06

At the next step, two clusters were allocated. The finding of cluster analysis showed in table 4. In the second cluster, the following countries were Germany, France, Poland, United Kingdom and Spain. The minimum volume of CM – 143,79 and GFI – 359,04 mln EUR for that cluster. Thus, if the developing countries (such as Ukraine) wish to move to the first cluster should spend in average 165,08 mln EUR of CM (5934.46 mln EUR for the second cluster) and 16182.43 mln EUR of GFI (16182.43 mln EUR). Besides, such volume of green investment corresponds to the average score of GSCI – 51,15 (for the second – 51,92).

Table 4: The findings of cluster analyses (four twoclusters) (the authors' calculations)

Cluster	CM	GFI	GSCI
1	165.08	2352.932	51.15227
2	5934.46	16182.43	51.92429

With the purpose to check the correlation between CM, GFI and GSCI the Pearson's correlation analysis was done. The finding presented in table 5.

Table 5: The matrix of Pearson correlation coefficient for EU countries (the authors' calculations)

	CM	GFI	GSCI
CM	1		
GFI	0.7774* 0.0000	1	
GSCI	0.6692** 0.0294	0.7518** 0.0490	1

*Note: *, ** represents significance at the 1% and 5% levels.*

The obtained results of Pearson's correlation analysis between GSCI, greenfield investment and country's contribution to the international commitment on climate-related expending proved the relation between abovementioned indicators. The correlation between GSCI and CFI exist with probability 75% and correspond significance 5%. The correlation between GSCI and CM exist with a probability of 67% and correspond significance 5%. With the purpose to check the statistical significance of the correlation between GFI, CM and GSCI the econometric method was used (table 6).

Table 6: The results of the analysis the linking between GFI, CM and GSCI
 (the authors' calculations)

Independent variables	Coef.	Std. Err.	t	P> t	[95% Conf. Interval]	
GFI	.0033569	.0009793	3.43	0.002	.0013311	.0053828
CM	.0093161	.0053054	1.76	0.092	-.0016589	.0202912
Depended variables – GSCI						

Thus, the findings (table 6) showed the statistical significance relation between GSCI, greenfield investment and country's contribution to the international commitment to climate-related expending. Therefore, the increase by one point of GFI leads to increasing of GSCI score by 0,034 points, the increasing of CM by one point lead to increasing of GSCI score by 0,093 points.

5. CONCLUSION

The results of analysis of EU experience showed that green investment is a perspective alternative recourse to finance the achieving of SDG 2030. However, the obtained results allocated the problems which restrict green investment market development: no universal normative and legislating bases, statistical accounting, lack of knowledge and information. From the other side, the investigation results of EU experience on developing and supporting of green investment market showed that adequate incentive mechanism stimulates the increase of greenfield investment and contribution to the international commitment on climate-related expending. The obtained results showed that countries, which try to develop green projects and allocate for that purpose additional financing were more effective in achieving the SDGs 2030 and had a higher position on GSCI. Besides, the obtained results proved the researcher's hypotheses, but the impact of chosen indicators CM and GFI were not so huge. In this case, for further research, it is necessary to allocate and analyse other more impactful indicators.

ACKNOWLEDGEMENT: This research was funded by the grant from the Ministry of Education and Science of Ukraine (№ g/r 0117U002251 and 0117U003932).

ABSTRACT

According to the reports of the Global Competitiveness which developed by the World Economic Forum, the competitiveness was defined as “a set of institutions, policies and production factors that form the level of the country’s performance”. This paper investigates the effect of macroeconomic stability, environmental performance on economic growth. The object of investigation – the countries with transformation process from the recourses to the effective economic model according to the reports of the Global Competitiveness which developed by the World Economic Forum. The authors indicated that the main goal to achieve the stable growth – increasing the level of the national economic competitiveness could be realized not only through the growth of the key determinants of the competitiveness: institutions; infrastructure; macroeconomic stability and etc., but also considering the aspects and parameters of country’s environmental performance. The methodology instruments of the investigation were modified production function of Cobb-Douglas which considering the level of the country’s macroeconomic stability and environmental performance. The period of investigation was 2000–2017 years. Under this research, the authors used the dataset from World Data Bank, Global Environmental performance Index, Global competitiveness report. The findings proved the correspondence of the developed models to the input dataset. Moreover, the assessments of the elasticity of the developed model components were positive and statistically significant.

Keywords: *economic growth, environmental performance index, human capital, physical capital, stability*

1. INTRODUCTION

The systematic progress process of globalization an international competitiveness are the main features of the dynamic changes which observed in the world economic. Therefore, the convergence of abovementioned processes follows from the necessity to adapt countries according to the rapid scientific and technological progress, internationalization of economic cooperation, aggravation of common social, ecological and economic problems. The long-term of the country’s macroeconomic instability, both in its internal and external appearance, lead to the high risks of a crisis, decreasing the economic growth temp and quality of life. The consequence of the last financial crisis in 2007 provoked implementing of new institutional

decisions which were going to improve the EU functioning. Thus, the macroeconomic imbalance (internal and external aspects) in the euro zone (European Commission, 2015) were mitigating. The external macroeconomic balance describes the relationship with other countries and could be estimated through the volume of foreign investment, the volume of export and import, stable exchange rate and etc. The internal balance could be achieved when the country's actual production corresponds to the full using of production factors, unemployment level corresponds to the natural unemployment, the level of inflation remains at a low and stable level. At the same time, in 2015 UN General Assembly resolution "Transforming our world: the 2030 Agenda for Sustainable Development" indicated the main goals of sustainable development which characterise the relationship between economic, social and ecological processes. Therefore, the safety of environment has become the key factors of success future country's development. Energy sector is a main factor, which determines social and economic development in the world. According to Ener Data during 1990-2016 the world energy production increased by 59% (from 8 759Mtoe in 1990 to 13 903Mtoein 2016). The largest share to provide this growth included non-renewable energy sources – 75.5% (Sawin et al., 2018), most of which is produced at thermal power station owing to the burning processes. It causes the increase of combustion products growth among which there is CO₂, and then increase of negative impact on environment. In particular, during 1961-1979 CO₂ emissions average growth in the European Union (EU) was 25.07% per year, which was 4 647 643.766 thousand kt at the end of 1979. Understanding of the ecological problem for EU Member States lead to introduction of Directives 67/548/EU on the approximation of laws, regulations and administrative provisions relating to the classification, packaging and labelling of dangerous substances (1967) and 70/220/EU on the approximation of EU Member States' legislation relating to the measures, taken against air pollution by vehicle emissions (1970). In 1972 UNO Stockholm Declaration on the Environment was adopted, and next year the first ecological program in EU was accepted (1972). Introduction of those regulatory documents lead to constant reduction of CO₂ during 1979-2014 on average by 14% annually. Volume of CO₂ emissions in 2014 was at the level of 3 241 844.353 thousand kt, that is 1 405 799.413 less than in 1979.

Figure 1: The temp of CO₂ emission in EU 1961-1979 u 1979-2014 (World Bank Data)

At the same time, limited resources of fossil fuel as the main energy source, using of which has negative impact on the environment, made to look for ways of rational energy management and to get it by means of the renewable energy sources. In this case the perspective way to reduce CO₂ emissions in the world is to use renewable energy sources (RES). Most countries, including all EU Member States and Ukraine, adopted programs on RES introduction and set up a goal to increase energy production based on RES.

Germany planned that 18% of the final energy consumption in electric power industry, transport sector and heat power industry will be provided through RES by 2020. In Poland, the main goal is that 15.5% of final energy consumption is provided through RES, in Lithuania – 23%, in Latvia – 40%, in Moldova –17%, in Estonia – 25% (Sawin et al., 2018, Prokopenko et al., 2017). 11 countries of EU achieved the set goals on RES in 2015, including Estonia and Lithuania. Total investment in RES in the world amounted to 113 billion \$ in 2006 and 242 billion \$ in 2016. The RES total installed capacity in the world in 2016 was 2 017 GW (Sawin et al., 2018). During the Ukraine's independence the largest level of CO₂ emissions of about 630 929,352 thousand kt was registered in 1992, figure 2.

Figure 2: CO₂ emissions in Ukraine during 1992-2014, kt (World Bank Data)

In 1992-2014 CO₂ emissions into the air were constantly reduced in average by 4.15% annually in Ukraine. It was facilitated by Ukraine's signing of Kyoto Protocol, by taxes on harmful substances emissions into the air and by reduction of production volumes, related to crisis in Ukraine 1990-1999, 2008 and from 2014 till today. According to Global Status Report 2017 Ukraine set a goal to achieve the RES final consumption index of about 11% (Sawin et al., 2018).

2. LITERATURE REVIEW

The connection between energy production growth and the environmental load can be explained by Environmental Kuznets curve (Kuznets, 1955). It demonstrates relationship of economic and ecological indicators and confirms that in countries with extremely developing economic indicators (GDP growth) the load on environment is growing, and at the same time, as the country's welfare increases, demand for clean and safe environment grows. Using Environmental Kuznets curve on the example of 17 countries OECD during 1977-2010, Bilgili F and Ozturk Ilhan (2015) came to decision about relationship between RES consumption volumes and CO₂ emissions. Thus, the authors in the papers (Bhandari, 2018; Mačaitytė et al., 2018; Pimonenko et al., 2017; Prokopenko et al., 2017; Cebula et al., 2015; Lyulyov et al., 2015;) analysed the causes of CO₂ emission and issues to decrease it. Besides, the scientists in the papers (Masharskyet al., 2018; Vasylyeva et al., 2014; Dkhili, 2018; Chygryn, 2016) proved that RES is key part of countries' energy security. The similar conclusions were gained after study of 68 countries by scientist from Cyprus—Panayotou for the period 1980-1991(1993). Scientist concluded that there was relationship between economic growth and environment degradation. The scientists proved the linking between social indicators (Vasylyeva et al., 2015), ecological indicators which include efficiency of RES (Singh, 2018; Chygryn, 2018; Vasylyeva et al., 2018), macroeconomic stability in low-middle income countries (Lyeonov et al., 2018).

At the same time, an empirical estimation of Environmental Kuznets curve for four countries with different income level for the period 1975-2014, fulfilled in the work of authors Azamand Khan (2016), proves absence of the proper dependences for countries with high income. In works (Apergis & Payne, 2014; Bildirici, 2013; Bilgili & Ozturk, 2015; Cho et al., 2015; Fang, 2011; Menegaki & Ozturk, 2016; Kahia et al., 2016; Ocal & Aslan, 2013; Salim & Rafiq, 2012) one of the proposed assumptions is bidirectional or unidirectional relationship of economic growth (GDP) and RES growth. For example, studies of Al-mulali (2015), Apergis and Payne (2014), Dogan, and Turkekul (2016), Menegaki (2016) are resulted in mathematic confirmation of bidirectional relationship between economic indicators growth (GDP) and RES growth in the country. Besides, works (Ben Jebli et al 2015; Mert, Bölük, 2016; Zoundi, 2017) study RES growth and associate it with volumes of CO2 emissions. Apergis (2010), Bildirici (2013), Ocal and Aslan (2013) prove dependence between CO2 emissions and RES (Ozturk & Bilgili, 2015). The research of Menegaki (2016) and Tugcu (2013) confirm independence (neutrality) of those indicators. To analyze relationship between RES and GDP in studies (Fang, 2011; Kahia et al, 2016; Tugcu, et al, 2012) authors use Cobb-Douglas production function:

$$Q = AL^{\alpha} * K^{\beta}$$

where Q = total production (the monetary value of all goods produced in a year); L = labour input (the total number of person-hours worked in a year); K = capital input (the monetary worth of all machinery, equipment, and buildings); A = total factor productivity; α , β are the output elasticity of labour and capital, respectively.

Modified function can be demonstrated as:

$$\ln Y_i = \phi + \alpha \ln REC + \beta \ln SREC + \gamma \ln K + \delta \ln L + \lambda \ln T + \mu$$

At the same time, we think that it is necessary to take into account level of country's political and macroeconomic stability, while studying the relationship between RES level and economic growth. It is explained by the fact that power plants, which use RES technologies, have long payback period. That is why, in the investment assessment the macroeconomic and political stability factors more significant, because most programs on RES introduction is supported by government. And GDP drop in countries, including EU member countries, during the financial an economic crisis was caused by macroeconomic instability (Vasylieva et al., 2018; Lyeonov et al., 2018). The main object of the article is to reveal connection between country's GDP fluctuation, RES volumes growth, considering political and macroeconomic situation in the country.

3. DATA

The authors have studied 7 European countries (Latvia, Lithuania, Moldova, Poland, Ukraine, Georgia and Belarus), which have similar economic situation by the time of the Soviet Union collapse. It lets to reveal general factors of development and dependencies between them. Analysing data of World Bank for the period 1995-2014, in relation to the ratio between average production volumes of RES and GDP per capita (fig 2), one may point out, that countries, which are not EU Member States - Moldova, Belarus and Ukraine, have low indicator regarding RES introduction and low GDP. At the same time Moldova, Belarus and Ukraine have larger potential of solar power plants, than other EU Member countries, but therefore, there is great difference in energy volumes, generated from RES. Poland and Lithuania have high indices of GDP per capita with low RES volume. We believe that soon one can observe increase of GDP level per capita and growth of the RES production. It is explained by the fact that there is relationship between GDP per capita and RES, because countries with high GDP per capita

have large production volumes owing to RES, and in rare instances, another situation can be observed, such as in Georgia. Therefore, Georgia is a country, which has abilities to increase GDP per capita thanks to RES.

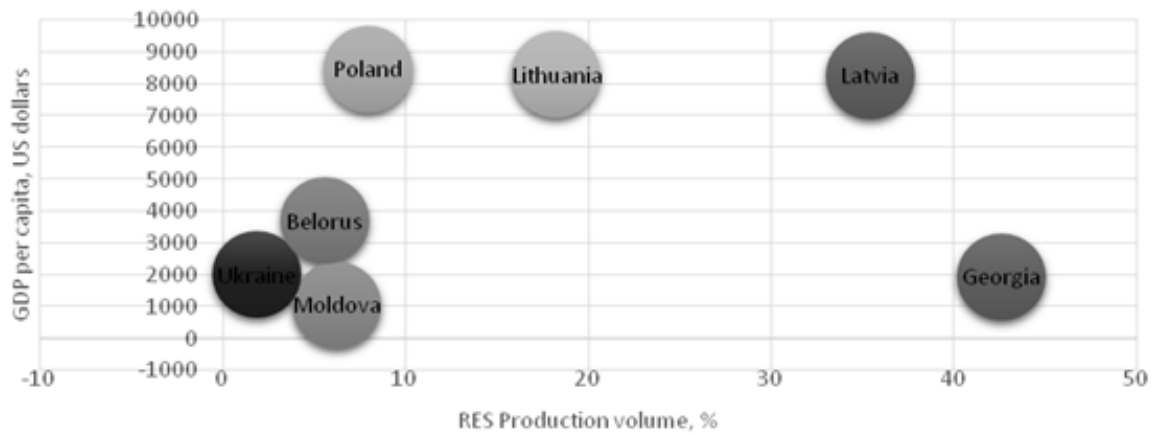

Figure 3: Ratio of energy production volumes thanks to RES and GDP per capita (the authors calculation)

4. METHODS

Considering studies (Fang, 2011; Kahia et al., 2016), we chose Cobb-Douglas production function as basic function of three constituents: technological coefficient, capital and labour, but it is modified considering RES production volumes, CO2 emissions, and political and macroeconomic stability level in the analysed countries. In works (Sadorsky, 2009) foreign investment impact on RES level is pointed out. In order to analyse panel data, we use fixed and random effects regression models, shown in the following way:

$$Y_{it} = \alpha + X'_{it}\beta + v_{it}, i = 1, \dots, N; t = 1, \dots, T$$

where α – intercept term, β – vector of dimension coefficients, X'_{it} vector-line of matrix, explaining the variables, t – time series of the model, v_{it} – modelling of the random fault. Herewith:

$$v_{it} = u_i + \varepsilon_{it}$$

where u_i – unobserved individual effect, which does not depend on time, but characterizes objects, which are not included into the regression model; ε_{it} – parameter, changed depending on time and analysed objects, may be observed as a random constituent.

Difference between fixed and random model consists in the fact that in the fixed model u_i is fixed parameter and ε_{it} is an individual equally distributed random parameter. It is expected that X_{it} is a parameter, which does not depend on ε_{it} for all i countries and t (2000-2014 in our model). Random effects model differs in the fact that individual random effects μ_i are presupposed to exist. Besides, $u_i \sim \text{IID}(0, \sigma_u^2)$, $\varepsilon_{it} \sim \text{IID}(0, \sigma_\varepsilon^2)$ and μ_i do not depend on ε_{it} (Clarke et al., 2015). X_{it} does not depend on u_i and ε_{it} for all countries (i) and years (t). This model is implemented for random set of objects. In order to select a model, which will describe the data most adequately, Hausman test may be used. It let to estimate and to choose the most objective model among fixed and random models. Main hypothesis is compared in the test, where u_i is fixed effect.

$$H_0: \text{corr}(u_i, X_{it}) = 0$$

or u_i is expressed as a random effect.

$$H_A: \text{corr}(\alpha_i, X_{it}) \neq 0$$

Hausman test is based on differences of assessments: $\hat{q} = \widehat{b}_{FE} - \widehat{b}_{RE}$, where b_{FE} – assessments of fixed effect model, and b_{RE} – assessments of random effect model.

Based on the above, modified Cobb-Douglas function may be shown in the following way:

$$\ln Y_1 = a_1 + b_1 \ln X_1 + b_2 \ln X_2 + b_3 \ln X_3 + b_4 \ln X_4 + b_5 \ln X_5 + b_6 \ln X_6 + b_7 \ln X_7$$

where Y_1 – GDP (current US\$), X_1 – capital (gross fixed capital formation), X_2 – labour (total population), X_3 – foreign direct investment, net inflows (BoP, current US\$), X_4 – economy openness, X_5 – macroeconomic stability in the country, X_6 – amount of renewable energy sources in the energy production system (%), X_7 – CO2 emissions.

Based on this function, hypothesis was checked by two ways: fixed method regression and random effects regression.

4.1. Panel results

Based on the calculations, we can see small similarity of fixed method regression and random effects regression results, table 1. Following the fixed method regression, non significant indicators include foreign direct investment (0.513) and economy openness (0.872). Data about CO2 emissions and macroeconomic stability are valid (0.003 and 0.001), they are within acceptable parameters ($X < 5\%$). The model is totally described with zero error. Dispersion is less than 0.06%. It should be mentioned that with increase of labour index, economy openness and foreign direct investment, total population (X_2) by 1%, will lead to GDP (Y_1) reduction by 2.953%. At the same time, RES volumes change (X_6) by 1% causes GDP growth by 0.2707%. GDP is positively influenced by capital (X_1), macroeconomic stability (X_5) and CO2 emissions (X_7).

Table 1: Fixed and Random Effects Regression (authors' calculations based on the World Bank data, estimated with Stata 14.2. * and ** represents significance at the 1% and 5% levels.)

Variables		Fixed Effects Regression		Random Effects Regression	
Depend	Inderpend	Coef.	P> t	Coef.	P> t
Y ₁	X ₁	0.6571554*	0.000	0.7735829*	0.000
	X ₂	-2.953006*	0.000	0.292325	0.703
	X ₃	-0.029413	0.513	0.0072939	0.397
	X ₄	-0.182067*	0.001	-0.4799553*	0.000
	X ₅	0.0148275	0.872	0.2501649**	0.033
	X ₆	0.2707344*	0.000	0.1588645*	0.000
	X ₇	0.3252465*	0.003	0.2427948*	0.000
	const	51.94154*	0.000	2.494204**	0.018
R-sq		0.9784		0.9604	

Following the random effects regression Table 2, insignificant figures are the same ones as in the fixed method regression, particularly–foreign direct investment (X_3 : 0.397) and economy openness (X_5 : 0,033).

In addition to them population index is an insignificant parameter ($X_2:0,703$). Therefore, all these parameters have positive impact on GDP level (Y_1). As the fixed method, this model has minimum dispersion and is described by these data. Macroeconomic stability parameters ($X_5:0.2501$) and RES level ($X_6:0.1588$) positively influence the GDP level (Y_1). While using both methods, RES percentage (X_6), macroeconomic stability indicator (X_4) and CO2 emissions volume (X_7) are significant and have positive impact on GDP level (Y_1). The received results have to be inspected for the necessity to implement instrumental variables using Hausman test. This test is a general test for model specification correctness. It is used to check the random effect model correctness in comparison with fixed effect model for penal data, the results of test are shown in the table 3. The received results show p-level <0.01 , that is why, in our case determined model is better suited to us. It was to be expected, because countries-neighbours of the European region with the same parameters are chosen in the concrete research. Based on data from Hausman test, it is necessary to use results of fixed method regression, since data of random effects regression do not conform to the fixed method.

*Table 2: Hausman Test
 (authors' calculations based on the World Bank data, estimated with Stata 14.2.)*

	Coefficients		(b-B) Difference	sqrt (diag(V_b-V_B))
	(b) fixed	(B) random		
X_1	0.6571554	0.7735829	-0.1164275	
X_2	-2.953006	0.292325	-2.982239	0.4173638
X_3	-0.029413	0.0072939	-0.102352	
X_4	-0.182067	-0.4799553	0.2978946	
X_5	0.0148275	0.2501649	-0.2353374	
X_6	0.2707344	0.1588645	0.1118699	0.231371
X_7	0.3252465	0.2427948	0.0824517	0.842984
b= consistent under Ho and Ha; obtained from xtreg				
B= inconsistent under Ha, efficient under Ho; obtained from xtreg				
Test	Ho: difference in coefficients not systematic $\chi^2(7)=(b-B)'[(V_b-V_B)^{-1}](b-B)=54.39$ Prob> $\chi^2=0.000$ (V_b-V_B is not positive definite)			

Although there is different GDP level, the studied countries have an explicit trend to increase GDP, and small reduction in all countries during 2005-2010, caused by the world crisis in 2008.

5. CONCLUSIONS

Providing humanity with energy is directly related to the environmental load. Most energy in the world is produced by means of the burning process. It leads to harmful substances emissions into the atmosphere. During 1961-1979 CO2 emissions into the atmosphere were constantly increased. Understanding the environmental problem, important documents were approved in European Union, among which Directives 67/548/EU, 70/220/EU and UNO Stockholm Declaration, the goal of which was to reduce the environmental load and emissions volume. It lead to decrease of CO2 emissions into the atmosphere on the average by 14 % annually. In order to ensure goals of the sustainable development and modern demands in energy in the world, renewable energy sources implementation gains great popularity. Many countries, including Latvia, Lithuania, Moldova, Poland, Ukraine, Georgia and Belarus set a goal to be greatly provided with energy thanks to renewable sources in future. The relationship between economic development and environmental load is studied by scientists from the whole world, among which Panayotou, Apergis, Bildirici, Ocal, Menegaki, Tugcuand others. They study linking between economic growth (in GDP) and renewable energy sources, and growth of

renewable energy sources with CO₂ emissions volume. In order to investigate changes of GDP level in the country with renewable energy sources growth taking into account political and macroeconomic stability of the country, we choose modified Cobb-Douglas production function, constituents of which are: technological coefficient, capital, labour, RES production volume, CO₂ emissions, macroeconomic stability level. The fixed and random effects regression model to analyse panel data of seven countries (Latvia, Lithuania, Moldova, Ukraine, Georgia, and Belarus) during 1995-2014 were used. In order to choose more adequate and objective model, Hausman test may be used. Based on the findings of fixed method regression parameters of foreign direct investment and economy openness were not significant. Parameters of labour, capital, CO₂ emissions, macroeconomic stability and RES production volumes were significant. Model was described with zero error, dispersion is less than 0.06%. The research's hypothesis is confirmed by the findings. The RES energy production volumes and macroeconomic stability were statistically significant. Growth of one parameter leads to GDP growth. In case of RES growth by 1% GDP growth will be 0.2707%. Increase of macroeconomic stability index by 1% will cause GDP growth by 0.0148%. In this case, it is necessary to update mechanism and instruments of spreading RES considering the statistically significant linking between RES and GDP with purpose to decrease CO₂ emission and achieve the macroeconomic stability.

ABSTRACT

It is one of the important priorities that the Azerbaijani government has put forward and successfully implemented provision of sustainable socio-economic development in our country. Sustainable development - it is envisaged that the needs of today's generations will be met in the normal way without interfering with the future generations' ability to meet consumer needs. The concept of sustainable development is harmoniously coordinated with ecological, economic and a trio of social issues. One of these economic issues is food security. The first strategic objective of the "Strategic Road Map for the Production and Processing of Agricultural Products in the Republic of Azerbaijan", consisting of nine strategic goals enhancing institutional capacity to ensure food security. Proposals for the creation of the Food Safety Commission on this strategic objective have been prepared. At the same time, international experience has been studied for conducting regular monitoring to assess the risks of food supply with respect to sustainability and a food safety monitoring project has been developed. Food Safety Agency has been established to ensure food security in the country effectively. The main purpose of long-term measures in the field of food security is to increase the profitability and competitiveness of Azerbaijan's agriculture, as well as to integrate it into the international economic system. Food security should be ensured primarily by improving agriculture and improving the food consumption situation in the country. However, experts do not consider the current level of subsidies to the state to be sufficient to ensure food security. Nevertheless, more subsidies are needed to achieve food security and the proper and efficient allocation of allocated funds remains an important issue.

Keywords: *Economic problems, Food safety, Sustainable development*

1. INTRODUCTION

Sustainable development means that the needs of today's generations will be met in the normal way without interfering with future generations' ability to meet consumer needs. The philosophical essence of the sustainable development concept is to use the planet's natural resources efficiently and economically, to preserve the environment, and to improve the quality of life of present and future generations. Along with that, sustainable development envisages socio-economic and environmental development aimed at meeting the needs of the people wisely and maintaining peace on the planet. The basis of the sustainable development concept is a trio of triangularly harmonized environmental, economic and social issues. Food security is the main social and economic issues of sustainable development.

2. FOOD SAFETY

The government of Azerbaijan put forward and is one of the important priorities that it has successfully accomplished provision of sustainable socio-economic development in our country. As it is evident, it envisages a comprehensive, diversified development of the country's economy. Sustainable development - the systematic approach that combines the economic, environmental and social components of the selection and realization of human development indicators a new development paradigm that reflects the vital importance of a systematic approach. Here is the talk the radical change of the values and goals of modern society, direction and content of various spheres of human activity based on the epoch of the new era of human

development. Blossoming, justice and healthy environment (environment) express a desire for a better future. Sustainable development with the correct choice and proper politics making it possible to realize this desire. Sustainable development the needs of today's generations are expected to be met without interfering with the possibility of future generations to meet consumer demands. The philosophical essence of the sustainable development concept is to use the planet's natural resources efficiently and economically, to preserve the environment, and to improve the quality of life of present and future generations. In addition to the sustainable development involves the wishes of people's needs and socioeconomic and ecological development aimed at maintaining peace on the planet. The basis for a sustainable development concept is a trio of triangular ecological, economic and social issues. Food security is the main social and economic issues of sustainable development. One of the main tasks facing each state national security of the country. An important part of the national security system that covers a wide range of issues is ensuring food security. The history of different countries shows that indifferent attitude to the problem can lead to public shaking of the state. When it comes to "food security" a set of measures that ensure the continuous, long-term and sustained repayment of the population's basic nutritional needs within the framework of defined quality standards. The concept of food security includes three elements: availability of high quality food products; families can get this food; similar nutritional composition of food. At the family level, this is a problem that is not enough, in other words, poverty. Food Program in Azerbaijan has been implemented since 1996. This program focuses on the long-term improvement of food security, along with sustainable agricultural development and poverty reduction. Food security means that people have access to sufficient physical and economic access to quality food products at any time to an active and healthy lifestyle. One of the main elements of this is the fact that each citizen has the physical and economic access to quality food, as well as the economic independence of the country's national food system, its dependence on the basic foodstuffs, reliability, protection against food, seasonal, weather and other factors, , the development of the national food system in the expansion of production. Food security is one of the basic human rights, one of the basic human rights. Therefore, ensuring this right is one of the most important tasks of the Government of the Republic of Azerbaijan. "Food Safety Program of the Republic of Azerbaijan" Covers the commitments and goals of the Government of the Republic of Azerbaijan in food security. The objectives of the food security program are:

- Implementation of measures aimed at increasing the production of local agricultural products and maintaining reasonable prices for food products;
- Establishing a system to prevent acute malnutrition.

To achieve food security, the Government of the Republic of Azerbaijan undertakes to implement the following two stages:

1. Introducing short-term and mid-term transition measures to ensure food security during reform. This is mainly provided through private farming and entrepreneurship. At this stage it is planned to conduct the following activities: control over implementation of relevant laws; specification of budget allocations required for achieving anticipated preliminary results; Consideration of application of temporary tax privileges in food production; assistance in obtaining loans for the production, processing and sale of food products; food products producers' protection from food imports; restructuring of mutual debt between enterprises; enhancing consumer protection; implementation of additional measures for emergency preparedness by establishing a relevant information system in the area of food safety.
2. The main purpose of long-term measures in the field of food security is to increase the profitability and competitiveness of agriculture in Azerbaijan, as well as to integrate it into

the international economic system. Food security should be ensured primarily by improving agriculture and improving the food consumption situation in the country.

In order to achieve this, it is planned to implement the following four key actions: converting farms into institutions that meet the requirements of commercial and market economy, limiting phases for the agricultural and food sectors; the development of food production in the country and ensuring the competitiveness of agriculture; Carrying out public investment policy that contributes to the development of infrastructure in the village. Quality and safety of food products can be provided by applying single-monitoring monitoring of food products produced in the country and imported from foreign countries. It is essential to take the above measures to improve the nutrition of the population. The first strategic objective of the Strategic Road Map for the Production and Processing of Agricultural Products in the Republic of Azerbaijan, consisting of nine strategic goals, is to strengthen the institutional capacity to ensure food security. Proposals for the creation of the Food Safety Commission on this strategic objective have been prepared. At the same time, international experience on regular monitoring of risk assessment in terms of food supply and supply stability has been studied and a draft guideline on food safety monitoring has been prepared. In order to assess the production potential of food products, the production, import and export of agricultural products in the country has been analyzed and predictions for the future have been calculated. Food Safety Agency has been established to ensure food security in the country effectively. The main purpose of long-term measures in the field of food security is to increase the profitability and competitiveness of Azerbaijan's agricultural sector and to integrate it into the international economic system. Food security should be ensured primarily by improving agriculture and improving the food consumption situation in the country. However, experts do not consider the current level of subsidies to the state to be sufficient to ensure food security. Nevertheless, more subsidies are needed to achieve food security and the proper and efficient allocation of allocated funds remains an important issue. The system of food security of the Republic of Azerbaijan differs significantly from international requirements and advanced practices and can not fully ensure the safety of food products. Compliance with the requirements of the European Union and related international organizations and enhancing the safety and quality of the food security system and the parallelism of the various bodies in the field of food safety are essential. The system of food security in Azerbaijan does not meet modern requirements and there are duplications in this area. Specifically, food safety standards, sanitation and phytosanitary norms and regulations have been developed during the Soviet era and there was a need to improve in line with international requirements. One of the key points is the improvement of product inspection mechanisms during export-import operations. In particular, there is a need to adjust the products inspection procedures to the requirements of the World Trade Organization. Approved by the Decree of the President of the Republic of Azerbaijan dated December 6, 2016 "Strategic Road Map on Production and Processing of Agricultural Products in the Republic of Azerbaijan" in the field of food security control, it was planned to eliminate parallelism and establish an effective regulatory system. In this regard, the Decree of the President of the Republic of Azerbaijan "On Additional Measures to Improve the Food Security System in the Republic of Azerbaijan" of February 10, 2017, is expected to contribute to the improvement of the food safety system in the establishment of the Food Security Agency of the Republic of Azerbaijan. The Food Safety Agency will provide the following activities from January 1, 2018:

1. Normative regulation on safety of food products in the Republic of Azerbaijan (preparation and approval of sanitary norms and rules, as well as hygienic normatives) and risk analysis;
2. Carrying out hygienic certification work, as well as issuing quality certificates to foodstuffs exported to foreign countries;

3. Implementation of state control at all stages of food production in accordance with the risk level of the product on the basis of the protection of the rights of consumers of foodstuffs and the principle of "from the field to the table".

Along with that, the Cabinet of Ministers together with the Agency will prepare and submit to the President of the Republic of Azerbaijan a draft of "State Program for Food Security in the Republic of Azerbaijan for 2018-2025" within 6 months. In the preparation of the State Program, the following priority areas will be taken into account: - Adjustment of normative legal acts on food safety, including standards, sanitation, phytosanitary and veterinary norms and rules, to the International Convention on Plant Protection, Codex Alimentarius Commission and the World Animal Health Organization provision; Ensuring compatibility of food product conformity assessment system with international requirements; - classification of food products on risk groups (low, medium and high risk) taking into account international experience and identification of criteria for risk assessment; - improving the control system for the circulation of genetically modified organisms and their derivatives; developing and implementing control systems and mechanisms in accordance with the risk level of the product at all stages of food production based on the principle of "from the field to the table"; - Strengthening human resources in food security; - Strengthening and modernization of the logistics base for the safety of food products (including the expansion of the network of laboratories and the international accreditation of laboratories). It should be noted that the decree of the President of the Republic of Azerbaijan "On Additional Measures to Improve the Food Security System in the Republic of Azerbaijan" of February 10, 2017 also contributed to the determination of the exact boundaries of the distribution of powers to eliminate parallelism in the activities of different bodies. Thus, the implementation of state control and services in the area of veterinary, plant protection and quarantine (except for animal and plant products and raw materials) is carried out by the Ministry of Agriculture of the Republic of Azerbaijan, control over the safety of food products including animal and vegetable products and raw materials and the implementation of the exercise will be carried out by the Agency. The Cabinet of Ministers will prepare and submit to the President of the Republic of Azerbaijan proposals on improvement of the existing normative legal acts with the Ministry of Agriculture of the Republic of Azerbaijan and the Agency for elimination of cases of repetition of the powers of other state bodies and organizations during the supervision of this field within 4 months. In addition, the State Committee for Property Issues of the Republic of Azerbaijan together with the Agency should solve material and technical issues for the organization of the Agency, inventory the property of other state bodies and agencies that can serve the Agency's activity, submit proposals on the transfer of that property to the Agency within 5 months prepare and submit to the President of the Republic of Azerbaijan. At the same time it should be noted that assignment of the National Coordinator of the Codex Alimentarius Commission of the Food Safety Agency has been included among the tasks to be provided, which will serve to further deepen the activities in this area. As a result of the establishment of the Food Security Agency, which acts as a single supervisory body, it will improve the system of food safety in the country, increase transparency in this area, eliminate duplication and duplication, as well as measures to be taken in the "Strategic Road Map on Agricultural Production and Processing in the Republic of Azerbaijan" will be implemented successfully. The main purpose of long-term measures in the field of food security is to increase the profitability and competitiveness of Azerbaijan's agriculture, as well as to integrate it into the international economic system. Food security should be ensured primarily by improving agriculture and improving the food consumption situation in the country. However, experts do not consider the current level of subsidies to the state to be sufficient to ensure food security. Nevertheless, more subsidies are needed to achieve food security and the proper and efficient allocation of allocated funds remains an important issue.

Food safety problem has been solved in Azerbaijan. However, in the context of global natural disasters and warming, world countries should work together to build a sustainable food chain. Now, international experience in establishing a stable food chain is transmitted to Azerbaijan. UN Food and Agriculture Organization (FAO) praises cooperation with Azerbaijan. According to the cooperation document between the organization and Azerbaijan, which will cover 2016-2020, new projects will be launched in the near future. These projects have been working for over two years. Azerbaijan's biggest success in ensuring sustainable development is to reduce poverty. The development of agriculture in the country is directly related to the successful implementation of sustainable development goals. The government attaches great importance to the development of agrarian sector. 47% of the country's population lives in the village. 1.7 million people work directly in agriculture. Agriculture has a special share in the formation of national product in the Azerbaijani economy and the government is closely involved in all global projects to ensure food security in the world. The agrarian sector has entered the new stage in the country and the achievements of Azerbaijan in the agrarian sphere are exemplary. The state is always with the farmer. At present, a number of new projects in the field of sowing and livestock are planned to be implemented. Projects are also being implemented to increase employment in the agrarian sector, and special programs for the employment of women are envisaged. The achievements in agriculture in Azerbaijan are evaluated as a result of proper coordination among all sectors. Reports on various aspects of Sustainable Development were presented at the seminar. In the modern world, food security is shaped by global influences, with the effects of various social, economic, political, technological, biological, geographical, historical, ethnic, and spiritual roots. In this sense, his full and thorough study obliges several science fields. The analysis shows that from a theoretically-economic point of view, food security covers the system of relationships that includes the production, transportation, processing, distribution and consumption of food products. In the theoretical solution of this problem, the ratio between the size of food and population, the average norm of consumption of foodstuff, composition, food productivity, poverty line, food supply level and other issues are determined. In addition to these key criteria, the concept of food security includes the calorie level, quality, appearance, and other factors of food products. The fact that the food problem has such a socio-economic nature indicates that this issue is broader than the production of agricultural and food products. In general, the global problem of food problem is related to many socio-economic problems faced by different countries. Here are the issues of strengthening the industrialization and urbanization processes, changing the directions and dimensions of agricultural production, the reduction of the volume of organic food products, and other fateful and serious concerns. At the same time, the existence of natural resources, the level of economic development, the rate of harvesting, the level of armaments of agriculture, the use of advanced production methods, the employment and education level of the rural population, the regulatory role of the state in the agrarian and food complex, these and other factors, such as existence, have a crucial role. There are numerous negative factors that are of concern to the modern world of globalization. For example, global climate change, decline in food supplies, and the occurrence of various types of dangerous infectious diseases; deterioration of the quality of food products due to environmental degradation, sharp increase in their prices, and others. Such an activity has a considerable impact on the harmony of the 81. Indicators characterizing the activities of the food market, in particular prices, the cost of the consumer basket, farmers' revenues, are based on the priorities of the agrarian and food complex. In economic literature, sometimes speaking about the possibility of agrarian development in terms of food supply, in many cases the role of the consumer goes to the second plan. We think that the agrarian and food market is ultimately unwanted because it works for the consumer. Certainly, the adoption of consumers as a priority in different economic and technological systems can also lead to unpleasant consequences for those systems.

This is typical for the food market and the agrarian sector. The consumer's superiority in the food market is not the only factor. It is noteworthy that at the civilized level we are the intellectuals, to go in the backyard of consumer thought, and to think that it is unquestionable, is inexpedient. Adjustment of agrarian and food relations in the market economy is sufficiently multi-faceted. From the point of view of ensuring food security, state regulation of these relations is characterized primarily by the state support to agricultural commodity producers. This process is more successful in the experience of developed countries. It should be noted that the state assistance provided to agricultural commodity producers from the aspect of ensuring food security in the countries of the European Union is also sufficiently completed by the public procurement system. At present global food markets need serious ecological clean and high quality agricultural and food products. Generally speaking, environmentally friendly agriculture should not be understood as the production of pure natural products. It is important for the environment to preserve soil fertility in natural ways in 84 ways, and the preservation of good microorganisms, flora and fauna in nature. It is important to take measures in accordance with the requirements of the technical regulation on production, storage, transportation, processing, realization and import operations of all stages in ensuring the safety of the products. Ecologically Clean Products - Products containing harmful substances are considered normative products that are fewer than ordinary products. Ecologically clean products are derived from pure fertilizers, pesticides and other non-polluting areas. The products obtained from the minimal external contribution from natural raw materials can also be considered as environmentally sound. Eco, bio, and organic terms are different concepts that express the same process. The ecological integrity of the goods is marked by the marks on their labels. Observations show that some countries have greater potential for producing environmentally friendly food products today. The number of farms producing organic foodstuffs grows rapidly in Europe, Asia, Africa and Latin America. For example, 70 percent of the world's environmentally-friendly foodstuffs fall on North American and European countries.

3. CONSLUSION

Effective use of existing useful lands, including sowing lands, increasing the role of the national economy in ensuring food security of the population of the world countries and reducing dependence on the international market; It is expedient to design and approve national physiological norms for the proper assessment of food security; Increasing the economic activity of the able-bodied population, ensuring full employment is a key factor in food security; Ensure adequate availability and acquisition of safe, diverse, nutritious food, prevent the lack of access to clean water, sanitation and health care, proper nutrition for children and adults, as well as assistance in identifying proper nutritional choices; Taking into account the needs of a single global economy, the application of a regular organizational and regulatory arrangement on a global scale and across different regions and countries is one of the tools to rationalize the use of natural resources and address the food security problem. We consider the abstinence of the production method based on the principle of spontaneous competition and the opinion of economists conducting research in this area, considering that one-fifth of the world's population experiences food shortages and suffer from hunger, rapid population growth, natural resources depletion. Planned and regulated production relations can be considered as a key condition for the solution of a global food security problem; The main types of foodstuffs are the decline in the area of crops, the major part of the land is withdrawn from the sowing cycle, involving industrial development, infrastructure development, as a result of increased soil erosion as a result of intensive agricultural development in the 60-80s, new forest lanes the emergence of the need to create grasslands and the creation of the meadows has resulted from the increase in the population of the world demanding the expansion of cities, settlements, gardening and

related infrastructure; Environmental pollution also harms agricultural and food security. Many waste, gas and other substances are environmentally friendly. Climate warming in the future, melting of glaciers may lead to the 6-7 meters rise of the World Ocean, which means hundreds of cities and villages are flooded; About 1.4 billion people worldwide, including 43 million children, suffer from weight loss. About a third of them are facing obesity and are facing cardiovascular diseases, diabetes, and other health problems. According to calculations, loss of labor productivity and the loss of the world economy in terms of direct health expenditures are less than 5 percent of global income. Complete cutting of the root of the world is a difficult issue, but the investment to be able to justify itself at a high level. For example, according to the CCT estimates, if the world community invests \$ 1.2 billion in micro-nutritional deficiencies for five years, it will result in better health, child mortality, and higher benefits for the future.

THE DEVELOPMENT OF INTERACTION FORMS AND METHODS FOR INNOVATION ACTIVITY SUBJECTS IN REGIONAL INNOVATION SYSTEMS

Naila Aliyeva Rauf

*Assistant professor of Economics department
Azerbaijan State University of Economics (UNEC)*

ABSTRACT

In this article, we systematize all the factors for the development of regional innovation systems and formulate the concept of innovative entrepreneurship. In the course of this research on issues related to an insufficient number of innovative entrepreneurs, an analysis was made of the main characteristics of programs of foreign universities that train specialists in innovative technological entrepreneurship. The results of this analysis showed that the basic principles of such programs are: Universities form an educational group of students in such a way that students of economic and natural sciences study at the same time in one group. For example, the University of Tennessee (Martin, USA) determines the contingent of students on the basis of 50:50. One of the leading programs in the field of technology entrepreneurship, the Georgia University of Technology program, forms groups in a way that each of the project teams includes at least three people: a student enrolled in the MBA program, a student in law school and a student in the natural sciences program or engineering specialties. The educational program is structured in such a way as to maximize students' practical skills in assessing market and technological prospects, skills in preparing business plans and developing the final product, and skills in conducting future business. Despite the diversity of educational programs aimed at participants of innovative business, all technological entrepreneurship programs are designed mainly for managers of innovative projects, and the objectives of this training are, as a rule, to transfer to the audience information about the rules and methods of functioning of innovative product markets necessary skills for managing innovative projects. However, it should be noted that it would be deeply mistaken to equate such participants in the innovation process as an innovation manager and an innovative entrepreneur.

Keywords: *subject, regional, innovation, renovation*

1. INTRODUCTION

This article is devoted to solving problems and, accordingly, is aimed at achieving the main objectives of this paper, the proposal of the development of interaction forms and methods between innovation activity subjects (IASs) in regional innovation systems (RISs). It is obvious that development of interaction forms and methods for innovation activity subjects in regional innovation systems cannot occur in isolation from development of the concept of an innovation business ecosystem. Therefore, creation of Regional Centres of Incubation and Acceleration (RCIA) on the way to develop the interaction of IAS in RIS is the main task. Such RCIA must necessarily be created on the basis of a public-private partnership in the legal form of a joint stock company (OJSC). The commercial form of organizing RCIA will allow us to hope that the activity of private regional business will be high, since in the case of successful development of this project, investments in the development of RCIA will be rewarded with dividends. The main income of RCIA will be associated with the possession of a certain number of shares of innovative enterprises that will be developed on RCIA platform. The author has placed Regional Centre for Incubation and Acceleration in the core of regional innovation system as the main platform for the development of innovative business in the region and has not proposed using, for example, the leading regional university for this purpose, as it was done in Silicon Valley or Boston, Massachusetts, USA (Stanford University and MIT, respectively).

Also, the author has not considered the largest production association forming the basis of a regional industrial innovation cluster as RIS platform, as it was done in Germany. The main reason for which the author has been forced to offer to create RIS platform ‘from scratch’ is the complete technical and psychological unpreparedness of regional universities and industrial enterprises to the development of modern RIS. Therefore, all attempts to remake the systems of regional Russian universities and industrial enterprises that had been folded over the years and even over generations to the developmental needs of modern RISs are of high risks associated with waste of time and enormous financial losses, as well as serious tests for these universities and enterprises. This is confirmed by the absence of examples that speak about the dynamics of the development of technological platforms in Azerbaijan which have been launched since 2011.

2. DESCRIPTION OF THE FUNCTIONING OF THE REGIONAL CENTRE FOR INCUBATION AND ACCELERATION (RCIA)

The central element of RCIA functioning as a self-organized innovation system (see Figure 1) is the Regional Innovation Centre (RIC). It is assumed that access to all resources and services of an individual RIC can be provided by any representative of IAS, not only in the region in which the RIC is located, but also in any other region of the country, as well as IASs from other countries. It is assumed that optimization of the regional innovation ecosystem is achieved through the use of electronic capabilities to provide RIC with projects in a given format. It should be noted the quality level of the projects that will come to RIC; RIC will receive and consider innovative projects at any stage of their development. Organization of the work of the RCIA is also different in that it incorporates such a mechanism that would allow the authors of ideas to contact RIC again and again. Therefore, a necessary condition for the successful launch and operation of a self-organized ecosystem is that all the mechanisms of this system, reflected in Figure 1, would be fully focused on active work with the authors of innovative ideas and projects.

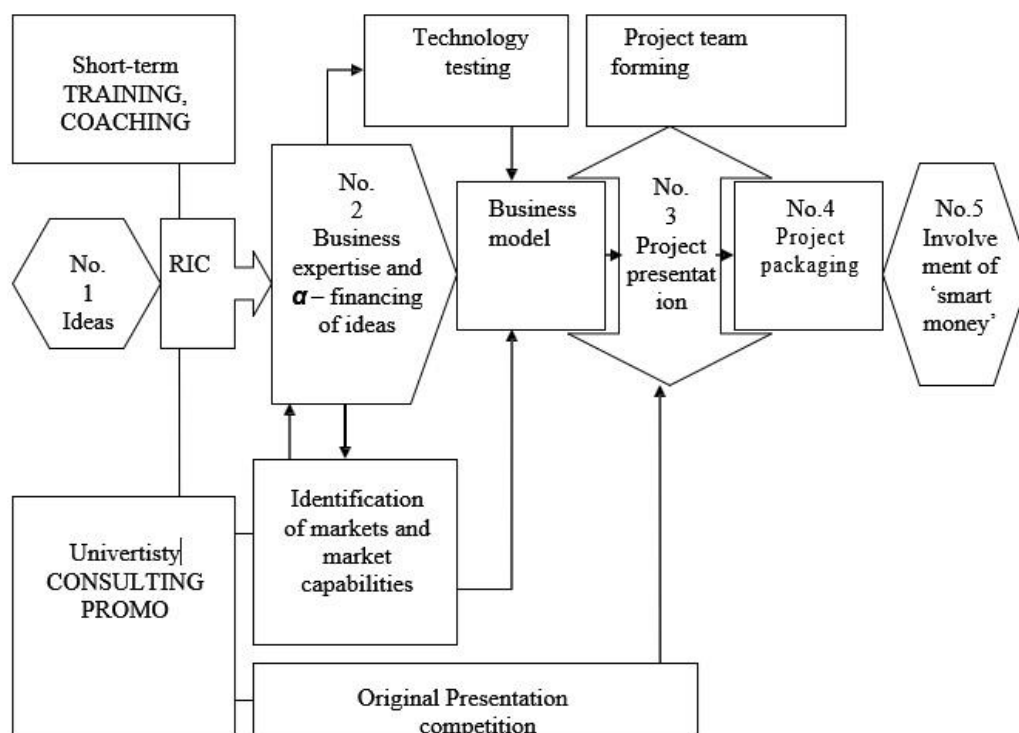

Figure 1: Organizational model of a self-organized regional innovation ecosystem based on RCIA

The main task of the regional centre for incubation and acceleration is to ensure that the flow of projects in RIC does not run out over time. To do this, certain work should be done with the applications of the project initiators. It is necessary that the authors of the applications receive mandatory feedback after each contact with RIC. On the other hand, it is clear that a large volume of applications cannot be processed by an individual specialist or a small group of specialists who would be responsible for initial and subsequent selection of applications. Therefore, it is difficult to imagine a solution to this problem without the active and systematic assistance of the university environment, where specialists and their assistants from a number of senior students specially trained to work at RICs would participate in the process of selection and accreditation of applications on innovative projects for RICs. Below are some explanations of Figure 1.

2.1. Element No.1 - 'Ideas'

A summary of projects can be received at the entrance of the innovation centre both remotely, via the Internet, and through personal delivery. The authors of innovative ideas can be not only residents of a particular region and representatives of other regions, but also authors of innovative ideas from other countries. Therefore, the languages of presentation of the summary of business plans for innovative projects should be Azerbaijani and English. 'Students of Business Departments' are students, graduate students of intercollegiate departments who have received or receive their first technical education at universities accredited by the innovation centre and who receive a second economic education at the intercollegiate department at any leading regional university.

2.2. Element no.2

Accredited experts are representatives of the venture business community in the region, country and foreign countries. The main tasks of experts should include an assessment of the business prospects of a new idea and technology, an assessment of a potential market, and the formulation of a business model. In addition to assessing the potential of the business idea of the project, experts should be actively involved in facilitating the allocation of financial resources for *a*-financing of projects. In addition, experts should be involved in master classes for students at the intercollegiate department. Today, *a*-financing of innovative projects at the seed stage is carried out on a regular basis in the country by the Science Foundation. It is proposed in the Organizational Model to combine the efforts of RIC and Science Foundation with the work of the expert group. It is necessary to involve in the work of the expert group not only scientists as organized by the Science Foundation today, but also the venture business community.

2.3. Short-term seminars

These are 1-3-day seminars, webinars, short-term courses that should be held on the territories of universities accredited by RIC. Holding seminars in the territories of accredited universities will allow attracting to this topic not only students from intercollegiate departments and project participants, but also students from other universities interested in the technology business. Attendance of seminars must necessarily be paid, however, the price of seminars must be lower than in the commercial market.

2.4. Element no.3. - Project accreditation stage

Before the project will receive accreditation in RIC, it is assumed that project participants (innovative teams) should go through five stages which will be organized and coordinated by RCIA. Thus, innovative teams will need:

1. To make a presentation of a project at a national innovation competition;
2. To take part in specialized team building events for innovative projects similar to the projects

Start!, Start up Weekend, Commercialization Reactor and others. All this will allow applicants 'try on the life of a start-up' participating in the abovementioned activities for several days, as well as prepare and make a presentation of the project to its potential investors;

3. To make a presentation to national venture capital investors on Smart Money Fairs which are yet to be organized in Russia;
4. To make a publication about a project in a specialized venture media. This will allow fixing the event of the birth of the project and notify the interested parties of the project;
5. To present the project at the international venture fair to foreign investors. This will enable the project team to prepare a presentation of their project in English and test the international component of the project business idea to international experts.

The main result of all the abovementioned stages will be considered not so much the success in attracting funding for the project, as the project team formed. Without a formed team, further development of the project will be impossible and, as a result, attracting venture capital to the project will be extremely difficult. Original Presentation contest should be held regularly among authors of innovative ideas and students of intercollegiate departments. The purpose of this contest is to attract project authors and students to modern technologies for conducting presentations for investors. Visibility, simplicity and persuasiveness, this is what companies lack today in presentations to investors. Therefore, investors must certainly be present in the jury of Original Presentation contest.

2.5. Element No.4 - 'Project Packaging'

At this stage, the project team should have the following three components: a presentation for the investor, a business plan and a project team prepared for the official proposal for future investors.

2.6. Element No.5 - Attraction of 'smart money'

It is assumed that investors of start-up projects will be businessmen who understand the logic and specifics of innovative technology projects, and the funds provided by such investors are called 'smart money.' These investors include, first of all, business angels and venture funds which may relate not only to the region where the authors of the projects live, but also be residents of other regions or even other countries. For the effective functioning of the innovation business ecosystem, the main idea should be laid in its mechanism; the project should not reach the investor bypassing at least the first three stages reflected in Figure 1 (stages - business expertise, team building and packaging). This important principle will allow projects to be dynamic when searching for investors and not to depend on individual random offers of those investors who far from understand the development of innovative projects.

3. TECHNOLOGY OF THE REGIONAL INNOVATION CENTRE (RIC) OPERATION

The successful operation of RICs lays the foundation for the successful functioning of the entire RCIA and, as a result, of the regional innovation ecosystem. Therefore, below is a model of RIC operation which is formed, among other things, on the basis of practical experience which the author of this dissertation has acquired working in several federal and regional investment companies and considering applications from applicants. The main stages passed by the application of financing applicant:

- Registration of Application for Financing. At this stage, it is assumed that the applicant must submit an application in the prescribed form in Russian and English in RIC (Figure 2) (Stage 1).
- Signing of Cooperation Memorandum take place in Stage 2.

- At the next stage, projects are sorted into stages of development and industry property: stage 'idea', phase ' α -testing', phase ' β -testing' (Stage 3).
- Training of project participants (courses, seminars, and webinars) takes place on Stage 4, and drafting a 'project summary' at Stage 5.
- The next stage passed by the application is related to the preparation of two project presentations, PowerPoint and Video-presentation, with the same capabilities as in Stage 4 (Stage 6).
- At Stage 7, the project is assigned an ID code which will remain unchanged until the authors of the project provide a good reason for this (change of project founders, change of concept or idea of the project).
- At the next stage passed by the application, a summary of projects and presentations is sent out either directly to investors or experts for further development. The obligatory component of this stage is guaranteed feedback from investors and experts accredited by RICs in the direction of the authors of the project (Stage 8).
- Stage of connecting the project to service capabilities of RIC is provided at Stage 9, and the accreditation of the project by RIC is at Stage 10.
- After receiving accreditation at RIC, the project can receive targeted development grants and recommendations from RIC for potential project partners (Phase 11).
- The archiving of application projects from the authors of the innovative idea takes place at Stage 12.

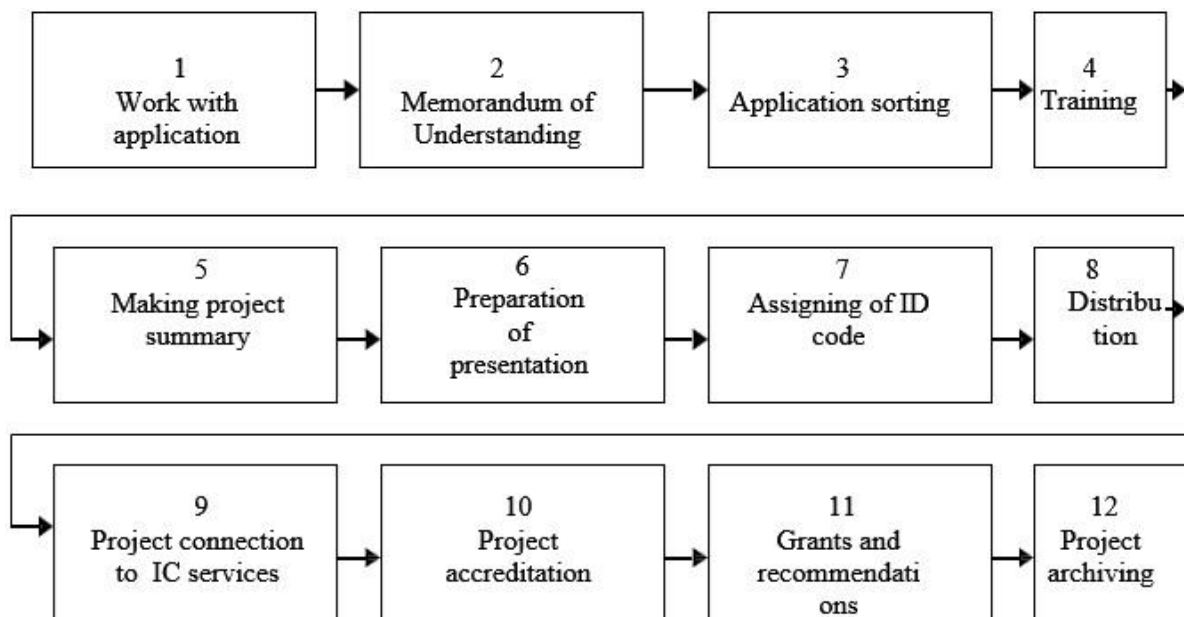

Figure 2: Model of organizational processes of RIC when the application is received from the authors of the innovative idea

The work of RIC should be organized by the venture community of Russia itself so that any author of an innovative idea, regardless of place of residence, could find attention to himself/herself and his/her idea in this centre. A satisfactory performance of an innovation business ecosystem can be considered as its ability to carry out a project from idea to market. Therefore, in order for the ecosystem of a regional innovative business to reach the level of self-organization, it is necessary to develop it step-by-step. At the first stage, the work of the subjects of the innovation system (SIS) in the direction of any industry specialization that would be consistent with RIS technological strategy should be adjusted. Development of a particular industry specialization implies the creation of an appropriate qualitative examination of projects

and other elements of the innovation business infrastructure associated with the chosen specialization. After the launch and adjustment of the first SIS will be considered complete, it will be logical to consider the creation and development of the next self-organized RIS with its specialization in another region of country. Thus, the task of expanding the range of RIC specializations over the entire range defined by NIS can be solved step-by-step. One of the advantages of RIS specialization is that the precise positioning of RCIA will allow involving in its work the maximum number of partners (universities and experts), both domestically and abroad, in a relatively short time. RIS specialization will allow laying a solid foundation for the further development of regional innovation clusters, as well as involving in the creation of a modern and rapidly developing international system of technological audit (due diligence), referred to as Proof of Concept Centres (POC).

4. MODEL OF CONVERSION GROWTH OF INNOVATIVE BUSINESS IDEAS

One of the main tasks that the proposed above model of ecosystem of a regional innovative business solves is to solve an important problem, an increase in the share of projects that managed to go through a difficult path from the first presentation to investors to getting funding, that is, an increase in the share of business ideas conversion. Successful conversion of business ideas into technological start-ups is possible only with the direct financial interest of each participant of the innovation process in the success of the project. Figure 3 offers a model of mutually beneficial cooperation among the participants of the innovation process. A new element of the interaction of IAS is that, as expected, all participants in the innovation process are project investors, including experts and consultants. It is this approach, in which the authors of the innovation project appeal to each participant of the innovation process as an investor, determines the vector of project development and contributes to the effective promotion of the project to its success. Settling by start-up shares for rendered consulting services contributes to the solution of two parallel tasks. Solving the first task allows attracting the best experts and consultants to technological projects, and solving the second task promotes development of the institute of protecting start-up minorities because after acquiring startup shares the consultants and lawyers themselves become project shareholders. Therefore, the protection of the minorities' rights will occur by means of consultants and lawyers themselves, competent people sophisticated in the protection of corporate interests. Such an approach in the interaction of IAS will contribute to the development of the institution of minorities' rights in Azerbaijan. In this light, the present practice of allocating grants to help start-ups for consulting can be considered ineffective in the long term, because it is much more effective to contribute to the development of projects by including consulting structures in project shareholders.

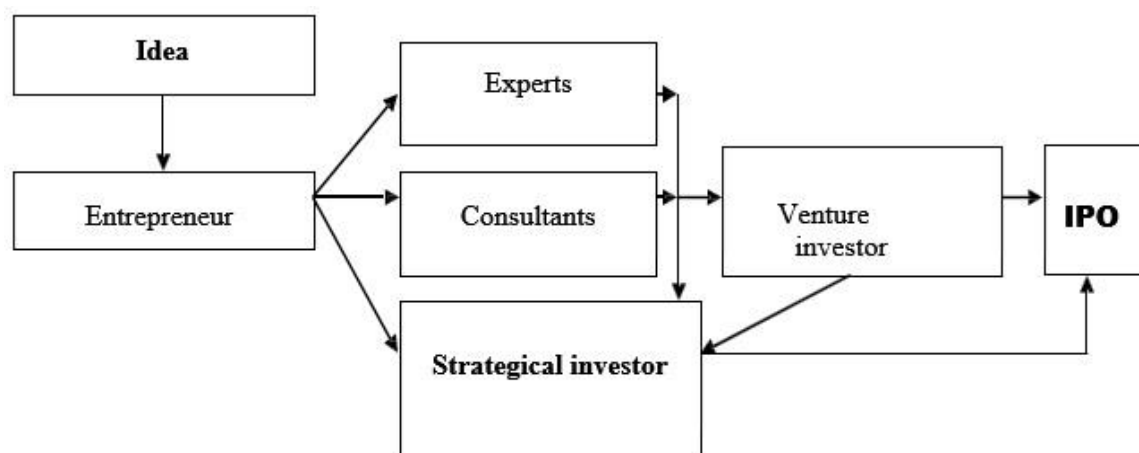

Figure 3: Model of conversion growth of innovative business ideas

From Figure 3 it can be seen that the appeal to a strategic investor occurs twice. For the first time, in order to draw the attention of a strategic investor to the project and obtain a preliminary Memorandum of Cooperation which will be necessary in the process of attracting investors to projects. The second time is when the project authors appeal to a strategic investor in order to exit investors from the project after the project has exceeded the break-even point and shows steady long-term profitability. The conversion growth approach proposed by the author (Figure 3) can significantly increase the proportion of invested business ideas and projects.

5. MODEL OF THE GENERATION 6 INNOVATION PROCESS (6G)

The following proposal for development of forms and methods of interaction between IASs in RIS is connected with the development of the mechanism itself of the innovation process. Obviously, creation of regional centres for incubation and acceleration contributes to the process of RIS self-organization, but does not define the model of interaction between IASs. Therefore, the paper has proposed a solution for development of the innovation process referred to as ‘Model of G6 innovation process’ (see Figure 4 below). The model of the innovation process is based on an alliance of medium and small businesses that are part of the syndicate of corporate venture investors (SCVI) which is supported by venture funds with the participation of public and private venture capital.

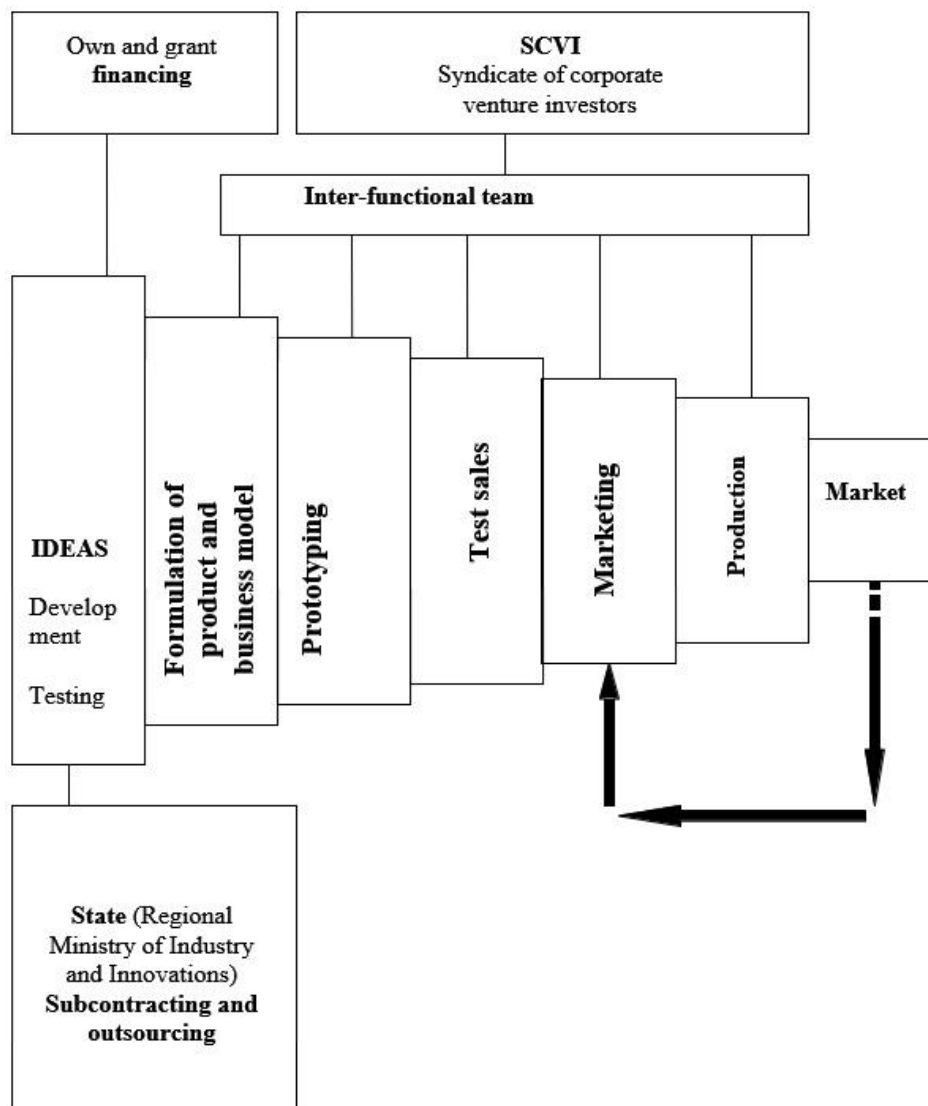

Figure 4: Model of Generation 6 innovation process (6G)

In Figure 4, you can find not only the traditional components of G4 and G5 models according to R.Rothwell, such as ‘Interfunctional team’, organization of ‘strategic alliances’, as well as the concept of ‘funnel of ideas’, but also completely new elements. The new elements include the block associated with the creation of the Syndicated Corporate Venture Capital Investment (SCVI), which includes not only the capital of certain small and medium businesses in the strategic alliance, but also the venture capital of public and private venture funds. The appearance of state investors in the alliance as a participant in the innovation process is a necessary element of success in the Russian context. The imperfection of current legislation regarding transfer of IS rights from public universities to private companies leads to the need for active participation of the state in innovative projects. Active participation of the state in the innovation process will also allow significantly expanding the funnel of ideas at the input by increasing the competence of the alliance of medium and small companies in the face of the university and academic communities. Today, fearing the legal consequences, the overwhelming majority of scientific state institutions do not wish to enter into negotiations with private business for the purpose of financing and developing scientific and applied designs. Another new element of the model of Figure 4 is the element ‘Test sales.’ This element conveys the philosophy of the work of the classic venture capital fund which moves the traditional element of the innovation process ‘Marketing’ back at a later stage. Venture funds prefer to conduct ‘reconnaissance by force’ rather than by interviewing focus groups of potential consumers of a new product (service) or through other traditional marketing tools. With regard to the element ‘Formulation of the product and business model’, I would like to emphasize that today innovative teams often formulate the product in isolation from the business model of the project. Such an approach leads to an overestimated project cost at ‘Prototyping’ stage. Excessive costs at the initial stage of product development create serious risks for the project to be in the portfolio of investors’ alliance companies. In order to exempt from additional taxation and unnecessary legal risks, in Figure 5 below we give the legal form, according to which it is recommended to consider applications from the authors of the innovative ideas of the alliance, where SCVI will be registered in the form of a managing company (MC), i.e. as ‘Managing Fellow’ (GP partner), and the participation of legal entities, the founders of this alliance, can be legally registered in the form of non-managing partners - Limited Partner, LP partner. The executive director of SCVI can be the manager who is appointed by the Board of Directors created from the founders of SCVI. Since shareholders are financially involved in the functioning of SCVI, this structure takes on a form similar to the structure of a venture fund where the shareholders (LP partnerships) are representatives of private business - syndicate of corporate venture investors.

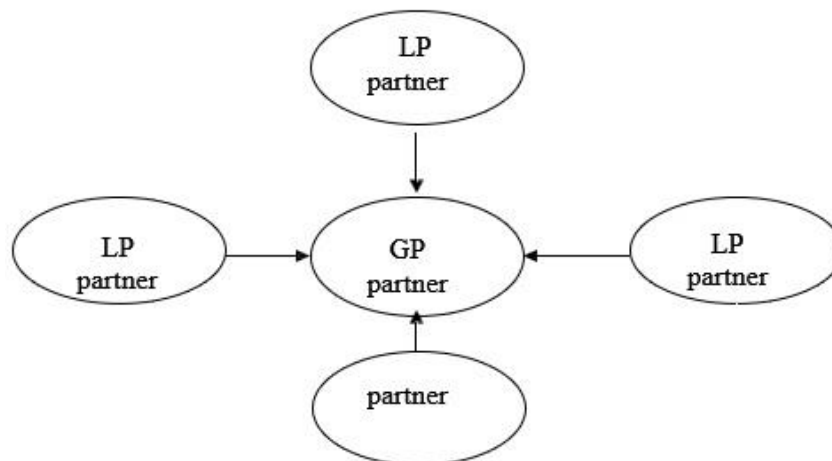

Figure 5: The traditional scheme of the venture fund operation

6. SYNDICATED R&DS ASSOCIATION FOR MEDIUM AND SMALL COMPANIES

One possible practical application for 6G innovative process model can be a project on the organization of Syndicated R&Ds Association for medium and small companies. Today, in practice, solution of the most difficult problem of organizing R&D by small and medium-sized companies is impossible both from a financial and organizational point of view. In this regard, in Azerbaijan there is a serious problem of attracting private investment in cities remote from Baku over a distance of more than 200 km. Private venture capital in such towns is small and, as a rule, consolidated in certain directions. On the other hand, in regional cities with developed scientific and technical potential there are a large number of inventors who are ready to participate in projects for the use of scientific and engineering discoveries for applied purposes. As a result, an imbalance is created between the investment and innovative capabilities of such cities. In the conditions of the development of economic relations in the form of ‘open innovations’, all the intellectual capital of such territories is subject to erosion and withdrawal either in Baku or in the innovation centres of other countries. The author proposes a new organizational model of the technological business allowing medium and small companies in the context of ‘open innovations’ paradigm become active participants in the innovation process and organize joint activities to develop their R&Ds. Since such an association is created with the involvement of financial resources of various companies representing strategic partners, this form of organization of R&D may be called Syndicated R&Ds. The idea of the model lies in the plane of cooperation (strategic cooperation) between participants in innovation processes based on the regional innovation business ecosystem. The idea of a syndicate organized by small and medium-sized companies is both to develop own technologies and to attract third-party innovative ideas either for the development of the current business or to solve issues of related or unrelated diversification. Thus, it can be concluded that Syndicated Research and Developments may become new modern regional innovation clustering centres in Azerbaijan. These associations will be established by strategic alliances of private medium and small companies in the region that are interested in their own development (Figure 6). The quantity and quality of such associations depends on the degree of diversification and the scale of the local business. In our opinion, the strategic alliance will include leading regional medium and small companies that do not compete directly with each other and are united by a common goal, search for new innovative ideas, new products and new business models. In this regard, there are two possible schemes that allow such an alliance to be sustainable. The first scheme is valid when companies in the alliance make up a vertically integrated partnership of companies:

Figure 6: Alliance of vertically integrated companies

The second scheme operates when companies within the alliance will be united by horizontal integration around the idea of mastering a new, highly profitable technology that will be of interest to all members of the alliance. The legal model that is best suited for Syndicated R&Ds Association proposed in Figure 7.

Figure following on the next page

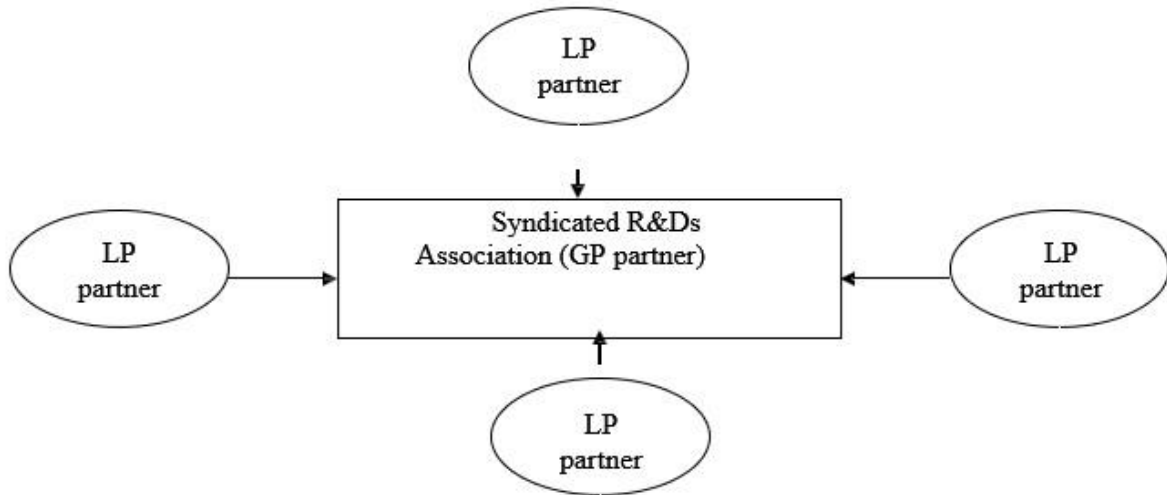

Figure 7: Organization scheme of Syndicate Research and Developments Association (SRA)

In this case, direct competitors occupying various niches and having no visible prospects for overlapping niches can join the alliance without fear. The main task of such SRAs is not so much to attract new innovative ideas for the needs of the syndicate rather than to examine and select innovative ideas that correspond to the mandate of the management company (GP partner). Therefore, in the 'Funnel of Alliance Ideas' in Figure 8, not only ideas from their own enterprises, but also ideas that come from Academic Institutes, local universities, private innovators and, certainly, from regional innovation centres (RICs) are displayed. At each of the four stages which innovative ideas pass active participation of venture capital funds and government institutional representatives is desirable. This will facilitate more active participation of authors of innovative ideas related to government and corporate organizations, cooperation and joint cooperation.

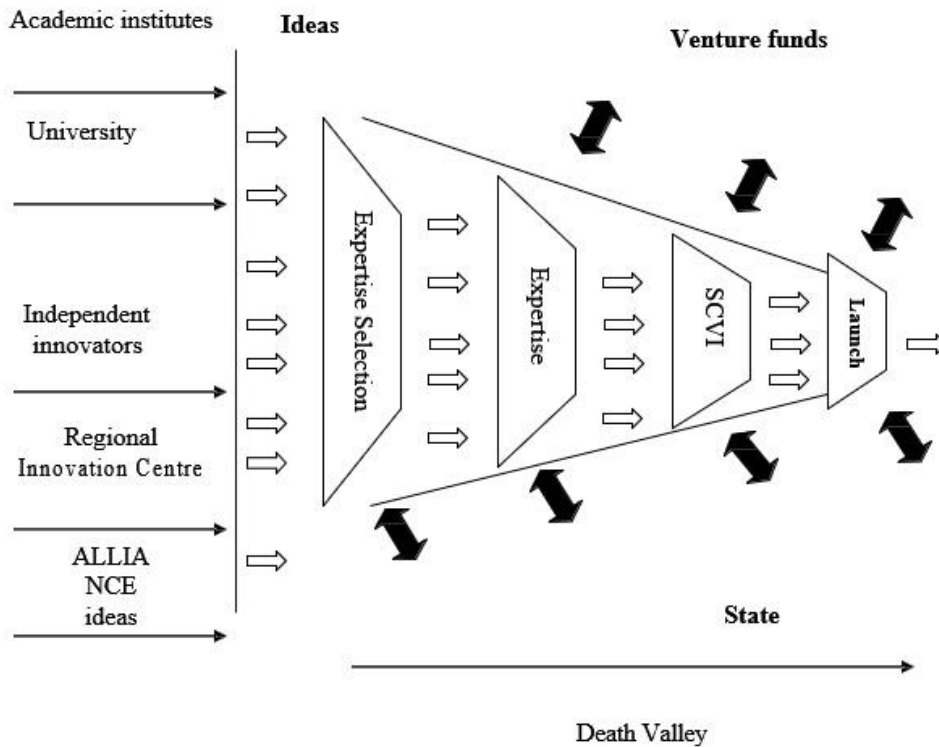

Figure 8: United funnel of ideas of Alliance

7. THE PRINCIPLE OF OPERATION OF THE SYNDICATED RESEARCH AND DEVELOPMENTS ASSOCIATION

Above, we have mentioned the possible use of the idea of strategic alliances of SMEs based on SCVI. We present a detailed scheme of the principle of operation of the Syndicated Research and Developments Association (herein after referred to as SRA Figure 9 and 10)

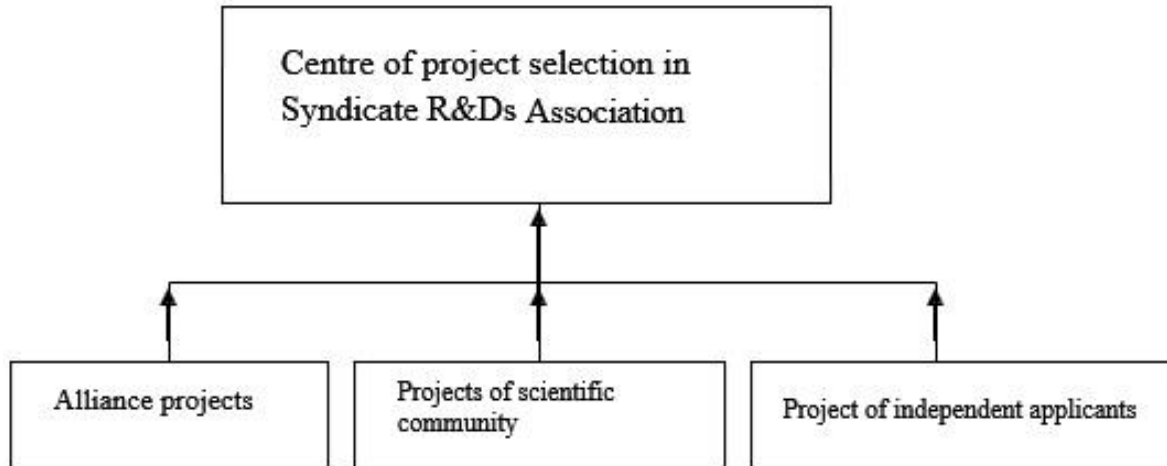

Figure 9: Functional diagram of project sources for SRA

The organizational chart of Centre for selection of ideas and projects of SRA is as follows:

Figure 10: The organizational chart of Centre for selection of ideas and projects

It is obvious that the implementation of the project of SRA will be associated with attracting the necessary financial resources. In our opinion, SCVI model can be recommended for innovative development not only of developed regional large megalopolises, but also of scientific closed territories, academic complexes, i.e. it has a socially significant character. Therefore, it is possible to support the initiative on organization of DOS by special state grants. The author proposes to limit duration of the project for allocation of grants to arrange the work of SRA and SCVI Foundation to five years with the possibility of prolongation if the working structure of SCVI Foundation is established in the first five years and the first start-ups start receiving funding from SCVI Foundation.

8. WAYS TO ESTIMATE AND MEASURE INNOVATIVE AND TECHNOLOGICAL TRANSACTION COSTS

In the scientific literature, the issues of quantitative estimates of transaction costs are not given sufficient attention. This is due to two reasons. The first is related to the complexity of quantitative estimates of a number of transaction costs, and the second reason is the insignificance of transaction costs compared to other costs of a firm during certain periods of the firms' activities. This article attempts to fill this gap for which a number of approaches are proposed that take into account the qualitative and quantitative values of the transaction costs of innovation entities in the process of innovation. Taking into account the specifics of the technological business, we give a typology of innovative technological transactional costs consistent with the terminology and needs of the technological business below. We will explain the content of the proposed classification for each component separately.

8.1. Costs of searching for information and drawing up a business plan for a technological project

In terms of the development and launch of a new product on the market, information about potential buyers and organization of the distribution network is key to attracting venture investors or other project stakeholders to the project. Before a potential investor receives information about an innovative project and a contract is concluded with him/her, we need to have information not only about where we can find potential buyers and sellers of relevant goods, but also about production factors (labour, capital, land, entrepreneurial abilities, information). Next, we need to understand the level of prices for innovative products. As a result of the implementation of the first stage of project development, costs arise that consist of the time and resources required for conducting information retrieval, as well as losses associated with the assessment, incompleteness and imperfection of the information acquired. In the case of the development of a technological project, information on certain issues in itself does not represent a large commercial interest until it is transformed into a business plan for the project. Business plans are most often addressed to investors and their preparation has a number of specific differences and requires certain knowledge, which, as a rule, project initiators do not possess. Therefore, it is often not clear to the project initiators what information they need to have in order to proceed to the next stage of project development. All this entails an increase in the transaction costs of the project. At the initial stage of development of an innovative project, the costs associated with negotiating are the most tangible among other possible costs. The search for potential partners in the project (investors, financial consultants, lawyers, patent specialists) involves not only the problem of finding the most suitable partners for a particular project, but also the ability and knowledge of how to negotiate and what to expect from them in each particular case. The main instrument for saving such costs, standard (model) contracts, as a rule, does not work in the technology business. Often, at the initial stage of technological project development, key highly qualified personnel is offered either options or company shares in addition to wages which cannot be high at the initial stage of project development. Otherwise, we will not succeed in attracting highly qualified personnel to the project which will certainly affect the prospects for development of the project. All this requires additional knowledge from the project initiators and entails an increase in transaction costs during development of technological projects. The final stage of negotiation is 'packaging a technological project', that is, the analysis of the project viability and its comprehensive assessment, definition of a project financing scheme, risk analysis, as well as modelling, development of a project marketing plan suitable for all project participants, including venture investors. As a rule, description of the project packaging is made in two languages: national and English. All this together also leads to an increase in transaction costs at this stage of the project development.

Such costs in the technology business are known as due diligence costs. There are such types of audit as business, technological, legal, tax and due diligence. These costs include the cost of appropriate measuring equipment, measurement, implementation of measures to protect the parties from measurement errors and, finally, the losses from these errors. The cost of measurement increases with increasing information accuracy requirements. This category includes the costs of registration and protection of property rights, including intellectual property (patents, know-how, trademarks, and copyrights). The costs of maintaining lawyers, experts and the costs of possible legal costs, international arbitration, interaction with government agencies, time and resources needed to restore the violated rights, as well as losses from their poor specification and unreliable protection. Since innovative projects, as a rule, tend to focus on international markets, there is a need for international patents and protection. It is known that development of any economic system requires the conditions, prerequisites and tools for transformation. Another direction for development of innovative entrepreneurship is related to legal aspects and problems of technological entrepreneurship. In this regard, Russian legislators are required to achieve greater homogenization of national rules of law and laws with international norms and laws in order to ensure national innovation projects with greater legal freedom while bringing their innovative products to international markets.

8.2. Business innovation

However, in addition to the need to develop the scientific and technical potential of certain regions of the country, the studies conducted by the author have showed that it is also necessary to improve drastically the overall business climate in all regions of Russia which will ensure the development of the regional technological policy towards minimizing innovative technological transaction costs. Further, I would like to comment on the prerequisites for conducting innovative entrepreneurship in Russia shown in this study. The main prerequisites for conducting innovative entrepreneurship in Russia are associated with positive signals that come from the state in this direction, as well as with the emergence of notable success stories in the country's technological entrepreneurship (yandex.ru, mail.ru, Kaspersky Lab, ABBYY and several other companies). In conclusion of the discussion on the conditions for the conduct of an innovative business, I would like to dwell on the issues related to development of technological entrepreneurship infrastructure. Thus, with regard to the conditions for conducting innovative entrepreneurship, it can be concluded that all the necessary conditions for the successful development of this type of activity in our country have not yet been established. Summing up, I would like to comment on the willingness of practical tools to transform the innovation business ecosystem in the country. The tools for developing technological entrepreneurship include the development and efficiency of the forms of interaction between IASs in RIS. In the present study, the author shows the directions and tools for development of RIS, and also presents various forms and methods of interaction between IASs in regional innovation systems.

9. CONCLUSION

1. It has been revealed that further development of IAS cooperation and development of technological entrepreneurship in RIS is impossible without building a self-organized regional ecosystem of innovative business. The article shows that Regional Centre for Incubation and Acceleration (RCIA) in which a regional innovation centre RIC will be created can become the basis of such an ecosystem.
2. The concept and model of a self-organized regional system and RCIA are shown.

NATIONAL WEALTH IS THE BASIS OF SUSTAINABLE DEVELOPMENT

Elshad Samedzade Ziyad

*Azerbaijan State University of Economics, Azerbaijan
selshad@yahoo.com*

ABSTRACT

The national wealth notion and increase ways have been historically thought by the economists. One of the advices for entrepreneurs is "recline to your assets". When an entrepreneur establishes and improves his activities, he should use the assets as the base of development. This success key saying at the level of entrepreneur, I think, can also be attributed to the country. The category of the national wealth is macroeconomic category that measures the aggregate assets in the country. One of the main questions in the economic theory is that what is the wealth, how it is calculated, and what is its source. Mercantilists, physiocrats, classics have different opinions about this issue. In the study of the national wealth notion, the prominent economist Raymond Goldsmith, Eurostat and the UN Statistical Commission researches have a special place. Analyzing the existing theory, let's try to describe this category as follows. National wealth is a monetary expression of national-moral values and the amount of money that has been formed by deducting the country's and its residents' aggregate assets from outside that country's non-residents. The size of the country's national wealth affects the credit, the investment volume, and conditions of its economy. There are different approaches to the national wealth. I think it's more convenient for modeling based on the accumulated wealth distribution, but I suggest its improved option:

- *natural wealth (depleted and inexhaustible)*
- *wealth created by human labor (physical, intellectual, financial)*
- *the essence of man.*

The methodology of calculating the national wealth category should be improved. The property must be calculated with full or residual value? When they calculate by residual value, there is a different approach to the amortization in the legislation of different countries. There are other questions from this point of view... Along with other factors, sustainable development, requires the national wealth structure to be effective on key and sub-elements. That's why the invested capital in it should be oriented in terms of efficiency. The major change in the structure of national wealth in the world is increase of the human wealth share. What is the national wealth of our country? We try to find answer to this question.

Keywords: *national health, sustainable development, assets*

*"Give me a point of support, I'll raise the Earth."
Archimedes*

1. INTRODUCTION

One of the advices for entrepreneurs is "recline to your assets". When an entrepreneur establishes and improves his activities, he should use the assets as the base of development. This makes him competitive in the competition and shortens the way to reach the goal. For example, having a car has a carrier advantage over someone else, so it is more likely to earn profits if it operates based on a truck with its own asset. This success key saying at the level of entrepreneur, I think, can also be attributed to the country. The category of the national wealth is macroeconomic category that measures the aggregate assets in the country. The concept of national wealth means the national income used by United Nations statistics, an international

macroeconomic indicator in Gross National Product level. The root of the word in Azerbaijani is "serv" (cypress). Serv is evergreen, beautiful, sky-flying. Probably the symbol of eternity wood, which prepared the Noah's ship, which has saved humanity, recommended writing all the laws by Plutarch on it. One of the main questions in the economic theory is what to count as a wealth, how to calculate it, and what its source is. Mercantilists count gold as wealth, and saw its source in trade. Physiocrats saw the peasant, their source as a real wealth. The classics saw labor in all areas as source, natural, human resources, produced and gathered blessings as wealth. National wealth is totality of national-spiritual wealth and material national wealth.

2. OPENING OF NATIONAL WEALTH CATEGORY

National spiritual wealth is national-moral values, cultural monuments, character and ideology of the people. Tangible national wealth is a monetary expression of the aggregate net assets of the country, its residents in that country and beyond. This also applies to the net financial requirements for non-residents. The size of the material national wealth of the country affects the credit, the amount and terms of the investment, forming its real trust in its economy.

2.1. the structure of national wealth

There are various approaches to the structure of the national wealth: Collected wealth, National economy balance and National accounts System. I based on collected wealth because it is more comfortable for analysis, but I offer improving it.

- natural resources (exhaustible, inexhaustible, partly exhaustible)
- created wealth by human labor ((physical (primary assets, circulating assets, goods- material valuables) intellectually (art pearls, research results, patents-licenses) finance (gold, cash, bank loan, securities, other financial requirements))
- the essence of man

2.2. Benefit from Raymond Goldsmith's researchs

Researchs by prominent economist Raymond Goldsmith is important for learning national wealth concept. (1) He only considers real assets as wealth. (For example. land, construction, equipment). He does not consider financial instruments that are manifestations of wealth. We based on Goldsmith, that means manat does not belong to national wealth. Manat belongs to personal wealth - as a financial requirement. The manat that Azerbaijani citizen saves is a loan given to the Azerbaijani state. It is a tool that substituting with his /her labor or asset. That is, the citizen's manat is his / her demand, but the Central Bank's passive-liability. That's why the demand and liability are zero and there is no effect on the rise or fall of national wealth. And how is dollars of the Azerbaijani citizen? Dollar is belongs to net financial requirements to non-residents in the definition of national wealth. If we try to calculate the totality of national wealth of the world, then the countries' demand for each other will not be counted. Thus, world-class paper money will automatically go beyond the concept of wealth. Therefore, based on Goldsmith, we can say that financial requirements for non-residents, which are known to be responsible for the precious metals and liabilities of our residents, belong to our national wealth. That's the dollar, bitcoin is not. The origin scheme of bank loan. People first create bank by taking manat that is the Central Bank's liability selling their labor, land and so on. Then he lends some of the money that he collects. The borrower receives equipment with this money. That equipment is national wealth. Money, credit is a mediator tool. If the foreign currency is borrowed instead of a loan, it will also belong to our national wealth. But in this case, our national wealth will serve the development of the economy of foreign country, not our national economy. It means that our national wealth is part of a certain period of time that serves our national economy and serves other economies.

3.METHODOLOGY

The value of exhaustible natural wealth is management from its value in the world market. It is solved by deducting totality expenses that delivery expenses to delivery extraction and sale point. So the prices in the world market are much , management: if the expenses of extraction and transportation are less then the value of our wealth of the earth is very much. Inexhaustible:

- Climate resources:
 - The sun. Total temperature per year. Solar energy conversion into electricity potential and its evaluation.
 - Wind. Annual wind speed is total.
 - Atmosphere. Real situation. Taking into account the contravention.
 - Wave energy.

- Partially exhausted / partially renewed:
 - land, relief is depleted.
 - water.
 - forest cost - service cost.
 - other flora and fauna. One of the remedies - The Red Book.

4. HUMAN WEALTH

The funds are converted into capital at that time, which brings in revenue. Human resources are totality of knowledge, skills, abilities to pay society's needs. It is believed that for the first time this term was used by American scientist Teodor Schulz in 1961. His successor, Harri Becker, has developed this idea since 1965 by justifying investments in human capital and forming an economic approach to human behavior. He was awarded the Nobel Prize in 1992 for his theory. Previously, human capital was invested in human resources, and its ability to work - increasing investments and profits. Later, the essence of this concept grew. World Bank adds: family and state expenditure on food, clothing, housing, education, health and culture. The origin of human capital theory go back to Adam Smith's research of the 18th century. He regarded the gained and useful skills of all members of society. Individuals spend money to earn their abilities, which ultimately turns into a capital in their person (2). The concept of human capital of the Shults explains the difference in the volume of production between the countries and the volumes of the spent resources. Schultz and some economists have suggested that investments in human capital are the basis of this difference (3). The most difficult part of the national wealth is linked to human wealth. "The value of human is the quantity of the value of human relationships. The word of Chinese ancestors. The insurance company insures evaluating its life. But, there is no common approach to the calculation of human resources in the world. It has ethical, intellectual, and other reasons. So, the scientific community will deal with this problem. Development prompts human capital to increase its specific weight in national wealth. The President of the Republic of Azerbaijan Mr. Ilham Aliyev proposes to "Turn oil capital into human capital" and create conditions for the material support of foreign education of Azerbaijanis to benefit from progressive international education.

5. CONCLUSION

The methodology for calculating the national wealth category should be improved. Should such property be calculated with full or residual value? When calculating the residual value, there is a different approach to depreciation in the legislation of different countries. There are other questions than this tribe. Sustainable development, along with other factors, requires the national wealth structure to be effective on key and sub-elements. So, the investment invested in it should be oriented in terms of efficiency. The major change in the structure of national wealth in the world is increasingly the share of human wealth.

Thus, what is the national wealth of our country? - try to find answers to the question. To compute the national wealth, let us attend some details. According(4) to the OPEC report, Azerbaijan's proven oil reserves are about 7 billion barrels. The Azerbaijani oil brand Azerilight has \$ 62.5 per barrel. According(5) to SOCAR data, we calculated that, the production cost of 1 barrels is \$ 10.4. $62.5 - 10.4 = 51.4 * 7 \text{ billion} = \$ 359.8 \text{ billion}$. The transportation and our foreign partners' profit share is deducted from that. Gas reserves are 1.277 trillion m³. US \$ 0.26 per is 1 m³ of Azerbaijani gas (6). According (7) to SOCAR data, we calculated that, Production cost of 1 m³ of gas is US \$ 0.036. $0.26 - 0.036 = 0.224 * 1.277 \text{ trillion m}^3 = \$ 286 \text{ billion}$. Sales and other expenses are deducted from this amount. The hydroenergy reserves of our rivers are 37 billion. Kvt. The value of fixed assets is \$ 99.5 billion.(8) The official gold-currency reserves of the Central Bank of Azerbaijan are USD 5.534 billion (28.09.2018). The assets of the SOFAZ are \$ 38,987 billion (01.10.2018). In The Commonwealth of Independent States(CIS) the average national wealth per capita is \$ 275,000.(9) If we apply this to Azerbaijan, which has a population of 10 million, the national wealth of our country is \$ 2.75 trillion. Calculation of national wealth is a difficult process both in terms of methodology and in gathering necessary information. The report will focus on its detailing. The continuation of the arguments in this direction will probably lead to real results. P.S First of all, I knew that first time human capital was used by Theodor Schulz in the year 1961. I wish a restoration of historical justice along with my great respect for his research. By quoting the famous poem by the famous Azerbaijani poet Mikayil Mushviq, published in 1937, "The Feeling Leaves":

*Sky is an open embrace of love,
Imagine stars are baby children,
Our young mothers on their lap
Many such stars will shine.*

*Who is wrong saying life is a talent,
Is it a sweet dream and sweet idea?
Beautify nature every moment
Human being is an inexhaustible capital!*

AGRICULTURAL SUBSIDIES IN MEXICO AS PART OF THE HACENDARY POLICY FOR THE REGIONAL DEVELOPMENT

Patricia Inzunza-Mejia

Universidad Autónoma de Sinaloa, México
inzunzap@uas.edu.mx

ABSTRACT

In Mexico it is recorded that by 2015, 14% of the population lives in rural areas, developing mainly agricultural activities under adverse and precarious conditions, which makes it necessary to provide financial support through subsidies to the agricultural sector. With the objective of identifying the causes and effects of the reduction of agricultural subsidies in the agricultural sector, the conditions and means of management of agricultural subsidies are analyzed as part of productive programs that make up the hacendary policy to determine its economic and financial impact on agricultural activity. Given the hypothesis of considering that the application of agricultural subsidies, they represent a fiscal-hacendary policy because they are part of the programmable public expenditure, with sectoral orientation and compensatory attributes to the income of agricultural producers, that by decreasing the agricultural activity has been discouraged and with this, the reduction of poverty in rural agricultural areas of the country has been hampered. Using the methodology proposed by Scott (2010), for the geographical apportionment of the distribution of agricultural subsidies, it is observed that the decrease of programmable public spending destined to agricultural public policies, is concentrated in a few agricultural producers that make up the richest half of the farmers in Mexico, which could explain the low contribution to the GDP of the agricultural sector and the low productive performance, which implies a lack of correlation between programmable public spending on agricultural subsidies and agricultural GDP growth.

Keywords: *Agricultural Subsidies, Hacendary Policy, Fiscal Policy, Programmable public expenditure, Regional development, Treasury Policy*

1. INTRODUCTION

Currently in Mexico, the dimension of rural poverty makes up an obvious reality from generation to generation. Although, the fight against poverty has a long history from the structural adjustment programs of the 1980s, to the innovative support mechanisms such as PROCAMPO now PROAGRO, the analysis of its evolution and performance is also registered as strategies of the agricultural policy of transfers, subsidies and general subsidies at national and international level. On the other hand, in the last seven years the public expenditure destined to the countryside has been reduced permanently. Through the Special Concurrent Program (PEC) for Rural Development, the constant changes applied to the agricultural package are shown. The Center for Studies for Sustainable Rural Development and Food Sovereignty (CEDRSSA) of the Chamber of Deputies; concluded in his analysis of the PEC, that the public account of the exercise of 2016 approved for the plans that make up the program, went from 351 thousand 571 million pesos to 334 thousand 481 million, yielding a negative budgetary result for the development of minor agricultural activity. The argument of the Budget of Expenditures for 2017, proposes "a macroeconomic strategy based on two elements: (1) a fiscal policy that contemplates transitory and decreasing deficits from 2013 to 2016 to respond to the conjunctural challenges and to accelerate the consolidation of the structural agenda that would raise the country's growth potential; and (2) an initiative to reform the Federal Budget and Fiscal Responsibility Law that, within the framework of the Social and Fiscal Reform, consolidates the country's commitment to macroeconomic stability and the responsible management of public finances as a Policy of State".

In addition to serving the following strategic lines of action that had been observed since the previous administration 2000-2016, regarding the Mexican countryside:

- a) Converge and optimize the programs and resources that increase the opportunities of access to services in rural areas and reduce poverty (Special Concurrent Program).
- b) Promote the diversification of economic activities in rural areas.
- c) Integrate the rural areas of high and very high marginalization to the dynamics of national development.
- d) Supply the domestic market with quality, healthy and accessible food from the fields and seas.
- e) Promote food security through ordering and market certainty.
- f) Ensure the supply of healthy food through the promotion of the production of crops and basic products for the food of Mexicans and strengthen their commercialization through the promotion and classification of markets.
- g) Increase labor productivity through organization, training and technical assistance.

1.1. Generality and importance of agricultural subsidies

The Chamber of Deputies of the H. Congress of the Union (2017), highlights that from seven years to date, the comparative analysis between the expenditure of the agricultural sector, determines a downward trend in relation to the programmable expenditure and in relation to the gross domestic product, which for 2016 was 8 and 1.7% respectively, while in 2010 it was 9.9 and 2% in the same order. As is evident, the actions to promote agriculture will be subtracted from 14.4% of the 2016 budget that will affect priority programs such as PROAGRO (Before PROCAMPO). Among other programs of support to the field, the PROCAMPO (currently known as PROAGRO) has in common with others the dejection to poverty, this condition or purpose, denotes the essence and social vocation of the program; therefore, we are talking about a social policy that is linked to the finance policy for the part of public spending that it represents. Initially, field support programs were intended for farmers in rural areas; but nevertheless, this is not the case, business farmers also participate and are beneficiaries; and by the economic conditions and productive characteristics of the latter, they are the most benefited in terms of income perception due to having more hectares to plant. With this, the main objective of poverty abatement that was intended with PROCAMPO or PROAGRO is lost. It is well known that business agriculture in Mexico does not have the characteristics or variables that are taken into account to determine if a farmer is poor, the main variable that is taken into account is income, therefore, it is important to recognize that as a social program it is lost from its main objective. On the other hand, from the perspective of international markets there is a conviction that subsidies to the agricultural field generate distortions in the market, due to the international agreement chosen by all the members of the UN, which was due first to a significant reduction in agricultural subsidies and in a second stage to elimination; however, both the United States and the European Union are regions in which agricultural activity is mostly subsidized and promote this incentive to agriculture, despite the fact that the rest of the developing countries, members of the UN, are at a competitive disadvantage to position their grains in both the internal and external markets (Anderson, et al., 2006). With the implementation of the current economic model, the Mexican agricultural sector has been one of the most affected, since since 1982 various reforms have been applied to agricultural policies, such as the elimination of the guarantee prices of basic products, the reform to the constitutional article 27, the creation of subsidies to the commercialization and for the year 1993 a mechanism of direct support to the agricultural production was instrumented, better known as Program of direct support to the field (PROCAMPO today PROAGRO), that although, has given important benefits, these have only been compensatory in the face of the negative balances left by NAFTA to the agricultural sector.

For more than ten years, Trivelli and Venero (2006) have explained that the agricultural policy adopted in Mexico has been selective, decapitalizing the sector through regressive policies for subsidies aimed at producers and entrepreneurs with higher incomes, political manipulation, corruption and the allocation of unproductive credits, among others. Under this scenario, shortly after the entry into force of the free trade agreement with Canada and the United States (NAFTA), the first unfavorable results were seen, at the end of 1994 and during 1995, an economic crisis was generated in the country that induced the GDP to contract at a rate of -6.2%, for that moment, this contraction in GDP was historic, given that it had not been seen in Mexico. Today, almost ten years after the world economy was affected by one of the most severe crises of the last hundred years, the 2008 subprime financial crisis collapsed the productive development and social welfare of Mexico. Although from the 80's, there is a low economic performance and a low level of agricultural productivity in Mexico, the economic and social reality is the product of an economic policy that articulates the economic crisis, productive agricultural stagnation, agricultural deindustrialization, inequality in the distribution of income, unemployment, wage discrepancy, underemployment and poverty. In Mexico, the dimension of rural poverty makes up an obvious reality from generation to generation. Although, the fight against poverty has a long history from the structural adjustment programs of the 1980s to the innovative support mechanisms such as PROCAMPO now ProAgro, the analysis of its evolution and performance is also recorded as strategies of the policy of transfers, subsidies and general subsidies at the national and international levels. Hence, to strengthen the agricultural sector is considered a determining factor in reducing poverty.

1.2. Characteristics and problem to be solved regarding agricultural subsidies

The problematic analyzed, forces us to generate answers for the agricultural sector, for what it is posed. What implications has the reduction of subsidies had in the Mexican agricultural sector (Sinaloa)? and Under what conditions are subsidies to the agricultural sector in Mexico managed? Historically, PROCAMPO arises in response to the serious precarious situation that the agricultural sector was living in 1993, that in synthesis can be characterized by an environment of rural poverty, loss of food self-sufficiency, migration, fall in agricultural productivity; that in synthesis can be characterized by an environment of rural poverty, loss of food self-sufficiency, migration, fall in agricultural productivity; hence, the Mexican State, responds to these problems through agricultural policy, being among other programs, PROCAMPO one of the most prominent public sector policy instruments known until a couple of decades ago, for the financial immediacy and economic solvency that generated the agricultural producers. However, what is now known as PROAGRO, has ceased to be a boost of financial support in agricultural production, mainly due to the reduction of programmable public spending and its impact on the reduction of agricultural subsidies. Based on the contextual analysis of the application and evolution of PROCAMPO, it is necessary to recognize that the agricultural producers in the entity perceive that the reduction of PROCAMPO benefits (amounts per hectare), it has negative economic and financial effects on the development of agricultural activity, which implies a financial deterioration and economic weakening for the sector; so it is assumed that "the application of PROCAMPO is a compensatory sectoral policy to the income of agricultural producers, with high characteristics of inequality and disproportionality, given that the support to the countryside is more significant for the rich agricultural producers, and less support for the rural sector of small farmers, with high characteristics of inequality and disproportionality, given that the support to the countryside is more significant for the rich agricultural producers, and less support for the rural sector of small farmers, which has had significantly adverse impacts on the reduction of rural poverty, due to the fact that it is due to deficiencies, inequities and inequalities, both in the design and in its application, which leads to a remarkable concentration of support in "a few

producers agricultural". For this reason, small agricultural producers have been poorly benefited by the program in terms of a zero reduction in their levels of poverty, since the "apparent increase" in their income, associated with its participation in the program, it is insufficient because it does not compensate for the microeconomic loss due to increases in production costs and the decrease in the real sale price absorbed by the producer. This idea of compensating the "losers", that is, (those who are harmed by the current agricultural policy of PROCAMPO), it would make sense, if those who benefit were the majority and certain minority interests will be harmed and therefore, can be compensated; but it loses meaning if the decisions only benefit a minority of agricultural entrepreneurs, and most of the producers of the rural sector with peasant ancestry are harmed.

1.3. Reduction of agricultural subsidies and management conditions

It is convenient to carry out more detailed analyzes of the impact of these programs at the regional and local level, which allow public policy designers to have the necessary elements and a more useful diagnosis for the regions that make up the great mosaic of geographic diversity and cultural of Mexico. The studies about PROCAMPO and its economic and social impact, are mostly of macroeconomic representation, observing the lack of regionally focused studies, therefore, it is necessary to carry out more detailed analyzes from local perspectives of both qualitative and quantitative nature. Due to the scarce visibility of this type of studies at the local-regional level, the need to carry out research that highlights the relationship between PROCAMPO, the levels of income and agricultural productivity, as well as the levels of poverty that exist in the rural regions of the State of Sinaloa. In this sense, the Program of Direct Support to the Field to be considered one of the main tools of sectoral public policy aimed at the population in rural areas, has as its central objective to compensate the income of farmers. It is fair to indicate that, in its origins, it did not contemplate influencing the reduction of rural poverty, the nature of its modus operandi, the dimensions of the budgets it had, as well as the profiles of the population served, in the years that it has been operating PROCAMPO has contributed to changing the poverty landscape in rural Mexico by fulfilling the explicit objective of increasing the income level of its beneficiaries (Zarazúa- Escobar et al., 2011), without specifying or analyzing the microdimensions of its scope. In context, the extinction of collateral prices led to the initiative of strategies that previously covered some of the functions of CONASUPO, regarding the marketing of food; so in 1991 the deconcentrated body of SAGARPA was created, called Support and Services to Agricultural Marketing (ASERCA). In this way, based on Trujillo Felix, et al. (2007), the public sector prompted price agreements between large buyers and producers using marketing support (payments), but only in some products and in regions with large surpluses. This did not represent the compensation that was needed for the guarantee prices, for which reason the Direct Field Support Program (PROCAMPO) was created as the most important sectoral policy instrument for agriculture at that stage. The original objective of PROCAMPO was to make direct transfers to compensate the loss of income of agricultural producers, before the commercial opening derived from the Free Trade Agreement of North America (DOF, July 25, 1994 and the Errata November 1994) and before the evaporation of intervention schemes for the support of market prices of agricultural products, while the collateral objectives proposed for PROCAMPO and published in "Claridades", the official magazine of ASERCA (Aguilar Villanueva, 1996), were:

- a) Promote the productive reconversion towards activities of greater profitability.
- b) Compensate subsidies that other countries grant to their producers.
- c) Stimulate the organization of the producers.
- d) Increase the competitiveness of productive chains.
- e) Stop the degradation of the environment, promoting ecological projects.

The Organization for Economic Co-operation and Development (OECD) indicated that PROCAMPO has granted direct payments linked to the historical use of the land rather than the current production, since it was expected that producers would switch to more profitable crops in the context of a more competitive economy. On the other hand, Schwentesius et al. (2008) in the meta-evaluation carried out by PROCAMPO, show that the evaluations of 1998, 2001, 2003 and 2008 reflect an effective program, efficient and that has fulfilled satisfactorily with most of the general and collateral objectives. Even with positive impacts even in areas that had not been their direct interference, as the improvement in prices and marketing of crops. Even in the quality of life an improvement was obtained. In this way, the operation of the program, in accordance with these evaluations, has been successful and has adequately complied with the stated objectives, both the main one and the collateral ones. In Nahmad (2012), it is recorded that the macroeconomic, agrarian and environmental neoliberal reforms implemented in Mexico since 1982 were designed to sustain economic growth, increase the standard of living of the population and combat poverty.

1.4. The costs of neoliberal model in the agricultural sector

Neoliberalism, as a technocratic, mercantilist and macroeconomic (and not necessarily philosophical) movement, it has a geopolitical dimension that moves away from social and collective interests. However, under neoliberal reforms, economic development actually declined, particularly within the peasant and indigenous sectors. The socio-economic costs of applying the neoliberal model have transcended to the reduction of public revenues and thus to the reduction of investment, directly affecting the growth and economic development of Mexico. This and other problems determine the imperative need to improve Mexico's economic performance. Thus, the interest to analyze the variable of public income and its distribution is justified, since this constitutes a real measure that affects the economic growth and development of Mexico, as well as being a fundamental reference through which citizens recover credibility in the tax and tax system of the country. The proposal to carry out an investigation about the implications that the agricultural sector policy has had on the subsidies and transfers to the agricultural sector and the economic growth of Mexico, it is timely given that at the beginning of the 21st century, we are immersed in one of the worst economic and financial crises of the last hundred years. Joseph Stiglitz on his last visit to Mexico in November 2009, said that Mexico's performance in the face of the crisis has been one of the worst in the world, and also expressed that it is worrisome that the Mexican government is betting on the recovery of the United States so that the country recovers, he also suggested that the Mexicans should be concerned that the government policy and public spending are not designed to promote economic growth, and therefore calls on the Mexican government to promote a finance policy aimed at productive spending and economic reactivation. According to data from INEGI, in 2009 as a result of the crisis there was a result of -6.5% of GDP, so it is considered that it is due to the application of the current economic policy that the economic and financial capacity of the State to face the crisis, from there, the political-economic errors that the Mexican government still applies, are based on the extreme faith in neoliberalism, and in the ways in which; On the one hand, the State has been failed and; on the other, the participation of the private sector has been magnified; however, this reality must be recognized as an area of opportunity in which it is prudent to resize the restructuring of necessary actions that link the application of public revenues with a better and equitable distribution. It is important to recognize that, in our country, we have been unable to design changes (not to say reforms), commercial, financial, fiscal and treasury, that lead us to be a country strong enough to consolidate on truly democratic and scientific bases. However, in Mexico, there are still few and controversial analyzes about the problems associated with the application and equitable distribution of spending.

It has been clear that the "fiscal reforms", enunciated and adopted, have not solved the problem of the obtaining, management and equitable distribution of income; nevertheless, it is estimated that this research contributes modestly to the discussion about the link between sectoral agrarian policy and fiscal-finance policy, from the perspective of the best application of programmable public spending in its section of subsidies, and more specifically if it is the application of the agricultural subsidy called PROCAMPO during the period 1995-2016.

1.5. Context of sectoral public policy

Although in a historical context, Castillo-Muñoz (2013) shows how in the decade of the 40's, the indigenous peoples of Mexico were excluded from receiving agricultural subsidies for the cultivation of corn, which implied a stimulus of the massive emigration of these communities to the lowlands of Nayarit and to the United States and affected the adaptation of Mexican rural workers to the life of a migrant; however, it set the precedent and made visible the condition of rural migration as a consequence of the absence of subsidies and government support to the agricultural sector. Also from Martínez (2011), the market liberalization measures taken by the Mexican government in the 1990s and its impact on migration and the agricultural sector were already examined. highlighting the analysis of events that affected the small agricultural producers of basic crops in Mexico, such as the elimination of price supports and subsidies for inputs, changes in the property laws of the communal landowners and the reduction of tariffs on agricultural imports and their impact on migration to the United States. It reveals that dependence on the production of basic crops is positively and significantly associated with the increase in migration rates. There are also small effects of exposure to changes in property rights and the negative but insignificant effects of exposure to globalization on migration to the United States. After the unfavorable conditions and the high migration of the rural sector, the Mexican State designs and implements public policies oriented to certain economic and social sectors, recognizing from this vision the sectoral public policy. Hence, the concern to analyze the broad discussion about the importance of the distribution of programmable public expenditure to assess the effect of agricultural subsidies, linking the distributive aspect and the application of public spending with the income conditions of agricultural households and rural, disaggregating the program information to estimate the geographical distribution of agricultural subsidies by distributable amounts of PROCAMPO, beneficiary, area, households and producers. This while recognizing and sharing the ecoconditionality analyzed by Ortiz, Rindermann and Cruz (2008), as an instrument of public policy that subordinates the delivery of incentives (that is, payments or subsidies) that are positioned from the political and government interests. Before the maneuver of the eco-conditionality that starts from the common agricultural policy of the European Union, for which it is proposed to solve some of the main agro-environmental problems in Mexico by means of the reformulation of the agricultural policy of Mexico, which emphasizes the transformation of the PROCAMPO program towards the inclusion of agro-environmental measurements. In this context, its impact is analyzed from the perspective of public policy based on Laswell (1971), it is emphasized that public policy is the discipline that deals with explaining the processes of elaboration and execution of guidelines that encourage and accelerate economic conditions and social of a country, a region or a locality. They are designed with scientific, interdisciplinary and at the service of citizens, emphasizing that knowledge of the decision process and knowledge in the decision process, are represented from the professional skills necessary to participate in public decision making, which would correspond to identify and assimilate the political decision process. When we talk about public policy, allusions are made to processes, decisions, and results, without excluding the conflicts of interest that arise, which makes us expect public policy to develop in a context full of power and conflict games. that take over the courses of action of public policy.

On the other hand, Aguilar Villanueva (1996), suggests that a public policy is the design of a collective action with the intention of benefiting as much as possible the subjects of the policy; as well as the course or path taken by the public policy action, as a result of the decisions that behave according to the facts and the collective needs that produce it, justify it and start it. While for Kraft and Furlong (2006), public policy is represented by the action of the government in response to public problems of social and economic order, representing with this, the resolution of conflicts, assigning him a decision of high stature. In summary, public policies are the answers that the State can give to social demands, whether in the form of norms, institutions, public goods, public services, plans and programs. In the opinion of Scott (2008), both the design and the application of agricultural public policies in Mexico, suffer from the multitude of conflicting objectives and disconnected from each other, for a single instrument of public policy, such is the case of the sectoral agricultural policy, since it is characterized by a duality of dual purpose in the vocation; that is to say, on the one hand they are endowed with characteristics with a productive vocation and on the other hand they show a social vocation, such is the case of PROCAMPO, since it is considered a program aimed at raising productivity in the rural sector and, in turn, it is a targeted program to mitigate rural poverty. Traditionally, this duality is observed in the federal and local public policy applied in Mexico, specifically in the productive programs promoted by the Ministry of Agriculture, Livestock, Rural Development, Fisheries and Food (SAGARPA), and in the social programs promoted by the Ministry of Social Development (SEDESOL), which finally rely on the Federal Budget and Fiscal Responsibility Law, as well as in the fiscal policy instrument PEC (Special Concurrent Program) that brings together a set of agricultural and rural development programs with specific rural development vocations and specific objectives according to the program in question, allowing a broad segmentation between the productive and the social.

2. METHODOLOGY: MATERIALS AND METHODS

The methodology applied is the one proposed by Scott (2010), based on the empirical evidence that determines the analysis of the variables of programmable public expenditure and the component of agricultural subsidies distributed geographically at the state and municipal level where PROCAMPO information is recorded. as a target income. Based on the procedures of Scott (2010), an analysis is made from the basic arithmetic that allows to identify the growth and evolution of programmable public spending in the country, as well as the component of subsidies and PROCAMPO-PROAGRO. Through the analysis of the program component, the information is ungrouped by federative entities to identify where the largest number of PROCAMPO beneficiaries are concentrated, the largest amounts of support and the largest productive area supported; as well as, the relationship that these variables have with the levels of agricultural growth in each state. For Sinaloa, the same analysis is replicated but using secondary information revealed by SAGARPA (2017) and making use of spatial statistics, which allows identifying, analyzing and graphing, the territorial distribution of agricultural subsidies in the state of Sinaloa, as well as its relationship with the rest of the variables. At the end, a summary of the results of recent works is presented which, using similar methods and objectives, have evaluated the impact of agricultural policies in our country, with special emphasis on the fulfillment of the stated objectives to be achieved in the implementation of PROCAMPO. By analyzing the components of programmable public spending and the disaggregation of subsidies comparable to the program, it is possible to identify an abundant accumulation of data ranging from the annual growth rates of public expenditure to the number of PROCAMPO beneficiaries according to their productive condition, amount allocated, and surface supported, either on irrigated land or on temporary land. It is clear that it is increasingly common to make an assessment of the events or annual events of the public budget, it is necessary to assimilate and interpret a considerable amount of data;

However, the information age allows the data to be processed, summarized and analyzed quickly and in detail. In addition, it can be observed that by assigning a lower public budget to the agricultural sector, and specifically by decreasing the support of PROCAMPO, the probable level of economic capacity and income is put to consideration to determine if it is possible to carry out a public marketing guide; that is, to define the demand of the program and the allocation of this resource as part of the public offer, highlighting as a priority interest, a comparative study in the management and reception of this type of support among large, medium and small agricultural producers. National level. Given that the population at the national level and mainly at the state level is broad, it is difficult to analyze it; however, it would be possible through the procedures of Newbold, Carlson and Thorne (2008: 3), taking "to the complete set of all the objects that interest to investigate" that will be the register of all the producers enrolled in PROCAMPO. For this case, the purpose of this probabilistic analysis is to affirm that the sample data have some validity on the population of data that represent the variables: number of beneficiaries (agricultural producers), amount of benefit (PROCAMPO), land area supported (in hectares) and the correlation of programmable public spending, subsidies and possibly economic growth, given that we intend to know what is the correlation of PROCAMPO with public spending and subsidies in particular. Likewise, following Newbold, Carlson and Thorne (2008) from the perspective of the descriptive and inferential statistical method, the observations that are contemplated correspond to the years from 1995 to 2016, dividing two categories of beneficiaries, the producers of temporary and the producers of irrigated land, for which the average or statistical is determined. From there, the distribution of PROCAMPO is reviewed by beneficiary, beneficiary surface, amount and type of production, using the administrative information criterion that provides data of producers by registered land size as the only available variable that approximates the level of wealth of the beneficiary. The information available for this research, offers the estimation of PROCAMPO under a quantitative approach with descriptive and correlational records of cross section that are supported in the effects of the treatment of descriptive statistics, based on the comparison of beneficiaries, amounts of benefit and surface beneficiary with correlational scope when using a reciprocity of 80 and 20 percent between agricultural producers of irrigation and temporary; However, without limiting the contribution of the discussion, it is recognized that the critical analysis is carried out under the qualitative approach with a purely descriptive scope. The data collection was given through the information offered by SAGARPA (2017), the National Survey of Rural Households in Mexico (ENHRUM) and the National Household Income Expenditure Survey (ENIGH) of INEGI from the national accounts system for effects of public expenditure parameters, finding that the strategy of support to the field that has been developed by the SHCP and SAGARPA, could be useful to identify the level of income of agricultural producers and their spending habits in relation to their productive activity. Second, a hypothesis about a parameter or category could be tested. For example, identify the years that have mostly supported agricultural producers or otherwise, identify the years in which less has been supported to see their correspondence with other items such as public spending or economic growth. In addition, it can be contrasted if irrigation or seasonal producers are susceptible to greater support. Differentiate if the average annual agricultural support per beneficiary is increased. In this regard, with the statistical analyzes, the relationships of two or more variables could be analyzed. Macroeconomic data series are also used to analyze the relationship between gross domestic product, public spending, programmable public spending, and the application of subsidies that indicate the general situation of the country's economy and the general condition of the application of the public expenditure oriented to subsidies.

3. RESULTS AND GRAPHICAL DESCRIPTION OF THE DATA

In this section, we seek to graphically expose information related to the allocation of public expenditure and PROCAMPO. The classification of the variables, are discrete numerical that according to Newbold, Carlson and Thorne (2008: 10) "can have a finite number of values; however, the most frequent type of discrete numerical variable with which we will find produces an answer that comes from a counting process ". In this sense, discrete numerical variables are considered for the control and management of data related to the number of PROCAMPO beneficiaries, support amounts and area supported. In Figure 1, the annual growth trend of PROCAMPO can be observed, during the period 1995-2009, highlighting a drastic decrease of -22.99% in the year 2001. This could be explained by the tendency to decrease budgetary public expenditure that since 1987 it is downward (see figure 2).

Figure 1: Annual growth rate of PROCAMPO (1995-2009)

Source: Own elaboration with data from ACERCA

It can be seen that by decreasing programmable public spending, subsidies tend to decrease as well, which allows us to consider that since 1987 some economic events that restricted Mexico's public finances had taken place, which had an impact on PROCAMPO's an inflation of 226% coupled with a devaluation of 205%, even when the financial sector declares bankruptcy, Bancomer is also sold. In figure 2, it can be observed that since the six years of Salinas de Gortari (1988-2000), the strong budget cuts began. In the year 2000, the sectorial budgets were reduced to their maximum expression and for the 2001, when initiating the presidency of the Republic Vicente Fox, it faces an insolvent economy that after the 9/11 fall World Stock Exchanges, making it impossible to increase the expense productive public and preventing improving the economic and financial conditions of Mexico.

Figure following on the next page

Figure 2: Annual Growth of Budgetary Expenditure, Programmable Expenditure and Subsidies-Transfers in Mexico (1977-2016)

Source: Bank of Mexico (2017), with statistics on Public Finance of the Economic Information System.

In addition, there is a significant reduction in the component of subsidies and transfers of -38.4 in the year 1995, and -9.2% in the year 2017, while the programmable spending records a fall below the 5% annual average of the year 2001 to 2017. Faced with the reduction of subsidies and transfers to the agricultural sector, since the late 1980s, negative consequences were anticipated each year in the well-being of agricultural families and in the income of farmers; due to the lack of new programs or subsidies aimed at productive improvement. Also, since the implementation of the policy of trade liberalization (1981) a drastic reduction in the evolution of both budget spending in general and in the section of programmable public expenditure that is where subsidies and transfers are contemplated, maintaining a decreasing trend was reflected over time, notice in Figure 3.

Figure 3: Mexico: Evolution of Budgetary Expenditure, programmable and Subsidies (1977-2017)

Source: Bank of Mexico (2017), with statistics on Public Finance of the Economic Information System

It is undeniable that the Mexican agricultural sector is affected by the budget decrease and the fall in transfers and subsidies. In the figure no. 4, there is a slight downward trend in the evolution of the amount of PROCAMPO distributed to temporary lands, even though its weight is 80% per year; While the amount distributed to irrigated land, reflects a slight upward trend, but remaining at the weight of 20% on an annual average.

Figure 4: Behavior of the PROCAMPO application according to the type of cultivated land (1995-2016)

Source: Own elaboration with data from ACERCA

When analyzing the behavior of the PROAMPO application according to the type of cultivated land, the categories were identified. Based on Lind, Marchal and Wathen (2012), it was possible to convert category frequencies into relative frequencies of categories to show the fraction of the total number of observations in each of the chosen ones. The relation between the totality of elements of a category and the total number of observations is observed. Regarding the application of PROCAMPO, it is observed that 85.8% of the beneficiaries are farmers who produce on rainfed land, while 14.2% are farmers who produce on irrigated land.

Table 1: Table of relative frequency of the number of PROCAMPO beneficiaries by type of land property

Category	Number of Beneficiaries	Relative frequency
Irrigation Lands	7,336,074	0.142
Temporary Lands	44,351,763	0.858
Total Beneficiaries	51,687,837	1.000

Source: Own elaboration with information from SAGARPA and ACERCA.

Between the analysis of incidence of the benefits of agricultural subsidies Scott (2008 and 2010), it shows that the evaluations of agricultural subsidies overestimate the degree of regression (concentration in the richest producers) and that these are destined for transfers unrelated to the production, however, the concentration of income is underestimated as are most subsidies that are concentrated on the largest or richest agricultural producers.

4. DISCUSSION OF THE ANALYSIS

For the Discussion on the implications of agricultural subsidies in Mexico, García-Salazar, et al. (2011), who evaluate the effects of PROCAMPO on the Mexican corn market from 2005 to

2007 and highlight that corn is the crop that has obtained the most resources from this program, they demonstrate through a model of spatial and intertemporal equilibrium that the benefits were higher than the program costs, and that a 50% increase in the subsidy would increase maize production by approximately 10%, thereby decreasing corn imports into 20.7%; therefore, due to the positive effects of the Program, the continuation and increase of support is recommended. Likewise, Appendini (2014) discusses the background of Mexico's agricultural policies and analyzes the programs implemented by the state agency ASERCA (Support and Services to Agricultural Marketing) that support corn commercialization, in addition, it argues that the restructuring of the domestic supply of corn is due to political decisions and subsidies to production to support private agents in the corn market; therefore, it considers that the State did not withdraw its participation but, rather, it has had a determining role in the construction of the "free" corn market, with the result that the domestic supply for the market is concentrated in the hands of relatively few producers and in relatively few regions. Although Lence (2016) estimates that contract farming ($A \times C$) is the main program of the Mexican government aimed at mitigating price risks for agricultural producers in Mexico, In addition, it has unique characteristics that include forward contracts and the provision of basic subsidies and futures options traded on a subsidized stock exchange for producers and intermediaries. For its part Echanove (2017: 47), documents the characteristics and contextualization of the subsidy programs that the Mexican government implemented to protect Mexican farmers from the risks that would imply price volatility as well as the effects of liquidity on producers of corn, emphasizing that "the programs of support to the field have important advantages for the producers, however, its impact is not tangible in terms of yields and productivity, which prevents the establishment of generous sales contracts, which is why there is a need to reorient agricultural policy in Mexico", directing resources dedicated to the government's coverage strategy to less regressive programs, such as direct income support for the producer, as in the case of PROCAMPO. From a sociological perspective, Navarro-Olmedo, Haenn, Schmook and Radel (2016), conducted a qualitative research with 94 Mexican ejidatarios to examine the impact of the reforms that in 1992 strengthened the social hierarchies of the agricultural sector, highlighting that these reforms consolidated the social status of producers, by contesting greater access to government subsidies, but responding to social pressures that called for greater justice and equity towards a stepped citizenship, but being inflexible with the term of citizenship of market, in which they have less access to resources or government transfers. However, the results of Lence (2016) show that contract farming causes large transfers in the agricultural sector and argues that if $A \times C$ reduces the market power of intermediaries to the greatest extent possible, the results indicate that even it would cause significant losses in aggregate welfare. As stated by Huacuja (2013), when estimating that Mexico was the fourth world producer of animal feed, a highly productive and dynamic sector in the last thirty years, what would have derived the analysis of the supply mechanisms of the food agroindustry and the role played by agricultural policies of subsidies in these mechanisms, highlighting that from 1994 to 2007, finding that the Mexican government subsidized grain imports from the producing sector; however, it recently implemented the "agriculture by contract" program to encourage companies to acquire national grains and support their producers, highlighting the main problem of subsidizing agriculture by contract, determining the prices of grains and the exchange rate, which makes it highly vulnerable. Zarazúa-Escobar, Almaguer-Vargas and Ocampo-Ledesma (2011), considering two segments of producers: smallholders with a traditional production system (less than one hectare) and producers of a commercial production system (with more than 20 hectares), analyze the fulfillment of the collateral objectives of PROCAMPO, in a representative sample of producers obtained from the list of beneficiaries of said program, finding evidence that while the smallholder system is in the transition stage towards the commercial sector, the agricultural system of commercial production finds a

gradual reduction in social, economic and ecological profitability, to which they emphasize that PROCAMPO does not meet its collateral objectives, which makes it necessary to include the agricultural sector, support for public goods, in order to develop knowledge management. For their part, Freudenreich and Mußhoff (2017), link subsidies to agriculture with risk mitigation through production insurance, noting that farmers in developing countries are risk averse, and therefore prone to lack for sure, which limits the adoption of technologies that improve agricultural production and productivity. In their study, they prove that production insurance is better than supports (subsidies) destined for compensation of crops, given that having agricultural subsidies would allow the purchase of insurance and technology that minimizes risks and potentializes agricultural productivity; that is, obtaining a subsidy for productivity is better than obtaining insurance support for production losses. Huacuja (2016), records that soybeans are the grain in which Mexico has the highest food dependency, so from 2008, the government has granted excellent subsidies to both producers and buyers of the grain, thus contributing to a recent process of expansion in certain states, as in Campeche, concluding that although producers have raised their income levels, the process continues to be vulnerable, since it depends on variables such as government support through transfers, determination of the international price of soybeans and the exchange rate. Based on the foregoing, the data provided by the 2016 INEGI agricultural census framework (July 5, 2017), allow verifying the validation of economic activities related to the agricultural sector, yielding infographics by cultivation figures with state relevance, allowing the consultation of the microdata laboratory for the purpose of obtaining special information such as the application of subsidies to the field.

Figure 5: Percentage Base of Beneficiaries of PROCAMPO-PROAGRO in Sinaloa (1995-2016)

Source: Own elaboration with information from SAGARPA (2017), on PROCAMPO results and indicators.

It is evident that the concentration of benefits has a greater coverage among producers with temporary lands (which are the majority but are the least favored, given that the effective benefits with minors for them (see Figure 5). Added to this, the total land area is distributed mostly among large farmers. According to the Agricultural Census 2012 and 2014, large producers are those whose production exceeds one million pesos of the value of their production. In this sense, INEGI (2017) records that only 2.4% of farmers are responsible for 14.7% of the rural area. While in figure 5, it is observed that an average of 80% of the beneficiaries are farmers with rainfed land, in contrast to 20% of the amount of benefits to this type of rainforest producers are granted as a product of PROCAMPO (see figure 6).

Figure 6: Percentage Base of Beneficiaries of PROCAMPO-PROAGRO in Sinaloa (1995-2016)

Source: Own elaboration with information from SAGARPA (2017), on PROCAMPO results and indicators

Otherwise it happens, with farmers with irrigation production system who were benefited with PROCAMPO, corresponding to 20% on average per year (see figure 5), while level of amount or benefit corresponds to 80% on average per year (see figure 6). Although the strategy seems appropriate, by supporting PROCAMPO mainly with farmers with irrigated land, it makes it clear that the program bases its bases on subsistence agriculture. Even and that its scope extended to benefits for landowners of temporary and in poverty (OECD, 2010). Although, for this type of farmers (temporary and subsistence), PROCAMPO, as an instrument of public policy, has brought benefits, but they have been insufficient. While for rich farmers, the program leaves an inequitable spill when the amount of benefits is proportionally greater, when those are less than seasonal farmers.

5. CONSLUSION

The most general conclusion derived from the analysis of information available for this study is that it confirms that PROCAMPO is a subsidy that is part of programmable public spending with social and non-productive vocation; and therefore, a tax policy that represents part of the compensatory agricultural public policy, with a welfare-oriented nature of the subsidies granted to agricultural producers, which means that it is an insufficient resource to resolve the lags that lead to marginalization and poverty in the sector agricultural. A reality was observed that reflects a decreasing evolution in the provision of programmable public spending, subsidies and transfers. From the hypothetical approach it could be considered that the decrease of PROCAMPO is due to the reduction of the programmable public budget as a result of the budget deficit, so that the higher the budget deficit, the smaller the allocation of programmable public spending to PROCAMPO. As a result, farmers are harmed. Therefore, the program would make sense to compensate the "losers", if those who benefit were the majority, and certain minority interests would be harmed, but it loses meaning if the decisions only benefit a minority of agricultural entrepreneurs and it harms the majority of producers in the rural sector with peasant and seasonal ancestry. The findings reveal that the subsidies generated by PROCAMPO have been taken as a strategy of apparent solution to the situation of lag and insolvency of the agricultural sector; meanwhile, the income of its beneficiaries depends to a great extent on this subsidy to cover needs of a welfare nature that appear moderately covered, while their amounts are destined for the payment of food, transportation, clothes and medicines; however, PROCAMPO was not designed for that, but by definition it was designed to generate

productive, economic and social results. Faced with this, reality has been very far from the central purpose for which it was created to exist large discrepancies between what was expected and what has actually materialized. Given this approach, recognize that the annual income of a farmer is strengthened with the support of PROCAMPO; and that this will allow it to have greater economic capacity and greater productive capacity, it only reflects a conformist and paternalistic language, which suggests the limited existence of financial security and productive certainty, however, if this program did not exist, many of these producers could disappear farmers, and with them the standard of living of their families would worsen. Therefore, it is important that this program be maintained as a social policy that helps small agricultural producers, who have been poorly benefited by the program in terms of a zero reduction in their levels of poverty, since the "apparent increase" in its income, associated with its participation in the program, is insufficient because it does not compensate for the microeconomic loss due to increases in production costs and the decrease in the real sale price absorbed by the producer. Despite the lack of mechanisms towards the conversion of crops and the non-completion of technology transfer, it is necessary to rethink the disappearance of PROCAMPO as part of agricultural sector policy, as this would undoubtedly generate; given the current conditions, a negative economic and financial impact of great importance for the majority of the beneficiaries of the Program. To conclude, there is a need to reassess the importance of the agricultural sector and its impact on economic growth, which is why it is necessary to redefine a finance policy with sectorial guidelines, which will be used to set up concessionary instruments, subsidies and programs to finance and solve the competitiveness of agricultural activity. In this strategy, an essential condition is to align the fiscal policies with sectoral policies with the rest of the macroeconomic policies. That the State distributes a programmable expenditure to strategic sectors such as agriculture, where the multiplication effect of agriculture in the economy is prioritized, which is inherent and important to make visible the resizing of agriculture in the economy. The PROAGRO (before PROCAMPO), is still necessary and today more than ever, it is still relevant, given the limited financial and economic conditions of the sector. For what is proposed, a redesign in its structure, purpose, application and management on the basis of an integral finance policy that makes it possible to visualize the agricultural dynamics to which it would solve and clarify the multiplying effect that together would generate the tax relation between the beneficiary subjects and State, which would allow to visualize the sustainable agricultural mechanics that possibly improves its incidence in the GDP in the medium and long term. Another alternative to finance the agricultural sector, would be the creation of another type of agricultural development programs, consistent with the regionalization and agricultural vocation of the states of the country, where the State allows price stability and with it a synchronous and economic development. harmonized with the needs of each agricultural subsector, be it fruit, horticultural, industrial, intensive, extensive, irrigated or temporary. Finally, it is convenient to carry out more detailed analyzes of the impact of these programs at the regional and local levels, which allow public policy makers to have the necessary elements and a more useful diagnosis for the regions that make up the great mosaic of the region. geographic and cultural diversity of Mexico.

SINALOA: THE FUTURE OF AGRICULTURAL SMES BEFORE THE NEW AGRICULTURAL POLICY

Jaime Jimenez - Santos
Universidad Autónoma de Sinaloa
capomos@yahoo.com.mx

ABSTRACT

This research work presents agricultural PYMES in the state of Sinaloa, México as a subject of study in a scenario where, based on their characteristics, the problems faced when it comes to internationalization are analyzed. The determining factors and the obstacles that restrict the possibilities of entering foreign markets are exposed and the different export strategies will be analyzed, in a scenario of business integration or export association that will allow a greater insertion in international markets and increase their competitiveness. Finally, the work presents a series of proposals and strategies to carry out the organizational schemes called export consortia and operationalized in agricultural Pymes in the state of Sinaloa.

Keywords: *Associationism, Competitiveness, Development, Internationalization, Pymes*

1. INTRODUCCION

If we study the past, we observe the present and we project the future, the primary sector in the state of Sinaloa was, and, we are called to be the engine that drives the economy towards better development stages, since from its origin this sector has given its dynamism, however, it must be recognized that, in the latest trends, especially since the entry into force of the North American Free Trade Agreement (NAFTA), the agricultural sector has been one of the more A serious stagnation has been achieved both in productivity levels and in a competition that is referred to. The foregoing has brought with it serious problems of various kinds, such as the high level of parcel rent in the face of the impossibility of accessing attractive financing sources for small producers, high production costs, the fall in market prices, others until the climate change that increasingly threatens the existence of species on the planet including the human. In the present work account first of the adverse conditions that has been going through the primary sector of the economy, particularly agriculture and as this has brought a process of decapitalization in the field and consequently a very limited regional development but it is negative, but we also maintain that from the incoming government of left profile and the economic policies directed to the Mexican countryside, there is the possibility that the primary sector initiates a very important recovery that brings with it a more balanced regional development and translate into higher levels of welfare of the population. Due to the high competitiveness that is currently developed in the different productive fields at regional, national and international levels, and the challenge that this represents for our region and state, it is justifiable to carry out this study, since it is necessary to generate opportunities for more equitable development and these are only achieved with the participation of government, research centers, society and of course the productive sectors., understanding that today not only compete against other regions of the country, but compete on a global scale. If we are able to balance the level of competitiveness of the different regions, it will allow designing strategies that determine its future performance and helps us to know what elements are required to develop new opportunities, without forgetting that this must bring with it the human development without which it does not have Reason to be. The investors of our region have a range of investment options of great importance, which can be strengthened under the scheme of balanced regional development. Therefore, it is important to understand the role that the government must play in different fields of its action to contribute to development, as stigliz I states when it affirms that the non-debatable roles of governments are clear enough: to protect property rights, enforce contractual obligations to foster competition, and provide public goods

such as research, technology, information and infrastructure. The most controversial roles are related to the redistribution of resources through forced measures, price stabilization, risk absorption and the provision of credit. . (Stiglitz, 1993.)

2. AGENTS OF CHANGE IN SINALOA'S AGRICULTURE

The importance of the present investigation lies in having clear each of the fields of action of the government and those that will be the responsibility of the different economic agents so that at the moment of making decisions, they define the responsibilities and scope of each one of them and the Focus your efforts on those areas that correspond to you. If we consider that one of the problems that afflicts all organizations is precisely their management capacity, especially those that have little specialized human capital as is the case of SMEs that are in economies that depend largely on the primary sector characteristic that identifies Sinaloa, then this study can contribute to the solution of much of this problem, by providing information that due to its relevance contributes to further studies in this field, the present work can provide elements for its possible use in a diverse range of problems that have to do with regional development. With regard to its theoretical value, it is intended to ensure that the information obtained from this research, as a guideline for broader studies on the subject and serve at the same time, as an input for discussion and analysis of problems similar to the one addressed in this paper. work, so we can say that if we look at the methodological usefulness then it helps to define a series of concepts that can be useful for the broader study of regional development issues making it clear where the information is that once treated and processed can become useful knowledge about the subject. It is necessary to make clear that, in this research, only the situation of the state of Sinaloa will be evaluated at the level of the role that the different actors of the agricultural sector must play in a strategy of associativity having as guide for this the theory of fourfold propeller. We will analyze those options in which there is the possibility of developing important vocational development strategies and capacities to promote activities that generate greater wealth and social welfare. The present study is limited to the state of Sinaloa, distributed by geographic zones with similar characteristics that allow its classification. Both the variables and the data presented that explain the problem studied in general will be valid as long as the conditions studied are present. Regarding the objectives pursued by this work, the analysis of the factors that affect the development of agricultural SMEs in the state of Sinaloa stands out, as well as the urgency to look for new organizational schemes oriented towards associativity within those that result from interest the Export Consortiums, the Clusters, among others, having as base of support the theory of the Quadruple helix as a proposal of productive organization that allows to elevate its competitiveness in the export markets and feels the bases to initiate a process in the medium term that allows to move from an agricultural economy to an agro-industrial economy where not only value is captured but also added and this can be appropriated by the productive agents and distributed in society, in such a way that this has an important and positive impact on the levels of regional development.

3. CURRENT SITUATION OF AGRICULTURAL SMES IN SINALOA

While it is true that the Mexican economy does not constitute an isolated entity, and therefore is affected by the dynamics of the world economy, it is possible to point out the variables that influence the "harmonious" performance of the economic system; nevertheless, we must advance that the course followed by the national economic system, at least during the years in which the so-called neoliberal policies have been applied, has been ultimately that of instability and general imbalance. Our country has traveled precisely because of the course by which it should not continue, at least desirable not only for the population but also for economic agents such as small and medium enterprises; since even in this process of imbalance and crisis there have been winners, who are the exception.

Keynes argued, in the mid-1930s, that the stability of the economic system and the general equilibrium, and consequently full employment, both of productive resources and of labor, were a function of the behavior of national income. Derived from their approaches, it was recognized that the economic system can be controlled by the government, as well as that the disturbances (crises) of the economic activity can be attenuated and corrected by the interference of the State in the economy (Rossetti, 1979); On the other hand, since national income is determined by the amount of national consumption plus the total investment made by private companies and the government, the general equilibrium of the economy, and therefore the stability of the economic system, can be maintained "Easily" if the government (State) adopts a compensatory fiscal policy that encourages investment, employment and consumption. In sum, among the factors that contribute to the balance of the economic system, government participation is vital, encouraging income and consumption, as well as investment levels. However, the neoliberal policy has opted for a contraction of consumption, the concentration of income and the reduction of public investment and the active role of the State in the promotion of production. In Mexico, it is from 1982 onwards that the start-up of neoliberal policies began, which among other aspects implies the unrestricted application of free trade, labor flexibilization, reduction of State participation, among other actions. From then until the current six-year term, the average GDP growth rate is of the order of 2.5% (Deputies, 2014), with a marked decreasing trend between each presidential term. The above obviously is not the work of chance, but an economic policy that has replaced domestic production with imported products; however, if the Mexican producers, especially the enormous masses of smallholder farmers, had technical advice, credit, technology and guarantee prices, our nation would have its food sovereignty assured. As a result of the application of the neoliberal policy, not only the growth rates of agricultural activity as a whole have been reduced, and their participation within the total of production, but also the country has been led to a state of insecurity and even greater vulnerability, due to the growing international demand for grains dedicated both to human consumption and to the incipient production of biofuels, which has not only caused the rise of basic grains, but has also reduced the amount available in the international market (Rubio, 2008). As a result of the lack of interest on the part of the current policy, with regard to what happens in the agricultural sector, we find the question regarding the increase of agricultural production and productivity; for the specific case of the cultivation of corn, the most important food product for our country has been influenced by this policy. Thus, the yields in the countries that make up the NAFTA trade bloc have increased by just over 3 tons in a period of thirty years, in the case of the United States, and of 2 tons for Canada. In the case of Mexico, in the same period, yields have increased on average 0.5 tons. With the progressive withdrawal of the State with regard to agricultural development policies, along with a growing rise in the price of agricultural inputs and the lack of capital goods essential for carrying out agricultural production under the conditions means that it imposes on the world market, as well as applied research, it is practically impossible to have a profitable production of corn, and therefore to increase yields. Some results of this long crisis of the Mexican economy, and of agriculture in particular, phenomena such as that of migration have worsened even more than in past decades. In this sense, the national and international migration of Mexicans has been a constant phenomenon throughout the history of our country, their different behaviors, origins and directions have made it clear that this social phenomenon responds, among other factors, to the different economic crises in the rural sector (León, 2007). Finally, as balances of more than thirty years of neoliberal policies in Mexico, we can point out the low growth of GDP and agricultural GDP, accompanied by ups and downs and even with presidential periods of zero growth or negative growth rates, both for the agricultural sector as well as for the national economy as a whole; such is the effect on the agricultural sector, that in several basic crops at the same time as a reduction in the planted area there is a reduction even in the yields per

hectare, which is indicative of the fall in profitability of agricultural activities. The previous thing translated in a constant reduction of the participation of the agricultural GDP in the total of the generated wealth at national level; which effectively translates in that the agricultural producers, especially the small farmers producing basic grains, abandon the agricultural activities or perform them under conditions of no profitability. And as for income, there is a huge polarization in terms of the way in which it is distributed to the interior of the population. Along with this variable, the salary shows signs of contraction in terms of its ability to purchase goods; situation that further restricts the expansion capacity of the economy, by reducing the consumption capacity of the mass of employees; so it would urge a policy that encourages consumption, and with it the domestic market so that it serves as a platform for expansion to agriculture itself but even to the same industrial sector. However, continuing under the spur of a policy that privileges the concentration of income only contributes to exacerbating the already low level of consumption and maintaining a strong domestic market. Although the revision of these variables does not exhaust the effects that neoliberal policies have brought, this has made it possible to demonstrate other phenomena resulting from this economic policy, such as migration and poverty in rural areas; today, as never before, the country has accumulated a continent of labor that currently extends beyond the traditional places of reception of migrants; the balances are many, but these are some of the most obvious and public domain. In addition to the incidence in these variables, others have appeared such as the increase in violence and drug trafficking, among other phenomena. One of the fundamental weaknesses that SMEs present, which paradoxically gives them the flexibility and agility necessary to respond to the changing demands of the market, is the small size of the same or the impossibility of generating an economy of scale allow to be competitive in the world markets. According to the researcher Juan Carlos Segura Mexia, small and medium enterprises (SMEs) are increasingly aware of the need to develop skills and competencies that allow them to expand their business geographically (Segura, 2014). And he adds that these tend to have difficulties exporting to foreign markets since they may lack the necessary financial means and knowledge, may not comply with foreign regulatory requirements, or may produce goods in quantity and quality not suitable for foreign buyers among many other potential problems. However, these problems can often be overcome through cooperation between SMEs (UNIDO, 2005). The OECD (2009) exemplifies the internationalization of PYMES and a theme of considerable relevance, mainly due to the creation of an observatory as a consecuencia of the efecto de cruce de fronteras de las empresas and the capacity of the demonstration of the PYMES to lead a national economy, regional and global level. As pointed out by Zignago, it is relevant to locate this phenomenon in a global environment of recurrent financial crises such as the most recent one in 2008, where the exporting PYMES are inserted, and where structures and international order begin to undergo major changes by the collapse of world trade that followed the financial meltdown of Lehman Brothers, which turned out to be very severe, widespread, sudden and synchronized (Zignago, 2010). This debate of world trade is clearly reflected by the decline in demand for products that generate economic consequences that are unfavorable for countries in their interaction or economic interdependence. Perhaps the most remarkable thing of this debacle was perhaps, its vertiginous propagation and its impact on a globalized level. Hodge, Williams, Lawrence (2005), quoted in Vega (2012), highlights that in an increasingly globalized world it becomes a complex environment that, as markets evolve, a higher level of competition is presented, which causes a great risk and uncertainty, which is propitiated by the phenomenon of internationalization. (Vega, 2012). In this globalizing era, it is urgent for SMEs and especially for those of the agricultural sector to be the weakest, to develop new forms of organization because of the role they play in the aforementioned economic interdependence. These new organizational forms or strategies must comply with certain characteristics as proposed (Rodriguez, 2003) who points out that they must be designed with flexible,

decentralized, participatory, competitive structures, with a high degree of automation that should be oriented towards internationalization and participation in international markets. On the other hand, and in agreement with (Jiménez, 2007) that points out that the processes of openness and globalization are of the utmost importance for Mexico to conduct research that will lead us to determine the behavior of the indicators related to the internationalization process. Thus, in this environment described above we can affirm, as do several researchers, that all countries have seen their exports decrease significantly in a very similar period as a result of the crisis in which the international economy is inserted and where consequently Mexico is not exempt. Safe (2014). On the other hand, we agree that the international economic environment is currently characterized more and more by its dynamism and globalization with trends such as the growing interdependence among countries, the formation of regional blocs, the emergence of emerging economies in Asia and Latin America, as well as the surprising technological advances in different sectors, configure a global environment increasingly competitive and changing, (Lugo, 2007). The opening of new markets abroad requires technical, human and financial means that are not available to many small and medium export companies, especially when it comes to going to countries with difficult access, such as China, Russia or India, (Barrios, 2012). In the case of Mexico, derived from this globalization, various free trade agreements have been signed, which has put us on the international scene; however, our companies do not have the adequate productivity to compete within this globalized environment, therefore, it is necessary to encourage and favor the development of Mexican SMEs. According to (Ysasi, 2012). General Director of the Mexican Foreign Trade Business Council (COMCE), underscores the need to promote a strategy between government and the private sector to link SMEs with export activity, which do not have the resources or the capacity required to adopt individual strategies. so the best alternative they have is to adopt associative strategies, through the complementation with other SMEs and support institutions, Barrios (2012). This, from my point of view, is a necessary condition that must be developed and implemented so that small businesses are sustainable over time and so that, in Mexico, and particularly in Sinaloa, we begin to compete with added value and stop competing with costs. All this "to generate companies that last over time and that generate better income for workers, better products for markets, with better technology and greater competitiveness of the country in the international context". Other lines of action that need to be put in place have to do with building public policy that enhances the productive vocations of each region, encouraging the creation of value chains. In the same way, it is necessary and of vital importance to accelerate the process of innovation throughout the country in order to reduce the differences between regions. It should not be forgotten that the current world is marked by the exponential change in technology and the way of generating knowledge, which makes it urgent to promote public and private investment in science, technology and innovation. But we must go further still, that is, we must ensure that new ideas are reflected in companies and that employees are better able to take advantage of them and contribute to improving the quality of life of society. In the case of Sinaloa, it is possible to confirm the need to generate new organization schemes under the characteristic of cooperativity, that is, associative schemes such as export consortiums, Clusters, cooperatives, among others, since, in recent years, companies are disappearing due to lack of competitiveness, hence the Sinaloa businessmen must implement in their organizations a good administration that emphasizes above all in recognizing that international competition is something that is here to stay and that we must turn our eyes to the interior of the organization and analyze what are the advantages of local companies against transnational companies and take advantage of them, as stated (Cereceres, 2007). On the other hand, the enormous opportunities offered by the associations are expressed in the natural process of collective learning that they entail, which is embodied in innovative management processes, and is derived from the articulation of models that impact long-term growth economic and competitive to

boost diverse regions (Cervilla, 2007). It is therefore convenient to advance in the development of a comprehensive strategy so that SMEs can appeal to the formation of network-based businesses, given the need to face their traditional constraints and enhance greater capabilities. In fact, it has been shown that they have a very positive impact in terms of efficiency and competitiveness in this business stratum, when SMEs act in an associative way for the acquisition of raw material at low cost, to solve certain technological problems, to advance training or qualification of the personnel, to promote processes of innovation and technological development of common interest, among others. It is important to remember that, as a result of economic liberalization, the improvement of transport and innovation in ICT, SMEs are increasingly exposed to global competition, while isolated companies find it increasingly difficult to implement them. penetrate foreign markets. Given their relatively small production capacity and limited financing capacity, SMEs find it difficult to compete with multinationals capable of exploiting economies of scale and, now that the product life cycles are progressively reduced, they are unable to position their products. abroad (Bittan, 2011). This model that could well be applied to the case that concerns us in the state of Sinaloa is the call of the FOUR Hélices where the government with public policy, workers, businessmen and civil society join together with the research and innovation centers to generate value in companies. The quadruple-helix innovation model refers to the one in which society joins forces with organizations, academia and public administration to direct innovation efforts that they could not independently achieve.

Figure 1: Model of the quadruple helix (Social XXII, 2010, Pag.)

As can be seen in the previous figure, the triple helix model referred to a model in which society was not taken into account. In some references, this fourth helix is usually referred to as a society or it is also usually referred to the individual people themselves. This last description is very much in line with the importance that concepts such as user innovation are taking. The fact of incorporating people as a key element in the innovation model has led public administrations to favor mechanisms so that companies, academia and people can relate to each other. One of the most common mechanisms are the Living Labs, which allow the development of projects in collaboration with citizens, companies and public and private research centers - Public Private People Partnership or PPPP- (Sanguesa, 2007).

4. CONCLUSIONS

Sinaloa, with prosperous and competitive economy. To achieve the prosperity of the population, innovative public policies are required that stimulate the creation of companies and the growth of existing ones, promote the attraction of investments and diversify production towards avant-garde economic sectors, making sustainable use of natural resources and capital human.

The constant changes of the factors that affect the development and the accelerated dynamism of the world economy are the opportunity to expand the participation of the State in programs and public policies that encourage competitive economic development, promoter of prosperity and the quality of life of the Sinaloans. The United Nations (UN) devotes more than 70% of its activities to economic, social, sustainable development and humanitarian assistance. The purpose of economic development is to mitigate global poverty and reduce inequality. Economic policies should focus on the sustained economic growth of the regions and improve their position with respect to others. Leader in sustainable and competitive agriculture, in profitable and productive livestock, and in the national tourist activity with global projection. Policies for development must be accompanied by institutions and regulatory frameworks that encourage innovation and investment, creating better and fairer systems of production and distribution of goods and services. Sinaloa being a key player in the production and export of agricultural products, the Sinaloan field, today, however, has indicators of depletion that are reflected in the low growth of productivity, as well as its low competitiveness and profitability. Moreover, it should be admitted that primary production in the region lacks sustainable management. In recent years, the agricultural sector of the state has had a growth rate lower than the national and state economy. For this reason, it is necessary to boost the productivity of strategic sectors, mainly the production of grains and food, with effective strategies and lines of action to increase the competitiveness of the agricultural sector and profitability of producers. For this, it is necessary to redesign the production model for the field, promoting new strategies with the commitment to renew the field and the agricultural sector of the state based on innovation, sustainable development, the incorporation of ICT among producers, as well as the renovation of the infrastructure of the Sinaloan countryside.

ABSTRACT

Ensuring financial sustainability of the banking sector is connected with effective system development of crisis management and regulation at the micro-, macro- and mega-levels. The main reasons for the development of crisis management systems for ensuring sustainable development of the banking sector are:

- *the extreme complexity of the mechanism of the international banking system and the use of a significant number of new financial instruments;*
- *variety of operations and the movement rate of financial capital;*
- *financial globalization and integration, that enhance the effects of systemic risks on the process of extrapolation from the banking sector to capital and derivative markets;*
- *the availability of information asymmetry in the financial market;*
- *the process of introducing common standards in the field of bank management;*
- *improving the management of banking activities, particularly anti-crisis management, based on the harmonization of international and national regulatory systems.*

The conclusion is that the transformation of international standards for providing sustainable development of the banking sector contributes to the recognition of the scale of the impact of the crisis factors on the solvency, liquidity and capital adequacy of banks; there were identified preventive measures to avoid crisis situations, crisis management techniques and measures to overcome the threat of a crisis with the least losses for the banking sector.

***Keywords:** anti-crises management, Basel principles, financial stability, macroprudential policy*

1. INTRODUCTION

Ensuring financial stability of the banking sector is connected with development of an effective system of crisis management and control at the micro-, macro- and mega-levels. The world central banks are responsible for the implementation of an effective monetary and credit policy, which implies the application of effective anti-crisis regulatory instruments affecting the financial stability of the banking system. Assuming that the crisis management at the mega-level is associated with the development and transformation of international standards of banking business, besides the central banks, other state structures should be involved in these activities which have the authority to do in this sphere.

2. ANALYSIS OF LAST PUBLICATIONS

Scientific works of many domestic and foreign researchers are dedicated to the issues of implementation of international standards for the functioning of national banking systems.

Among them are: (Keller, 1999); (Juglar, 1962); (Piet, 2010); (Eichengreen, 2003); (Dovhan, 2011); (Mischenko, 2013); (Naumenkova, 2015); (Osadchy, 2010), and many other scientists. But issues of the formation of anti-crisis systems relating to the financial stability of the banking sector remain unresolved both in global and national economies. The main reasons of these issues are: the extreme complexity of the mechanism of the international banking system and the use of a significant number of new financial instruments; variety of operations and the movement rate of financial capital that increases the banking risks and the uncertainty of the impact of their implementation; financial globalization and integration, reinforcing the impact of systemic risks on the process of extrapolation from the banking sector to capital markets and derivatives markets; availability of information asymmetry on the financial market, which requires improving the explication of information processes and ensuring transparency through the use of macro-prudential indicators that reflect the functioning of the interbank money market, repo markets, shares, bonds, derivative financial instruments; the process of introducing common standards in sphere of bank management; improving supervision over the banking activities (particularly in the conditions of crisis), based on harmonization of international and national regulatory systems; providing technical compatibility of infrastructure, transparent price policy for the appropriate banking and financial services (Makarenko, 2008); (Kuznietsova, 2009). The aim of the work is to systematize the basic concepts of the provision of anti-crisis financial sustainability of banking systems in accordance with international standards.

3. THE FORMATION OF THE PRINCIPLES OF ANTI-CRISIS FINANCIAL STABILITY OF BANKS MANAGEMENT

Formation of the anti-crisis principles of financial sustainability of the banking system requires taking into account the factors which should be considered at the mega, macro and micro levels: mega-level factors (global financial imbalances, the cyclical economic development, the problem of ensuring international financial stability and liquidity); macro-level factors (disproportions in the financial market development, the formation and spread processes of systemic risk, disintermediation, financial innovations and communications, information asymmetry on the financial market); micro-level factors (systemic nature of the financial banking instability). The purpose of crisis management of financial stability of the banking sector system is to recognize the full extent of the impact of the crisis factors; to identify ways and methods of crisis management, measures to overcome future crisis with the least losses (table 1).

Table following on the next page

*Table 1: Levels of anti-crisis management of financial stability in the banking sector
 (Kovalenko, Dadashev, 2016, p. 58).*

Elements of level system	Mega-level the leading system	Macro-level the leading and led system	Micro-level the led system
Managing the realization process	stress testing; macro-prudential regulation; forecasting, corrective measures	monitoring, methodical approaches to the assessment and formation of financial stability reports; corrective measures	choice of management strategy, development and implementation of anti-crisis programs for financial stability
Agents of management	international regulators	internal system regulators	banks
The object of influence	destabilizing external environment factors	the formation and spread processes of systemic risk	internal banking risks
The aim of influence	recognizing the full extent of the impact of the crisis factors; identifying ways of anticrisis regulation and levelling crisis leverages	timely identification and minimization of crisis factors	timely identification and minimization of crisis factors
Instruments of influence	standardization and unification of the anti-crisis laws around the world; the development of financial stability indicators; a common system of financial reporting standards and transparency of banking activities	the implementation of preventive measures over the bank supervision; early diagnostics of the bank financial problems; improvement of banks and deposit insurance system; setting standards of banking activity, taking into account the specifics of state	stress testing; establishing internal limits and regulations; reorganization of the banks on their own initiative; special measures: benchmarking, outsourcing

There are a lot of organizations engaged in improving the regulation and supervision over financial institutions in the international area (table 2).

Table following on the next page

Table 2: Institutions and instruments of crisis management at the international, national, regional levels (Dovhan, 2011, p. 224; Kovalenko, Harkusha, 2015, p. 64)

	Institutions	Instruments
Anticrisis regulation at the international and regional levels	<p><i>International regulatory organizations:</i></p> <ul style="list-style-type: none"> - International Monetary Fund; - The World Bank; - Basel Committee on Banking Supervision; - Financial Stability Board; - The United Nations. <p><i>Regional regulatory organizations:</i></p> <ul style="list-style-type: none"> - regional development banks; - EU regulators; - multilateral regional organizations; - Forum of Banking Supervisors SEANSA; - GCC; - Caribbean Group; - Arabic Committee. 	<ul style="list-style-type: none"> - standardization and unification of anti-crisis legislation around the world; - the development of financial stability indicators; - the allocation of general standards of financial stability in banking sector; - the financial, informational and professional assistance during the financial crisis.
Anticrisis regulation at the national level	<p><i>Central banks and national regulators:</i></p> <ul style="list-style-type: none"> - Federal Reserve System (USA); - Office of the Superintendent of Financial Institutions (Canada); - Financial Market Authority (Austria, the Netherlands); - Financial Supervisory/Services Authority (Denmark, Estonia, Hungary, Sweden); - Financial and Capital Market Commission (Latvia); - Financial Sector Supervisory Commission (Luxembourg); - Financial Service Centre (Malta); - Kredittilsynet (Norway); - The Interministerial Committee for Credit and Savings (Italy); - Bank of England. Prudential Regulation Authority (Great Britain). <p><i>National megaregulators:</i></p> <ul style="list-style-type: none"> - Central Bank of Ireland (Ireland); - Banque de France, Prudential Control Authority (France); - Bank of Greece Capital Market Commission (Greece); - Bank of Lithuania (Lithuania). 	<ul style="list-style-type: none"> - the implementation of preventive measures over the bank supervision; - early diagnostics of the bank financial problems; - cooperation with the "problem" banks; - improvement of banks (provision of additional financial resources, changes in the organizational bank structure, the personnel policy optimization); - the formation of a deposit insurance system; - setting standards of banking activity

Based on previous mentions - the main purpose of anti-crisis measures is to ensure financial stability, stability and solvency of banking. Therefore, governance and banking supervision should ensure the stability and sustainability. Public administration process of selecting and implementing anti-crisis measures should be coordinated on methodological, macro and micro levels, taking into account the specific characteristics of functioning of banks, its importance for the state, including state participation in the capital of banks and the economy as a whole (table 3).

Table following on the next page

*Table 3: Matrix participation of management in the operation of banks and systems
 (Kovalenko, 2017, p. 138)*

Governing bodies	Normal operation	The appearance of the first signs of crisis	Crisis
Legislative power	x	-	x
Institute Presidency	x	-	-
The government, as a body of higher executive	x	x	x
Central Bank, Ministry of Finance and other state authorities involved in the management	x	x	x
Shareholders and managers of banks	x	x	x
International organizations	x	x	x
The supervisory authorities of other countries	x	x	x

The main anti-crisis measures to overcome the financial crisis included: the development assistance programs of troubled banks, measures to strengthen deposit guarantee systems; recapitalization of banks. Thus, international experience implementing anti-crisis measures to counter effects of the financial crisis demonstrates the existence of various mechanisms and schemes braking crisis. In general, the advantages and disadvantages of the implementation of anti-crisis measures largely depend on regional characteristics of their implementation and how practical tools linked with a set of anti-crisis model of action in each country. The efficiency and effectiveness of anti-crisis measures, which conducts the Central Bank can be estimated using the values of the profitability of the banking business (table 4).

*Table 4: Top 1000 World Banks 2018: Top 5 by Tier 1: Global
 (Top 1000 World Banks ranking, 2018)*

no	Bank Name	Country	World Region	Tier 1, Capital, \$m
1	ICBC	China	Asia-Pacific	324,126
2	China Construction Bank	China	Asia-Pacific	272,215
3	Bank of China	China	Asia-Pacific	224,438
4	Agricultural Bank of China	China	Asia-Pacific	218,104
5	JP Morgan Chase & Co	US	North America	208,644

4. PLACE OF MACRO-PRUDENTIAL REGULATION TO ENSURE FINANCIAL STABILITY OF THE BANKING SECTOR

It is necessary to refer to the implementation of the concept of macroprudential policy to measures for ensuring financial stability to the banking sector. The main features of macroprudential regulation are the following:

- macroprudential regulation – a complex of the preventive measures directed to minimization of systemic financial crisis;
- the purpose – management of systemic risk, that is the risk connected with the terms of providing financial services caused by the deterioration in terms of all financial system or its part having potentially negative consequences on real economy;
- objects of regulation – relationship between financial intermediaries, the markets, infrastructure of the financial market, and also between a financial system and real sector of economy;
- problems of regulation – support of resistance of the financial system to aggregate shocks; restriction of excessive financial risks which are assumed by a financial system in general; smoothing of a financial cycle (Kovalenko, Dadashev, 2016).

Macroprudential regulation is concentrated on systemic stability of financial sector, but not on insolvency of separate banks. At the same time special attention is paid to systemically important banks and their interrelations in the financial market as the risk of systemic stability depends on collective behavior of participants of the financial market therefore risks in a financial system for regulation will gain endogenous character (table 5).

Table 5: Systematization of macro prudential measures

No	Problem	Tools
1.	Macroeconomic risk and risk of "financial bubbles"	<ul style="list-style-type: none"> • taxes on consumer crediting (tax on the main amount of debt) • reserve requirements;
2.	Credit risk and market risk	<ul style="list-style-type: none"> • limits of crediting volumes; • standards of a ratio of credit volume and cost of pledge (loan-to-value ratio – LTV ratio); • standards of a ratio of the sum of debt and the income (debt-to-income ratio – DTI ratio); • creation of counter cyclic / dynamic reserves (countercyclical/dynamic provisioning), formation of reserves for possible losses according to loans; • change of coefficients of risk on different types of crediting; • restrictions for "short sales"; • restrictions for operations with CDS (credit default swap).
3.	Currency risk and risk of flows of the capital	<ul style="list-style-type: none"> • taxes on operations with the capital; • restrictions for open currency positions of banks; • restrictions for investments of assets in foreign currency; • restrictions for loans in foreign currency; • restrictions for investments for nonresidents in national assets; • special requirements for licensing; • administrative measures;
4.	Documents BKBN; realization of banks monitoring by "Basel III", realization of Basel reforms in member countries of BKBN; stress testing	

Thus, process of transformation of the international standards to ensure financial stability in banking system is directed, first of all, to development of crisis responding measures of systemic risk, involving sharp growth of interest rates, increase of banks problem and debts, essential reduction of crediting, chain bankruptcies, transition to unprofitable model of banking activity, a prevalence of speculative activity over investment financial activity, large-scale fall of price of securities, a delay of calculations, bank panic. Macroprudential tools is a wide range of tools that are used to prevent the occurrence and spread of systemic risk in the financial sector in order to minimize losses from irregularities in financial services. The global financial crisis led to review approaches to supervision of systemic their relationships and their regulation, and the need for introduction, sophisticated tools of identification and limiting systemic distribution:

- First, provide to regulators and oversight a special mandate to monitor systemic risk;
- Second, the nomination additional requirements for financial institutions with regard to their “contribution” in the generation of systemic risk.

International regulatory practices identified tools for identifying systemic risk (table 6).

Table 6: Tools for identification and measurement of systemic risk (Michenko, Naumenkova, 2014; Blancher, Mitra, Morsy, and others, 2013)

№	Tools	coverage			Information requirements	
		Institutions	Markets	Sectors	Periodicity	Type of data
1.	Conditional Value at Risk, <i>CoVaR</i>	+		financial	high	these bank balance sheets and asset prices
2.	Joint Distress Indicators	+		financial	high	asset prices

4.	Distress Spillovers	+	+	financial	high	asset prices
5.	Market-Based Probability of Default	+		financial and corporate	high	these bank balance sheets and asset prices
6.	Debt Sustainability Analysis			external and state	low	these payments balance and tax information
7.	Indicators of Fiscal Stress			fiscal	low	tax information
8.	Sovereign Funding Shock Scenarios		+	financial and state	average	the investment framework and data bank assets
9.	Asset Price Models		+		average	prices of assets and data of cash funds
10.	Balance Sheet Approach			key sectors	low	these intersectoral the balance
11.	Systemic Contingent Claims Analysis	+		financial	high	these bank balance sheets and asset prices
12.	Cross-Border Interconnectedness	+		bank	low	cross-border transfers and data balances
13.	Cross-Border Network Contagion	+		bank	low	cross-border transfers and data balances
14.	Systemic Liquidity Risk Indicator	+		financial	high	these balances and prices asset
15.	Regime Switching		+	financial	high	asset prices

The implementation of monetary policy is based on the implementation of Central Bank principles.

- Independence - Macroprudential policy has be independent of other central functions banks and regulators (monetary policy, micro-prudential supervision) and from external ones influences of the financial sector or authorities.
- Transparency - Goals and grounds for application macro-prudential instruments should be understandable for financial market participants and the public.
- Preventive approach - The central bank should Identify systemic risks in advance and on time take measures to minimize them.
- Predictable (rational) flexibility (guided discretion) - Macro-durability tools should be apply according to advance defined rules.

- Coordination - Efficiency of macroprudential the policy depends on its coordination with others politicians that are competent the central bank and other authorities.
- Proportionality - As a result of application macroprudential instruments to financial ones institutions will be subject to certain requirements. They should be proportional to the contribution specific institution in the total size of systemic risk.
- Avoiding Regulatory Arbitration - Macroprudential policy will only be effective if the financial market participants do not will be able to avoid restrictions by migrating to less regulated segments.
- Taking into account national peculiarities - Macroprudential policy should be taken into account national features of the financial system, so that the selected tools are effective and contributing achievement of goals.

5. CONCLUSION

Transformation of the international standards of a sustainable development of the banking sector are possible through formation of system of anti-recession financial stability which main goal is recognition of influence of crisis factors on solvency, liquidity and capital adequacy of banks; definition of preventive measures for prevention of crisis situations, methods of crisis management and measures for overcoming the threat of crisis with the minimum losses for banks. The main requirement to a banking capital is its use for compensation of financial losses. "Basel III" provides an exceptional structure of own capital with not enough liquid assets which can't be used for covering losses. According to the results of empirical researches which are carried out by western experts, measures for increase of standards of banking capital, introduction of coefficients of liquidity, adoption of more tough standards of the capital provided by the Basel III program for large international banks will lead to decrease in growth rates of GDP. But at the same time new rules can promote increase of stability in world economy and decrease in probability of bank crises. At the present stage of development of the financial market great attention is paid to the question of development and realization of the macroprudential policy providing stability of development in banking sector. In this regard special attention deserves identification of tools of macroprudential policy, in particular, defined by "Basel III"—as creation of the buffer and countercyclic capitals. Realization of macroprudential policy provides the solution of the following tasks. First, definition of institutional bases of macroprudential regulation. Secondly, measurement of systemic risk. For measurement of systemic risk the macroprudential body traces credit risks, risks of liquidity, market risks, and also concentration of these risks with the purpose of making decisions on the most effective measures for their overcoming. Thirdly, in terms of globalization of the financial market it is necessary to coordinate macroprudential regulation that can be promoted by universal tools and the international agreements on uniform use of such tools. In our opinion, each commercial bank needs to develop organizational and economic mechanism of the analysis and an assessment of future tendencies of capital sufficiency while introducing new regulatory requirements according to requirements of "Basel II" and "Basel III". The algorithm of the similar mechanism can include four main stages: choice of scenarios of testing, payment under this scenario, analysis of results of calculation, development of recommendations taking into account the received results. As the experience of many countries, especially in times of crisis, a prerequisite for implementation of functions enabling monetary policy to ensure exchange rate, price and overall financial stability is its coordination with fiscal policy. Lack of coordination of monetary and fiscal policy affects the state of public finances, bank-lending conditions and the stability of the financial system as a whole. The result of this inconsistency can be high yield on government bonds, which stimulates increased cost of funds in the money market and thereby undermine the efforts of the Central Bank to reduce of interest rates.

The most important task today is to coordinate the monetary policy and macroprudential measures as among the causes of the financial crisis are structural weaknesses in financial systems. In the arsenal of monetary policy is no effective tools to address these deficiencies. In this case, the macroprudential regulation will be more effective. However, it is necessary to evaluate the effect of macro-prudential measures on monetary policy transmission channels (for example, limiting the dynamics of loans). Thus, the effective coordination of monetary policy and macroprudential policy - the key to financial stability. The practice of recent years has shown that central banks have accumulated considerable experience in monitoring macroeconomic changes affecting financial stability. Therefore, they will continue to play a crucial role in both price and overall financial stability. In determining the discount rate of the Central Bank should focus on its approach to the maximum base rate "overnight", which provides real levers of money market liquidity. The implementation of tight monetary policy is an obligatory condition for restoring macroeconomic and financial stability. In a crisis, with the aim of curbing inflation, ensuring stability and restore confidence in the banking system the central bank should conduct a restrictive monetary policy, while ensuring positive real interest rates. In terms of implementation of tight monetary policy fiscal policy should not be expansionary. The degree of hardness or softness of the policy should be consistent with the nature of other policies through their coordination.

PROVIDING SAFETY AND HIGH QUALITY OF PRODUCTS IN ENTERPRISES AND ORGANIZATIONS BASED ON THE REQUIREMENTS OF INTERNATIONAL STANDARDS

Kheyri Umudova

Azerbaijan State University of Economics (UNEC), Baku
xeyri.umudova@gmail.com

ABSTRACT

It is important that the quality and safety of the products produced in the time of rapid development of science and technology meet the modern requirements. Therefore, ensuring the safety of the products, as well as the production process, the raw materials and semi-finished products used in this process, and the high quality of the product are taken into account in the International Standards. Manufacturers from different countries around the world apply the requirements of the International Standards at all stages of the production cycle and product life cycle irrespective of their production capacity. In the world practice these Standards are widely used: ISO 9000, ISO 22000 (based on HACCP system), ISO 14000, ISO 31000, GMP (Good Manufacturing Practice). These normative documents have been updated over time and improved versions are widely used today. In a number of countries, a national standard project has been developed and implemented by harmonizing them. The use of such standard projects in enterprises and organizations creates the conditions for high quality products, cost-effective production process, products with low cost value and high quality. The products obtained through the application of international standards are of high quality, low cost and have high purchasing power in local and international markets. Thus, as a result of the application of international standards, each stage of the production process is systematically monitored, potentially possible risks are explored, and an emergency response plan is developed for continuous improvement. Thus, with less material resources, high profitability and high economic efficiency are achieved, which, in turn, plays a positive role in economic development.

Keywords: *Continuous improvement, International Standards, Production process, Products, Quality, Safety*

1. INTRODUCTION

It is mandatory for enterprises and organizations to establish, manage and monitor their quality control systems, integral standard operating procedures and other quality documents to provide high-quality products and services to fully satisfy customer needs and expectations, so high quality and safety are an essential basic requirements taken into account by in the International Standards. To date, a number of standard projects have been developed in many leading countries around the world, allowing various different international organizations to make significant improvements in production, economics, medicine and many other areas and to get products and services of high quality and safety. These projects have gradually improved, have been tested and applied by many manufacturers in different areas of businesses. Such standards could be an example of ISO 9000, ISO 22000 (based on HACCP system), ISO 14000, ISO 31000, GMP (Good Manufacturing Practice), ISO 31000: 2009 and etc. Each of these standards is normative documents that are widely used throughout the world, enabling the safety and high quality of product of the area in which they are applied.

2. WHAT IS THE INTERNATIONAL ORGANIZATION FOR STANDARDIZATION (ISO)?

The International Organization for Standardization (ISO) is an international standard-setting body that creates documents that provide requirements, specifications, guidelines or characteristics that can be used consistently to ensure that materials, products, processes and services are fit for their purpose. Organization published 22602 International Standards that are used in all areas of human activity, thus ISO series standards are the most widely used standard projects all around the world (<https://www.iso.org/home>). Let's take a look at a few ISO standards that are widely used before, during and after the production process and that are relevant to high quality and safety of product, production process, environment and etc.

2.1. International Standards that are developed by ISO and used in production and provides high quality and safety

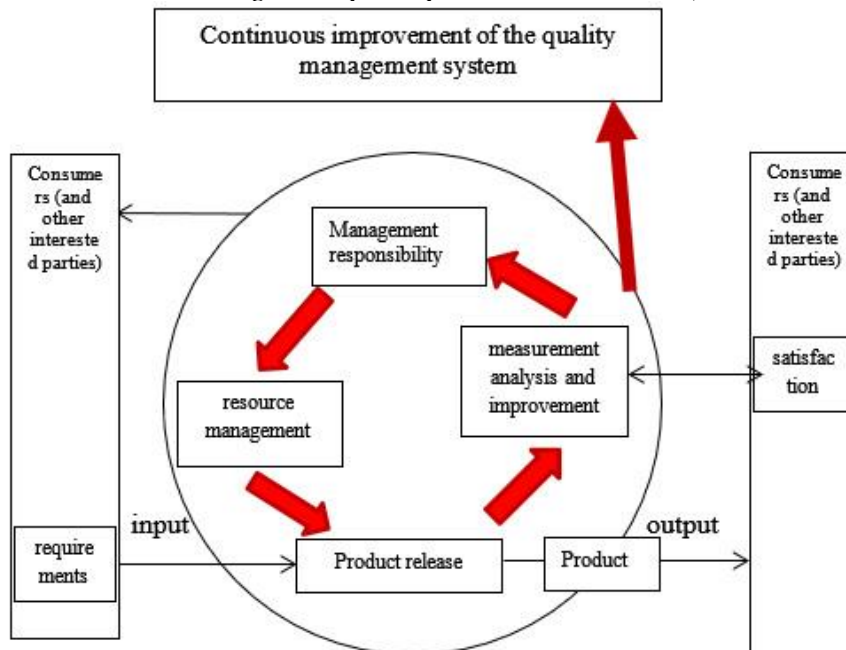

2.1.1. ISO 9000

ISO 9000 is the international series standards of quality management systems and designed to help organisations ensure that they meet the needs of customers and other stakeholders while meeting statutory and regulatory requirements related to a product or service (ISO 9000:2015 - Quality management". ISO). Here are seven quality management principles (QMP) of ISO 9000 series are based on:

- QMP 1 – Customer focus;
- QMP 2 – Leadership;
- QMP 3 – Engagement of people;
- QMP 4 – Process approach;
- QMP 5 – Improvement;
- QMP 6 – Evidence based decision making;
- QMP 7 – Relationship management.

This standart is applying in this sequence that are the principles listed.

Figure 1: Basic provisions for the introduction of a quality management system (quality management principles, ISO directories)

2.1.2. The international standard ISO 22000

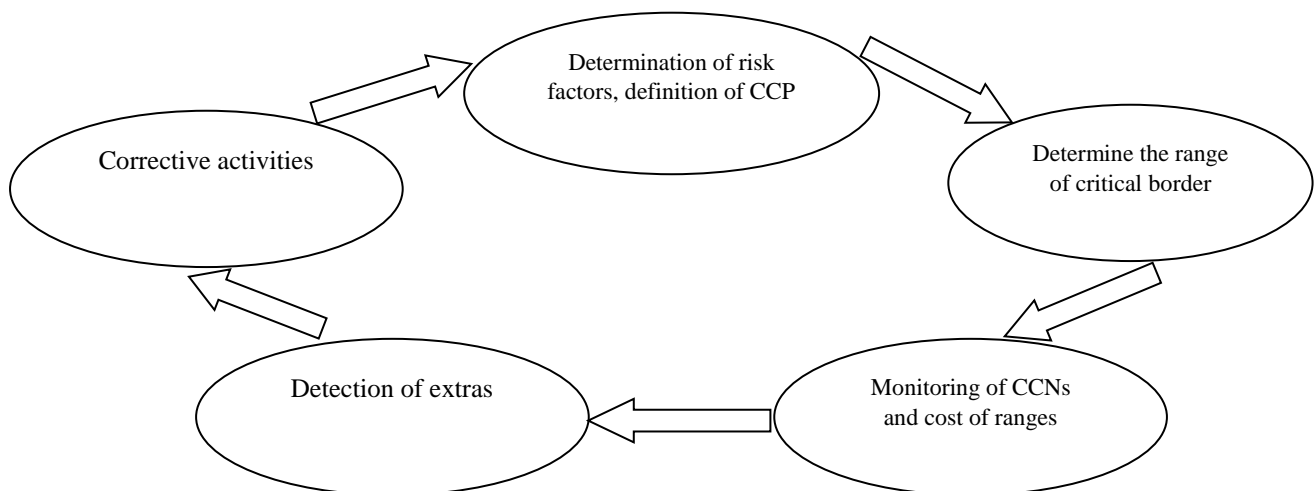

The international standard ISO 22000 can be applied independently of other management system standards. At the same time, it is built on the basis of the ISO 9001 standard to enhance the compatibility of the two standards, which facilitates the creation of integrated quality and safety management systems. The ISO 22000 international standard specifies the requirements for a food safety management system and that system involves the following elements (Сурак Джон Г., 2008):

- interactive communication;
- system management;
- prerequisite programs;
- HACCP principles.

HACCP is a system for managing and controlling risks that may arise during the whole process from the delivery of raw materials to the storage or shipment of finished products (Аришакуни В. Л., 2008). Therefore, it should be systematic, all-encompassing, fully executable and constantly supported, and should be based on 7 basic principles defined in the Codex Alimentarius and outlined below:

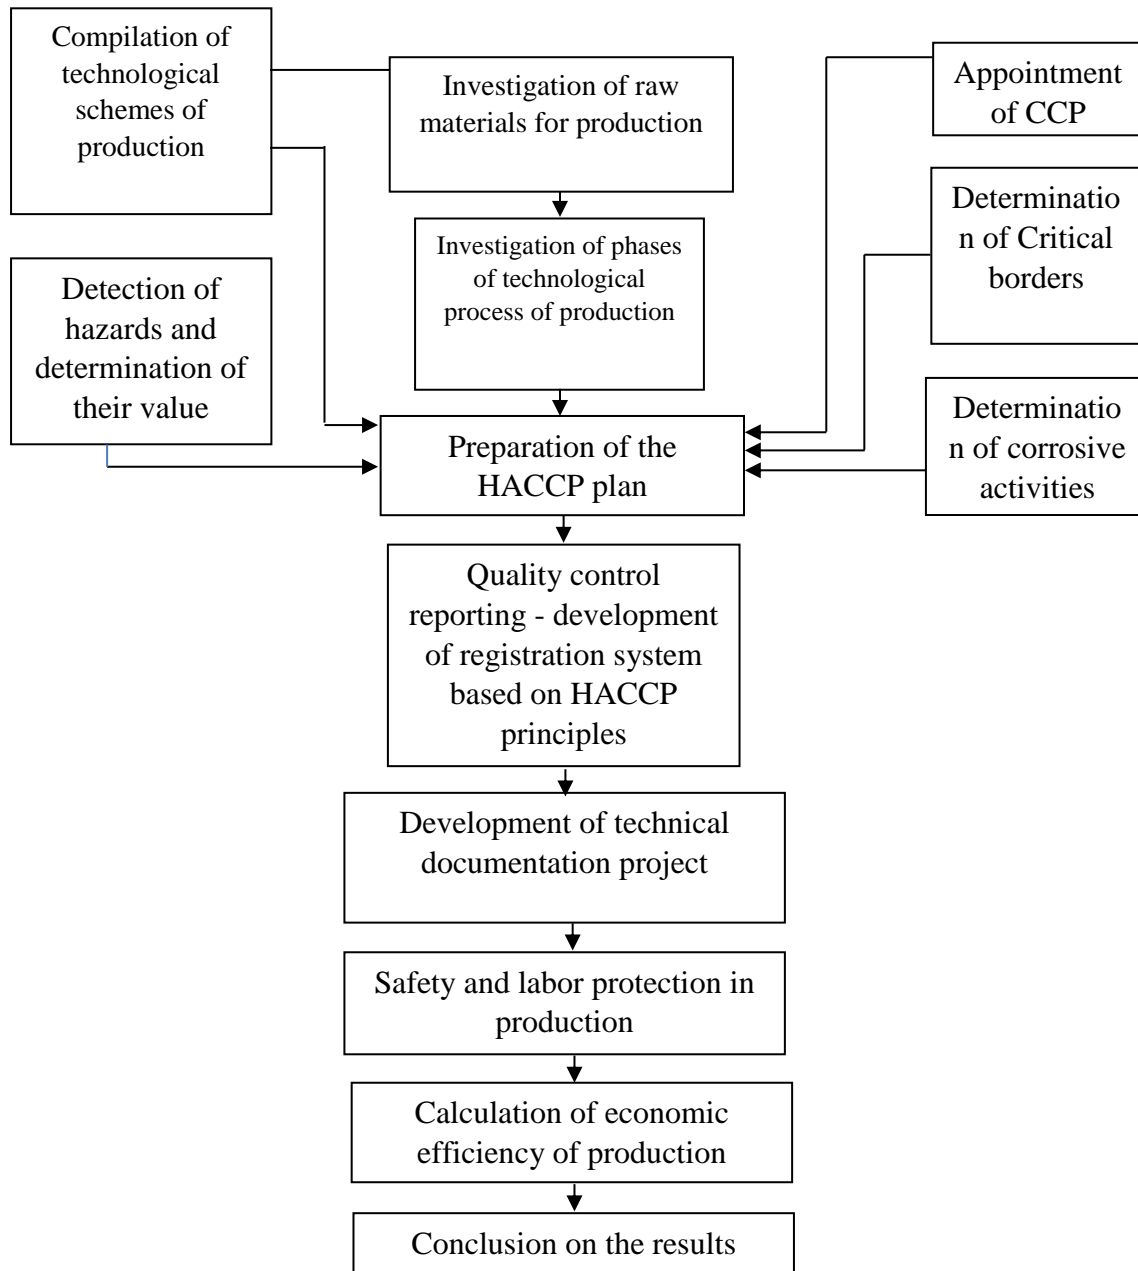

1. Conduct a Hazard Analysis
2. Identify Critical Control Points
3. Establish Critical Limits
4. Establish Monitoring
5. Establish Corrective Actions
6. Establish Verification
7. Establish Documentation and Records

Figure 2: Periodic scheme of risk management according to HACCP system principles
(Е. Ю. Путилина., 2013)

The implementation of the HACCP system will require a certain amount of knowledge, but first of all, it is knowledge of its product, its raw materials processes, and also an understanding of risks that may threaten the health of consumers. HACCP system applying also requires personnel training and personnel involvement. Personnel training: enterprises with large numbers of personnel and high levels of staff turnover have big problems. It is necessary to introduce initial personnel training, to include food safety issues in adaptation programs. Explain why food safety is important for staff and their families. It is necessary to make it their personal matter, thought without a good learning system, HACCP will not work.

Figure 3: Scheme of experimentation when applying HACCP principles
(ГОСТ Р 51705.1 — 2001)

Involvement of staff: if the staff is not involved, then there is the problem of misunderstanding their role and importance, and this in turn leads to poor record keeping, control, supervision of the CCP, as well as inappropriate execution of corrective actions (Е. Ю. Путилина., 2013.). Implementation of mandatory preliminary measures: initially, if the necessary conditions for the release are not created safe products, i.e. GMP, GHP (sanitary programs) products do not work - unsafe.

2.1.3. The ISO 14000 family

The ISO 14000 family includes most notably the ISO 14001 standard, which represents the core set of standards used by organizations for designing and implementing an effective environmental management system (EMS). it is a set of rules which creates a system by which organizations manage their activities that have an influence or a potential influence on the

environment (<https://14000store.com/iso-14000-family-of-standards>). ISO 14000 family of standards not only provide environmental benefits but also economic advantages, including:

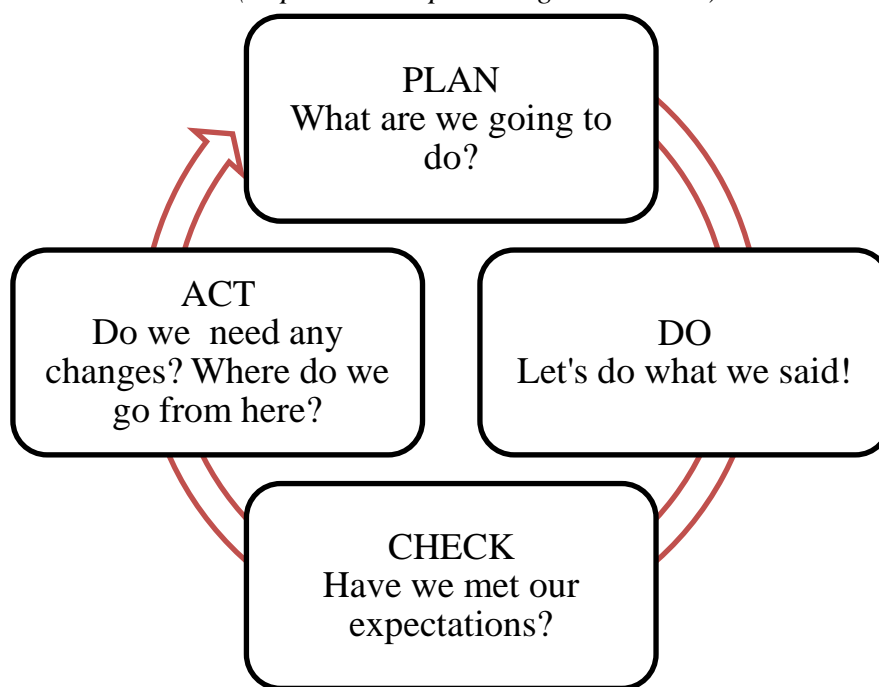

- reduced raw material/resource use;
- reduced energy consumption;
- improved process efficiency;
- reduced waste generation and disposal costs;
- utilization of recoverable resources.

The basic principles of ISO 14001 are based on the well-known Plan-Do-Check-Act (PDCA) cycle:

- Plan – Establish objectives and processes required;
- Do – Implement the processes;
- Check – Measure and monitor the processes and report results;
- Act – Take action to improve performance of EMS based on results.

The result of implementing an Environmental Management Plan will be better environmental performance and increased awareness of the importance of the environment.

Figure 4: PDCA (Plan- Do – Check - Act) Cycle
(<https://en.wikipedia.org/wiki/PDCA>)

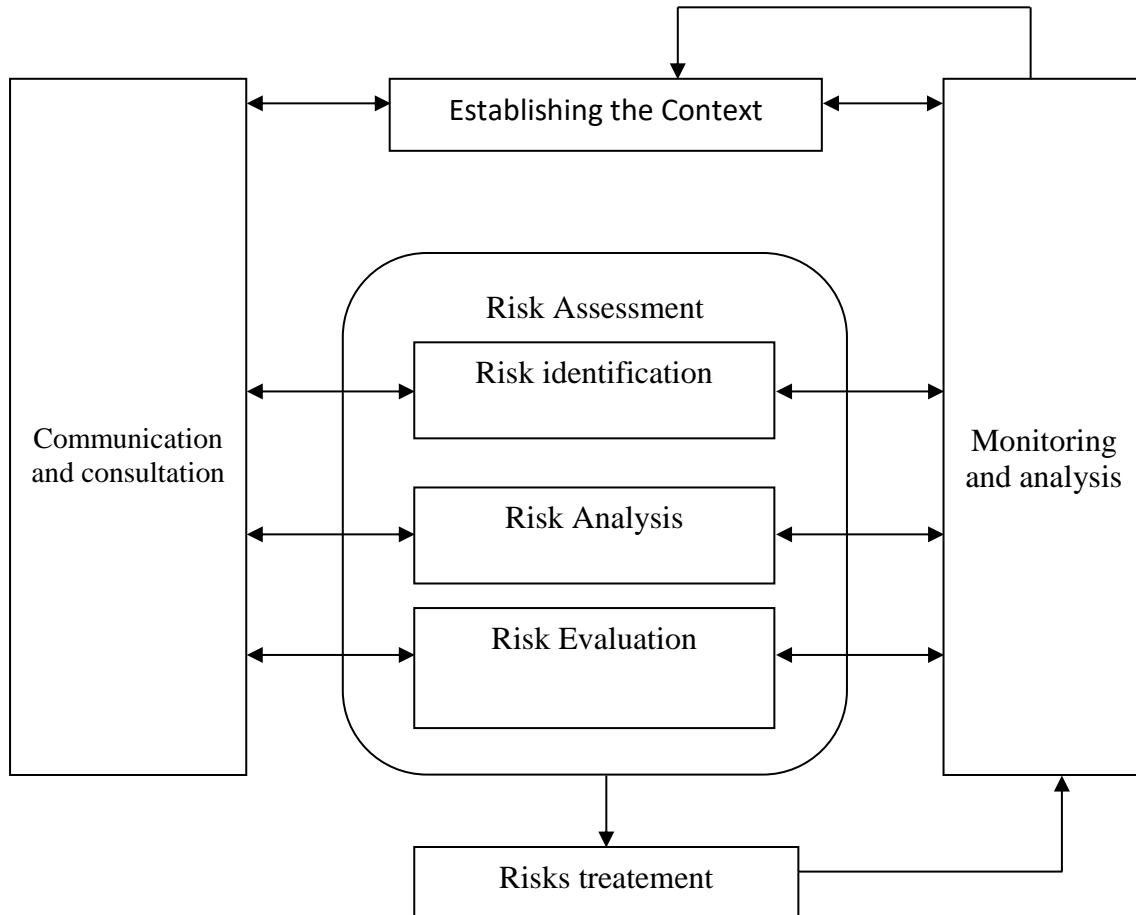

ISO 14001 encourages a company to continually improve its environmental performance. Overall, the CI concept expects the organization to gradually move away from merely operational environmental measures towards a more strategic approach on how to deal with environmental challenges.

2.1.4. ISO 31000:2018, Risk management

ISO 31000:2018, Risk management – Guidelines, provides principles, framework and a process for managing risk. ISO 31000: 2009 "Risk Management. The Guidelines and Guidance standard reflects the principles and comprehensive requirements for managing potential and existing risks in any area of human activity (ISO 31000:2009 "RISK MANAGEMENT – PRINCIPLES

AND GUIDELINES”). This standard was developed by the ISO Technical Management Board Working Group. It can be used by any organization regardless of its size, activity or sector (<https://www.iso.org/iso-31000-risk-management.html>).

Figure 5: Risk management process, ISO 31000 (ISO 31000:2009.)

Contact and consultation with internal and external stakeholders should take place at all stages of risk management. Therefore, plans for communication and consultation should still be developed at the first stage. When establishing a context, the organization explicitly identifies its objectives, identifies internal and external factors that will be taken into account when managing risks, and chooses the risk areas and criteria for the remaining processes. Using ISO 31000 can help organizations increase the likelihood of achieving objectives, improve the identification of opportunities and threats and effectively allocate and use resources for risk treatment.

3. GMP (GOOD MANUFACTURING PRACTICE)

GMP (Good Manufacturing Practice) – good manufacturing practices, or simply the rules of production. Good manufacturing practices are the practices required in order to conform to the guidelines recommended by agencies that control the authorization and licensing of the manufacture and sale of food and beverages, cosmetics, pharmaceutical products, dietary supplements, and medical devices. These guidelines provide minimum requirements that a manufacturer must meet to assure that their products are consistently high in quality. GMP determines the requirements for the production, storage and transportation of products, the requirements for production facilities, process equipment, personnel, and the sanitary and hygienic regime of production.

4. SAFETY AND QUALITY

Product safety regulations must be provided with “product safety awareness” to ensure thorough product safety. Manufacturers, managers of enterprises and organizations should apply the requirements of the standards if they want to get quality products and also follow the safety rules, so that safety is a fundamental value of products (<https://www.lg.com/global/sustainability/customer/product-quality-and-safety>). Some areas like food production, medical supplies have a more direct impact on people's health and the environment. The standards have high safety and quality requirements for these areas, as well as in all other areas. There are many definitions in various food safety regulations. Here are some of them:

- food safety - a state of reasonable confidence that food products under normal conditions of their use are not harmful and do not represent a danger to the health of present and future generations.
- safety of food raw materials and food products - a set of properties of food raw materials and food products, in which they are not harmful and do not represent a danger to the life and health of current and future generations under normal conditions of their use.

5. CONCLUSION

Usually, well-functioning security systems bring such benefits to the company:

- effectiveness / efficiency;
- employee satisfaction;
- increase staff competence;
- the best, rational control of activities, processes;
- standardization of processes;
- definition of stages which are subject to the main control (CCP);
- harmonization of relations between departments;
- support the quality of products (services).

Quality and safety, especially in food production, should be the main goal for all members in this sector - suppliers of raw materials and ingredients, manufacturers, organizations of transportation, storage and food vendors. And the application of proven over many years, improved standards guaranteeing high results will be beneficial for both producers and consumers, the environment and for the whole world.

WHAT EMPLOYABILITY QUALITIES DO COMMERCIAL BANK MANAGERS EXPECT FROM GRADUATES IN AZERBAIJAN?

Khumar Huseynova

Khazar University, Azerbaijan

Central Bank of the Republic of Azerbaijan

Khumar.Huseynova@khazar.org; Xumar_Huseynova@cbar.az

ABSTRACT

The purpose of this research was find out what employability qualities commercial bank managers expect from graduates in Azerbaijan. The reviewed literature was segmented into the themes such as the definition of employability; the expectations of employers and developed models of employability. A few practical models were studied, including CareerEDGE (Dacre Pool and Sewell, 2007). The CareerEDGE model was used as an instrument to define bank managers' expectations. A qualitative research method with semi-structured interviews was adapted to question 25 managers from 12 commercial banks and the Financial Market Supervisory Body of Azerbaijan. The respondents considered the model important and well-designed, and suitable for use by all stakeholders: educators, employers, parents and students. The managers discussed the elements of the model in succession, described their expectations, gave valuable suggestions and shared their experiences. Importantly, not only graduates' work experience and academic knowledge were valued by the managers, but also their generic skills that could be obtained through the learning experience. The research was not able to involve more managers from commercial banks, including managers from their regional branches, due to limited time and resources. A beneficial output of this research is that it has been suggested as a way to introduce the model to students and other stakeholders. As the topic is pertinent to the society there are many routes to explore in this field.

Keywords: *Azerbaijan, bank managers, employability qualities, graduates*

1. INTRODUCTION

The author's concern regarding students who applied for the internship program at the Central Bank of Azerbaijan led to the desire to study the roots of the problems which graduates face and explore ways to assist those young people. Employers, educators, parents and students are concerned with the case and the questions it raised (Huseynova, 2015): Why do universities and enterprises not collaborate to smooth graduates' paths from Higher Education Institutes (HEIs) to the labour market? Why do students and their parents not consider the potential graduates' employability qualities seriously? Why do professionals not develop, for example, a model for universities, enterprises, students and parents to help them with the problem? The core of the anxiety was the lack of employability skills including career skills, academic knowledge, soft skills, experiences, general knowledge, emotional intelligence and positive attitudes. All of these qualities help newcomers to perform well, not only to get a job (Dacre Pool et al., 2014; Huseynova, 2015; Schultz, 1963, cited in Rasul et al., 2012). Both the concept of employability quality, which is based on Human capital theory (Schultz, 1963, cited in Rasul et al., 2012), and the concept of connecting universities and enterprises to improve the preparation of youth for the labour market are not new. Employment support for graduates, for example, dates back to the University of Cincinnati Cooperative Education Programme in 1906 (Thiel and Hartley, 1997). In Azerbaijan the policy for developing employability qualities and helping graduates to move smoothly into the labour market requires serious changes (Isaxanli, 2008). Indeed, most graduates in the country are not able to move smoothly from universities to businesses, especially to the banking sector. Unfortunately, Azerbaijan's banking sector has faced serious, unfavorable processes which increased the rate of unemployment in the country.

In February 2016, according to the decision of the President of the Republic of Azerbaijan, a Financial Market Supervisory Body (FMSA) was established (APA, 2016). The organization immediately started to conduct a series of reforms which promised an enhancement of the banking system in Azerbaijan. One of the results of these reforms was a reduction in the number of commercial banks from 45 to 32 (Global banking finance review, 2017; Banker.az, 2017). This reform has created dramatic competition among those whose career goals related to the banking system. The conditions for graduates now compared to those with several years' experience in the banking system have become more dramatic. Clearly, the situation is less than predictable for graduates. Only commercial bank managers can provide expected answers through accurate research. It will open routes to graduates and potential graduates in becoming newcomers in the banking sector of Azerbaijan. The purpose of this research is to find out what employability qualities commercial bank managers expect from graduates in Azerbaijan.

2. WHAT IS EMPLOYABILITY?

There are different definitions of employability. For Dacre Pool and Sewell (2007), people are committed and effective in their jobs when they have appropriate skills, knowledge, experience and personal characteristics. All of these dimensions provide them with security in their chosen role. Yorke and Knight (2004), however, argue that employability is more than a combination of 'core' skills. Employability is developed through different means. Its components vary from good academic knowledge to desirable communication skills. Some features mould employability, including intelligence and experience. Cox and King (2006) distinguish between the significance of employability for students, for universities and for employers. The goal of students who attend degree courses is to build capacity for employment. It is their main focus after so much investment in their education. Growing expenditures on studying disturbs students and parents a lot (Gault et al., 2010). They want to have a guaranteed employment after graduation. High graduate employment levels provide universities with a high employment rate which increases its reputation among potential students (Cox and King, 2006) and their sponsors. Employability differs from employment as much as education varies from training. Employability describes how a graduate matches their employment (Knight and Yorke, 2003; Cox and King, 2006). Additionally, Hawkins (1999, in Cox and King, 2006) agrees that it is not being employed, but being employable which eliminates the risk of unemployment. Lim (2015) concurs that employability is shaped by students' own experiences. HEIs can provide students with basic skills but being able to manage challenges in their employment depends on the students' capacities. Moreland (2006), however, offers a more comprehensive definition of employability: people's knowledge, skills and personal characteristics build their employability, which makes them feel safe and effective in their chosen profession. Enjoying their role, they contribute to every stakeholder's wellbeing. Employability was not a concern pre-1990s, as HEIs in England and post-Soviet Union countries had an established tradition of developing professional and vocational skills in students. The era was characterised by fewer universities and limited admission to HEIs (Rae, 2007; Knight and Yorke, 2003; Isaxanli, 2008; Jonbekova, 2015; Guliyev, 2016; DeYoung, 2011, cited in Jonbekova, 2015). However, Tomlinson's (2008) qualitative research among 53 fourth year students in the early 1992 university depicted that although technical or degree knowledge was essential for final-year undergraduates' employment, they had concerns to obtain more values to be competitive for employment. HEIs have given vital attention to individuals' employability since the late 1990s (Rothwell et al., 2009). There were many arguments about including development employability skills into HEIs' curricula and most of HEIs showed a serious attitude to employability development during academic years (Tymon, 2013). According to HESA (2016) in UK, 93.3 percent of 2012/2013 academic year graduates were employed or continued their education within three years and a half after their graduation.

Despite the increase in employment rates, employers still continue to express their disappointment about employability qualities of graduates (Tymon, 2013).

2.1. Expectations of employers

It is observed that the best period to invest in employability development is 'emerging adulthood'. This period starts in the late teens to twenties, with a focus on ages 18-25. This period is unique in terms of its changes and exploration. The youth appreciate the opportunities that life offers, progressively making long-term decisions about their career and love, trying to understand philosophy of life. Not all youth are open to the opportunities that come during emerging adulthood. Reasons vary from personal to environmental (Arnett, 2000). According to Human capital theory, future opportunities for individuals and communities originate from investment in people (Sweetland, 1996). Schultz (1981) argues that neither natural resources, including land, or other physical investment can be as essential to modernisation and development as the skills and knowledge in human resources (human capital). Managers who are interested in developing graduates' skills attempt to meet students before they leave university. They invite students to see how employers appreciate their education. For example, James Morrish, a Publicity and Promotions Officer, was happy to spend his time guiding graduates in developing public speaking skills, communication and leadership skills (Raybould and Sheedy, 2005: 261). Moreover, universities should think about development of employability skills when students start as freshmen. For that, employers should be involved to course programmes' design as their engagement contributes to communication between educators and employers. For example, by including an 'Employer Engagement module' in a 'Computer Sciences module', different aspects of employability such as communication, time management, and teamwork were developed in first year students.

The results of this change became apparent as when in the students' second year. They had acquired key skills and improved academic achievement. The process also increased student engagement. In addition, stakeholders profited from this process because students received opportunities to develop their employability skills while in education; educators nurtured communications with employers to enable future cooperation; and employers had the chance to create a future employee pool and recruit the required talent (Hanna et al., 2015: 297-300). The case study of Lithuania concludes that the labour market no longer receives the desired professional competence it expects, which proves the existence of a gap between educational systems and the labour market. Graduates frequently arrive at a particular workplace lacking necessary skills and personal qualities. Employers prefer the labour force not only to arrive with required skills but also with flexibility and good learning abilities (Braziene and Dorelaitiene, 2012). Cox and King (2006) agree that it is employers who evaluate graduate skill sets. Therefore, their contribution to course design, which aims to develop student employability, would be comprehensive. The skills which employers expect from graduates guarantee long-term employability because they are conceptual skills. Such skills are not task-related and so are not considered short-term employment skills. Raybould and Sheedy (2005: 259-260) agree that employers expect students to develop more soft skills during their education and work experiences in comparison to academic knowledge. During the recruitment process, employers appreciate the following skills: Stress management; communication; negotiation skills; team-management skills; IT skills; openness to innovation and learning, self-confidence. Additionally, they want graduates with emotional intelligence. Gallopeni (2013) notes that there is a gap between the employability skills that employers expect and those provided by universities. Additionally, he highlights the importance of personal qualifications for successfully moving from education into employment.

According to the Statistical Office of Kosova (2009), the country faces serious unemployment problem. Data gathered from employers and employees suggests the reason for this is graduates' low preparation. Furthermore, employers evaluate universities' role in improving employability skills incorrectly. In addition, skills needed to perform tasks were not designated as employability skills. It is apparent that personal networks and family contacts are an important aspect of gaining employment in Kosova. This reflects the previous argument about the importance of personal qualifications in the move from education to employment. Rasul et al. (2012) questioned what employability qualities, which manufacturing industry employers anticipate from graduates and defined that respondents appreciate not also technical skills but also personality qualities. They prefer graduates who are able to solve problems themselves instead of asking for assistance from others; are able to obtain information from different sources and analyse it adequately; share knowledge and ideas with others; support and understand team members in the workplace; have good technology skills; give ideas and save resources; lead and motivate team members and are honest with high self-esteem. Manufacturing employers believe that these characteristics create a positive work environment, increase productivity and satisfy customers. Cassidy (2006) agrees that students should learn not only technical skills such as subject specific knowledge, but also non-technical skills such as basic employability skills, during their university years. It is mentioned that obtaining non-technical skills is as important as gaining degree subject knowledge for employers. Jonbekova (2015) describes precisely the reasons for graduate skills mismatches in post-Soviet Tajikistan. The findings show that not only are there problems in the education system, but also reduced employment opportunities, unclear recruitment processes and poor economic situation create skills mismatches. The research also depicts that there are many more graduates who have diplomas without knowledge and understanding of their subject than those who hold a diploma and adequate knowledge. A growing number of HEIs and students are promised neither knowledge and skills nor employment opportunities. This echoes the 'diploma disease' in most post-Soviet countries (Dore, 1980:3). DeYoung's (2011, cited in Jonbekova, 2015) findings about Kyrgyzstan graduate problems are very similar to those for Tajik graduates. Unqualified teachers, corruption in HEIs, and inadequate employment opportunities destroy student employability. Jonbekova (2015) agrees that universities do not completely prepare students for employment, but research respondents agreed that students must have good subject knowledge and the ability to learn while working. Although a lot has been done to nurture employability in HEIs, there is still room for empirical investigation and development (Rae, 2007; Braziene and Dorelaitiene, 2012).

3. A MODEL OF EMPLOYABILITY

The CareerEDGE model of graduate employability (Dacre Pool and Sewell, 2007: 280) is considered the most comprehensive among the employability models studied. Dacre Pool et al. (2014) mention that foundations of this model are the USEM model (Yorke and Knight, 2004) and the 'magic bullet' model (Harvey, 2001: 102). Importantly, the authors include 'emotional intelligence in important components such as career development learning, work experience, academic knowledge and understanding and generic skills'. They described the role of reflection, self-confidence and self-esteem on the way of employment. The model challenges graduates to enhance their employability through reflection and evaluation on their own learning. Continuous learning and/or improvement occur when people have self-efficacy, self-confidence and self-esteem. The completeness and attractiveness of the model comes from the harmony among the elements. This orchestration allows users to accept each element of the model seriously. If one element is missed the employer may not love the music produced.

4. PURPOSE/OBJECTIVES OF THE STUDY

The purposes of the study are:

1. To explore bank managers' perceptions of the importance of graduate employability skills for effective performance;
2. To explore bank managers' attitudes to the establishment of communication channels between commercial banks and universities in order to develop a labour pool with the expected skills;
3. To provide a rationale for developing students' employability skills through collaboration between University Careers Centers (UCC) and commercial banks' HR departments.

5. METHODOLOGY

Qualitative research using interviews were carried out. The respondents consisted of twenty-five managers. Twenty-three managers were from twelve commercial banks and two managers were from the Financial Markets Supervision Authority of the Republic of Azerbaijan, which is responsible for the activities of commercial banks and other financial institutions. Twenty-four interviews were conducted and twenty-three were recorded. Only two managers from the same bank preferred to be interviewed together and they did not want their interview to be recorded. The average work experience of the managers was around 12 years, and managerial experience around 7 years. 8 of the managers represented top management, 12 belonged to middle management and 5 were line managers. The average interview time was 31 minutes. Although the research tested the theory of the CareerEDGE (Dacre Pool and Sewell, 2007: 280) model, the researcher managed to compare the model with empirical knowledge obtained through the interviews. Interviewees were asked to describe the essence of each component in forming graduates' employability qualities. Additionally, they answered the following question: "Would you like another component in this model, for example, a positive attitude to work?"

6. SAMPLE DEMOGRAPHICS

The average age of the respondents was 33 years. All of the top managers were males, and 3 middle managers and one line manager were females.

7. FINDINGS

When the question was understood the interviewee gave his/her opinions about each component step-by-step. Most started with the one they found most significant. A few respondents talked briefly about some of the components in order to have more room for those they considered more essential. The respondents' answers will be presented in the same sequence as the CareerEDGE model.

7.1. Importance of career development learning

Generally, respondents considered this element to be very important. They found it is a starting point upon which everything else depends. In their answers they mentioned that parents and school career centers can help teenagers to define their potential, talent and interests: To define children's abilities and potential early should be the responsibility of parents and the school (Director of Finance Department, 2018). Career Centers do not just have to try to connect universities with businesses and ask for employment opportunities. They have to develop the required skills and direct the students correctly. It would be better if careers professionals invite famous people to share their experiences with students to help them understand what their career path was (Director of Risk Department and Chairman of Audit Committee, 2018).

Interestingly, managers not only described the kind of graduates they expect, but also described the CVs they would like to receive: Today writing a CV can be a routine task but there are nuances Career Center staff should teach students. For example, I cannot accept a 'glamorous CV' for a position in the Finance department. A finance student's CV should be modest (Head of Investment Banking, 2018). I appreciate when candidates have a clear vision about their careers. For example, I may ask: Which field do you want to work in? They say: in finance. In order to clarify, I ask a second question: Where in finance? If I get an answer 'in finance' again I question this attitude (Deputy-Director of Risk Department, 2018).

Students' attitudes to their own career development were also reflected upon: I do not like when graduates start blaming others like school or university for their failures. They do not have to expect everything from university or from other units. It is the main responsibility of an individual to care about his/her career development and look for the right direction (Chairman of Audit Committee and Head of Investment Banking, 2018).

Remarkably, while discussing the factors which contribute to graduate success and depend on their approach to career development, one of the interviewees declared: I do not think a good career beginning always depends on graduate employability qualities. Sometimes we observe that lack of transparency in the hiring process is the reason for a graduate's failure (Director of Risk Department, 2018).

Most of the interviewees observed that immediately after university graduates focus on finding a job to earn a living. Their priority becomes the promised salary: I observed a brilliant girl in the HR department studying hard to pass a CFA level 1¹ exam. She was successful after the first attempt. I asked her why she had not tried to improve her professionalism in the field of HR Management. She replied that she came to the HR department because she did not have a choice and she was in financial difficulties (Director of Law Department, Head of Learning Division and Director of Risk Department, 2018).

Graduates who have internationally recognized certificates create a good impression on managers, as they consider those individuals to be goal-oriented: If I see a candidate with 650 GMAT score I do not ask any questions. That result says many things about their goal-orientation and bright vision (Board member, 2018).

Commercial bank managers do not want to have vacant positions on a regular basis. It takes time and money to find someone suitable for each position. Consequently, managers appreciate when they feel a candidate has clear vision about his or her career. They want their clerk, or front office operator to be ambitious: Usually, I ask job candidates about the activity of our department. If they do not have information and knowledge I stop interviewing. It means they are here because they just saw a vacancy announcement (Head of Reporting, 2018). Having a vision about their future career makes an individual's career path smooth. For example, one of the Board members of our bank started his career as a courier in this bank (Director of HR Department, 2018). Each manager prefers to have a person who knows where they come, what they expect from this company and what they can contribute to the organisation. Attitude toward career development should be measured seriously (Marketing and Product Manager, 2018).

Therefore, a graduate with a career plan based on his/her talents and ambitions is described as a valuable asset of the company.

¹ Chartered Financial Analyst

7.2. Importance of work and life experience

Surprisingly, the approach of managers to work and life experience was not similar. Generally, managers choose people with experience and there are few job announced which do not require experience. Most of the managers expressed their desire to employ interns and shape them within their own corporate culture. I wish I could have met a candidate with relevant experience; however it is almost impossible in our case... That is why I ask them to start as an intern... people with experience do not accept that offer... it seems it is hard for them to adapt to a new corporate culture (Director of Risk Department, 2018). It is not important for me. We work with newcomers... we support them to gain the required experience here (Director of Finance Department, 2018). Work experience is desirable but not important. Who cares about irrelevant experiences? For me people some years at work without appropriate knowledge are worse than people without work experience. It is a risk to hire those kinds of people (Deputy-Director of Risk Department, 2018).

Interestingly, two managers declared that they would never hire people who have work experience in other commercial banks: Corporate cultures are dramatically different in Azerbaijan commercial banks. Recently, we have seen how many banks were closed. I do not want somebody to be here with non-transparent banking experience (Deputy-Director of branch and Chair of Audit Committee, 2018).

Another reason why managers do not request work experience is the continuously changing work environment: The business world is very dynamic. A candidate's experience gained 5 years ago is not valuable to us today (Board member, 2018). Of course it is desirable to have interns, to develop and shape them. Moreover, to hire fresh graduates is efficient. We have to create the conditions for them (Chairman of Audit Committee, 2018).

A General Director (2018) noted that he had to involve the team in decision making. It is often impossible to decide alone: That is a reason I need interns to start in our organisation and grow up here. Those people contribute a lot (General Director, 2018). Generally, I do not think it is correct to expect a graduate to arrive at a workplace with experience (Head of Investment Banking, 2018).

In contrast, a few managers – depending on their role – stated the significance of work and life experience: Jobs specific to the treasury department and the functions in the department are the same in all commercial banks. Consequently, we appreciate a candidate with at least internship experience in the department in question. This is because it takes us a minimum of five months to teach the basic skills to newcomers (Director of Treasury Department, 2018).

Significantly, five of the interviewed commercial bank managers started their careers as interns at the Central Bank and they expressed how lucky they were to have that opportunity: 70 percent of basic organisational skills I use in my work today I learned during my internship in the CBAR (Head of L&D Division, 2018). I appreciate internship experience in graduates. When I was an intern I learned what corporate culture and discipline were. This helped me to adapt easily to my workplace. Students who attend Work and Travel (Work and Travel, 2018) usually come back with valuable life and work experience (Head of Treasury Division, 2018).

Additionally, managers described how much volunteering experience in the organisational teams of international events such as the Eurovision Song Contest 2012 (eurovisionworld.com, 2018), Baku 2015 First European Games (Baku 2015 First European Games, 2018), and 4th Islamic Solidarity Games (Baku 2017, 2018) played a great role in their life and contributed to

their employability. However, one manager considered such activities impractical: Some students confuse social work with work experience. Spending much time on social work they sacrifice their professional development (Director of Risk Department, 2018).

The Director of the Law Department (2018) depicted the advantages and disadvantages of hiring inexperienced people: To work with interns and develop them takes a lot effort and time. But they are like a clean piece of paper. You can write on it anything you want. Additionally, experienced people can bring values that you do not need. Even their values can create problems for you.

Another Director of the Law Department (2018) considered graduates with experience as valuable, but he mentioned that an individual's experience by itself is not enough. However, it is powerful when coupled with academic knowledge, which together with work experience nourishes creativity. Significantly, Azerbaijani commercial bank managers consider it a social responsibility to involve new graduates in creating the conditions for their development. It was exciting to find that the HR manager (2018), with 16 years' experience in the same leading commercial bank, noted that as of these years she has hired 7,000 employees of which 3,000 were directly from universities.

7.3. Importance of degree subject knowledge, understanding and skills

All of the managers claimed that they want to have graduates with advanced degree knowledge in addition to other knowledge and skills such as Microsoft Office programs, especially Excel, good writing abilities, and even blind typing skills: We need good MS Excel program knowledge... among 50 candidates, we found only two who learned and improved their Excel knowledge and skills themselves. We appreciated their knowledge and enthusiasm. Both are extremely important in our work (Head of Treasury Division, 2018).

However, the knowledge graduates gain in university is not quite sufficient in the workplace. Managers suggested courses such as 'Consumer Psychology' for business school students: Employees, who must manage difficulties with problematic customers, really need psychological knowledge (Deputy-Director of branch, 2018). What students get at university is not enough for today's dynamic business world. The importance of having international certificates such as CFA and FRM² was emphasised in this part of the interviews several times. Until 2015 there were only 5 certified Financial Risk Managers in Azerbaijan, but today they are 16 (Global Association of Risk Professionals, 2018). To have students among those certified people shows growing interest in professional knowledge (Director of Risk Management Department, 2018).

The clear demand of certified graduates was also mentioned by Information Technology Department manager (2018). He noted that there are many cases of school leavers entering university with a high score according to the demands of university but they do not gain the necessary knowledge that today's business world demands. They just learn something to pass exams poorly. Their focus is not on gaining knowledge but just getting a diploma (Head of Treasury Division, 2018).

Managers compared graduates from local universities with graduates from Western and American universities. Although some managers found international graduates too ambitious and confident, most of them preferred graduates with foreign degree diplomas. Nevertheless, there were managers who emphasised that the quality of knowledge depends on the graduates'

² Financial Risk Manager

attitude toward study: Right now I work with 9 Azeri interns with diplomas from 5 different countries and universities. Their educational background is colorful. I enjoy working with them. During this time, I understand that the countries and range of universities do not contribute if a person does not have a serious attitude toward studying and working. Seven of them will be selected in regards to their attitude to learning and working (Advisor to the Chairman, 2018). Good academic knowledge is enormously important in our work. It is like a good seed for me. When I get it I consider it a responsibility to plant it in fruitful soil and grow it in a sunny area (Director of Law Department, 2018).

According to their expectations, managers demand knowledge from different disciplines to work in some fields within the banking system: employees who work in the International Relations department, Communication and Marketing department and Centralised Credit Registry must have knowledge of the fields of banking and economics in addition to their majors in subjects such as international relations, marketing and information technology respectively. Moreover, research participants suggested universities involve the leading commercial banks in curriculum design. They may advise the courses which are important for the banking sector but are not yet taught at universities.

7.4. Importance of generic skills

It seemed that managers looked for opportunities to talk about the generic skills which they expect from graduates. They spent the greatest portion of their thirty minutes on this component. They talked very enthusiastically. One could believe that it is purely generic skills which drive graduates through their career paths. The managers' expectations were very colorful. Additionally, they appreciated a new trend among graduates: there is a serious focus on self-development: A graduate with good communication skills is very valuable. That person becomes a good organiser and manager in the future. I also prefer graduates with their own opinion. I want them to be innovative. I do not like those who immediately agree what their managers say (Director of IT Department, 2018).

Managers also valued honesty, persistence and the ability to manage stress. They also described that it is generic skills which predict how successful graduates will be in their careers: Graduates may open an employer's door with their theoretical knowledge but personal and generic skills define their growth... the banking sector is risk management. We consider the future dreaming about happiness. We can transform all inputs into desirable outputs through analytical skills, hard work and honesty (Chairman of Audit Committee, 2018).

When expressing their thoughts about general skills, surprisingly, managers mentioned that appearance and conversation style is important to them. They even called them their minimum demands: I prefer good-looking people. I like when people have a good conversation style. If I find them I will help those candidates to improve other employability skills (Director of Law Department, 2018).

Furthermore, managers expect newcomers to become the owner of their work, take possession and sacrifice something for the sake of work. They expect newly hired people to learn eagerly, come to work early and leave work late: We want a newcomer to continuously ask for something to do. We appreciate when they take responsibility for doing something, creating a product with love. If they do a task just because they have to, then the highest position for them will only ever be a senior specialist. I do not understand when they wait for the end of work (Head of Investment Banking and Board member, 2018).

Working with interns helps managers to define their generic skills. One commercial bank manager depicted how he tested the interns' teamwork and other skills: I usually give one of them a difficult task and ask them to finish it to a deadline. It is impossible for one person to do it within the defined period. I appreciate when I see them divide the task among team members and work together... Tolerance of diversity is important. Recently, I offered to have lunch with the interns and intentionally started talk about religion. It was a good chance to observe them. One girl was so excited that she started interrupt her fellows with no care over others' thoughts and feelings (Advisor to the Chairman, 2018).

Managers also emphasised the importance of research orientation at entry level: We appreciate people who think outside the box. For example, I usually ask what financial sites they know. They can say: 'Bloomberg.' Then I ask about the articles they have read recently. It may be something about oil prices or transactions. When we find a graduate who is research-oriented and self-motivated we appreciate it (Head of Treasury Division, 2018).

Moreover, managers are looking for creative people: I would love to work with creative people: I am glad when I hear somebody from my team paints or carves figures in wood or marble. Those people usually are perfectionists. But I need realistic perfectionists (Head of Law Department, 2018).

The General Director's (2018) contribution was also illustrative: We expect a talent has IT knowledge, i.e. he/she should be able to build an algorithm and a language to enter the global library.

It was pleasant to hear how the managers who attended internship program in the CBAR described the essence of soft skills seminars in improving their generic skills. They also told how they apply that experience in their bank. According to the interviews conducted across all 25 commercial bank managers, they expect to have graduates with the following generic skills or personal attributes: Reasoning skills; Problem solving skills; Analytical skills; Critical judgment; Passion; Self-development skills; Team spirit; Creative thinking skills; Communication skills (oral and written); Ability to work under pressure; Tolerance; Decision making skills; Learning ability; Hard working; Enthusiasm; Focus; Future orientation; Taking possession; Politeness; Ethical behaviour; Knowledge sharing skills; Discipline; Execution; Cooperation; Research orientation; Negotiation skills.

7.5. Importance of emotional intelligence

When depicting the generic skills of employees, managers brought into focus human capabilities, known as emotional intelligence (EI). Considering EI an important factor when evaluating a job candidate is a new trend in Azerbaijan. Nevertheless, during the interviews managers displayed good knowledge and understanding about it. They enthusiastically shared the ideas of Daniel Goleman and thoughts of Dr Travis Bradberry. Remarkably, only a few asked the researcher to remind them of the components of EI: 'self-awareness; self-regulation; motivation; empathy and social skills' (Goleman, 2004: 3).

It is clear all of the managers consider these components essential. Some shared the methods they use to define candidates' EI. To do this they use tests and arrange group discussions: Usually we arrange those discussions during the orientation period. We intentionally challenge them. We usually observe that those with some life experience have good self-regulation. It is pleasure to work with self-confident and motivated people. They like sharing and caring. That is the beginning of good network building (Head of L&D Division, 2018).

The Head of the Reporting Division (2018) shared an interesting experience regarding empathy: I always ask interns about the books they read. I feel that those who read *Les Misérables* by Victor Hugo, *King Lear* by William Shakespeare, *Eugene Onegin* by Alexander Pushkin, *Khamsa* by Nizami Ganjavi and other classic world writers are different from others. They are able easily to wear others' shoes. I also ask them how often they go to the theater or opera. These events are very important to shape the youth's personality and emotional intelligence.

Having good knowledge of the components of EI, the managers were aware of the factors that shape emotional intelligence: Undoubtedly, the environment in which an individual grows up plays an essential role in shaping his/her emotional intelligence. That is why I always ask how many children they are in the family. Graduates with more than three siblings, usually, have higher empathy and social skills. Those people are more tolerant and adaptable (Head of Investment Banking, 2018).

The managers of the Finance, Risk and Treasury departments (2018) depicted the challenges and sometimes stressful conditions at work. Such challenges may frighten interns and demotivate them to continue working in these departments. If they are able to motivate themselves, however, they carry on toward their goal. The Chairman of the Audit Committee (2018) claimed that self-confidence is the most important feature in a person. Auditors must be confident about whatever they say, otherwise they will not be taken seriously. Nevertheless, not all of the interviewees agreed that newcomers' emotional intelligence is important when they arrive in the organisation: Emotional intelligence is important for leaders and managers. They shape their followers' EI. I remember from a psychology course at university that a team is becoming like the leader. So at the beginning of graduate's career, I do not consider EI significant (Head of Law Department, 2018).

During the interviews it was clear that commercial bank managers value EI highly and consider it a vital element in keeping their customers. All of the components of EI contribute enormously to the quality of service in a knowledge economy. Employee socialising was also considered essential. Their wide network positively influences the number of customers. Moreover, banks face challenges. Thanks to self-motivated employees' teams are able to manage stressful situations. Thus managers expect graduates with good EI because it is not only convenient to work with them but also they contribute to the bank's effectiveness.

7.6. Importance of reflection and evaluation

During interviews it was evident that managers focus on the dynamics of the knowledge economy. There is no chance to stop learning and studying.

7.7. Self-Efficacy/self-confidence/self-esteem

The managers considered last elements of the model; the 3Ss (Dacre Pool and Sewell, 2007: 285) which are essential for attaining and retaining one's employability. They agreed that good results in the low line components of the model create a sufficient base for self-efficacy: When I see that graduates' self-confidence is based on their talent, knowledge and understanding I am pleased. Sometimes graduates are not well equipped and they have a lack of self-awareness. I am more than upset when I see that graduates' potential does not match with their confidence (Director of Finance Department, 2018).

Overall, the self-esteem component was evaluated as one of the most valuable attributes of a human being: They like to compete with smart and talented people... I have found them to be

innovative. Self-esteem never allows them to give up or stop improving (Deputy-Director of branch, 2018).

Managers were deeply pleased with the statement that, 'self-esteem is not everything; ...there is nothing without it' (Gloria Steinem, 1992: 26, cited in Dacre Pool and Sewell, 2007: 287). Commercial Bank Managers characterised people who have self-esteem as modest, hard-working and open to learning opportunities.

7.8. Would you like another component in this model, for example, a positive attitude to work?

Alongside generic skills the managers gave opinions about personality traits. All preferred extrovert people. Most interviewees want to see positive people around them: I never hire a person who has a negative aura (Chairman of Audit Committee, 2018). On the other hand, two managers claimed they are not concerned if a person is positive or negative, until he/she creates a problem. Another Chairman of the Audit Committee (2018) said that in the field of audit and risk management they need people who see negatives first. It is illustrated professionally and one can remember it easily... I would offer to add a sixth component to the lower line: positive attitude (Head of L&D Division, 2018). The managers' contribution to this question indicates that having positive people around means a good learning environment where people have a solid team spirit. These people have intrinsic motivation. Instead of complaining they try to find reasonable solutions. Their positive energy improves productivity and increases the effectiveness and efficiency of their work.

8. CONCLUSION

The managers' responses and suggestions regarding the components of the CareerEDGE model described the employability qualities commercial bank managers expect from graduates: they want to have human resources which perform effectively and efficiently. The managers anticipate their potential employees are equipped with a clear understanding about their careers, have work experience at least as volunteers and/or interns, understand what a corporation and work environment are, and have good problem solving, analytical, communication, teamwork and other important generic skills necessary for the work process. In a knowledge-based economy, increasing interaction between customers and specialists in the service fields, including in the banking sector and stressful lives demand that employees have high Emotional Intelligence. The manager's thoughts indicate that competent graduates – human resources – are an essential input in a company's operations. The more qualified the input, the more effective the company's performance. Additionally, managers appreciate interns and/or newcomers' ability who take the opportunity to reflect on and evaluate what they have learned. Doing this, they never miss chances to improve. All development processes create self-efficacy, the virtue of how one believes his/her knowledge, skills and self-confidence are presented in one's abilities. Moving successfully toward employability graduates thus develops 'a major part of the key of employability' (Dacre Pool and Sewell, 2007: 287). Expectations of graduates are high. Fortunately, if students have the desire and an open mind they can use opportunities to succeed in an intensive business environment. Employers not only expressed the kind of graduates they expect but also suggested ways for developing the necessary qualities. According to them HR departments and UCCs should work together to help all those who are interested in developing the employability qualities of young people. They arrange internship programs but it is expected they will do more. HR staff can arrange soft skills seminars at universities arrange student visits to companies, initiate research and much more. Through these internship programs the banks contribute significantly to developing the required employability

qualities in young people. The program also forms a valuable talent pool for the corporation which can be accessed easily.

DEVELOPMENT OF THE SOUTH BOHEMIAN REGION AS VIEWED BY ITS INHABITANTS

Alena Kajanova

Vysoká škola technická a ekonomická v Českých Budějovicích

Czech Republic

kajanova@zsf.jcu.cz

ABSTRACT

The article presents the subjective opinion of the inhabitants of the South Bohemian Region on the development of their region, as well as the satisfaction of the municipalities of the South Bohemian Region with their place of residence and with the municipal life. The outputs are based on the questionnaire survey which was implemented on a representative sample of 700 inhabitants of municipalities of different size and character in the South Bohemian Region. The data were statistically processed in the SPSS program in relation to the size of the municipality and to other selected sociodemographic characteristics of the respondents through the chi-square test and t-test analysis at a 95% level of significance. The following outputs were found. The tested sociodemographic variables had no significant relation with the satisfaction with the life in any given municipality: gender ($p=0.520$), education ($p=0.509$), and socioeconomic status ($p=0.340$). 44.8 % respondents assess the situation in their municipality as an average situation; only 19.2 % state that the situation is good. 20.8 % respondents plan to move house; 13.5 % in the course of the current year. The respondents most frequently plan to settle in their current district. 51.2 % respondents believe that their municipality develops; 47.5 % see the differences between municipalities of the Czech Republic as significant. 38.9 % believe that the people in their municipality live like people in other Czech municipalities; 26.3 % believe that they live better, which is related to their answer to the next question - the respondents most frequently state that their municipality has developed equally well or better in recent ten years, as compared to other similar municipalities. Nevertheless, the prospects are more conservative; about one half of the respondents believe that the municipality development will stop and stagnate.

Keywords: *regional development, municipality life, quality of life, moving house*

1. INTRODUCTION

1.1. Regional Development

Regional development is a concept closely connected to social-economic policies in regions. It plays the main role in many aspects of regional policies, such as economic geography, regional economics, regional science, and the economic growth theory (Nijkamp and Abreu, 2006). Regional development is not only a domain of regional self-government, but it is also a domain of government, mainly a domain of the Ministry of Regional Development, which was introduced on November 1, 1996. The Ministry of Regional Development is a central governmental authority and deals with the matters of regional policy, housing policy, development of dwelling and housing, letting of flats and non-residential premises, spatial planning, building rules, expropriation, investment policy, tourism, and undertaking (Ministry, 2018). The main task of the state and its government regarding regional policies, including regional development, is to establish fundamental legislative, intuitional and conceptual framework for regional policies, as well as to reduce the most crucial regional disparities that exceed the rights of regional self-governments (Postránecký, 2010). Since regional policies are problematic - their increasing importance due to the context of globalization and the growing importance of decision-making on both local and national levels - regional development is gaining more attention from regional administrative institutions, but also from the media and

the public. These facts are even more significant for regional development in border regions that were often marginalized in the past (Husák, 2010).

1.2. Strategy of regional development in the Czech Republic

The main document dealing with fundamental strategies of regional development is The Strategy of Regional Development, which was published by The Ministry of Regional Development for the period of 2014-2020. It defines overall objectives, issues, and priorities that will need to be introduced as a part of the regional development policies in the Czech Republic, and which combines the European and the national regional policies of the Czech Republic. The document also features subsequent sections that address individual two-years segments called "Action Plans". The essential points of this strategy are regional competitiveness, territorial cohesion, environmental sustainability, public administration, and public cooperation. These documents have been approved by the Chamber of Deputies in 2013 (Strategie regionálního rozvoje, 2013).

1.3. Strategy of regional development in the South Bohemian Region

Additionally, each region in the Czech Republic publishes strategic documents on its self-government level for the same time periods (four years), which are approved by the deputies of the region. The main objective of the document named "Development Program of the South Bohemian region 2014-2020" is to define strategic development visions and an overall objective for the South Bohemian Region for the period of 2014-2020. The document also includes the delimitation plans for economically weaker areas of the South Bohemian Region. (Program rozvoje Jihočeského kraje 2014-2020, 2014)

1.4. Quality of life

Quality of life is a term, which can be described as the product of the interaction of many psychological factors related to health, society, environment, economics and politics. The quality of life always remains the subjective experience of a person's life. (Cheradi and Chibane, 2014). Measuring all components of the quality of life and obtaining an overall rating of QoL is a complex task. Most researchers therefore measure each domain of QoL separately, by asking questions related to the most important aspects of each domain (Feinstein, 1987). QoL is often used as a comparison of standard of living and satisfaction between people living in different areas. There is a lot of research that compares QoL, both on the domestic and international levels.

1.4.1. Quality of life in the Czech Republic

According to the research Social Progress Index 2018, conducted by the non-profit organization Social Progress Imperative together with Deloitte, the Czech Republic placed 26th on the QoL scale. The Czech Republic dropped four places in one year, not by worsening its QoL score, but by not improving as much as other countries (Social Progress Index 2018, 2018).

1.4.2. Quality of life in the South Bohemian Region

For the purposes of comparing the QoL of the different regions in the Czech Republic, a new study called "Místo pro život" (Place for living) was recently published. This research evaluates Czech regions based on 54 criteria of the 8 separate categories of QoL. The South Bohemian Region placed 7th out of 14 regions. This research also states that the people in the South Bohemian Region are satisfied with the air quality and almost all aspects of environmental politics. Outstanding ranking was also given in the safety category, which also includes traffic accidents and police services.

The worst rating that the South Bohemian Region received was in the category of development of infrastructure, education, healthcare, and culture.(Jihočeský kraj, 2018)

1.5. Migration within the Czech Republic

QoL is also one of the main reasons, why people migrate within the Czech Republic. Usually, young people move from rural areas to cities due to economic reasons. The opposite movement from to cities to rural areas is popular among the older part of population (Vošta, 2010). Reasoning for this movement often differs, but main reasons are often connected to poor housing affordability in cities, family reasons, and economic reasons (Bernard, 2006). This - and the fact that the population is ageing - causes problems in rural areas, since the economically active habitants move from rural areas to cities and leave people in retirement age in rural areas (Burcin, Drbohlav, Kučera, 2008).

2. METHODOLOGY

This research was carried out using quantitative research strategy, questioning methods and the technique of a unique questionnaire containing closed and semi-closed questions. The research group consists of the inhabitants of the South Bohemian Region older than 15 years of age. In 2016, the total population of the region was 638,782. Of these, 15% were younger than the age limit set by the researchers. At the 3.7 confidence interval, a representative sample of 700 people was acquired. This was also the number of received and completed questionnaires. The return was 60%. The respondents were selected by the quota selection with the quotas given: gender, age, district and place of residence, determined by the size of the municipality. 45.5% of men and 54.5% of women participated in the survey. 6.4% had primary education, 66.6% secondary and 27% a university degree. The average age was 40.6 years. Prior to the survey, respondents were introduced to the aim and use of the research and its anonymity. Questionnaires were distributed by trainees from university students. Data was processed in the SPSS statistical program through correlation, ANOVA, chi-square test and t-test analysis at a 95% level of significance.

3. RESULTS

The first researched factor was satisfaction with housing in the given municipality in relation to selected socio-demographic variables. In its results, the t-test concerning sex vs. life satisfaction in the municipality (answers based on a five-tier Likert scale) show that there is no statistically relevant relation between the variables ($p=0.520$), the average value was 3.97 for men and 4.05 for women. When looking at age, there was detected a statistically relevant relationship - a weak correlation ($p=0.006$; $r=0.107$). The factor education ($p=0.509$) did not correlate with the satisfaction with the place of residence, neither did the socioeconomic status - ANOVA ($p=0.340$). The factors residence satisfaction and the opinion on the situation of local economy of the municipality ($p=0.3665$) also do not correlate. A statistically relevant relationship was detected for the factors residence satisfaction and the tendency to move away ($p=0.000$), which is logical - who is not satisfied with their place of residence will move to a different location with a higher probability. The next set of questions focused on moving. Respondents were asked if they are planning on moving from their current place of residence, if yes then why, and where they would like to move. 20.8 percent of respondents planned on moving; 13.5 percent were planning to move within the current year. The respondents most frequently planned to settle in their current district. The reasons for moving were chosen by the respondents from several options. The results are shown in the Figure 1. The most frequently mentioned reason for moving was a shorter distance to work.

Figure 1: What is the main reason for moving?

Respondents were also asked if they think that their municipality is developing, stagnating, or worsening. 44.8 % of respondents assessed that the situation in their municipality was average; only 19.2 % think that the situation is positive. 51.2 % of respondents believe that their municipality is developing, as shown in Figure 2.

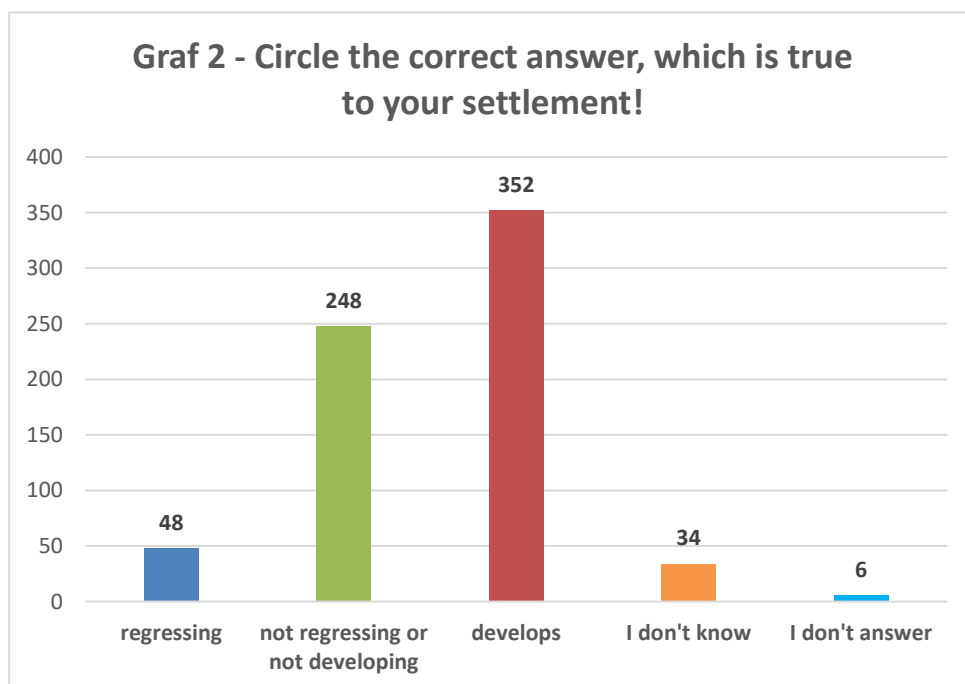

Figure 2: Circle the correct answer, which is true to your settlement!

Differences between municipalities in the Czech Republic were perceived by the respondents as follows. 47.5 % see the differences between Czech municipalities as significant, as shown in Figure 3. 38.9 % believe that the people in their municipality live similarly to people in other Czech municipalities; 26.3 % believe they live better than others - related to the answer of the following question: the respondents most frequently state that their municipality has developed equally well or better in recent ten years, as compared to other similar municipalities. Nevertheless, the prospects are more conservative; about one half of the respondents believe that the municipality development will stop and stagnate - Figure 4.

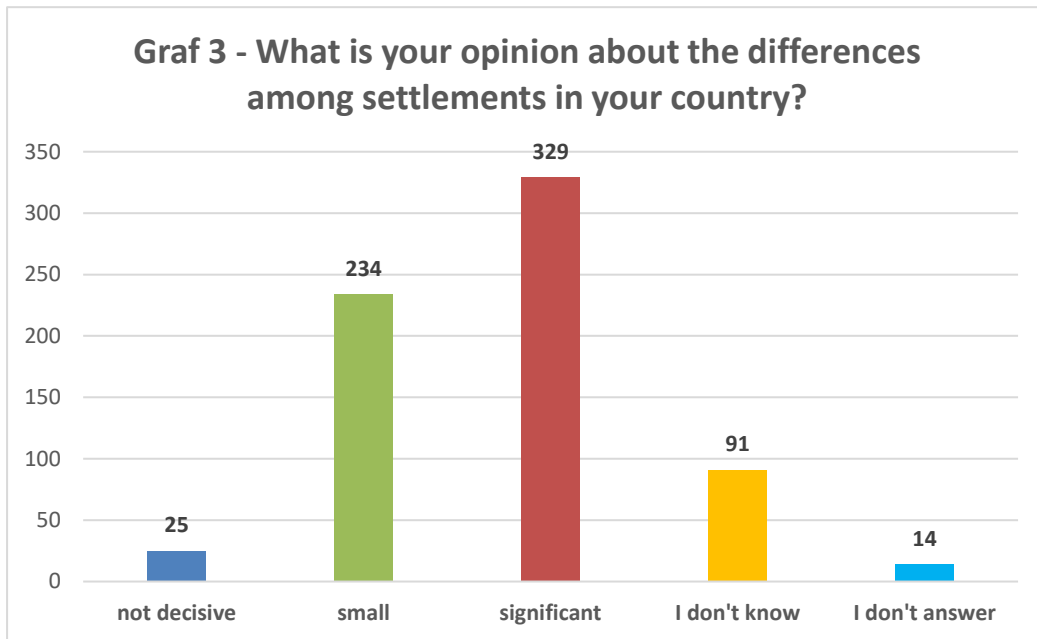

Figure 3: What is your opinion about the differences among settlements in your country?

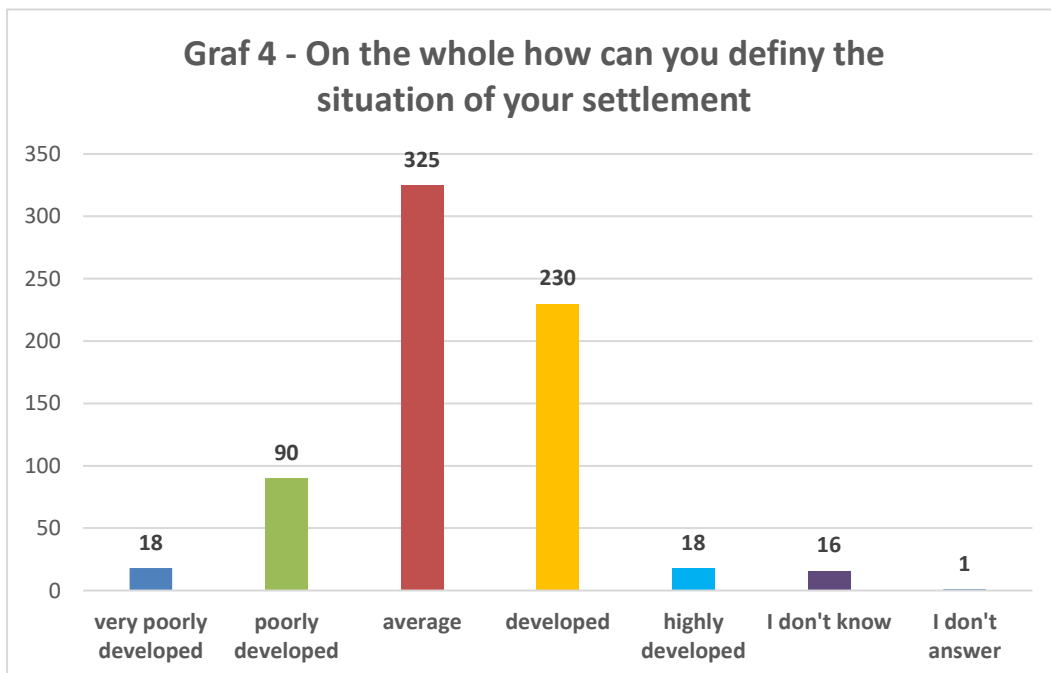

Figure 4: On the whole how can you define the situation of your settlement

Statistical relationships between questions concerning on municipality development were asked next. The relationship between municipality development perception and the tendency to move, shows a statistically relevant correlation between the variables: $p=0.002$. The Chi-squared test had the value of 37.396. The ones who think that their municipality is stagnating or worsening, have a higher tendency to move than the ones who think that their municipality is developing positively. The connection between the perception of the municipality and the opinion on the differences between Czech municipalities shows a statistically relevant correlation between the variables $p=0.000$; the value of the Chi-squared test is 71.040. The ones who think that their municipality is stagnating or worsening have a higher tendency to perceive other municipalities as more developed or the rate of development as inconsistent. The sex does not at all correlate to the perception of the municipality development ($p=0.539$), neither does age ($p=0.596$), socio-economic status ($p=0.911$), or education ($p=0.073$).

4. DISCUSSION AND CONCLUSION

Research on subjective perceptions of satisfaction with community life and regional development is scarce in the Czech Republic, and the ones dealing with this research field are usually bachelor's or master's thesis. The data agree that the quality of life is higher in districts located in close proximity to large cities, but not directly in the cities. This can be interpreted as people being drawn to certain advantages offered by large cities (employment, education, etc.), yet not wanting to live there. The South Bohemian Region is somewhere in the middle of the district ranking. Analyses confirm that there is no significant increase in regional differences at regional level (Ministry for Regional Development, 2017). As far as migration is concerned, research shows that the most common factor is employment, migration for education is mostly done by college students. In terms of distance, in most cases, people move to another region within the Czech Republic. Two-thirds of Czechs would not, however, move even for a more attractive job offer or better wage conditions (Stenmark, 2017).

ABSTRACT

Purpose: ISO 9001 is an international standard prepared for quality management systems in various industries. Six Sigma is a widely used methodology for improving processes. However, when looking at the ISO 9001 standard and the Six Sigma methodology, they have general requirements. This article deals with the possible application of ISO 9001 and Six Sigma, which are used for different purposes at the enterprise.

Design: Different literature on the subject has been studied and compared to ISO 9001 and Six Sigma and their integration is analyzed.

Finding: With the integration of ISO 9001 and Six Sigma, it is possible to reduce the inconsistency at the enterprise and to ensure sustainable quality improvement by improving the quality of the product. This article provides the theoretical basis for the integration of Six Sigma and ISO 9001.

Research limitations / implications: The article presents the integration model of ISO 9001 and Six Sigma. However, these models can be expanded by incorporating normativ references and other standards.

Practical conclusions: The aim of this study is to examine the advantages and benefits of Six Sigma integration with ISO quality management system.

Originality / value: The paper structure is based on the analysis of various ideas related to the application of ISO 9001 Integration with Six Sigma in Literature. In addition, this theme provides a useful framework for the development, implementation, maintenance and improvement of QMS in parallel with the Six Sigma program.

Keywords: *Continuous Improvement, ISO 9001, Integration, Quality Management System, Six Sigma*

1. INTRODUCTION

Quality is the most important factor distinguishing enterprises from competitors. Qualitative steps create quality products and provide quality services. This will increase customer profits and productivity by meeting customer needs. There are various systems, methodologies and tools that help to improve quality, including Six Sigma and ISO 9001. They can be used individually or at the same time to achieve the desired level of quality. Six Sigma is an approach to improving the process. The main goal here is to improve the performance of a particular process in the form of a project every time. Businesses have implemented Six Sigma as a continuous improvement methodology. Companies such as IBM, General Electric and Ford have adopted Six Sigma as a requirement to achieve a high level of performance and increase

employee skills. ISO 9001 is a quality management system that requires a continuous process of development based on the overall control of production operations. ISO 9001 is a control system that requires documentation of all activities. It uses the ISO 9001 Plan-Do-Check-Act (PDCA) model in all systems to apply all the processes, but also improvements to the process. The above suggests that ISO 9001 and Six Sigma serve two different purposes. ISO 9001 is a system for quality management, the methodology for improving the Six Sigma process. There is a logical connection between the ISO 9001 quality management system and Six Sigma, and these relationships and their integration allow for mutual benefit. The purpose of this article is to provide an idea and value by linking Six Sigma with ISO 9001. The topic is to analyze ISO and Six Sigma separately, to identify the relationships between them and to learn the advantages of their integration.

2. LITERATURE RESEARCH

2.1. Six Sigma

Six sigma is a process improvement method used by companies such as AlliedSignal and General Electric in the mid-1980s, which was widely used by Motorola in the mid-1980s. Nakhai and Neves (2009) state that Six Sigma is a scientific, systematic and statistical approach to improving the business process. Six Sigma is a defect rate of 3.4 per million or less. The whole process is not required at the Six Sigma level, because the quality of performance depends on its strategic value and improvement costs. (Kumar et al., 2007, pp 849-866). Six Sigma has five implementation cycles: "Identify," "Measure," "Analysis," "Improve," and "Control" (DMAIC) (Antony, 2006, pp 20-27).

- Determine: Processes, customer requirements and expectations of stakeholders.
- Measurement: The actual performance of the process is determined. Data is collected for actual measurement.
- Analysis: statistical data and process data are analyzed in detail to determine the causes of deviations in the performance of the processes.
- Improvement: solutions aimed at improving the performance of the process are applied.
- Control: The current state of the process is monitored continuously

Six sigma companies are used as projects to improve a certain portion of the process. The key issue is the sustainability of the Six Sigma project results.

2.1.1. Six Sigma Problems and Problems

The Successful Six Sigma project saves financial costs while reducing defects. Management's attitudes, beliefs, are critical to the successful application of Six Sigma (Abel 2015, 94-111) Large expense and knowledgeable human resources are factors that limit the implementation of Six Sigma projects. It is also a difficult task to select and apply the right Six Sigma project in production. Sambhe,(2012) argued that most of the selection criteria depend on the quality of the product, delivery, and the product's usefulness. If the selection criteria do not meet the requirements of the enterprise, the company's goals will not be compatible with the company's human, capital and time resources. The Six Sigma project can take a long time and a bigger stock if it's too big and multifunctional. When the project is small, sometimes the management does not want to invest it.

2.2. ISO 9001

The ISO 9000 series is the standard that sets out requirements for quality management systems (9001) and rules (9004). For the first time in 1987, the ISO 9000 released by the International Organization for Standardization was revised in 1994 and 2000. ISO 9001 Quality Management Standard.

This Quality Management System is a system that describes the structure, processes, responsibilities, and resources required to identify minimum quality requirements. This standard is also used to evaluate enterprise quality assurance efforts. ISO 9001 bases the documentation of processes and hence serves as a basic training mechanism. Continuous improvement activities are standardized by reviewing or revising the newly developed procedures and guidelines.

2.2.1. ISO successful implementation terms

"Management Responsibility", "Resource Management", "Product Realization" and "Measurement, Analysis and Improvement" are key factors in the application of ISO to achieve customer satisfaction in the Quality Management System. In addition, the sustainable development of the QMS is an essential element for achieving customer satisfaction. It is important to apply the following steps to effectively apply the ISO 9001 standard in an enterprise:

- The first requirement is the quality management systems basics- the general requirements of the standard covering all activities in the documentation of the quality management system intended to achieve planned results.
- Management responsibility depends on the commitment of managers to the quality management system.
- The third requirement of the standard provides the criteria needed to manage resource management and to perform activities in a capable and safe environment. This section deals with human resources, infrastructure planning and working conditions.
- Product realization phases cover everything from product planning to the final delivery stage.
- Throughout the measurement, analysis and improvement phase, it is based on internal audit, customer satisfaction monitoring, inappropriate product monitoring, data analysis and monitoring, measuring, analyzing and improving quality management system by performing corrective and preventive activities.

2.3. Communication between Six Sigma and ISO 9001

In ISO 9001, the "process approach" is presented as one of the key parts of the Quality Management System. It is based on the popular Deming Circles (PDCA) in the world. Instead of providing quality, attention was focused on 'Improving Quality'. However, this standard does not provide any means or methodology. As a result, although quality improvement activities were important, quality managers and inspectors did not use the tools to improve quality. As a result, some enterprises consider the application of this standard useful, but some do not. Zeng and Tam say that ISO 9001 increases operational costs and reduces product quality. This is due to the fact that ISO has a paper business volume and a lack of focus on continuous improvement. (Chini and Valdez, 2003, pp 78-82) Therefore, enterprises implementing ISO 9001 need to integrate with QMS and Six Sigma in order to achieve full benefit. At the same time, the application of the Six Sigma in the environment used by the weaker QMS program also does not give a positive result. Therefore, enterprises have identified weaknesses of the current QMS and need to integrate and strengthen the Six Sigma methodology in order to ensure success of both approaches later.

Table following on the next page

Table 1: Comparison of ISO 9001 QMS and Six Sigma

Parameter	ISO 9001	Six Sigma
APPROACH	Quality management system	It is a strategy to improve your business performance
FRAMEWORK	Framework to create "the idea of improvement"	It is a framework for improving and combining it with earnings
AREA	Identifies the requirements for the quality management system	Uses some strategy, methodology, tools, and metrics to improve your business performance
INTENT	Contracts are used for certification and / or evaluation purposes	Used to optimize performance and increase profitability
PROBLEM SOLUTION	Provides solutions to the problem, but does not indicate how the process will take place	Provides the necessary improvement process
LEADERSHIP	Representative in quality management	Belt system
TOOLS	Non-specific	Statistical tools
TRAINING	Human resources	Belt system training
BENEFITS	Improve financial performance but is not quantifiable	Profit Oriented
METHOD OF IMPROVEMENT	PDCA model	DMAIC or DFSS roadmap
DOCUMENTATION	High level paperwork	No specific documentation available

3. SIX SIGMA AND ISO 9001 INTEGRATION

The best way to successfully integrate Six Sigma with ISO 9001 is to recognize it as a management system that covers all levels of enterprise. Six Sigma and ISO 9001 are both versatile and have many similar principles, but serve different purposes. (Snee & Hoerl, 2003). Six Sigma Integration with ISO Quality Management System is the key to quality management. Literature research focuses on obtaining general information about ISO and Six Sigma. In the second part, strong and weaknesses of both ISO and Six Sigma were studied. Based on the information obtained in this section, the issues of integration of ISO and Six Sigma have been analyzed. Six Sigma and ISO Integration are available in the following areas.

3.1. Integration of Six Sigma and ISO “Resource Management”

The Six Sigma Belt System can be integrated into the "Resource Management" of a process-based model in ISO 9001: 2008. (Karthi, 2011, pp 309-331). The human resources management process in ISO 9001 can be adapted to the Six Sigma belt system (Marques, 2013, 36-59). As a leader of the Six Sigma project, it is possible to select highly qualified staff. In addition, the training needs of the Six Sigma staff are determined by comparing the specific and required skills needed to achieve a higher level of skill (Pfeifer et al., 2004, pp 241-249). Six Sigma is useful for enterp-rise development, implementation, maintenance and improvement of ISO 9001 helping to identify possible means and methods. Pfeifer et al. (2004) recommends using SIPOC diagrams to fulfill specific ISO 9001 management requirements. Gupta (2004) recommends using the Six Sigma statistical tools to comply with the data analysis requirements included in the standard.

3.2. Integration of Six Sigma and ISO 9001 "Management responsibility"

ISO Quality Control Review can be reviewed with the Six Sigma Project. (Sambhe, 2012, pp). In this sense, along with management review activities, it may also recommend the Six Sigma project (Marques, 2013, pp 36-59) and also offers a solution to overcome the barrier during the implementation of the Six Sigma project. Top management's sense of responsibility and participation ensures the success of the Six Sigma project. (Anthony and Banuelas, 2002, pp 20-27).

3.3. Integration of Six Sigma and ISO 9001 "Product Realization"

Implementation of ISO product consists of planning process, operational control and product design. The Six Sigma DMAIC methodology is included in the product realization to improve the planning process. The statistical tools in Six Sigma determine the process change to ensure productivity in the pr-oduct realization and reduce the deficit rate (Thomas, 2010). Marques found that the Six Sigma measurement system analysis could increase stability and accuracy in the process of controlling the process.

3.4. Integration of Six Sigma and ISO 9001 "Measurement, Analysis and Refinement"

Six Sigma and ISO are the same as a sustainable improvement approach. Emphasizing the importance of sustainable development of the ISO process, he presented a broad model that sustained development to ensure customer satisfaction. ISO needed the systematic and scientifically sustainable improvement approach like the Six Sigma. (Nakhai & Neves, 2009, pp 26) Warnack notes that the Six Sigma project is one of the most important ways to ensure continuous improvement in the enterprise. Six Sigma is the ideal feature to help improve quality improvement in ISO because it has a feature that can reduce up to 3.4 million per million (Chakrabarty and Tan, 2007, pp 194-208).

4. EFFECTS OF ISO 9001 AND SIX SIGMA INTEGRATION ON THE ENTERPRISE

Relationships between Six Sigma and ISO 9001 QMS have a positive impact on on-premises culture. As a result of his research, Yeung has witnessed the need to integrate customer requirements and requirements into the Six Sigma program with improved internal culture. (2007) Documents produced by ISO 9001 and Six Sigma help systematize and standardize the performance. According to Snee and Hoer,(2003) ISO 9001 is the perfect tool for documenting and protecting process management systems included in the Six Sigma. ISO 9001 QMS documents as the systemicity and effectiveness of the Six Sigma programs increases, the documents received during the implementation of the Six Sigma projects can also provide a continuous improvement of the QMS. Since the responsibilities, responsibilities and mandate of the staff involved in the ISO 9001 QMS are to be determined, this information may be used to select the most competent participants in the Six Sigma project (Bewoor and Pawar, 2010, pp 105-131). ISO 9001 internal audits can be implemented in parallel with the Six Sigma DMAIC project. ISO 9001 may help sustain Six Sigma projects (Dey, 2002) In this sense, internal audit programs can cover not only the administrative capabilities of the Six Sigma initiative, but also individual control stages and related projects (Warnack, 2003, pp 42-49) . Both approaches are aimed at continually improving. The Six Sigma DMAIC is based on the PDCA's continuous development cycle, so it can be used to perform a continuous improvement of the standard from the DMAIC method. (Gupta, 2004). From this point of view, Six Sigma projects are used as a way to ensure continuous improvement in one enterprise (Warnack, 2003, pp 42-49). ISO 9001 requirements are consistent with the identification of potential Six Sigma projects. QMS audits serve as a source of information for potential improvement areas. Also, the ISO 9001 QMS can be based on customer satisfaction and satisfaction levels, and can also identify areas for Six Sigma projects.

5. CONCLUSION

Six Sigma and ISO quality management systems are well-known quality methodologies and can be applied in industry. When compared to the quality management system, Six Sigma is a more structured and effective sustainable development methodology with its own instrument and method. However, these methodologies are applied separately for different purposes and targets in the enterprise. Integration of Six Sigma and ISO 9001 is a further expansion of the methodology in the quality world. When integrating Six Sigma and ISO 9001, Six Sigma provides the following methodology to achieve quality-related objectives:

1. Prevention of defects at each stage, from design to customer delivery
2. Statistical methods required to establish, manage and verify the process's capability and product characteristics;
3. examine the reasons for defects in product, process and quality system;
4. continuous improvement of quality of products and services

Six Sigma supports ISO and helps an organization that provides ISO requirements. Additionally, ISO is an excellent tool for documenting and storing process management systems for Six Sigma. Detailed training is required for the successful implementation of both systems.

SPECIES COMPOSITION AND QUANTITATIVE DISTRIBUTION OF LARVAE OF DRAGONFLIES (ODONATA) IN THE NEW ECOLOGICAL CONDITIONS OF THE LAKE MEHMAN

Sanubar Guliyeva A.

*Azerbaijan State University of Economics (UNEC), Azerbaijan
Sama2013@bk.ru*

ABSTRACT

*The paper presents new data on species composition, number and distribution of the larvae of dragonflies (Odonata) in new environmental conditions of the different habitats of in the lake Mehman. Field works conducted in 2015 - 2017 in the lake Mehman resulted in the rearings of 25 species and forms of dragonfly larvae. Seven of these *L. nympha*, *S. fusca*, *E. viridulum*, *Í. pumilio*, *O. concellatum*, *L. depressa*, *L. quadrimaculata*, *Cordulia sp.* are new to the lake. Species *Lestes virens*, and *I.elegans*, were found in winter, spring and autumn of 2015 and winter and autumn of 2017; *C.scitulumin* winter and autumn of 2015; *C.hastulatum* - winter, spring and autumn of 2017; *E.fatimein* winter and autumn of 2015 - 2017; in winter and spring of 2015 - 2017. Species *C. mercuriale*, *C. scitulum*, *L. virens*, *Í. elegans*, *C. puella*, *E. najas*, *O. albistylum* are observed in the lake in all seasons and are dominated by widespread. It should be noted that the decrease in the number of larvae of dragonflies in the summer, especially at depths of up to 0.5 m is due to their intensive consumption by fish and water birds and emergence of adult dragonflies which leave the lake. On the other hand, in summer period, the volume of oxygen in shallow water of the lake Mehman greatly reduced, and asa result of evaporation of water, the amount of salts in water is increased. In such circumstances, the probability of occurrence of freshwater organisms in the benthos is naturally decreased. The study of the distribution of larvae of dragonflies on specific habitats of the lake revealed their maximum development on plant and silty habitats, and the minimum - on black silty sand. Changes in biomass of benthic organisms as well as larvae of dragonflies, which developed very poor is analyzed. Poor development of dragonfly larvae in the lake Mehman characterized, on the one hand with their intensive consumption by fish and water birds and on the other hand - the steady worsening of the environmental conditions of the lake.*

Keywords: *Lake Mehman, larvae of the dragonflies, species composition, number, habitat, distribution*

1. INTRODUCTION

The larvae play an important role in the formation of the biological productivity of water basins. They form the basis of the fish food in fishery, especially predatory fishes. The main purpose of the research is to study the species and quantities of larvae in the Mehman lake.

2. MATERIALS AND METHODIC

The study was conducted in 2015/2017 seasons. The larvae have been collected using common methods adopted in hydrobiological studies (Jadin, 1956). In order to study the composition of species of larch species, the samples were collected using narrow eyelets and scraper made of gas material №20 using the damping device with a drainage area of 0.025 m² to calculate their uniformity. Collecting of the larvae, which is found among the plants, has been carried out in special containers - washing in lounges. 70% alcohol or 4% formalin solution was used to fix the collected materials. To identify species of larvae, used the book A. N. Popova (2) "Larvae of dragonflies fauna CCCP (Odonata)" and the Internet data. Mehman Lake is located in Aghjabadi, partly in the Beylagan region, in the plain between the Aggöl and Kura river, on the right bank of the river, 2 km from the river.

It is nourished by the water of the Kur River, and finally has a modern appearance. Currently, the lake exists at the expense of Aggol through the Boz-Gobu Canal and partly due to drainage waters. On the other hand, floods in the Kur River flow into the lake Mehman. The paper presents new data on species composition, number and distribution of the larvae of dragonflies (Odonata) in new environmental conditions of the different habitats of in the lake Mehman. Field works conducted in 2015 - 2017 in the lake Mehman resulted in the rearings of 25 species and forms of dragonfly larvae. Eight of these *L. nympha*, *S. fusca*, *E. viridulum*, *I. pumilio*, *O. concellatum*, *L. depressa*, *L. quadrimaculata*, *Cordulia sp.* are new to the lake. Species *Lestes virens*, and *I. elegans*, were found in winter, spring and autumn of 2015 and winter and autumn of 2017; *C. scitulum* in winter and autumn of 2015; *C. hastulatum* - winter, spring and autumn of 2017; *E. fatime* in winter and autumn of 2015 - 2017; in winter and spring of 2015 - 2017. In the study period (2015 - 2017) the number of species of dragonfly larvae reaches a minimum in summer (13 species), and the maximum (18 species) in autumn. Species *L. virens*, *I. elegans*, *C. hastulatum*, *C. mercuriale*, *C. scitulum*, *O. albistylum* are observed in the lake in all seasons and are dominated by widespread. It should be noted that the decrease in the number of larvae of dragonflies in the summer, especially at depths of up to 0.5 m is due to their intensive consumption by fish and water birds and emergence of adult dragonflies which leave the lake. On the other hand, in summer period, the volume of oxygen in shallow water of the lake Mehman is greatly reduced, and as a result of evaporation of water, the amount of salts in water is increased. In such circumstances, the probability of occurrence of freshwater organisms in the benthosis naturally decreased.

3. CONCLUSION

In the Article describes species composition larvae Odonata in lake Mehman 25 species are the main species Coenagrion genus), quantity (1 m² in field 21 - 30 the individuals, 0,21 - 0,25 g) and give about information 8 species – (L. nympha, S. fusca, E. viridulum, I. pumilio, O. concellatum, L. depressa, L. quadrimaculata, Cordilia sp.) are new species for fauna of Azerbaijan. Changes in biomass of benthic organisms as well as larvae of dragonflies, which developed very poor is analyzed. Poor development of dragonfly larvae in the lake Mehman is characterized, on the one hand with their intensive consumption by fish and water birds and on the other hand - the steady worsening of the environmental conditions of the lake.

ABSTRACT

The entry of Azerbaijan into the list of developed countries by 2025 is a priority task set by government. Further development of country is based on sustainable development conception. Since the recent economic achievements of Azerbaijan are based on the principles of inclusive and innovative management and this trend is the basis of transition to a sustainable green economy. Knowledge-based economy in parallel with the inclusive and innovative governance, in turn, serves to restore the ecological balance and effective resource management. At the same time conveying the effectiveness of innovative development to the population provides social welfare. In this regard, some examples of efforts and initiatives for sustainable development by government reviewed in the article.

Keywords: *Inclusive and innovative governance, sustainable development, green economy, knowledge based economy, environmental management, competitive economy, energy efficiency*

1. INTRODUCTION

An environmental education will empower future leaders with the knowledge and tools necessary to relate to the environmental challenges of our time. Our actions today are the seeds we sow that will bear fruits reaped tomorrow. [Aliyeva, 51]. For the country that took the path of sustainable economic development is particularly important to make constructive use of scarce resources as well as knowledge-based human potential. Indeed, in the recent years Azerbaijan has succeeded to achieve a competitive economic structure based on information and innovation, improve the living standards of society, adoption of democratic tradition by society, providing high-quality employment opportunities through reforms realized in public administration and economic management during last decade. Policies and implementations targeted for raising economic welfare of the society inevitably contribute to all pillars of sustainable development [Ahmadov, 258]. In this context, structural problems of the economy were overcome and significant improvements were achieved in economic indicators such as GDP growth rate, GDP per capita, borrowing requirement and public finance, inflation, balance of payments and employment. At present, Azerbaijan provides 100% of its gross energy consumption through domestic production, which is currently largely reliant on the exploitation of the country's hydrocarbon reserves, namely oil and natural gas. Azerbaijan exports oil, natural gas and electricity. Over the last years, the Republic of Azerbaijan has successfully identified political development, administrative reform and comprehensive economic development as national priorities in order to increase economic growth, alleviate poverty and unemployment. Proof of this Azerbaijan has become a member of United Nations Economic and Social Council (ECOSOC UN). Slow progress in living standards and widening inequality have contributed to political polarization and erosion of social cohesion in many advanced and

emerging economies. This has led to the emergence of a worldwide consensus on the need for a more inclusive and sustainable model of growth and development that promotes high living standards for all [21, p.2]. GDP growth is best understood as a top-line measure of national economic performance, in the sense that it is a means (albeit a crucially important one) to the bottom-line societal measure of success: broad-based progress in living standards. As many countries have experienced and the Inclusive Development Index data illustrate, growth is a necessary but not sufficient condition for robustly rising median living standards. Accordingly, policymakers and citizens alike would benefit from having an alternative, or at least complementary, bottom-line metric that measures the level and rate of improvement in shared socioeconomic progress. Designed as an alternative to GDP, the Inclusive Development Index (IDI) reflects more closely the criteria by which people evaluate their countries' economic progress. (Figure 1).

Figure 1: Inclusive Growth and Development Key Performance Indicators
 Source: *The Inclusive Development Index 2018 Summary and Data Highlights*

In the ranking of emerging economies, six European economies are among the top 10: Lithuania (1), Hungary (2), Azerbaijan (3), Latvia (4), Poland (5), Croatia (7), and Romania (10). (Figure 2). These economies perform particularly well on Growth and Development, benefiting from EU membership, and Inclusion, with rising median living standards and declining wealth inequality. However, Azerbaijan has not EU membership its economy performs well. It is result of intensive reforms, reforms on governance especially on e-governance, government support to inclusive and innovative societies, youth societies and good neighborliness policy that held by government. Figure 2 show us that Azerbaijan not badly corrected by his challenges. The first main challenge was growth and development which contains GDP, employment, labor productivity, health life expectancy. The second challenge was Inclusion which contains median household income, poverty rate, income Gini and Wealth Gini. The third final challenge was intergenerational equity and sustainability. Intergenerational equity and sustainability consists of adjusted net savings, public debt, dependency ratio and carbon intensity of GDP. All the above key performance indicators played very important role to show high performance on Inclusive Development Index (IDI).

 Source: The Inclusive Development Index 2018 Summary and Data Highlights

The other important indicators that specify the position of any country in the world community is competitiveness. This comprehensive indicator synthesizes many aspects of the economy: the quality of products and processes, resource consumption goods at all stages of their life cycles, image and brand value, business excellence manufacturers, retail and service organizations, legal certainty, and the organization, professionalism and efficiency of the public administration. The indices presented on Table 1, show that Azerbaijan between 2014-2016 had a best result among the CIS and Eastern Europe countries, ranking 38th among 140 countries.

Table 1. The Global Competitive Report				
2014-2015			2015-2016	
Country	Rank	Score	Rank	Score
Azerbaijan	38	4,53	40	4,50

Rapid development and swift industrialization of the South Caucasus region has brought about environmental concerns and raised many ecological issues in recent years.

From the date of “International Dialogue for Environmental Action” opening the centre has been home to many short and long term training courses, seminars, roundtables and lectures on environmental topics, as well as “eco-cinema” sessions both for students and specialists in this field. It subscribes to a number of international journals and bulletins in order to secure up-to-date information on environmental matters and make a difference through innovation, leadership and proactive actions [Aliyeva, 40]. Environment is a key cause of concern for young people in Azerbaijan as it is in the region and the world. 85 environmentalists from 35 countries participated in the International Camp of Young Environmentalists, held in Gabala. The Youth Camp was held for three days through an opening ceremony and three different workshops. Participants adopted «Gabala Declaration» calling on the people around the world to take personal responsibility on ecological problems and urging to bring environmental action and thinking into their daily lives. The main objectives of this camp were to promote active participation of the young environmentalists in public life of the region, to reinforce the role of young environmentalists in their own communities and encourage them to become an ambassador for local environmental awareness, and to nurture communities through an open dialogue, while ensuring the emergence of a new generation of independent young experts in the field of environmental studies. The future depends on how we live today. The Green Week dialogues were aimed at providing a platform where leaders from around the globe could voice concerns about the future of our planet and find innovative solutions for our economy and environment. Some of the objectives and themes that were discussed included the youth response to Rio+20, the role of major stakeholders in post Rio+20, the Green Economy, environmental diplomacy and international affairs. [Aliyeva, 65]. This is a reality that needs to be embraced by younger generations across the globe. We need to take responsibility for our environment and admit that our actions today are the seeds we sow that will bear the fruits to be reaped tomorrow. It is time to sum up the achievements of the recent year, plan for tomorrow and unite for one earth, one future” [Aliyeva, 2].

2. HOW THE KNOWLEDGE AND INCLUSIVE COMMUNITY AFFECTS AN ECONOMICAL PERFORMANCE

Promoting the wellbeing of current and future generations is the central objective of sustainable development. Sustainable Development is a pattern of economic development in which resource use aims to meet human needs while preserving the environment so that these needs can be met not only in the present, but also for generations to come. Here we must to analyse differences between generations. World is now sharing a number of fundamentally different generations, and it is necessary to address this issue by generations. Because economic performance and its sustainability depends not just only knowledge, innovation, smart and inclusive community. It also depends on generation habits. Individual generations of people or employees can be chronologically defined on Generation Baby Boomers, Generation X, Generation Y, Generation Z, and Last Alpha Generation. The characteristics of each generation can affect course development and sustainable development remains an integral part of these events. [Jana., Andrea, p.335]. Sustained social development, the reduction of poverty, a rise in living standards and improvements in wellbeing is not possible without economic development an increase in the production of goods and services and economic development cannot be decoupled from environmental change. The production and provision of all goods and services implies a transformation, degradation and depletion of natural resources. Effective use of energy resources is essential for sustainable development and there are various methods used in evaluating whether these resources are used. One of the widely proven methods for measuring the efficient use of resources is the index showing the consumption of energy needed to produce gross domestic product (GDP) [Alakbarov, 133]. From 2003-2013, GDP per unit of energy in Azerbaijan is increased by more than 3 times. (Figure 3).

In terms of these indicators, Azerbaijan demonstrates high performance in par with the developed countries. Managing natural resources to aid in the transition to sustainable development involves more than just extensive education at all levels. A sustainable nexus between social, economic and environmental development will not only require a more balanced distribution of economic resources, but also a shift towards green economies, characterized by sustainable patterns of consumption and production. [Alakbarov, 134].

Figure 3: GDP per unit of energy use (PPP \$ per kg of oil equivalent) in Azerbaijan Source: Own construction according to the World Development Indicators & Global Development Finance

As an indicator of this trend we can show more than 700 thousand new jobs from 2005 to 2015 most of which falls on the share of non-oil sector. Also an alternative energy use in Azerbaijan including sun, wind and electric power was in the focus of sustainable development trends. Nevertheless, economic and political crises taking place in the world has not passed Azerbaijan economy. During the economic crises of 2008 and 2014 non-oil sector growth rate increased at first, and then slowed down. See the Figure 2. The process of slowing down is due primarily to the decline in oil prices on world markets and the reduction of the State budget. In this regard, the government is taking steps to reduce some public investment programs that have been planned in advance for the development of the productive sectors of non-oil sector, while the budget allocated more funds to the social and economic programs. Despite the efforts of the Government of Azerbaijan to realize the diversification of industries and stimulating the development of non-oil sector, Azerbaijan today has a competitive advantage in the main oil refining and chemical industries. The main priority sectors in the development of non-oil sector in Azerbaijan are considered to be agriculture, tourism, technology of information and communication, processing industry. International financial institutions emphasize the importance of the agricultural and tourism sectors. Thus, 44 % of the employed population is working in this particular field. For this reason, the development of agriculture is carried out successive government programs and reforms involved the latest technology.

Figure 4: Non-oil economy share in GDP in Azerbaijan (%) Source: Own construction according to compiled by the author according to the Central Bank of Azerbaijan

The concept of green economies has emerged in recent years as a widely accepted shift from traditional thinking, in which environmental protection and management was viewed as being separate from economic development. It is now recognized that future economic development must be linked to both environmental and social pillars. With the democratic changes occurring all the world over, the populace in which the work community is inclusive must internalize democracy and discharge their civic duties to the country. [Ontor.,Emanuel, 2018, p.568]. A green economy must benefit coastal communities in developing states who depend on a healthy ocean for their survival. Healthy oceans are essential for the sustainable development of millions of people. Therefore, the concept of a green economy needs to be extended to a blue-green economy [16]. In this concern also Caspian Sea and Azerbaijan coastal area is of great importance according to green economy transformation progress. Population dynamics also have a critical influence on social, economic and environmental development and consideration of them needs to be central to any future development agenda [6]. Besides the weightless economy is also a knowledge based economy and considered to be a part of contribution to the green economy, where knowledge is widely traded as an intangible product, not just used as a tool to manufacture physical products. Software, databases and intellectual property are some examples of weightless economy. There are only two avenues still open for the continual betterment of a society, once its resources have been allocated to maximise the economic welfare of its citizens. The first is expropriation: a society can plunder the economic achievements of other societies. The second is technical progress: a society can utilise continuing developments in the arts and sciences to improve the lives of its citizens. The former option is neither clever nor subtle. More crucially, it is self-liquidating: it cannot result in sustained improvement [7]. Therefore, technical progress is the only feasible engine of growth in a modern economy. But it is naive to suppose there is not a price to pay for technical progress, and that to ensure continuing economic growth; societies can get by without making difficult sacrifices. Those choices might turn on whether to channel resources into blue-sky research, exploring the boundaries of human knowledge and experience, but which might have no immediately visible pay-off. Or, they might hinge on smoothing the reallocation of people and resources from one line of work to another, as new productive options open and others close. One example of these changes is what has come to be known as the "weightless economy". It is mean an economy where creating value is associated increasingly with dematerialised products: computers, telecommunications, machine and biological software, mathematical algorithms, and related services. Such an economy also includes designs and ideas - computer databases, new financial products, better entertainment and more efficient ways of transmitting

information. These objects are dematerialised because their economic values reside not in a physical form, but in their organisation of zeroes and ones, binary bits of logic. “Dematerialized products are important for economic growth for a number of reasons. First, they are infinitely expandable: their use by one person takes nothing away from their contribution to another's welfare or productivity. For instance, when a piece of software - installed on a satellite server circling the Earth - is used by myself in my office, no physical limitations prevent the simultaneous and equally efficient use of that software by someone else in New Zealand. The same is not true of a chocolate biscuit - once I have eaten that biscuit, no one else can” [7].

3. ENVIRONMENTAL MANAGEMENT

According to the Constitution of the Republic of Azerbaijan, everyone has a right to live in a healthy environment, as well as receive information about the current state of the ecology of the country. At the same time, no one is allowed to harm or damage the environment and natural resources. This is guaranteed by the state. According to the Constitution, the protection of the environment is the duty of every person. Ecological balance can only be achieved through the formation of an appropriate environmental outlook in all age groups, especially among the younger generation. Youngsters should be inculcated with a feeling of responsibility for the protection and improvement of the ecology in order to ensure their careful attention to the environment. For this purpose, different propaganda mechanism should be used. Key point here is to change the public attitude to the environmental problems [25, p.16]. Azerbaijan is situated between Europe and Asia, and embodies the Eastern wisdom and Western progress. The unique feature of Baku is that the architectures of ancient Icherisheher and Maiden Tower harmonize with samples of newly constructed modern buildings. In the past, Azerbaijan was the hub of the historic Silk Way. Geographical position of Azerbaijan has not only influenced our culture, but also our nature. 9 out of the 11 climate zones exist in Azerbaijan, and this ensures our biodiversity” [6]. Azerbaijan, as a country blessed with natural oil and gas reserves and located in an environmentally challenging region, has also been active in solidifying and focusing society efforts to thwart the dangers posed by ecological challenges. To that end, the year of 2010 was announced the «Year of Ecology» in Azerbaijan. To reduce dependence from fuel and gas the government adopted State Program on the Use of Alternative and Renewable Energy Sources. By this program it's expected to decrease CO₂ emissions and till the 2020 it's expected to increase alternative and nuclear energy percentage of total energy use in Azerbaijan. One of main environment disaster in over the world is carbon dioxide emissions. Carbon dioxide emissions are those stemming from the burning of fossil fuels and the manufacture of cement. They include carbon dioxide produced during consumption of solid, liquid, and gas fuels and gas flaring [13]. According to IEA and World Development Indicators on trends in greenhouse gas emissions the results of Azerbaijan emissions are less than Europe and Asia developed and developing countries, also with upper middle income countries. (Figure 5).

Despite its young age, the country managed to reshuffle and refocus on environmental-friendly industries and businesses, while engaging younger generation in awareness-building and empowering each member of its community to become the leader for local environmental action. The first ever Center for Restoration and Rehabilitation of Wild Nature in the South Caucasus was established in Azerbaijan. Children in Azerbaijan and throughout the Southern Caucasus grow up proudly learning that they live in a region which boasts nine of the world's eleven climate zones. It has more than its fair share of environmental wonders. But it also is a country and a region with serious environmental challenges, from endangered species to industrial pollution to basic issues of water supply and safety. The beginnings of a government-led environmental investment programme are beginning to be seen in Azerbaijan, with industrial clean-up, a strong National Parks project, mass tree planting, and the first moves into renewable energy. The young generation in Azerbaijan understands the difficulty and urgency of the environmental burdens of the time and shares a common passion for the environment. The Caucasian Biodiversity Summit was held at the Heydar Aliyev Center, following the initiative of IDEA (International Dialogue for Environmental Action) Public Association. The event was also joined by well-known international experts, representatives of a number of influential organizations, including the International Union for Conservation of Nature (IUCN), World Wildlife Fund (WWF), Smithsonian Institute, London Zoology Association and Harvard University, as well as scholars from Azerbaijan. In the recent years a lot of different projects have been implemented. The project "The Big Five of the Caucasus" providing for protection of 5 endangered animal species – brown bear, emperor eagle, wolf, gazelle and the Caucasian leopard is of special significance". IDEA participants launched a special campaign with the motto of «Young tree for Young Spirit», according to which, 300.000 trees were planted in 2012. Volunteers – students from different universities of Baku, government workers, and representatives from different organizations – have already made a huge progress and initial mass tree-planting took place on the «Greening Department 2» located on the 17th km of the highway from airport towards the city centre, in Zikh highway. Over 3 million trees were planted within the framework of the projects implemented; classes have been created at education establishments on protection of the environment. "Our primary objective is to secure rehabilitation of endangered species in the world, and their protection.

Joint works are being carried out with a number of international organizations in this direction. Azerbaijan is a member of the International Union for Conservation of Nature” [9]. The close attention of the country’s leadership to environmental issues has increased the efficiency of the measures taken in this field. Major projects have been successfully implemented and continue to be fulfilled in this direction. Over the past ten years, due to the intensification of tree planting and reforestation measures the forest area has reached more than 1 million hectares, increasing from 11.4 to 11.8 % of the total territory of the country. Over the past 10 years more than 20 million different species of trees and shrubs have been planted in the areas outside the forest territories. Over the last 5 years large landscaping projects based on up-to-date methods have been implemented around the city of Baku and Absheron peninsula. 3.4 million trees and shrubs were planted on an area of 3294 hectares, with the length of drip irrigation system of about 9 kilometres. As a part of these projects more than 845,000 olive saplings have been planted in different regions over an area of 1384 hectares. It is worth mentioning that the area of these new olive plantations equals the area of all the olive groves planted throughout Azerbaijani history. We face the task of achieving the Millennium Development Goals in water management. In order to improve wastewater management, the existing large wastewater treatment plants are being modernized and new ones built and a sewer system is being laid in all the regions of the country. Based on the order of the President of the Republic of Azerbaijan «On Measures for the Protection of the Caspian Sea from pollution» the Ministry of Ecology and Natural Resources established the “environmental protection system of the Caspian Sea” consisting of 17 stations of sewage treatment plants for the cleaning of around 6400 cubic meters of wastewater daily aimed at preventing the contamination of about 100 kilometres of the coastal strip of the Absheron peninsula. Large-scale projects are also being implemented for the population’s supply of drinking water and water supply systems are built in all regions of the country. Since 2007, according to the order of the President of the Republic of Azerbaijan «On some measures to improve supplies of clean drinking water» the Ministry of Ecology and Natural Resources installed water treatment modular structures aimed at providing safe drinking water to the most remote settlements in a short time; as a result, more than 400,000 people in 222 villages along the Kura and Araz rivers have been provided with clean drinking water. Work on the development of specially protected natural territory has been carried out in order to preserve the biodiversity and save the gene pool of rare species of plants and animals, with the area having doubled over the last 10 years. Currently there are 9 national parks, 11 state nature reserves and 24 state national parks with a total area of 893 thousand hectares. There was not a single national park in Azerbaijan until 2003, while today the specially protected areas form 10.3 % of the country’s territory, including national parks of 3.7%. Special attention is being paid to the historic reintroduction of some species to their habitat. More than a hundred head of gazelle have been resettled in their historical habitats as part of the project. As a result of all these measures there has been a natural growth of rare species that were in danger of extinction. Progress has been achieved in the field of waste management. A modern plant for the incineration of municipal solid waste was built in Baku with the capacity of 500 thousand tons per annum together with a screening plant; in addition, the Balakhani landfill has been rehabilitated. Special attention is being paid to the management of hazardous waste. The National Centre for the management of hazardous waste was established at the Ministry of Ecology and Natural Resources and the landfill of hazardous waste was built where more than 100 thousand cubic meters of toxic mercury waste and other industrial waste, including medical waste has been disposed of. In recent years outstanding results have been achieved in Azerbaijan in the field of the mitigation of climate change. Despite the fact that Azerbaijan is not included in the group of Annex 1 of the United Nations Framework Convention on Climate Change (i.e. the country didn’t take quantitative commitments to reduce waste causing a thermal effect) and these wastes in Azerbaijan constitute a very small part of the world’s waste,

in the period after Kyoto concrete measures have been taken aimed at reducing waste; as a result, despite the rapid development of the economy, this waste has been reduced from 70 million tons in 1990 to 50 ± 2 , 5 million tons per year since 2005.

4. WATER GOVERNANCE AND REGULATION

Improvement of the water supply in Azerbaijan is another important infrastructure area required investment. Poor water management, heavy losses in the four major pipelines and industrial pollution, and lack of wastewater treatment/sewage plants, particularly in the Absheron peninsula, offer important opportunities for investors. Since 1887 Baku's main source of water has been the Kura River, delivered by barges and steamers. But even then when the environment was far less polluted than it is today. Filtered Kura water was of a poor quality. The increasingly polluted water of the Kura river, is one of the main sources of Baku's water supply. The amount of total mineralisation in the water intake region is 1 – 1.2 h/l; the content of chloride, sulphates, phenols, fatty acids, petroleum products, heavy metals and other harmful substances well exceeds maximum admissible standards. There are, however, still supporters of the use of Kura water through the Mingechaur reservoir, where the mechanical impurity ration is less, but the heavy metal content and other impurities exceeds admissible standards. Kura water can be used only for industrial and irrigational purposes [5. p.8]. The main law on water supply and efficient use of water resources in Azerbaijan Republic concludes "Developing draft version of MCLNS standards for enterprises applying technical standards and tolerance limits of waste and recommendations on its content". State Environmental Committee, 1994; "Rules for protecting surface water sources form impure water contamination". State Committee on Environment and Control over Use of Natural Resources. Baku, 1994; "Standardizing rules for use and protection of water sources", Resolution 2006 of the Cabinet of Ministers of Azerbaijan Republic, October 15, 1988, article 8; Resolution 150 of the Cabinet of Ministers of Azerbaijan Republic on Application of rules for paid use of water in Azerbaijan Republic (1996). Rules for use of water objects for cultural and community purposes, recreation and sport purposes. Resolution 216 of the Cabinet of Ministers of Azerbaijan Republic (1998). Allowable limits of detrimental effects to fishery water bodies. Resolution of the Cabinet of Ministers of Azerbaijan Republic (1999). Rules for state control over protection and use of water bodies. Resolution 198 of the Cabinet of Ministers of Azerbaijan Republic (1998). Regulations on development and application of limits for use of water. Article 8, (1998). Council of Ministries' Decision No: 206. Resolution 122 of the Cabinet of Ministers of Azerbaijan Republic on Application of fees for use of natural resources, discharge of pollutants into environment, and on use of funds formed from these sources (1992). Regulations on processing, preparation, submission, state expertise, approval and application of systems for comprehensive use and protection of water resources – Article 8 (1998), The Cabinet of Ministers Resolution 206. Radiation Safety Norms QN 2.6.1.054-90 (NRB-90); State Standard 2874-82. Drinking Water. Hygienic Requirements and Water Quality Control; SNIP (Construction Norms and Regulations): For water treatment plants: SNIP 2.04.02-84; State Construction Committee, 1985 - For waste water treatment plants: SNIP 2.04.03-85; State Construction Committee, 1985. Resolution of the Cabinet of Ministers of Azerbaijan Republic on approval of norms for maximum concentration limits of dangerous substances in air, soil and surface water bodies. 2000. The main legislation relevant to EIA in Azerbaijan is given in Table 2. The Law states main principles of preservation of nature, rights and obligations of government, public institutions and citizens in this area; determines objectives of users of nature in conducting environmental monitoring, term of "ecological insurance" for dangerous activities, and establishes volunteer and compulsory environmental audit of economic activities. Basic responsibilities for violation of its requirements have also been formulated.

Legislative Acts	Year adopted
Sanitarian-epidemiological Safety Law	1992
Radioactive Wastes Law	1994
Radiation Safety of Population Law	1997
Water Code	1997
Industrial and Domestic Wastes Law	1998
Environmental Protection Law	1999
Soil Code	1999
Environmental Safety Law	1999
Specially Protected Natural Areas and Objects Law	2000
Soil Productivity Law	2000
Protection of Atmosphere Law	2001

Table 2: Main environmental laws. Source: own construction according to Ministry of Environment and Natural Resources of Azerbaijan

The law establishes basic standards of environmental quality, environmental requirements for economic activities, and sets requirement for state and local environmental monitoring. Quality of environment is included in environmental standards: Maximum concentration limit of noxious substances (MCLNS) in environment; Tolerance limits of noxious substances discharged to the environment; Levels of radiation safety; Sanitary-hygienic norms and standards. Violation of above-mentioned norms and requirements can result in termination or restriction of business activity. The main goals and objectives of State Ecological Expertise (SEE) and Public Ecological Expertise (PEE) are included in the Environmental Protection Law and includes assessment and approval of EIAs and their role in environmental and construction permitting. Implementation of recommendations of State Ecological Expertise is compulsory. Public opinion is necessary for making optional or alternative decisions, but different from environmental expertise (EE) and SEE recommendations, this is informative and suggestive. Azerbaijan Republic is a member of international organizations on environment and standardization. Partnership and Cooperation Agreement (PCA) between European Union member countries and Azerbaijan (signed on April 22, 1996 in Luxemburg) became effective from June 22, 1999, which indicates high level of cooperation between the two sides. According to article 50 of this agreement, Azerbaijan should attempt to “Promote use of technical rules of the Union in this area and application of European standards and compliance evaluation methods” within “Cooperation in the area of standards and compliance evaluation”. Under article 50 of the Agreement - “Environment” Azerbaijan has taken commitment to “Improve national legislation on the basis of European standards”. European Commission recommendation on involving South Caucasus countries in European Neighbourhood Policy (ENP) was confirmed in Brussels Summit of heads of states and governments of European Union countries held on 17-18 June, 2004. Within the framework of European Neighbourhood Policy “European Union - Azerbaijan Joint Plan of Actions” was signed in 2006. The following are recommended to Azerbaijan in this document: Integrating into EU and international legislation and management practices in the area of standards, technical regulations and evaluation of compliance; Improving procedures and institutes for evaluating factors affecting environment, including adopting and applying relevant laws; Preparing framework legislation and main procedures, and providing the planning for main environmental sectors, especially for air quality, water quality, management of wastes, protection of environment classified in national plan of actions on environment, and continuing the process pf adapting to European requirements. Complete reconstruction of water supply and sewer systems of 43 cities and towns of Azerbaijan and construction of relevant plants and networks is planned within the framework of I and II projects of National Water Supply and Sanitation Project financed by

World Bank. Suggested standards are Water Supply and Sanitation: British Standards (BS), British Water Industry Standards (BWIS), DIN Standards, ISO Standards, AWWA (American Water Works Association) Standards, European Norms (EN); Construction and electromechanical equipment: British Standards (BS), DIN Standards, ISO Standards, AWWA (American Water Works Association) Standards, European Norms (EN); Working projects on Waste Water Treatment Plants: ATV 301 Standards.

5. SUSTAINABLE ENERGY STRATEGY

The State Programme for the Development of the Fuel and Energy Sector (2005–2015) targets the reduction of losses and prevention of theft and the inefficient use of energy in order to cover the electric power and natural gas demands. It is stated that full payment of the cost of the electricity and natural gas consumed is one of the factors that would ensure the efficient use of these resources. The State Programme on the Use of Alternative and Renewable Sources (2004) also envisages more efficient utilisation of hydrocarbon energy sources as one of the objectives. Although the government sets the targets for an energy efficient economy, there is no law or secondary legislation specific to EE activities. Since 2009, Azerbaijan has been signatory to the International Renewable Energy Agency (IRENA) and has created the State Agency on Alternative and Renewable Energy Sources (SAARES). A national strategy on the use of alternative sources of energy and RES for the period 2012–2020 is being prepared by SAARES and by the Ministry of Industry and Energy (MIE), including an RES Law, which is expected to be published by the end of 2012. As of June 2012, SAARES has become the State Company on Alternative and Renewable Energy Sources. This will provide a mandate to develop RES projects. A state budget of \$60 million has been committed to the development of RES. Hydropower is for now the most important renewable energy (RE) resource in Azerbaijan and in 2010 hydropower satisfied about 18% of the need for electricity generation. Azerbaijan has about 1000 MW of operating hydropower capacity and an additional 62 MW of planned hydropower capacity. Although there has been little implementation of wind energy in Azerbaijan until the present day, interest has been growing. Its use has huge prospects in some regions of Azerbaijan. Calculations suggest that the Republic of Azerbaijan has the economically feasible potential to produce about 800 MW of wind power. The main potential is in the southeast around the Caspian coast. There is also competition with tourism development. The estimates of the solar, biomass and geothermal potential are more uncertain. Even though there is sufficient space to install solar panels, the estimated potential of 5000 MW can only be a long-term goal due to the relatively high upfront investment cost. Biomass utilization is equally unlikely without an incentive system in place. There exists only the potential of geothermal energy for heat supply, due to the relatively low temperatures of the wells. The main barrier to RES development is the low tariffs that were set in 2007 and are still valid for 2012, with 3.2 US\$/kWh for small hydropower plants (HPPs) and 5.7 US\$/kWh for wind. Another barrier is the lack of a legal basis for connection rules. In order to overcome the barriers to developing RES in Azerbaijan two projects are relevant. The project for preparation and implementation of an action plan for RE and EE will be undertaken by the Khazar Consulting Agency. This project is ongoing on the part of SAARES in co-operation with the International Academy of Eco energy. Azerbaijan is interested in finding solutions to the problems regarding environmental protection and the rational utilisation of natural resources. In support of Azerbaijan's environmental protection goals, a number of important laws, legal documents and state programmes have been developed and approved in order to improve the ecological situation in the country. There are two gross indicators of progress. First, the reliability of power supplies has improved, leading to a flow of funds to the power sector in Azerbaijan. Second, a 90% collection rate of the electricity bills has been achieved. This happened after many years of significant problems, when transmission and distribution

companies were unable to collect bills and consequently had insufficient funds to pay for the generated electricity. The three priority areas for development in the energy sector of Azerbaijan are identified as follows: rehabilitation of power grid for improvement of power supply quality and loss reduction; development of renewable energy; improvement of demand-side EE and energy conservation'. The main objective of the Azerbaijani Government in the field of energy has been to become self-sufficient in terms of meeting the energy demand. This objective has been achieved for oil since 1998 and for gas since 2007. Moreover, in addition to committed exports, there is currently an overcapacity of 6 billion m³ of gas that could be exported to Europe and this is expected to increase to 10 billion m³ by 2017. According to Action Plan 2011–2015 approved by the President for the implementation of the State Programme on Poverty Reduction and Sustainable Development 2008–2015 the country will begin privatisation of enterprises in the fuel and energy sector. The institutional arrangements for EE are at early stage of development in Azerbaijan. Institutional development should be informed by an understanding of the short, medium and long-term tasks to be accomplished and to which the authorities need to give early and high-level consideration. The European Bank for Reconstruction and Development (EBRD) has supported the preparation of a €165 million investment programme to modernise and upgrade AzDRES TPP (the country's largest thermal power plant (TPP)). This project has also applied for carbon credits under the clean development mechanism (CDM) and is expected to reduce CO² emissions by 3 million tons CO² eq. annually. Nevertheless, the output of gas fired power plants could be considerably reduced, by developing this RES potential, which could make the GDP growth, which is currently mainly driven by oil and gas exports, more sustainable and long lasting. International donors, the EU and the Energy Charter are strongly supportive of Azerbaijan in terms of its EE efforts; with a view to complying with concluded agreements the administration should take a more explicit and structured approach to capturing the benefits of EE for all.

6. CONCLUSION

The rapid development of all spheres of economics and human activity has led to an increasingly negative impact on the environment, including the inefficient usage of natural resources. As can be seen in many other countries, Azerbaijan is interested in finding solutions to the problems regarding environmental protection and rational utilization of natural resources. In support of Azerbaijan's environmental protection goals, a number of important laws, legal documents and state programs, all of which conform to European law requirements, have been developed and approved in order to improve the ecological situation in the country. In this regard recent years Azerbaijan could achieve important results and now there is sustainable basis for future inclusive development. As it was seen on above figure Azerbaijan between emerged economies took a worthy place and it gives look to the future with great optimism.

IMPROVING THE COMPETITIVENESS OF NATIONAL ECONOMY AND STRENGTHENING STATE AID TO ENTREPRENEURSHIP

Leyla Z. Aliyeva

Azerbaijan State University of Economics, The Republic of Azerbaijan
Aliyeva.L@unec.edu.az

ABSTRACT

The work indicates that developing the business and making improvements in this area, improving the legislative basis, domestic and foreign investments, modern technologies, attracting management experience, and using all of it in producing high quality competitive goods are priorities of the state economic development strategy. The aim of the state policy in this field is to improve the business environment and state support, to develop relations between the state and entrepreneur, at the next stage, to create new institutions in accordance with the requirements of market economy and to support their effective activities at the next stage. It was noted that the National Fund for Entrepreneurship Support is the first national financial institution to provide small and medium-sized businesses with preferential lending through the state budget for the establishment and development of private structures in the country. It operates under the Ministry of Economy of the Republic of Azerbaijan. As a result of changes in the normative-legal acts regulating the Fund's business, its elaborate mechanism of business have been formulated and the amount of funds allocated for issuing preferential loans from the state budget has been increased. The development of small and medium-sized businesses in Azerbaijan has particular importance in terms of diversification of the economy, increasing competitiveness, ensuring employment, meeting demand for consumer goods through local resources and ensuring economic development. Thus, when considering the share of small and medium-sized businesses in GDP and employment in developed countries, it can be concluded that transformation of small and medium-sized businesses into a major driving force in sustainable economic development in Azerbaijan is one of the main challenges ahead. The "Strategic Roadmap on the Production of Consumer Goods at the Level of Small and Medium-sized Enterprises in the Republic of Azerbaijan" has been developed as part of efforts of the country to ensure competitiveness, inclusiveness and sustainability in the country's economy.

Keywords: *Business activity, Business environment, Competitiveness, Investment, Non-oil sector, Provision of concessional loans, State support*

1. INTRODUCTION

The development of free market relations is the priority of economic policy for the Republic of Azerbaijan. Azerbaijan is implementing consistent and systematic measures for the expansion of the private sector, eliminating the obstacles to the development of small and medium-sized businesses in the country and, in general, for the creation of a viable business investment environment. The entrepreneurship development strategy is successfully implemented by the President of the Republic of Azerbaijan, Ilham Aliyev. The identified directions in the State Program are: improvement of the business environment in the country, increasing the financial provision of the entrepreneurship in the regions, establishing information data on existing potentials, development of infrastructure, promotion of entrepreneurship directed to the implementation of the state regulation, development of the state-entrepreneurship relations, improvement of mechanisms for protection of entrepreneurs' rights and extension of technical assistance to entrepreneurs are carried on.

2. THE CONCEPTION OF COMPETITIVENESS OF NATIONAL ECONOMY

Competitiveness - is the feature characterizing the degree of the meeting demand of competitiveness of the object compared to the other best similar objects. Competitiveness- is more attractiveness of price and non-price characteristics of the goods to the consumers than the competitors' goods in the available conditions of the firms. Competitiveness is determined with technical level of commodity; marketing and advertising information; compliance with the consumer's requirements, technical conditions and standards; the organization of the service, author's supervision, warranty, training of personnel from the purchaser; with the duration of the warranty, product sending (operation, manufacturing, sale); prices; with the terms of the payments; timely appearance of this commodity in a particular market; with this region's political-economic situation. This feature allows you to distinguish between high, medium, or low-power abilities. M.E. Porter points out that there are five competitive forces in the theory of "Five Forces of Competitive Model": competition amongst vendors dealing with each other; competition of substitute and price competitive commodities, the threat of new entrants to the market, the bargaining power and economic opportunities of suppliers, the bargaining power and economic opportunities of customers. (Samadzada, 2012, p.320). Also, the levels of competitiveness such as competitiveness of commodity, the competitiveness of commodity producers, the competitiveness of the country and area can be noted. At the contemporary stage of economic development, ensuring the country's competitiveness is not only a very serious problem that characterizes the positions of the country in the global market, but also the problem significantly identifying its national security. The structure of the competitiveness of each country differs considerably because none of the countries can have competition at all areas or at least in the vast majority of areas. In conclusion, countries will be able to succeed only in certain areas, as their internal conditions will be more dynamic and promising in corresponding situations. Azerbaijan has some competitive advantages compared to other countries. These advantages allow our country to take the 40th place in the global competitiveness rating and to overcome all the CIS countries. The advantages we are talking about are: a suitable economic and geographical situation; advanced transport communications system and overall production infrastructure; rich natural resources; scientific and technical potential; diversified industrial companies; high level of educated population and so on. At the same time, the following measures should be taken to raise the competitiveness of the country:

- improvement of the mechanism of stimulating the effective use of gross revenue growth with all entities for obtaining new techniques and "know-how" from high-developed countries;
- attracting investments for modernization of technology, as well as for reducing the energy-intensive and material-intensive production;
- to develop the export operations of commodities and services of national companies with the world's leading companies;
- to develop the competitiveness of transport system in the international market of transport services.

3. STRENGTHENING STATE SUPPORT FOR ENTREPRENEURSHIP IN THE REPUBLIC OF AZERBAIJAN

In terms of helping entrepreneurship, the state's complex incentive system has a distinctive set of characteristics in the different countries. Thus, for example, the goal of the incentives for entrepreneurship system in Turkey is to create the favorable economic condition for developing the goods, businesses and work types needed by the different economic regions of the country and the society. A range of economic instruments are used to perform these duties such as tax, credit, customs privileges, forgiveness of investment, insurance, etc. (Manafov, 2011, p. 142).

The National Fund for Entrepreneurship Support is the first national financial institution to provide small and medium-sized businesses with preferential lending through the state budget for the establishment and development of private structures in the republic. It operates under the Ministry of Economy. The mechanism and terms of use of funds of ANFES are defined in accordance with the "Rules on use of fund of the National Fund for the Entrepreneurship Support of the Republic of Azerbaijan" and the "Regulations on the National Fund for Entrepreneurship Support of the Republic of Azerbaijan" dated August 27, 2002. According to these documents, the National Fund's funds are distributed through authorized banks selected by the Competitive Commission created by the representatives of the Ministry of Economic Development, the Ministry of Finance and the Central Bank. Providing loans to national entrepreneurs in the national currency at the lowest interest rates (7% annually, 5% annually for media development projects), as well as the grace period for the first two-third part of the loan period and the low loan interest rate has led to excessive interest in the use of these loans in entrepreneurship subjects. By the Decree of the President of the Republic of Azerbaijan №:504 dated 2006, the activity mechanism of ANFES was changed by the creation of Supervisory Board which is the governing body of the Fund's Representative Offices in regions and Fund. In the Decree of October 7, 2009 (this Decree came into force on October 9, 2009) important measures such as further improvement of the Fund's functioning mechanism, its rights and obligations, its legislative basis and management structure, implementation of more accurate and effective control over its activities are envisaged. As a result of the amendments to the normative-legal acts governing the Fund's work, its functioning mechanism has been formulated and the amount of funds allocated to the issuance of concessional loans from the state budget has been increased. The goals and objectives of the National Fund for Entrepreneurship Support are as follows. Supporting to develop entrepreneurship, especially small and medium entrepreneurship in the Republic of Azerbaijan and to increase business activity of population and providing financial support to them:

- financing investment projects of entrepreneurship subjects in priority areas of socio-economic development of the Republic of Azerbaijan through the Fund;
- to take measures to attract financial resources to the Fund, including negotiating and making proposals on attracting loans in the financial markets;
- ensure the funds given to the Fund for the financing of entrepreneurship subjects are used effectively and designated;
- to expertise investment projects financed by the Fund;
- to give preference to the financing of investment projects for development of entrepreneurship from state programs;
- participating in the development and implementation of regional programs, promoting the necessary scientific and technical knowledge and innovations;
- to assist expansion of foreign business activity of entrepreneurship subjects, formation and development of entrepreneurship market infrastructures;
- to carry out other duties for entrepreneurship entities in accordance with the legislation.

Currently, the National Fund for Entrepreneurship Support uses services of 38 authorized credit agencies, including 30 banks, 1 non-bank credit organization and 7 credit unions, to deliver business loans to entrepreneurial subjects. In accordance with the Fund's working mechanism, entrepreneurship entities are applying to authorized lending institutions firstly for getting concessional credit at the expense of the Fund. Authorized lending institutions analyze investment projects and present them to the Fund, based on their business interests and minimum requirements and criteria for evaluation of investment projects set by the Fund no later than 10 banking days. Business entities are provided with the letter of rejection by the authorized credit agencies in 3 banking days, if their investment projects are evaluated

negatively. After signing the credit agreement with the entrepreneurship subjects on positive evaluated projects, the authorized credit organization sends an order to the Fund for allocation of loan funds. The Fund ensures the allocation of funds to authorized credit organizations within 3 banking days. Within 2 banking days, the credit organization transfers funds to the account of entrepreneurship subjects. At the end of each quarter, in the first five banking days of the next month, the Fund is informed by the authorized credit organizations about all business entities submitted the investment project. At the same time, monitoring of the use of investment project is carried out by authorized credit organization. When uncovering cases of non-use of concessional loan funds during the monitoring conducted by the Fund, the concessional loan granted to the beneficiary sub-organizations and interest debt should be transferred to the fund from the authorized credit organization, regardless of the fulfilling commitments of the entrepreneurship subjects to the organization, based on the Fund's written request. Effective organization of ANFES's work is particularly important, in the development of the private sector, strengthening the state financial support for entrepreneurship in Azerbaijan. Over 12,000 entrepreneurship subjects have been granted concessional loans amounted up to 700 million AZN during the Fund's activity. 60% of the concessional loans are given to the development of the agrarian sector (80% of which is the production and processing of agricultural products, 20% - the creation of infrastructure areas - grain storage facilities and refrigeration storage facilities stimulating the development of the field). It is planned to create about 94,000 new jobs at the expense of these loans. 80% of the concessional loans accounted for the share of the regions of the republic and 20% accounted for the share of Baku settlements. In 2009-2011, the Fund has provided 273.7 million AZN concessional loans to 160 investment projects worth 619.9 million AZN, with a total loan portfolio of 290.5 million AZN, which is particularly important for the non-oil sector of the economy. 79 of these projects were commissioned, and construction and installation works were carried out on other 81 investment projects. Taking into consideration the traditions of Baku settlements, natural climatic conditions in accordance with the "State program on the socio-economic development of Baku and its settlements in 2011-2013", the Fund has carried out investment projects for accelerating the development of entrepreneurship and the improvement of living standards of the population in settlements. In order to ensure transparency and to get more information about the given concessional loans to entrepreneurship development, Annual Reports of the National Fund for Entrepreneurship Support are published in Azerbaijani and English languages, financial statements are audited by the international auditing firm, regularly updated website (www.anfes.gov.az) operates. "Taking into account Article 109, paragraph 32, of the Constitution of the Republic of Azerbaijan, for the improvement of the mechanism of support of entrepreneurship development, creation of new production, processing and infrastructure facilities based on innovative technologies in the non-oil sector, financing export operations, acceleration of investments into the real sector and expanding access of economic entities to financial resources, On August 1, 2018 President Ilham Aliyev signed a decree on the abolition of the National Fund for Entrepreneurship Support. (Article 109, Powers of the President of the Republic of Azerbaijan, 1995) Based on the fund, under the Ministry of Economy of the Republic of Azerbaijan, the Azerbaijan Republic's Entrepreneurship Development Fund has been established as the legal entity. The charter capital of the Fund is 1 094 254 581 (one billion ninety four million two hundred fifty four thousand five hundred eighty one) AZN and is formed by the properties allocated to it, as well as the funds allocated from the state budget. The reorganization or liquidation of the Fund shall be carried out by the President of the Republic of Azerbaijan. The World Bank's Doing Business report, the 2016 Doing Business report, explains many useful information: Azerbaijan is in a satisfactory position on indicators such as starting a business, registering a property, protecting investors' rights, paying taxes, and executing contracts.

These findings show that due to the implemented measures, including the recent orders of the President of the country, reforms in many areas of Azerbaijan are carried out in accordance with world standards. Although Azerbaijan is ahead of most of the post-Soviet countries, the initiatives related to strengthening the business environment can be improved by starting the review of the following areas: lease payments for construction, connecting to power supply networks, obtaining loans, foreign trade and closure of company. These areas, which will contribute to the development of the private sector, are based on certain rules and provisions and these issues are detailed in the "Strategic Road Map on the Production of Consumer Goods at the Level of Small and Medium Enterprises in the Republic of Azerbaijan". Increased attention to ease in business facilitation in Azerbaijan can accomplish current reforms in supporting economic development. In this regard, an appropriate Commission was set up based on the Order of the President of the country "On Additional Measures to Increase Entrepreneurship Enhancement in the Republic of Azerbaijan and Further Improvement of Our Country's position in International Ratings" dated July 13, 2016 in order to explore additional reform opportunities and measures to be taken in this area. The recommendations of this Commission may be very important for strengthening the overall objective of targeted economic development for professional tactical movements. International ratings play a useful role in identifying priorities for development goals and should be viewed as an indicator of progress, not just a goal. Improving the Statistics Infrastructure, the purposeful economic reforms are being carried out in order to create an environment that promotes entrepreneurship development in Azerbaijan and to improve the business environment. In order to implement economic reforms in parallel, the possible measures are constantly being considered and developed for removing rules and obstacles that have a negative impact on the business environment in the country.

Figure 1: The distribution of the permanent jobs created by the legal entities during the first nine months of 2018, according to the economic activity types, (by percentage)

- A Agriculture, forestry and fishing
- B Mining industry
- C Processing industry
- D Electric power, gas and steam production, distribution and supply
- E Water supply, waste cleaning and production
- F Construction
- G Trading; repairment of vehicles

H	Transportation and storage
I	Placement of tourists and public catering
J	Information and communication
K	Financial and insurance activities
L	Real Estate Operations
M	Occupational, scientific and technical activities
N	Providing administrative and auxiliary services
O	Public administration and defense; social security
P	Education
Q	Health and social services
R	Activities in the field of leisure, entertainment and art
S	Providing services in other areas
T	Activities of households; activities related to goods and services produced by households for personal consumption
U	Activities of organizations with the right to immunity

NOTE: Small and medium-sized entrepreneurship subjects have been identified in accordance with the criteria of large, medium and small entrepreneurship approved by the Cabinet of Ministers of the Republic of Azerbaijan dated June 5, 2015, No 215. Small sized entrepreneurs are businesses with average 25 employees and annual income up to 200,000 AZN. Medium sized entrepreneurs are businesses with average 25 to 125 employees and with the annual income between 200,000 and 1250,000 AZN (Small Entrepreneurship in Azerbaijan, 2018). The development of small and medium-sized businesses in Azerbaijan is of particular importance in terms of diversification of the economy, increasing competitiveness, ensuring employment, meeting demand for consumer goods through local resources and ensuring economic development. Thus, when considering the share of small and medium-size enterprises in GDP and employment in developed countries, it can be concluded that transformation of small and medium-sized enterprises into main driving factor for sustainable economic development is one of the main challenges that Azerbaijan is facing. The "Strategic Road Map on the Production of Consumer Goods at the Level of Small and Medium Enterprises in the Republic of Azerbaijan" has been developed as part of the country's efforts in ensuring competitiveness, inclusiveness and sustainability in the country's economy. These measures include strategic roadmaps on national economic prospects of the Republic of Azerbaijan covering eleven different sectors of the country's economy, as well as common themes on each sector. The national economy and 11 sectors of the economy, in general 12 strategic roadmaps, have been prepared for the execution of the Order of the President of the Republic of Azerbaijan, No. 1897 of 16 March 2016 "On the approval of the main directions of the strategic road map for the main sectors of national economy and economy and the issues arise from this". The Strategic Roadmap identifies the main directions of economic reform and development in the short, medium and long term perspective in small and medium-sized enterprises. This document consists of a strategic vision until 2020, a long-term vision for the period until 2025, and a target view for the period from 2025. The document states that the development strategy and action plan for 2016-2020 will not only focus on strategic objectives and targets for the relevant period, but also identify the identified priorities and measures to be taken within those priorities for reaching the goals set in those years, and the name of the event, key and other executors, outcome indicators and specific implementation deadlines are included. (Priority 4.1., 2016, pp. 95-96) The effective implementation of these priorities in the short term will be the basis for the next steps to be implemented in the medium and long term and thus the effectiveness of the enforcement process will be ensured. The implementation of the Strategic Roadmap will be ensured through communication and collaboration with non-governmental

organizations, local and international private sector partners. The following are defined as strategic targets in order to achieve the strategic objectives set out in the Strategic Road Map for the development of small and medium-sized businesses in the country and to ensure maximum use of appropriate capacities: (Baku trend, 2016)

- Further improvement of the business environment and regulatory framework in the country in order to increase the impact of small and medium-sized businesses on GDP in the long-term perspective;
- Provision of affordable and efficient access to funding resources for the establishment of a sustainable network of small and medium-sized businesses;
- Internationalization and increasing access of small and medium-sized businesses to foreign markets in order to increase the country's currency reserves and ensure compliance of goods produced in the country with international standards;
- Increasing the supply of high quality products and services at regional markets by paying special attention to the preparation of skilled workforce and development of skills of small and medium entrepreneurship subjects;
- Promotion of innovation to increase the competitiveness of small and medium-sized businesses, strengthening research and development activities in this area. The main activity is to strengthen the financial and tax policy stimulus effectiveness, improve access to financial resources, strengthen technical and information base and optimize placement of small and medium-sized businesses on the territory, protect the internal market, develop market infrastructure, applying the principle of "one window" in obtaining the necessary documents, strengthening interaction between the subjects representing this area, and so on, by improving the legislative framework for small and medium-sized businesses in Azerbaijan. About 700 million AZN is required to achieve defined strategic goals, which will result in the creation of approximately 1 billion 260 million AZN additive value in the economy and 34,240 new jobs in 2020.

In the past period, a number of measures have been implemented to support entrepreneurship development in Azerbaijan. Thus, in accordance with the Decrees of the President of the Republic of Azerbaijan No 610 of June 24, 1997 and No. 753 of August 17, 2002, the " Small and Medium Entrepreneurship Assistance Program in the Republic of Azerbaijan (1997-2000) and "The State Program for the Development of Small and Medium Enterprises in the Republic of Azerbaijan (2002-2005)" was adopted and implemented. In addition, measures are envisaged for developing the entrepreneurship, improving the business environment and ensuring the protection of entrepreneurs' rights and legitimate interests, in the Decrees of the President of the Republic of Azerbaijan No. 3004 of August 2008 and No. 3043 of September 15, 2008, "State Program on Reliable Provision of Population with Foodstuffs in the Republic of Azerbaijan for 2008-2015", and "State Program on Poverty Reduction and Sustainable Development in the Republic of Azerbaijan in 2008-2015", also in the "State Program of Social and Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018" approved by the Decree No 118 of February 27, 2014 and "The State Program for the Development of Industry in the Republic of Azerbaijan for 2015-2020" approved by the Decree No 964 dated December 26, 2014. April 25, 2016 was established as the "Entrepreneurs Day" in Azerbaijan by the Decree of the President of the Republic of Azerbaijan dated April 21, 2016 with a view of increasing the role of entrepreneurs in strategic issues such as employment, non-oil exports, business environment development, and promotion of entrepreneurial support in society. At the same time, two years of suspension of business inspections, reductions in the in the number and payments of rents and licenses for entrepreneurial activity, simplification of leasing procedures, including continuation of works on creating e-portals in this field, also the establishment of Appeal Councils for protection of entrepreneurs' rights, applying "one

window" principle for the transportation of transit cargoes across the country, tax and customs privileges for 7 years in order to promote investment in the country, further expansion of electronic customs services for the purposes of simplifying customs procedures during import-export operations, minimizing the number of required documents and procedures, establishment of the Green Corridor and other transport systems existing in the international expertise for importing and exporting goods and vehicles through customs, the improvement of public procurement, the provision of direct responds to entrepreneurs' applications in government agencies, establishment of call centers for information and consulting services, and other activities was held. Processes in the region and around the world in the economic sphere once again highlight the deepening of cooperation and the state support for small and medium-sized businesses. Thus, in order to diversify the economy, there is a need for a number of changes in this area for the full realization of the potential of small and medium-sized businesses. Although some progress has been made to improve the legislative framework, some improvements still need to be made. Thus, the legislative framework for matters such as the private credit bureau, the movable property registry and the arrangement of collateral transactions should be improved. Priorities should be identified for broader implementation of a single approach to small and medium-sized entrepreneurship, innovation, international standards, increasing government support for researching export markets, further expanding financial support and other support mechanisms, and setting up monitoring and evaluation mechanisms for government support instruments and the development of entrepreneurship in the country should be strongly supported.

4. CONSLUSION

1. Entrepreneurship activity is the center of market economy development. It is impossible to imagine the formation of a perfect market without reaching its development. Therefore, one of the important tasks that the Azerbaijani government is facing is the issue of forming small, medium and large businesses.
2. Small and medium-sized businesses eliminate shortages in production areas, apply scientific and technical innovations more flexibly in production, and compensates paid expenditures in the shortest possible time.
3. Small and medium-sized entrepreneurship creates a robust business environment that is of particular importance to the market economy, based on the individual interests and initiatives of manufacturers, and it is impossible to imagine such a market economy without this.
4. There is strong potential and wide opportunities for the development of small and medium-sized businesses and, in general, the country's economy. In order to do this, improving the overall business environment, making the financial resources more accessible and effective, providing small and medium-sized businesses with access to local and foreign markets, and building up skilled and qualified staff are important steps to be taken.

ABSTRACT

The paper considers the concept of sustainable development as a combination of three components - economy, society and ecology, in their unity. The implementation of the sustainable development concept in Vietnam during the period from 1992 to 2017 is analyzed. The problem of selecting indicators for monitoring and evaluating sustainable development is discussed. On the basis of quantitative and factual data, achievements are assessed and the difficulties encountered in the implementation of the sustainable development concept in Vietnam are identified. Prospective recommendations for maintaining dynamic balance between elements of the sustainable development triad are substantiated.

Keywords: *sustainable development, indicators of sustainable development, economic development, social development, environment protection*

1. INTRODUCTION

The strategy of sustainable development as an idea of a new cultural paradigm appeared at the end of the twentieth century due to the realization that evolution brought mankind into a difficult situation. This situation is characterized as follows: the consumption of natural resources is ahead of their recovery; extremely uneven resources distribution destabilizes both separate countries and the world as a whole; degradation of the natural environment takes place and irreversible negative processes are developing in the biosphere. The term "sustainable development" was first used in 1972 at the UN conference on the human environment in Stockholm. In 1992, at the UN Conference on Environment and Development in Rio de Janeiro, this term was used as the name of a new concept of all mankind existence. In the context of the UN documents, sustainable development should provide meeting the needs of the present time, while not jeopardizing the possibility of subsequent generations to meet their needs. Some researchers point out the large variety of sustainable development definitions, which constitutes several dozens, and, as Ursul (2005) notes, tends to increase. They cast doubt on the existence of a single concept, while admitting the existence of certain ideas that are widely acknowledged and declared in political decisions. (Gvishiani, 1997; Loguntsev, 2000). These researchers regard the idea of sustainable development, as a kind of "fruitful mistake", an analogue of the philosopher's stone or perpetuum mobile, and believe that, being unrealizable, it can nevertheless be highly productive (Bratersky, 2016). Currently, sustainable development is considered as a combination of three areas:

1. Economy. According to a new look at economic efficiency long-term projects, taking into account the laws of nature, are preferable compared with projects which does not take into account possible environmental consequences.
2. Ecology. The main goal of sustainable development in the field of ecology is the stability of natural and ecological systems. Ignoring the needs of ecology leads to environmental degradation and threatens the existence of all mankind.

3. Society. Achieving cultural and social stability, reducing the number of destructive conflicts is considered in conjunction with economic activity and the environment both as the main goal of development and as the means for achievement economic and ecological goals.

For traditional understanding of economic or social progress the generalization of development as growth is characteristic. The issue of growth limits was firstly raised and investigated in papers (Meadows, Meadows, Randers & Behrens, 1972; Meadows, Meadows & Randers, 1993). In contrast to stable growth, sustainable development reflects the human attitude of to the surrounding reality determined by this reality. The highest form of sustainable system organization is one in which the system is able to develop, self-regulate, self-manage, and self-improve based on the sane use of internal and available external resources (Kuvshinov, 2011). The dynamic balance of the three components listed above is the main condition for sustainable development implementation (Vasiljeva, 2012); therefore, economic development cannot be considered in isolation from social progress and the creation of a favorable ecological environment. Developing the national economy, each country faces many environmental and social problems. In order to implement sustainable development, it is necessary to focus on interactions and interrelationships in the triad “economy - ecology - society” (Kovalev, 2014). From the standpoint of sustainable development, the development of a country is not eivalent to increase in production and consumption, but above all supposes the development of a personality, citizens, and their communities. Development implies not a sharing of resources, but their multiplication due the new ways of using available resources, new technologies. Hence, wealth and well-being are not an initial condition, but a by-product, just another transmuted form of development (Bratersky, 2016). Taking into account the ongoing exacerbation of the poverty and environmental degradation problems it should be noted that the progress made within the sustainable development concept is extremely little. This confirms that in its current form, sustainable development concept can’t provide the unambiguous practical results and generates three main critiques, “1) sustainable development is Western construct, perpetuating the ideological underpinnings of former approaches, 2) it focuses its efforts on the unsustainable expansion of economic growth, and 3) its broad nature creates dangerous opportunities for actors to reinterpret and mould the approach the way they see fit.” (Hove, 2004, 53). Discussing the sustainable development concept, Lélé (1991) pointed out the dilemma between the urge to take strong stands on fundamental concerns and the need to gain wide political acceptance and support, characteristic for the relevant programmes of political action and social change. Lélé (1991, 618) writes that sustainable development “is being packaged as the inevitable outcome of objective scientific analysis, virtually an historical necessity, that does not contradict the deep-rooted normative notion of development as economic growth. In other words, sustainable development is an attempt to have one's cake and eat it too”. The mentioned author concludes that to provide real sustainability, efforts are needed in theoretical and practical aspect - theory should work out the precise concept and the practice should suggest flexible diversity of approaches and strategies. In combination these “might lead to a society living in harmony with the environment and with itself” (Lélé, 1991, 618). The aim of this study is to assess the results achieved in Vietnam within the framework of the sustainable development concept of and formulate prospective recommendations on the model of sustainable development.

2. DATA AND METHODS

The study is based on the analysis of scientific works for the period of the sustainable development concept existence, materials of international organizations, official documents of the government of Vietnam. Methods of system and statistical analysis were used. The main source of numerical data is the website of General statistics office of Vietnam www.gso.gov.vn.

The following websites were also used as sources of numerical and factual information: www.worldbank.org – website of World Bank, knoema.ru – website of World Data Atlas, data.trendeconomy.ru – International trade statistics, vneconomy.vn – Economy of Vietnam, vietnamfinance.vn – Vietnam finance, trithucvn.net – Extension of Knowledge, vov.vn – People of Vietnam, nongnghiep.vn – Vietnam industry, www.overshootday.org – Earth Overshoot Day.

3. MAIN PROVISIONS AND RESULTS

In Vietnam, sustainable development is an important strategic goal. The harmonious combination of economic growth with social progress and environmental protection has become the basic principle of country's development (Lo Thi Hong Van, 2018). Analysis of Vietnamese economic development models from ancient times to the present confirmed the need to build a model of the country's economy based on balancing three aspects: economy, society and ecology, which in a whole coincides with the sustainable development conceptual vision (Guzikova, Lo Thi Hong Van, 2018). Evaluation of the results achieved in the three aspects listed above makes it possible to assess the balance within the Vietnamese sustainable development triad and to provide recommendations for improving the sustainable development strategy.

3.1. Indicators for Monitoring and Evaluating Sustainable Development in Vietnam

Assessing the sustainability of a country's development requires taking into account the specific conditions inherent in that country; therefore, creating a set of indicators to monitor and evaluate sustainable development in Vietnam is an important task of the government. In Vietnam, three sets of indicators are used to assess the progress of sustainable development (Tri Ngo Dang, Y Tran Van, Chi Tran Thuy and Tuan Nguyen Thanh, 2018): 1) a set of sustainable development indicators of (SDIs); 2) a set of Millennium development goals indicators (MDGIs); 3) a set of sustainable development goals indicators (SDGIs). The sustainable development indicators in Vietnam are applied in two levels: the state as a whole and the particular provinces. In (VPM, 2012) a set of indicators for monitoring and evaluating sustainable development in Vietnam was clearly established. This set of indicators was constituted by four groups of indicators: (1) general indicators, (2) economic indicators, (3) social indicators, (4) indicators of natural resources and the environment. In parallel with the UN SDIs set, since 2012, in Vietnam there are two other indicators sets: MSDGIs and SDGIs. MDGIs include 43 development targets stated by UN and 35 Vietnamese development targets. These subsets of indicators are used for two different purposes, not contradicting, but complementary to each other. In 2015, UN approved a set of SDGIs. In (VPM, 2017) the set SDGIs for Vietnam was approved which includes 17 sustainable development goals. The use of international indicators in assessing sustainable development in Vietnam meets many difficulties. In particular, their calculation is difficult because the formation of the sets of indicators is not linked with the availability of data. So, today the government assesses the characteristics, achievements and shortcomings of sustainable development in Vietnam and works out proposals for improving the development model on the basis of indicators shown in the Table 1.

Table following on the next page

Table 1: Indicators for monitoring and evaluating sustainable development

Economic	Social	Ecological
1. GDP per capita, USD	1. Poverty level of the population, %.	1. Share of the territory covered with forests, %
2. GDP growth rate,%	2. Unemployment rate %	2. Share of lands to be protected and for biodiversity conservation, %
3. Structure of economy,%	3. Share of highly skilled labor,%	3. Share of degraded lands, %
4. Share of women in the agricultural sector,%	4. Income inequality (Gini coefficient)	4. Reduction of groundwater, surface water, %
5. Share of investment in GDP,%	5. Sex ratio at birth (the ratio of the number of boys born to the number of girls born)	5. Share of recycled industrial waste,%
6. Government support for development (GSD) and foreign direct investment in total investment,%	6. Number of students per 10,000 inhabitants, persons	6. Proportion of days with of harmful substances concentration in the air exceeding the maximum admissible level, %
7. R & D expenses,% of GDP	7. Number of Internet users per 100 people, persons	7. Share of solid waste collected and processed according with national standards and technical regulations, %.
8. Government spending on education,% of GDP	8. Share of population having social insurance, health insurance and unemployment insurance, %	
9. Trade balance, USD	9. Number of deaths due to road accidents per 100,000 inhabitants, persons.	
10. Total public debt, % of GDP.		
11. Energy intensity of GDP (the ratio of annual energy consumption to GDP)		
12. Share of waste recycling, %.		

3.2. Achievements and disadvantages of sustainable development in economy

Over the 20 years of Agenda XXI (from 1992 to 2012) implementing, especially the decade of the Strategic Orientation for Sustainable Development in Vietnam (from 2002 to 2012) (UNCSD, 2012) the country took advantage of opportunities, overcame many difficulties and got important achievements in economy. Economic indicators of sustainable development monitoring and evaluating are presented in Table 2.

Table following on the next page

Table 2: Economic indicators of sustainable development in Vietnam in 1992 - 2017

Indicator	1992	2002	2012	2013	2014	2015	2016	2017
GDP, \$ billion	9.87	35.06	155.57	170.57	185.90	191.45	201.31	220.41

Total government debt,% of GDP	-	-	48.4	51.8	55.0	57.0	59.8	58.2
GDP per unit of energy consumption, \$ per kg of oil equivalent	-	-	7.41	7.94	-	-	-	-

Sources: www.gso.gov.vn. www.worldbank.org, knoema.ru

According to the data of Table 1, it can be revealed that the Vietnamese economy demonstrates positive trends. For 25 years, its scale has increased by 22 times. From 1992 to 2017, Vietnam's GDP grew from \$ 9.87 billion to \$ 220.41 billion.

As shown in Figure 1, GDP growth was continuous and well modeled by a linear function. The main reason for the decline in GDP growth in 2016 was the decline in agriculture due to natural disasters and difficulties in the mining industry. However, considering the development of the economy as a whole, allows saying that Vietnam has a high economic growth, constantly exceeding 5% which is an important sign of sustainable economic development. Growth of the economy is understood as the basic condition for the transforming Vietnam into a new Asian tiger. Vietnam's economy is ranked 6th in the Association of Southeast Asian Nations (ASEAN).

Figure 1: GDP of Vietnam in 2002 - 2017, \$ billion

The growth of Vietnamese economy was based on its structural change towards industrialization and modernization. In accordance with Table 1, these changes occurred progressively. The share of industry and services in GDP increased from 66.06% in 1992 to 84.66% in 2017, the share of agriculture decreased correspondingly by 18.6%. Separately, shares of industry and services exceed the share of agriculture, which is also a sign of sustainable economic development. The structure of the economy changed towards openness and integration into the global economy. In the period 2012 - 2017 Vietnam has achieved great success in foreign trade. In 2012, for the first time in the history of the Vietnamese economy, the trade balance became positive. According to General Statistic Office of Vietnam, the share of exports in GDP increased from 73.8% in 2012 to 83.8% in 2017, the average export growth rate was very high and constituted 14.6%. Many Vietnamese products, such as rice, rubber, shoes, seafood, showed high competitiveness in the global market. Increase of share of exports in GDP is the manifestation of the openness. Vietnam has achieved significant results in calling in foreign investment. Over 6 years, foreign direct investment (FDI) and official funding for development purposes have increased. During the 27 years period from 1991 to 2017, FDI constituted 22–25% total investments and total investment capital amounted to about \$ 161 billion. Calling in foreign investment has created new opportunities for economic development, in particular, the development of the country's infrastructure. Vietnamese investment abroad also started as rather small. Vietnamese enterprises have launched a number of investment projects, for example, a rubber plantation project in Laos, the development of telecommunications systems (Viettel) in Africa and Latin America, and a milk processing plant of the TN company in the Russian Federation. The very fact of investing abroad can be considered as a development compared to the previous period. From 2012 to 2016, the percentage of spending on education and R & D in government spending increased from

12.99% to 14.38% and from 0.6% to 0.77%, correspondingly. Though the share of spending on education and R & D in total government spending is not large, its growth creates incentives for economic development. Despite Vietnam's economy has achieved success in sustainable development, there are some drawbacks. Vietnam has high rates of GDP growth and per capita income but the size of economy remains small. By data of the World Bank, Vietnam's GDP in 2017 was only 31% of Indonesia's GDP. From 1992 to 2017, per capita income in Vietnam grew 17 times but it remains the lowest in the group of new Asian tigers (Malaysia, Indonesia, Thailand, Philippines). During the period from 2012 to 2017, the process of Vietnamese economy's restructuring was slow and structural disadvantages still saved. From 2012 to 2017, the share of agriculture in GDP decreased by only 3.88%, and the share of services increased by 3.76%. The share of agriculture never declined below 15%. The slow restructuring of the Vietnamese economy is the main obstacle for sustainable economic development. Vietnam is currently facing the "growth trap" problem: although the economy was growing very fast, the signs of instability take place. In the report of the Ministry of Finance published in January 2018, it was announced that Vietnam's public debt has been growing very fast, its average growth rate over the past five years equals to 18.4%, that is three times higher than the economic growth rate. The public debt of Vietnam in 2017 reached 58% of GDP. The growth rate of this indicator is the highest in the group of new Asian tigers, from 2012 to 2017 it increased by 10%. The main reasons for Vietnam's public debt growth are an increase in the state budget deficit and low investment efficiency. Foreign investment in Vietnam has played an important role in increasing production and exports. The presence of companies based on FDI creates motivation to increase the competitiveness of domestic companies. However, in addition to the positive effects of FDI, it should be noted that they also create negative consequences, such as environmental pollution and the use of outdated technologies.

3.3. Achievements and disadvantages of sustainable development in social sphere

In the triad of sustainable development, the economy plays an important role, since it "earns" for the social development and the maintenance of ecology. An analysis of the social indicators of monitoring and evaluating sustainable development (Table 3) allowed revealing an imbalance in the Vietnam sustainable development triad. For 25 years, Vietnam has received positive results in social development. The human development index increased continuously from 0.496 to 0.694, which brought Vietnam into the group of countries with a middle level of human development. Vietnam ranked 116 of 189 countries on the human development index, sharing this rank with Indonesia. From 1990 to 2017, according to (UNDP, 2018), the index of human development increased by 46.1%, life expectancy at birth increased by 6.0 years, the average period of study increased by 4.3 years, and the expected period of study increased by 4.9 years. Within the same period Vietnam's GNI per capita increased by about 324.9 % (UNDP, 2018). Increased level of human development results from the growth of the Vietnamese economy. The development of the national economy has created favorable conditions for the development of society.

Table following on the next page

Table 3: Social indicators of sustainable development in Vietnam in 1992 - 2017

Indicator	1992	2002	2012	2013	2014	2015	2016	2017
Human Development Index	0.496	0.595	0.67	0.675	0.678	0.684	0.689	0.694
Rank on human development index	102/160	109/13	-	127/186	121/18	116/188	115/188	116/189
Poverty level,%	58.1	28.9	17.2	-	13.5	-	9.8	-
Unemployment level, %	11	6.01	2.7	2.8	2.1	2.3	2.3	2.2
Gini coefficient	35.70	37	35.60	-	34.80	-	-	-
Share of highly skilled labor, %	-	-	16.6	17.9	18.2	19.9	20.6	21.4
Sex ratio at birth	1.06	1.068	1.12	1.115	1.111	1.106	1.102	1.097
Number of Internet users (million persons)	-	1.5	31.2	40.1	44.6	47.4	49.06	53.9
Number of deaths from road accidents per 100,000 inhabitants	-	-	-	-	-	24	-	-

Sources: knoema.ru, data.trendeconomy.ru

The growth of the economy in Vietnam is related with the reduction of poverty and the solution to the unemployment problem. The poverty rate decreased from 58.2% in 1992 to 9.8% in 2016. The unemployment rate decreased from 11% to 2.2%. Reducing unemployment proves that the government of the country is making great and successful efforts to solve the problem of employment. The growth of the Vietnamese economy is also related with progress in social protection and social justice. In July 2018, the number of persons participating in mandatory social insurance amounted to 13.94 million; voluntary social insurance covered 230 thousand people; unemployment insurance – 11.89 million people; health insurance – 81.69 million people. The share of the population provided by health insurance was equal to 87.2%. In 2017, the share of population having Internet access equaled to 53% and Vietnam ranked 12th in the number of Internet users in the world. Thus, the quality of life gradually improves. Along with advances in the fight against poverty and unemployment, Vietnam still faces a large gap between the rich and the poor. The Gini index in 2014 was 34.8. Although the share of skilled labor increased from 16.6% in 2012 to 21.4% in 2017, this level, as well as the competitiveness of market participants, remained low compared to other countries in the region. Gender imbalance impeded the distribution of labor and the implementation of demographic policies. The number of deaths from road accidents is big. According to the report of the National Committee for Road Safety, in 2017, 2,080 road accidents occurred throughout the country, resulting in 8,279 deaths and 17,040 injured.

3.4. Achievements and disadvantages of sustainable development in ecology

In Vietnam, environmental awareness and regulatory framework for environmental protection are gradually being created. A large amount of resources was mobilized to build a clean water supply for 76% of the urban population. The proportion of municipal solid waste collection increased from 60–70% in 2003 to 80-82% in 2013. The share of collected and treated solid waste in hospitals equals to 80% (Tri Ngo Dang, Y Tran Van, Chi Tran Thuy, Tuan Nguyen Thanh, 2018). From 1992 to 2017, the share of forest land increased from 28% to 41.45%.

These achievements in the environmental protection show that the Vietnamese government pays attention to ecology as an element of the of sustainable development triad. Developing the national economy, Vietnam faces variety of environmental problems. Rapid economic growth resulted in the shortage of non-renewable resources. Intensive exploitation and wasteful use of natural resources leads to environmental degradation. Rapid urbanization leads to over-exploitation of groundwater, pollution of surface water and air. The lack of environment management system and of civil servants experienced in environmental management can be considered the cause of the economic growth's negative impact on the environment. At the end of the XX, environmentalists began to assess the human consumption of earthly reserves. The conclusion turned out to be disappointing: from year to year mankind used to get into debt, spending the resources of the next year. The Ecological Debt Day, further named as Earth Overshoot Day, is defined by the Global Footprint Network (GFN) research organization as the day when the amount of resources used exceeds the amount that the Earth is able to recover in a year. Similar dates are calculated for the particular countries. It should be noted that in 2018, Overshoot Day in Vietnam came on December 21 and was the latest among the countries analyzed by GFN.

4. CONCLUSIONS

The concept of sustainable development in Vietnam is an officially adopted doctrine, correspondently to which development of the country has been managed since 1992. Vietnam has created a system of legal instruments on sustainable development. To monitor and evaluate sustainable development, a system of indicators is used, consistent with those used by the UN, and including indicators that take into account the specifics of the country. Practical use of this system in full requires changes in the statistical accounting system. After twenty years of implementation of the concept of sustainable development (1992-2012), determined by official documents, Vietnam got outstanding achievements in economic growth. Vietnam has moved from a group of poor countries to a group of middle-income countries. In the following six years, despite certain successes some shortcomings remained in Vietnam's economy and the problem of "growth trap" has arisen. Economic development created conditions for social development and the strengthening of environmental protection. Low competitiveness of market participants, gender imbalance, income gap between the rich and the poor became constraining factors for sustainable development. As a result, together with the growth of the economy in 25 years, Vietnam received achievements in the development of the social sphere. The most striking achievements are the low level of unemployment and a wide coverage of the population with insurance services - health and loss of job insurance. As the result of rapid economic growth Vietnam faces the shortage of non-renewable resources, but from the standpoint of ecological footprint the situation in the country is much better than in the most countries of the world. The country has taken successful measures to restore the forest and prevent pollution by solid waste. These facts may be considered as the positive result of sustainable development of the country. Implementing the sustainable development strategy in Vietnam, it is necessary to observe the principle of dynamic balance of elements of the sustainable development triad "economy - society - ecology". Thus, the prospective task of sustainable development in Vietnam becomes further development of the economy, within constraints caused by the requirements for non-deterioration of the environment and for the priority social development. Such a nature of economic development can be achieved on the basis of the following:

1. rational agriculture, aimed at the production of organic food for the population of the country and export products that are in demand in the world market, where prices for organic products tend to increase;
2. introducing "clean" industrial technologies, controlling emissions of harmful substances

and air, land and water pollution; defining rational boundaries for the development of industries that consume non-renewable and slowly renewable natural resources; conducting research and development, the development of new technologies and the creation of jobs in high-tech industries;

3. expanding and maintaining the diversity of opportunities for access to education, intellectual and creative development for the population, including those living in rural areas; promotion and promotion of rational consumption and healthy lifestyle.

BENEFITS AND FAILURES OF ELECTRONIC SYSTEMS OF PAYMENT

Sinisa Franjic

sinisa.franjic@gmail.com

ABSTRACT

The development of modern information technology has also enabled the development of electronic payment systems. Economic entities have quickly accepted and implemented it in their business because electronic payment systems are not too demanding in the technological sense and allow business transactions to be realized in just a few seconds. Further development of business through the Internet has developed, but is still developing, a new discipline within the economy as a science called the digital economy. Likewise, the development of modern information technology is accompanied by negative side effects, criminal offenses in the field of computer crime.

Keywords: *Information technology, Digital economy, Electronic commerce, Computer criminality*

1. INTRODUCTION

Electronic payment systems keep the contours of the classical cash transactions, leaving the same idea of using credit card numbers, checks and money, but they are used in a completely different way that is dictated by the specificities of electronic communications (Šimović et al., 1999.). Each system has a somewhat different application and has its own specifics, advantages and disadvantages. It is therefore necessary to know these systems in order to prevent this form of computer crime more effectively. The discovery of a perpetrated computer offense would be considerably more difficult because it does not leave any material traces, and besides, the perpetration of such a delinquency can be considerably larger than property delicacies committed in classical ways. With the development of modern information technologies, especially computer networks, the great advantage of automating cash transactions has been noted. Instead of traveling to another continent for buying a book, this process can now be done electronically via computer networks. In the same way, you can transact between two remote banks in just a few seconds. But without the protection of money transactions and the use of special communication protocols, there is a great possibility of misuse. It must be borne in mind that perpetrators of all incidents of computer crime are persons who possess much more knowledge and intellectual abilities than perpetrators of other criminal offenses. They can intercept communications of money transactions in terms of the way they go to the data they can handle the most varied manipulations. These can be the numbers of credit cards, bank accounts, large business cash, and all other bank secrets that are currently circulating in computer networks. For these reasons, the need to protect electronic money transactions has arisen with the introduction of special communication techniques and protocols.

2. DIGITAL ECONOMY

The Internet today represents a unique model of electronic communications because there is no similar model that could be characterized by such geographic coverage. From a technical point of view, the most important feature of the internet is the extremely fast connectivity capability that allows contact with the other side in just a few seconds. For this characteristic, one can freely say that it represents a set of business opportunities that should be adapted by economic operators to be more successful in the market. Contemporary society is an information society. The new techno-economic paradigm of information-communication technologies is based on cheap information input, obtained through microelectronics and telecommunications

technology: information becomes raw material (Ćosić et al., 2012.). While the earlier information (knowledge) has been involved in the development of technology, today and technologies are involved in information - information technology products represent information processing devices, ie information that processes itself. In addition to being the most significant resource in the information society, information becomes the most important product. Innovations in the field of information-communication technologies were key to the rise of a networked economy. The most important structural effect of the influence of information-communication technologies is network or networked society. Networking at a global level has allowed access to new markets and consumers, and increased profitability of multinational and transnational corporations. The earliest and most direct users of global networks were the ones who underlined the restructuring - financial institutions and corporations in the field of state-of-the-art technology. Information networking technology has experienced a quantum leap through the development of the international infrastructure of public computer networks, which has enabled the expansion of the effective range of the market and the emergence of a digital economy. The Digital Networked Economy is a "natural" environment for a new form of money and banking. Some companies have learned much earlier about the possibilities of using the Internet for the purpose of changing business patterns and exploring the possibilities of buying and selling online (Babić et al., 2011.). Such attempts were, however, limited and of local character, except in the case of genuine innovators and leaders of electronic business, which soon became the most obvious examples of the development of new business models. Web sites become much more intuitive by nature, creating a collaboration and communication platform that largely exceeds the one-way flow of information. At the center of corporate thinking, faster and cheaper communications with end-users are offered, offering special forms for ordering products, initiating business events electronically. The use of the site becomes easier, the methods of navigation and search of data are more advanced, and companies connect with customers, partners and suppliers. Intuitive business applications are expanding rapidly to complement traditional and promote additional electronic business channels. Applying advanced web tools and techniques irreversibly changes the relatively "primitive" electronic commerce web pages, and influences the development of new sales channels and expanding end-user relationships. The term e-commerce becomes a synonym for purchasing and selling processes via the Internet, which eliminates the time and physical barriers to business that exists in the traditional trading system.

3. DATABASES

The database consists of a series of data tailored to the needs of users used to obtain information. The databases we know today have had a huge impact on the development of modern IT technology. Modern IT technology has brought a number of advantages to organizing business, and most important of these are ease of use and low price of equipment. Modernly organized databases can also mean the advantage ahead of competition, which is the desire of almost every business entity. Database research and management systems are the basis for the study of information systems.

4. COMPUTER NETWORKING

Networking is a procedure that aims to provide better functionality not only for economic but also for non-business entities. The availability and flexibility of today's modern computer networks technology allows you to connect to any network on the planet from any point on the planet and get the information you want (Milosavljević et al., 2009.). Compared to the former use of network services, the prices of exploiting today's networks are lower. Computer networks are today an irreplaceable part of the business infrastructure, both small and large organizations. Knowing the technology and using the network is not just a matter of general culture.

In many segments of business, the application of computer networks can provide an advantage to organizations in the market (for example, electronic commerce enables small firms to compete on the market). The computer network is basically a set of two or more computers that are connected to a connection medium and can communicate with each other and share resources. It is used for transferring both digital and analog data, which must be adapted to appropriate transmission systems. Computer data, speech, pictures, videos can be transferred to the network, and applications on the user's side may be such as to require data transfer in real time (speech, video, etc.) or this does not have to be a condition (electronic mail, file transfer). The network consists of computers, transmission media (wires, fiber optics, air) and devices such as nodes, hubs, routers, etc. that make up the network infrastructure. Some devices, such as network cards, serve as a connection between computers and the network.

5. ELECTRONIC TRADE

A large number of Internet applications in developed electronic commerce terms are related to financial transactions - the payment of own debts and financial liabilities to creditors and the payment of receivables from their debtors (Panian, 2000.). They are very delicate and serious internet applications and operations where any mistakes are difficult to rectify, so they pay close attention in practice and work intensively on their promotion, primarily in the security sense.

The emergence of e-commerce represents a real revolution in business, not just the unprecedented superordinate technological basis based on modern telecommunications, computing, information technologies and cryptology (Milosavljević et al., 2016.). Before the age of e-commerce marketing and sales of products relied on massive unmerited marketing and workforce and input of immediate sellers. Consumers are perceived as passive targets of advertising campaigns that change the long-term customer relationship towards the given product and currently affect their buying habits. The consumer was captured by geographic and social barriers, limited to narrow local loops in search of the best price-quality relationship. Information on prices, costs and taxes could be hidden from the buyers, enabling the formation of profitable so-called.

Asymmetry information in favor of sales organizations. In this way, information asymmetry will imply any disparity in the relevant market information provided by the participants in a transaction. Looking forward, the potential for electronic commerce to gain a sizeable share of consumer and business purchases appears to be large, although it is difficult to quantify (Yun, 2005.). The developments in communications infrastructure, digital networks, and graphic-based Internet applications have made and will continue to make transmission of information much faster, cheaper, and simpler. With further technological improvements, communication shall become much more reliable and thus more applicants shall be attracted to this splendid field. This shall inevitably increase productivity and efficiency in a number of industries and businesses. Increased productivity will theoretically yield higher profit margins and a more stable economic system. Accordingly, commercial use of the Internet, more specifically, electronic commerce, should have a magnificent future.

6. TYPES OF ELECTRONIC TRADE

A lot of scientific papers have been written about the types of electronic commerce and they are not unknown. Therefore, we will not specifically describe them in detail, but we will just list them most often. These are:

1. B2C (Business to Consumer)
2. B2B (Business to Business)
3. C2C (Consumer to Consumer)
4. P2P (Peer to Peer)

5. M-Shop
6. Social networking
7. Local e-commerce

7. BUSINESS OPERATIONS

Foreign trade is a very important item in the balance of each company. Today, foreign operations can be considered as imperative. International business is exciting because it combines the science and the art of business with many other disciplines, such as economics, anthropology, geography, history, language, jurisprudence, statistics, and demography (Czinkota et al., 2011.). International business is important and necessary because economic isolationism has become impossible. Failure to become a part of the global market assures a nation of declining economic influence and a deteriorating standard of living for its citizens. Successful participation in international business, however, holds the promise of improved quality of life and a better society, even leading, some believe, to a more peaceful world.

8. COCLUDING THE CONTRACT WITH THE FOREIGN PARTNER

The foregoing has presented the legal principles relating to offer and acceptance in line with the 'classical model' of contract (Kelly et al., 2002.). As has been stated, underlying that model is the operation of the market in which individuals freely negotiate the terms on which they are to be bound. The offeror sets out terms to which he is willing to be bound and, if the offeree accepts those terms, then a contract is formed. If, however, the offeree alters the terms, then the parties reverse their roles: the former offeree now becomes the offeror and the former offeror becomes the offeree, able to accept or reject the new terms as he chooses. This process of role reversal continues until an agreement is reached or the parties decide that there are no grounds on which they can form an agreement. Thus, the classical model of contract insists that there must be a correspondence of offer and acceptance, and that any failure to match acceptance to offer will not result in a binding contract. Technical regulations setting standards for product design and performance can vary widely from country to country (Schaffer et al., 2009.). This might include safety standards for foods, pharmaceuticals, automobiles, toys, and consumer goods; flammability standards for children's clothing; fire and electrical codes; health codes; environmental standards; and rules for packaging or labeling products. Obviously, these issues are more important in international trade, where the standards are far less uniform, than in domestic commerce.

9. DIGITAL SIGNATURE

Legislation providing for electronic signatures has, essentially, been directed to provide for the authenticity of the person using the signature, although various statutes provide for additional uses, such as providing for the integrity of a message or document (Mason, 2016.). Authentication can be the process by which a person or legal entity seeks to verify the validity or genuineness of a particular piece of information. Alternatively, it can mean the formal assertion of validity, such as the signing of a certificate: we authenticate what it certifies. In certain circumstances, there may also be a need to verify the identity of an individual or legal entity, although what is meant by 'identity' will also depend on the reason for ascertaining the identity. With a cheque, the signature serves to link the name of the person printed on the cheque with the person that claims to have the authority to draw money from the account indicated on the cheque. The existence of the cheque guarantee card with a manuscript signature on the reverse serves to reinforce the link between the card and the cheque, although the signature, even if the signature on the reverse of the cheque guarantee card matches the signature on the cheque, does not necessarily identify the person signing, even if the signature on the reverse of the cheque guarantee card matches the signature on the cheque, does not necessarily identify

the person signing the cheque. In cheque cases, the printed name on a cheque is not necessarily accepted as a form of signature, although it can contribute to authenticity.

10. INFORMATIC TECHNOLOGY AND COMPUTER CRIMINALITY

In more modern times, the creation of the World Wide Web has proved to be something of a miracle (Bradley, 2006.). In one decade it has transformed the way people work, study, shop, and play, and within a generation it has changed the way people interact. It has created entire business models, new streams of revenue, and new fields of employment. The Web has made almost every piece of information you could possibly want available at the click of a button. While the printing press made it possible to mass-produce written works so they could be shared with everyone rather than only an elite few, the Web took the notion a quantum leap farther so that almost every thought that has ever been written can be retrieved in the blink of an eye. In short, the World Wide Web has changed the world. It has created new ways to conduct financial transactions, conduct research, hold an auction, and shop for a car. However, with the advent of the Web and its conveniences, a new type of crime has also emerged: cybercrime. Global computer networks have created opportunities for new forms of crime (Porobić et al., 2012.). There is a "special, sophisticated, penetrating, technically controversial, unscrupulous, obsessed, sometimes vindictive individual to whom it is difficult to stand up and even more difficult to stop". He often does not want to be alone, but he needs society as much as he needs "audience." The ease of "doing" with the cyber space gives him a sense of power and elusiveness. These feelings are without reason, because it is really difficult to find it at the moment of the act, which is, in essence, a "real" moment for its identification and capture. On the other hand, the Internet that is so vulnerable and insecure due to the huge number of users, openness and unregulated is the ideal hiding place for criminals of different types. In such an environment and with such individuals, more and more attempts are being made not only by many national law, international organizations and associations, but it also includes "private sector" and users to mitigate the negative consequences and reduce the losses caused by criminal activities. It's hard to find a facet of modern life that does not involve a computer system, at least on some level (Easttom, 2012.). Online purchases, debit cards, and automatic bill pay are standard parts of modern life. Some retailers are using computerized automatic checkout. It is even likely that you have taken a class online, and you may even be using this textbook for a class you are currently taking online. Because so much of our business is transacted online, a great deal of personal information is stored in computers. Medical records, tax records, school records, and more are all stored in computer data-bases. This leads to some very important questions:

1. How is information safeguarded?
2. What are the vulnerabilities to these systems?
3. What steps are taken to ensure that these systems and data are safe?

The timely patching of security issues is generally recognized to be critical in maintaining the operational availability, confidentiality, and integrity of the information infrastructure (Wu et al., 2013.). However, failure to keep both the operating system and application software patched is one of the most common issues identified by security and IT professionals. New patches are released daily, and it is often difficult for even experienced system administrators to keep abreast of all the new patches and ensure their proper deployment in a timely manner. Major attacks in the past few years have targeted known vulnerabilities for which patches existed before the outbreaks. Indeed, the moment a patch is released, attackers make a concerted effort to quickly reverse engineer, in days or even hours, the patch, identify the vulnerability and develop and release an exploit code. Thus, the time immediately after the release of a patch is ironically a particularly vulnerable moment for most organizations due to the time lag in

obtaining, testing, and deploying a patch. The most important European legal source for combating computer crime is the Convention on Cybercrime. According to the Convention, and according to Recommendation R (89) of the Council of Europe, the minimum catalog of computer offenses that should contain national legislation includes the following criminal offenses: computer fraud, counterfeiting of computer data, computer data or software damage, computer sabotage, unauthorized access, unauthorized reproduction of protected computer programs, unauthorized reproduction of computer fundamentals (Pavišić et al., 2012.). In addition to the above-mentioned forms of criminal offenses deemed to be included in national legislation, a non-mandatory, optional list of voters, including computer data or programs, computer espionage, unauthorized use of the computer and unauthorized use of protected computer programs, is also compiled.

11. FINANCIAL TRANSACTIONS AND COMPUTER SECURITY

Many transactions are now effected electronically (Bainbridge, 2008.). For example, by the use of automated teller machines (ATMs or cash point dispensers outside banks) and electronic fund transfers (EFTs) transactions are made between financial institutions and at the point of sale. Most organisations now exchange data electronically. For example, a large manufacturing company may order components automatically and electronically from its suppliers when stock levels reach a predetermined lower limit. Electronic data interchange (EDI) has the potential to maximise efficiency by reducing repetition and delays, increasing accuracy and permitting the maintenance of minimum stock levels by placing orders for 'just-in-time' delivery. A large proportion of the information flowing between organisations may be handled electronically, including quoting or submitting tenders for work, ordering, scheduling, invoicing and accounting. Traditionally, security has been defined as a process to prevent unauthorized access, use, alteration, theft, or physical damage to an object through maintaining high confidentiality and integrity of information about the object and making information about the object available whenever needed (Kizza, 2009.).

However, there is a common fallacy, taken for granted by many, that a perfect state of security can be achieved; they are wrong. There is nothing like a secure state of any object, tangible or not, because no such object can ever be in a perfectly secure state and still be useful. An object is secure if the process can maintain its highest intrinsic value. Since the intrinsic value of an object depends on a number of factors, both internal and external to the object during a given time frame, an object is secure if the object assumes its maximum intrinsic value under all possible conditions. The process of security, therefore, strives to maintain the maximum intrinsic value of the object at all times. While the benefits of the Internet and other forms of computer networks are streamlining financial institutions, the same institutions are often among the first institutions to be affected by Cybercrime and Cybersecurity issues due to the financial incentives as well as their strategic place in each nation's infrastructure and economy (Reich, 2008.). We must look not only at the efficiency, but also at the negative aspects of the use of technology by financial institutions. Consumers as well as businesses must be well informed about conducting transactions in the safest manner possible. The nature of the Internet is cross-border, and thus Cybercrime and Internet Security issues involving financial institutions should be made known by international organizations, regional organizations, and when there have been cross-border law enforcement collaborations in investigations, extraditions, and so forth. At present, due to the fact that law is generally written at the national (or even state level, as is the case of Identity Theft law in the U.S.), there is a need for reporting of cross-border cases in the literature if such data can be obtained from law enforcement officials by scholars.

12. CONCLUSION

The development of modern information technology has brought a number of advantages to economic entities, and they quickly adapted to emerging market conditions. Online business enabled faster and cheaper communication between parties, which are very important items in the business of every business entity. The new way of doing business is all satisfied, so new science disciplines emerged in the field of economics - the digital economy. On the other hand, the development of modern information technology has brought a series of socially unacceptable behaviors that need to be adequately sanctioned. The consequences of damage caused by computer crime can be so great that they can destroy the business of an economic entity. In order to prevent potential computer offenses, computers and computer systems need to be well-known. In addition, it is necessary to invest constantly in the security of computers and computer systems, as business transactions can only be safely done without the adverse impact of all possible forms of computer criminality.

TERMS OF POST-SECONDARY EDUCATION MANAGEMENT

Mammadov Mammad

Azerbaijan State University of Economics (UNEC)

mhmammadov@gmail.com

ABSTRACT

Modern know-how is currently being transformed into a crucial factor in economic growth and competitiveness of our country. The country's economic leadership can only be achieved on the basis of modern technology and the most advanced technology in public production. The important factor of socio-economic development in modern Azerbaijan is the constant renewal and modernization of knowledge. Generation of knowledge, the main means of their collection and transmission is education, especially higher education and post-secondary education. The modern stage of development and management of education is characterized by the globalization and institutionalization of economic relations. Particular attention should be paid to the co-operation of enterprises in establishing a single educational space within the intensification of relations in the educational process. Thus, in contrast to economic entities entering into competition with each other for the consumer, it is necessary to achieve the cooperation of educational institutions, especially the higher education institutions. This, in its turn, will lead to the availability of "hands-on" solutions for all services provided by the education system and increase the quality of education. Higher education, especially after the postgraduate education, is characterized by the transition from the training of highly qualified personnel to the formation of human personality. This requires the preparation and implementation of a new educational paradigm that focuses on the formation of education, and in particular, the post-graduate education. Post-graduate vocational education is the next stage in vocational training, which enables citizens to raise their education, science and professional level on the basis of higher vocational education. Such education can be acquired at the doctoral, philatelic, adjuncture and doctoral studies of the relevant specialties created at the Higher Vocational Education Institutions and Research Institutions. Traditionally, philosophy and doctoral studies include the fourth and fifth levels of vocational education. In fact, however, the job is more complicated. Thus, in the development of the Law of Azerbaijan Republic "On Education", this stage of professional education was defined as a special area of postgraduate education. In our opinion, it would be better for this stage of education to be called "scientific education". Post-graduate professional (vocational) education realizes programs designed to train highly qualified scientific and scientific-pedagogical cadres - philosophy and doctors of sciences. Preparation of scientific and scientific-pedagogical cadres is carried out in the form of doctoral studies, dissertations, thesis of philosophy and science. Scientific and scientific-pedagogical staff training and attestation system operates in Azerbaijan. PhD degree in scientific specialties is awarded on dissertation boards as a result of open dissertation defense of researchers having higher or higher education and approved by the Supreme Attestation Commission under the President of the Republic of Azerbaijan. the name of the doctor of sciences is issued by the Higher Attestation Commission of the President of the Republic of Azerbaijan on the basis of the presentation of the specialized dissertation councils after the dissertation defense of the researcher. The main form of training of scientific-pedagogical and scientific cadres, as well as education, science and pedagogical specialties on the basis of higher vocational education, is a doctorate in scientific specialties. The preparation of philosophical doctors is carried out in accordance with the current nomenclature of scientific worker specialties for the fields of science and scientific specialties.

Keywords: *higher education, dissertation, doctorate post-graduate education, post-graduate studies*

1. INTRODUCTION

In the contemporary world, as in the leading world countries, great attention is paid to the development of education in Azerbaijan. The slogan "Education is the future of the people" by nationwide leader Heydar Aliyev today will remain very actual and up-to-date. Modern know-how that are currently being transformed into a crucial factor in economic growth and competitiveness of our country. The country's economic leadership can only be made on the basis of modern technology and the most advanced technology in public production. The important factor of socio-economic development in modern Azerbaijan is the constant renewal and modernization of knowledge. Generation of knowledge, the main means of their collection and transmission is education, especially higher education and post-secondary education. The modern stage of development and management of education is characterized by the globalization and institutionalization of economic relations. Particular attention should be paid to the co-operation of enterprises in establishing a single educational space within the intensification of relations in the educational process. Thus, in contrast to economic entities entering into competition with each other for the consumer, it is necessary to achieve the cooperation of educational institutions, especially the higher education institutions. This, in its turn, will lead to the availability of "hands-on" services for all services provided by the education system and increase the quality of education.

2. CHAPTER 2

Higher education, especially after the postgraduate education, is characterized by the transition from the training of highly qualified personnel to the formation of human personality. This requires the preparation and implementation of a new educational paradigm that focuses on the formation of education, and in particular, the post-graduate education. Post-graduate vocational education is the next stage in vocational training, which enables citizens to raise their education, science and professional level on the basis of higher vocational education. Such education can be acquired at the doctoral, philatelic, adjuncture and doctoral studies of the relevant specialties created at the Higher Vocational Education Institutions and Research Institutions. Traditionally, philosophy and doctoral studies include the fourth and fifth levels of vocational education. In fact, however, the job is more complicated. Thus, in the development of the Law of Azerbaijan Republic "On Education", this stage of professional education was defined as a special area of postgraduate education. In our opinion, it would be better for this stage of education to be called "scientific education". Post-graduate professional (vocational) education realizes programs designed to train highly qualified scientific and scientific-pedagogical cadres - philosophy and doctors of sciences. Preparation of scientific and scientific-pedagogical cadres is carried out in the form of doctoral studies, dissertations, thesis of philosophy and science. Scientific and scientific-pedagogical staff training and attestation system operates in Azerbaijan. PhD degree in scientific specialties is awarded on dissertation boards as a result of open dissertation defense of researchers having higher or higher education and approved by the Supreme Attestation Commission under the President of the Republic of Azerbaijan. the name of the doctor of sciences is issued by the Higher Attestation Commission of the President of the Republic of Azerbaijan on the basis of the presentation of the specialized dissertation councils after the dissertation defense of the researcher. The main form of training of scientific-pedagogical and scientific cadres, as well as education, science and pedagogical specialties on the basis of higher vocational education, is a doctorate in scientific specialties. The preparation of philosophical doctors is carried out in accordance with the current nomenclature of scientific worker specialties for the fields of science and scientific specialties. Today the Higher Attestation Commission under the President of the Republic of Azerbaijan has approved the nomenclature of scientific worker qualifications.

As an example, it is possible to show the nomenclature of scientific worker specialties on economics as 08.00.00:

- 08.00.01-Economic theory
- 08.00.05-Economy and management of the national economy (macroeconomics)
- 08.00.05-Finance, money circulation and credit

At present, the Commission for Higher Attestation under the President of the Republic of Azerbaijan is preparing a draft of the new nomenclature of scientific worker specialties.

3. CHAPTER 3

The educational science at the doctoral candidacy is carried out in the form of visual and correspondence forms. The doctorate should have three full-time education, and the correspondence education should not exceed four years. Education in doctoral studies is usually carried out under the guidance of a doctor of sciences, professor. The form of certification of scientific personnel is the official confirmation of the scientific specialties of the specialists, the award of scientific degrees and scientific titles. The date of granting scientific degrees coincides with the period of the first Western European Universities (12th-13th centuries). The scientific degrees and names in the Republic of Azerbaijan are issued in accordance with the relevant regulations. Granting of scientific degrees is carried out at the dissertation councils created at higher educational institutions and scientific-research institutes. The establishment of these councils is under the authority of the Supreme Attestation Commission under the President of the Republic of Azerbaijan. Scientific degrees of Doctor of Philosophy and Sciences are awarded on the specialty nomenclature of scientific workers. Scientific names are the expression of the official and scientific-social recognition of the services of the scientist, including the preparation of scientific workers, as well as the creation of educational and scientific literature. Scientific titles are also the names of a number of leading positions in higher education institutions (docent, professor) and scientific positions in scientific research institutes (eg, "scientific workers"). The status of "professor" (Latin-professor-teacher) at the high school was first defined at Oxford University in the sixteenth century. In a number of countries, professors of "Staff" (ordinar) and "non-state" (extraordinarily) professors have been established. "Associate Professor" (docent in Latin, docentis-learning) is given to persons who have one of the following minimum degrees. In the 19th century, many countries were given the task of "privat-docent" (receiving salaries from the teaching of students). One of the smaller titles of scientific names in countries that favored the French system of higher education was called "agreje" (1808). In Russia, the name "professor" begins to be introduced after the foundation of the Moscow University (1755). Until 1863 the name "associate professor" was equated to "adjunct professor". In 1863 the name "associate professor" was defined, and in 1884 the task of "privat-docent" was established. In Azerbaijan, the title "Associate Professor" and "Professor" began to be applied in 1919 with the establishment of the Baku State University. Associate Professor is the academic name given to teachers in the Higher Vocational Education Institutions. These names are given to doctors, philosophy doctors, or teachers at Higher Vocational Education institutions who have certain work experience, scientific works or specialties. Professor is the academic name given to teachers in the Higher Vocational Education Institutions. This name is given to doctors of science or to highly qualified teachers and researchers (philosophers who conduct independent training courses or philosophical doctors leading scientific research). Master (Master in Latin, Head, Head, Teacher), 1) An official in Ancient Rome; a little later, president of some secular and religious institutions in Europe; 2) Scientific degrees among bachelors and philosophers in many countries around the world. This name is given to those who have graduated from universities (or equivalent educational institutions) and who have completed the course (1-2 years), who make special

exams and defend the master's thesis. The name of the undergraduate degree is between a bachelor and a doctor of philosophy started to be given in Azerbaijan since in 1990. The system of attestation of scientific names in scientific institutions has been revised several times. Since 1986 he has been the head, leading, senior scientific worker, scientific and small scientific worker names in scientific establishments. Postgraduate studies (aspirate in Latin, try to get closer) became the main form of preparation of scientific and scientific-pedagogical cadres in professional education after higher vocational education. In Azerbaijan, postgraduate studies were organized in 1930 in higher education institutions and research institutes, and in 1934, defended candidate dissertations. Admission to the postgraduate study was carried out on a competitive basis after the relevant exams. All postgraduate students were admitted to the admission exams on history and philosophy, foreign language (English, German, French) and specialty (subject). Historical and philosophical sciences and foreign language candidates are exempt from admission exams. As a rule, they are admitted to a scientific degree only. Separating the graduate from one another, leaving the production (visual) and leaving the production (correspondence). The duration of study at the postgraduate study is three years, and four years in the interdisciplinary form. Post graduate students receive a scholarship. Postgraduate students report on the results of their scientific work at the department (lab, department) each year. When completing the postgraduate study, they must pass the examination (attestation) at the department (department or laboratory) and submit their dissertation to defense. Those who submit the dissertation work to the dissertation board established by the relevant scientific specialty have successfully completed the post graduate course. In the majority of foreign countries, post-graduate training is similarly carried out at special centers at universities, especially after the post-diploma education (graduate, licensor, and other). At the end of their education, they defend their research and receive a higher degree of academic degree (often a doctor). The doctorate is a part of the continuing education system in Azerbaijan, the highest stage of the scientific and scientific-pedagogical training process. He has been working in the former USSR since 1956. The doctorate is organized in the leading educational institutions, scientific institutions and organizations of the Higher Vocational Education System. PhD students are awarded PhD degree and those who have achieved great scientific achievements in the chosen field. Education in doctoral studies is 4 years. PhD students are given state scholarships. Return to scientific and scientific-pedagogical activity in enterprises and organizations sent by the graduates of the doctorate is legal. Admission to PhD The Higher Vocational Education is adopted on the basis of the opinion given by the relevant department at the scientific council of the enterprise or scientific organization to a detailed scientific report of the laboratory and a comprehensive review of the dissertation work. The scientific council also approves the duration of the dissertation work and the individual work plan of the doctorate.

4. CONCLUSION

To assist the doctor in conducting researches on the dissertation, a scientific consultant is assigned to the organization where he / she is prepared. In case of necessity, leading experts from other institutions and organizations may be invited to consult a doctor. The doctoral candidate annually presents to the scientific council a report on the implementation of the individual work plan. On this basis, the attestation of a doctorate is made and a decision is made to continue his / her education. During his / her doctoral studies, the doctoral candidate must complete the dissertation work and submit it to defense, including the conduct of an initial examination. During the period of study at the doctorate, both philosophy and doctors of science should publish a number of articles in a number of prestigious media. These publications must meet the requirements set out by the Higher Attestation Commission near the President of the Republic of Azerbaijan.

Scientific works on the results of research on the dissertation by philosophers and doctors of sciences should be published in open media in the following names:

- monographs and textbooks;
- articles and theses in journals and collections of scientific works;
- theses and presentations in international, republican and regional scientific-practical conferences;

The main findings of scientific research on philosophy and doctors of sciences should be published in refereed journals included in the rector of the Higher Attestation Commission under the President of the Republic of Azerbaijan. The list of periodical scientific and scientific-technical editions recommended for publishing the main results of the dissertation for the PhD and Ph.D. in Azerbaijan does not remain unchanged, but is constantly renewed and enriched. This list is published in the Bulletin of the Higher Attestation Commission under the President of the Republic of Azerbaijan and is posted on the website of the Higher Attestation Commission. The criteria for selecting reseller journals are as follows:

- the publication should be scientific and resentful, in other words all the materials published should be carefully examined;
- the publication should be extremely well-known and accessible. As a general rule, it should be included in the Higher Attestation Commission's directory, published with a significant number of copies, and sent to the country's libraries;
- the publication must be approved and protected by the Higher Attestation Commission under the President of the Republic of Azerbaijan.

The circulation of the monograph published by the doctor should also meet certain requirements. Thus, the circulation of most monographs has a maximum of five hundred copies. We do not think it's satisfactory. Because the main purpose of the monographs is to introduce the author to the broader scientific community. Dissertation councils are established in higher educational institutions and scientific organizations recognized by the general public with their scientific achievements in the field of relevant science in accordance with the decision of the Higher Attestation Commission under the President of the Republic of Azerbaijan. Dissertation councils carry out their activity under the leadership of the Higher Attestation Commission under the President of the Republic of Azerbaijan. The commission, periodically reviewing the list of academic staff specialties, looks at the dissertation councils network and makes changes. Dissertation councils are responsible for the quality and objectivity of the examination of dissertations, as well as the perception of the decisions taken. At the same time, they must ensure that the dissertation work is in conformity with the requirements set out in the regulations on the granting of scientific degrees. Dissertation councils operate in publicity. His colleagues from the educational and scientific organizations are well informed about his meetings. During all his activities, the dissertation councils should help to create the most favorable conditions for researchers to defend their dissertations. The researcher should be allowed to get acquainted with all the materials related to the dissertation defense at the dissertation council and receive specialized assistance from the board's supervisor on matters relating to the defense of the dissertation. PhD students in philosophy and physics are the main forms of post-graduate education. Their main purpose is to develop scientific creativity of people who want to engage in scientific and pedagogical activity and prepare them for their scientific, pedagogical activity. The dissertation for the completed and defended dissertation can be submitted to the dissertation council on the relevant specialty for the final and open defense.

THE ANALYSES OF EMPLOYMENT AND SALARY IN AGRARIAN FIELD

Mirzabayeva Mehriban Samaddin

*Azerbaijan State University of Economics (UNEC),
researcher of department of the regulation of Economics
p.nazrin@mail.ru*

ABSTRACT

The adaptation of labor relations and its regulation acts as a component of state's economic policy. The purpose of the article is to have a glance at the formulation level of labor market in the republic, as well as, pay particular attention to the implementation of improvement of employment relating to the agrarian field, labor, labor sociology, investigation of scientific profile of labor relations are highlighted in the research paper of some economic scientists. The statistic indicators stipulating economic development of the Republic of Azerbaijan, labor market activities, as well as imprinted indicators are used in the article. Considering the social importance of the problem and rational management of labor market and its regulation, a lot of measures are implemented in this field. Being the leading force of economic development the formulation and regulation of labor market is a complex process as social, demographic, psychological factors influence to the labor market. That is why the economic scientists have a long dispute for the formulation of labor market. According to the western economic theory the labor market is considered as a place where only one of the production resources is realized. This conceptual task is envisaged from 4 angels and have their own peculiarities. The reforms carried out in the republic caused to the radical changes, and dynamic economic development is provided. Some measures are implemented particularly in the provision of economic development of regions, social well fare etc. New work places, institutions and infrastructures are created for the purpose providing the populations` employment

Keywords: *agrarian, agriculture, labor market, employment, income, salary, regulation*

1. INTRODUCTION

The following conceptions have special point of view to conceptual problems on labor market in theories of west economy. Classic view is the main of neoclassic approach of conception. It means that, as all markets, price equality is the main in labor market. Thus, the main regulator is the price of labor. Price of labor is defined by salary, demand to labor and offer. This case only occurs with existence of price equality, employment or carries voluntary character. In contrast to the neoclassic, Keynesian economists consider labor market as unstable environment. From their point of view salary (according to agreement) is unchangeable. Due to decreasing of regulation role of price in this conception, government should undertake regulation function. Thus, regulation of labor relations should be regulated by scope of production but not on the basis of price model. Monetarists approaches to cost of workforce from serious structural point of view. Using for "natural" unemployment understanding the monetarists consider that, government may increase unemployment with minimum level of wages. For this purpose, government should use monetary credit means in order to regulate labor market. For the opinion of Marxists the labor market is the special. It differs from other commodity markets that, cost which appeared from labor process is passed to product cost. For this purpose, the Marxists consider that, labor market has specific features along with complying general economic rules. So, as factor of production, it is also sold and reflects demand and offers, finally defined its market price. Activity of labor market is regulated under influence if numerous factors in real economic life. One of these factors is demographic phenomena, level of birth, growth of employed population, their gender structure and etc., but

the second is economic activity level of various ethnic groups. The third factor is migration of population. After forced movement of Azerbaijani from territories of Armenia and due to Armenian occupation problem in Garabagh and surrounding territories, officially 1 million refugees and IDP have in our Republic. These people forced changed their settlement and all of these facts reflected to labor market. The reforms executed in agrarian field is the one of the main reforms in the economy of the Republic of Azerbaijan. Codes about water, forest, land have been accepted into force in the Republic of Azerbaijan. Decreasing of poverty in the Republic of Azerbaijan and successful executing of important social-economic position in governmental programs for economic development are continued. Thus, low on employment has been improved and updated in the republic, labor right of each person confirmed in the Constitution of the Republic of Azerbaijan, steps directed to establishing of labor stocks, electron version of registration and recruiting of unemployed persons have been executed. Practice of states with regulation of labor market is learned and used their methods. One of the main directions of social- economic policy which implemented in the Republic of Azerbaijan is the development of labor market and productive use of workforce. Reforms implemented in the state caused substantial quality changes in economic field and provided dynamic economic development. Relevant events have been realized for ensuring of economic development of regions, social welfare and further improvement of living standards of population, in the field of economy and specially improvement of non- oil sector. For the purpose of ensuring labor ability of population, new work places, institutions, infrastructure objects and etc. have been established.

2. ANALYZING OF REAL SOCIAL-ECONOMIC SITUATION IN THE FIELD OF AGRICULTURE

Privatization of lands is started to realize. Peasant, farmer and other private agricultural fields have been established as the result of land reforms. Referring to indicators of 2017, we can consider that, 36,3 % of population are working in agrarian sphere.

Table 1: Development situation of agriculture in economy of Azerbaijan

	2010	2015	2017
Number of employed persons in Republic , thousand people	4329,1	4671,6	4822,1
Number of employed persons in agriculture, thousand people	1655	1698,4	1752,9
Institutions if agriculture	2043	1695	1735
State institutions in agriculture	217	180	189
Private institutions in agriculture	1533	1507	1523
Municipal property and joint ventures	-	8	23
Individual entrepreneurship	2618	1534	955
Area , thousand sq. km	86,6	86,6	86,6
Usable land areas in agriculture, thousand ha.	4766,8	4769,8	4777,5
Place of cultivation, thousand ha	842,7	1897,5	2054,7
Scope of manufactured product in agriculture , million manat	3877,7	5635,3	6580
Scope of income from sale in agriculture, thousand manat	188634,9	391801	504032
Average monthly nominal salary of persons dealing with agriculture	160,3	245,8	261,5

Source: <https://www.stat.gov.az/source/agriculture/>

Generally, reforms in the field of agriculture have been realized very fast relative to other CIS countries. This field is under control of private sector and state sector for 2017 consists of only 10,8%. In order to compare, we should consider that, after accepting of Land Code of the republic of Azerbaijan in 1993, 440 farmings have been established in 1994 and 4137 family members worked in these farmings. Peasant farming has developed in 2003 and their numbers reached to 25891. In 2004 the agricultural corporations in the republic covered 33.9 % of total corporations, 54,8 % of peoples which worked in this field, 33,0 % of scope of sold product (work or service). ("Statistical Indicators of Azerbaijan" Baku. 2018). Number of physical and legal persons belonging to private field of agriculture were more than 2500 in 2017. In 2010 people dealing with agriculture covered 38,2% of total employed people, but in 2015 this indicator was 36,3%. Problems in order to meet requirement of population of the republic to agricultural products have been eliminated gradually. However in this case, increasing of living standards of employed people was not compatible with increasing of number of agriculture. It is known that, living standards is the main indicator reflecting physiological, moral and social requirements of people and their living situation. Achieving high living standard is impossible without high income, special high salary. It needs to note that, average monthly salary may be considered low yet. Because in 1995 average monthly salary of person dealing with agriculture covered 33548 manats (for the purpose of comparison 1 USD was equal to 4465 manats and this salary was 7,5 USD), this result was 43957 manats (11,3 USD) in 1998. (1 USD=3862 manats). This was 3 times lower in 1995 than in industry and 6 times less in 1998. In 2017, the average monthly nominal fee for the agricultural worker was \$ 153.8 and in compare with the mining sector 11.7 times and 2.1 times lower in the processing industry. From other hand average monthly salary of people working in foreign and joint ventures are higher than people which working in agricultural field in the republic. If we refer to international experience, we will see that, 180 billion dollar of total national product in USA was in agricultural field in 1998 and importance part of this product has been manufactured in farms. 2% of employed population work in agricultural field. 10% of revenue from the US \$ (36 billion USD) was generated from agricultural products. In the achievement of all these quantities, the sovereignty of the economy is indefinable. Naturally, the economy has not come to such a level of development suddenly. From the beginnings of 70s, as the result of special care of USA government income of farmers were more than other non-farmers. For example, in 1985, the average national income per capital was 29066, while the average income of the farmer families was 29,436. Our purpose for giving example from economy of USA is providing solving of problems related to agricultural institutions.

3. DIRECTIONS ON INCREASING INCOME AND SOLVING EXISTING PROBLEMS IN AGRICULTURE

According to theory, income belonging to each of the above mentioned factors is equal to amount of this factors` presence at income obtained after sale of production. Such kind of division of income may be considered fair in relation with employees as well as owners of labor resources (land, capital). But in real time, according to productivity limit theory division of incomes reaches to non-equality and this occurs because of non-equality in division of production resources. For this purpose, execution of income policy of government is necessary for decreasing of non-equality within modern democratic society. Scope (including salary) of incomes in non-sufficient competitive conditions in the market does not always reflect of production factors in manufacturing of products. The price which obtained because of quality and quantity of product exported to market, purchasing capability and other such kind of factors is realized during procurement process with agreement of users and producers. Changing of level of prices in market relations are under influence of production factors and market factors.

Thus, if there is no purchasing capability, purchasers of product is increased, sale of product is delayed, in some case ritten product damaged producers. By other hand when producers export the product to market more than required or raise the prices in such case the product also will be out of competition and cannot ve covered sale of product. By other hand risks related to combining of capital, labor and natural resources in unique production process of commodity and service, making the decisions for managing of activity, involving of new products and technologies, defining of cooperatives and their returning may be impacted to this process. But according to researches, numerous people have been gained more comfortable areas which near to watering and transport because of non-complying principles of social fairness in realizing of agrarian reforms. And this case as well as impacts to competition in market. Changing of prices, specially prices of fertilizer, machinery and equipment, seeds and other raw materials, increasing and decreasing in state and cooperative commerce, in purchasing process with farmers impact to employees in agrarian field and some cases social-psychological effects is high more than economic. Radical economic reforms carried out in the direction of market relations in our country improve for reconstruction of all chains of economic mechanism and management and has a strong impact on all aspects of society's life. Implementation of active social policy, increasing the role of human factor, increasing the efficiency of labor resources use and solution of employment problem depend on directly these reformes. Increasing in the leading role of human factor conducting and forming the economy on new grounds require research of workforce as the main productive force of society in various aspects from new point of view of reproduction problems. Division of workforce menas distribution of participants of social production on different activities and regions. Forms of division of workforce are realized by such kind of methods that farming areas and regions are provided by labor force by their help in a certain proportion. This proportion relates to division of public product and is appeared under the influence of dominant production relationships in the current production mode. Along to this, first of all, the distribution of production occurs and consumed things are distributed depending on its distribution. As K.Marx said: "The most distinct division appears as a distribution of products and thus, far from production and will be independent against to production. But along to division of product, this division is 1) distribution of production tools and 2) according to different types of production division of society members which consisting of the further identification of that relationship (subjecting of individuals to to certain production relationships)". Thus, division of labor force between farms and regions as production tools and financial resources is one of the main factors of the proportion existing in society. That there is no such kind of important national economy, the number of available workforce and labor resources, their quantity-quality composition are not considered in solving of this problem. Any common mistake in this area can negatively affect the development of production. During developing any farming area demand and supply of labor force and balance between them must be taken into account. It is very important in a condition that our economy is transitioning to market relations. Because in the conditions of market relations needs skilled, labor-trained workers which follows the character of the field and the nature of the production. In accordance with the nature of the work done economic relations about workforce occupation areas, farms, businesses are regulated by labor law. This law regulates the relationship between the society and the enterprise and the workforce. The interests of society and producers and entrepreneurs which is reflected in the relative distribution of the work force should ensure maximum profit of production tools and workforce distribution. Enterprises and entrepreneurs try to ensure the stability of the personnel and the integrity of the employees and the efficiency of production. In the same time workers with the capacity to work inreested in choosing labor application units which suitable for execution their requirements (labor, material, moral and social needs). Efficiency of labor force use depends on how each of these subjects relates their income.

Development of labor force and means of production make their merging process inevitable with labor division. This law acts jointly into the law about compliance of the quality of the work force with the applied production means with law about changing the labor. Material basis of division of the labor force among the types of property and economic activity and re-division consists of increasing technical arming of production and social labor productivity. Division of the workforce between economic areas and occupations is the important indicator defining the level of socio-economic development of this or that country in concrete history of development, as well as changes in the use of labor potential. At the modern stage of socio-economic development, decreasing the specific weight of workers in material production among all the workers involved in the national economy is one of the important indicator which defining the nature of changing the occupational structure of the population. Development of productive forces is observed on the one hand, with the expansion of the scope of labor application and by other hand with the increase in the use of the labor of those employed in those areas. This process is related closely with the changes taking place in the structure of the national economy and first of all changes in the occupation structure of the population, as well as consists of one of the crucial conditions for the intensification of the public recycling process. The nature of the workforce's employment level and the nature of its formation are defined by property forms on production means and the division of social work, which has historically been formed. In connection with acceleration of scientific and technical progress, deepening of the division of public labor causes the development of new areas within the traditional production areas. By this objective, causes to be employed of the able-bodied population of each country in those production areas and their separate spheres of public economy and distribution and redistribution within these areas, as well as proportionally to districts, cities and rural areas. Employment level and structure of labor force in different regions is one of the main factors describing the level of development of forces and directly impacts to change of the proportion of the national economy depending on socio-economic and demographic factors. Demographic factor means, at first of all dynamics of population, age composition, mechanical movements and so on. indicators. The effect of this factor on the employees' employment structure occurs with working properly the formation of the demand for people to participate in public production, the desire to gain family income, education, qualifications and professionalism, as well as moral enrichment and in essence, depends on the personal qualities and vital interests of the worker. Along to this, the definitive aspect is the material-constructive structure of the social production and the level of development of productive forces. In other words, the distribution of the workforce between types of ownership and economic activity and the distribution of public spheres are characterized objectively and governed by the economic development laws of the society. Quantitative and qualitative distribution of workforce and labor resources between different production areas and business spheres is reflected in the basic economic law of the society, increasing demand, saving time, increasing labor productivity and other economic laws and meets existing production method. 12 strategic roadmap has been compiled in the decree of the President of the Republic "Approval the main directions of the strategic road map for key sectors of the national economy and problems related to this" which covered total of 11 sectors of the national economy. This project, which covers short-term, medium-term and long-term, consists of developing a strategy and action plan until 2020, a long-term vision of 2025, and finally a target view that covers the period after 2025. The document covers not only development principles and targets, but also international development requirements, measures to be taken, cash investments to be attracted, and their outcomes. Implementation of selected targets for the short term will play a key role for the next generations. The private sector, as an object of economic development, will play a key role, and public investment will act as the driving force of this development process. Relevant state agencies will be responsible for implementing measures and projects envisaged in the document

[1]. Our country's rich natural resources and favorable position are one of the factors that contribute to its socio-economic progress. However, since these resources are unevenly distributed across the regions, there is a sharp contrast between the development of the regions. Even Concentration of many infrastructures, industrial zones in capital have led to the flow of people here. This negatively affected the economic development of the regions. Under these circumstances, state regulation was necessary in order to ensure regional socio-economic development. In recent years, successful policies have been implemented to improve the employment level and reduce the unemployment rate. Thus, in 2003 the State Program on Poverty Reduction and Sustainable Development was adopted. The First State Program covers 2003-2008 years and the second State Program 2008-2015 years. It is important to improve the country's macroeconomic indicators in terms of reducing unemployment. For the present time, the purpose of this administration is to provide a favorable living environment for current and future generations, to provide high welfare for the population, to create different infrastructure areas, to attract people to employment, and to reduce unemployment. The labor market reflects the main trends in employment, the mobility of the workforce, the scale and dynamics of the unemployment, and the factors that affect it, depending on the level of employment, dynamics, employment of the population, the field and demographic changes.

4. CONCLUSION

Therefore, the fall in the price of the product will notify in advance that the product will be offered in the future, but on the contrary, it will stimulate the price. It means that creation of abundance of products lies through formation of the prices by means of market factors. We believe that in market conditions it is possible to ensure production growth in the system of the agro-industrial complex on the basis of price policy pursuant to the principles of market relations. However, in our country, the state price policy should be based on the following considerations in the context of price constraints: informative function of the price; the penalty function of the price and the function of attracting the price to the production growth. It is known that profit-making prices provide the production growth. In our opinion, the attraction should be preferred. In the present case, the price and penalty functions are not fully considered. Therefore, despite the fact that a price increase may temporarily provide for an increase in production, in other cases, for example, in crisis situations, prices again do not create attractiveness.

ABSTRACT

Improving the management process requires an understanding of the new economic approach - mental accounting, ways to more effectively manage human psychology and its interaction with the environment. This paper explains the essence of the mental accounting concept in a theoretical-practical way. The psychological, economic and organizational aspects of the decisions taken by the people regarding the management have been analyzed and have led to rational and irrational decisions. The influence of psychological states, logic, knowledge, and skills on decision-making processes has been studied when people make their financial decisions. Along with the reasons for making accounting decisions, the results and problems revealed. Explaining the mechanisms of influence of interest in making financial decisions, the possibilities of balancing their psychological and economic conformity with the rational behavior of people were attracted to an investigation. Preparation of decisions affecting entrepreneurial activity has been explained in accounting stages, analysis of the opportunities given in the decision-making process and the existing problems. The psychological and organizational difficulties arising from financial decisions have been shown. The influence and attitudes of existing attitudes and relationships within the structures and deficiencies during the implementation have been identified, based on the diversity of the management system. In the research process, we conducted a survey questionnaire by focusing on various accountants' experiences and used a comparative and related analysis, summarization, grouping, and synthesis methods. The paper introduces recommendations to enhance the effectiveness of financial decision and identify the limitations of the psychological impacts on making financial decisions within the scope of the authority, law and duty commitments of the organization. In the context of the limited resources and increased need, the practical consideration suggestions were made regarding the adoption, implementation, and evaluation of financial decisions.

Keywords: *Accounting, Decision-Making, Financial, Mental Accounting, Behavior, Decision-Making, Rational Decision*

1. INTRODUCTION

Accounting is an information system that collects, keeps and processes financial and accounting data that are used by decision makers. Perhaps, we need to understand the accountability theory. In most of the management literature, accountability is placed within a context which involves a wide range of values, beliefs, attitudes, and behaviors which are important for the existence and endurance of accountability arrangements (Leclerc, 1996). Accountability is the duty to give an account for one's actions and the resulting outcome(s). On the other hand, Romzek and Dubnick (1998:6) define accountability as 'a relationship' in which an individual or agency is held to account for their performance by the authority overseeing their actions. It is a relationship between an actor and a forum (Pollit, 2003), in which the actor has an obligation to explain and to justify his or her conduct, the forum can pose questions and pass judgment, and the actor can be sanctioned.

In this conception of accountability, the actor may be an individual or an official, civil servants or an organization. Thus, the actors are motivated to use managerial accounting to make a financial decision based on their financial events. Another approach of making a decision is the mental accounting which defined as “[...] the set of cognitive, affective and social operations used by individuals or households to assess their financial activities” (Thaler 1999). As an actor of economic environment, individuals make a decision on different financial transactions such as selling buying, and saving. the decision is not only made by the information available on the market, but also how it perceived and passed through the cognitive filter by the individuals. Last two decades many studies were done in order to define how people cognitively describe decision outcomes (Gärling, Karlsson, Romanus, & Selart, 1997). Tahiler (1999) clarified how do people perform mental accounting operations. Mental accounting is the decision making process which is based on the perception and evaluation of the outcomes in the human brain. Mental accounting is used as a process of coding the perceived information and allocating of this type information into risk level. Shefrin and Thaler (1988, 1992; Thaler & Shefrin, 1981) similarly used mental accounting as a description of how people code and impose restrictions on monetary assets. Mental account refers the fact that people based on their risk aversion level, allocates their decision on entertainment, education, food, and investment into various blocks of their brain that results with different outcomes for the similar events. Thus, mental accounting concerns the nature of rationality and logic of decision making. However, sometimes the rationality of the decision can be affected by the social, emotional and cognitive factors that prompt the individuals to make some irrational decisions. The main goal of this paper is to examine mental accounting in order to understand the sensory and cognitive prejudices and the deviations of rational behavior in decision making process.

2. MENTAL ACCOUNTING

Mental accounting as a concept of behavioral finance established by economist Richard H. Thaler in his paper named “Mental Accounting matter” in 1999 and clarified with three main components:

1. Perception of outcomes – it captures how information are perceived, decision is made and subsequently outcomes are evaluated. The accounting system of the human brain provides information about past and new inputs to make cost benefit analyses by comparing the outcomes. The decision of the individual or an investor can be changed according to the mental account that person evaluated the event.
2. Labeling – A second component captures how source of fund and their use are labeled in the real as well as in mental accounting. It involves the assignment of activities to specific accounts. The expenditures are grouped into food, clothing, shelter and other categories and spending and consumption is sometimes labeling the decision depending on the individual's budget boundary.
3. Frequency of valuation – it concerns the frequency of mental accounting. Accounts can be balanced daily, weekly, yearly, and so on, and can be categorized narrowly or broadly. The frequency of evaluation can be too high because of the importance level of some accounts.

3. METHODOLOGY

The main objective of this research is to examine the impact of emotions on mental accounting during the decision making on financial events. To analyse this study, we conducted a survey consisting of 25 questions the result was evaluated by hypothesis. Moreover, Chi-Square test and Paired Samples T test was used to analyze the following criteria. The hypothesis testing was used by paired sample t-test:

- H_1 There is a significant relationship between the source of income and the level of anxiety at the end of the expense

- H₂ there is a significant relationship between the asset valued by consumer's brain and by seller

The hypothesis were tested by Chi-Square:

- H₁ There is a statistical link between the level of risk and marital status of participants
- H₂ There is a statistical link between the level of education and risk of participants
- H₃ There is a significant statistical relationship between the psychological influence and social status (profession) of an individual regarding the partial or single income/loss

In order to analyse the impact of financial decisions of individuals on mental accounting the similar questiniary were designed which previously conducted by Pollit, (2003) Richard H. Thaler (1999), Kahneman və Tversky (1979), and M.Atik, B. Yilmaz and Y. Kose (2018) in their researches. A survey consisting of 25 questions were conducted among 95 population, including academic staff and students of UNEC Business school at Azerbaijan State Economics University (UNEC). The paper reflects the relationship between psychological situations and feelings by the result of income/expençe, making or not making risk and social status, the impact of profit and loss by the result of making financial decision.

4. ANALYSES

Figure 1 reflects: - the transactions recorded at the sub-accounts are transferred to the main accounts where financial decisions are made. By the result of wrong transaction of past made financial operations, is following with the wrong decision. According to the recorded accounts, the population will make wrong financial decision in terms of in terms of similar financial operations. It is associated with the fact that, to make faster decision human brain uses shortened snippets. Thus, if there is any similar notes or events in past accounts, the new transactions will be done from the past accounts. Although the decision-making mechanism is correct, the decision will not be rational. (M. Atik, B. Yılmaz, Y.Köse, 2018).

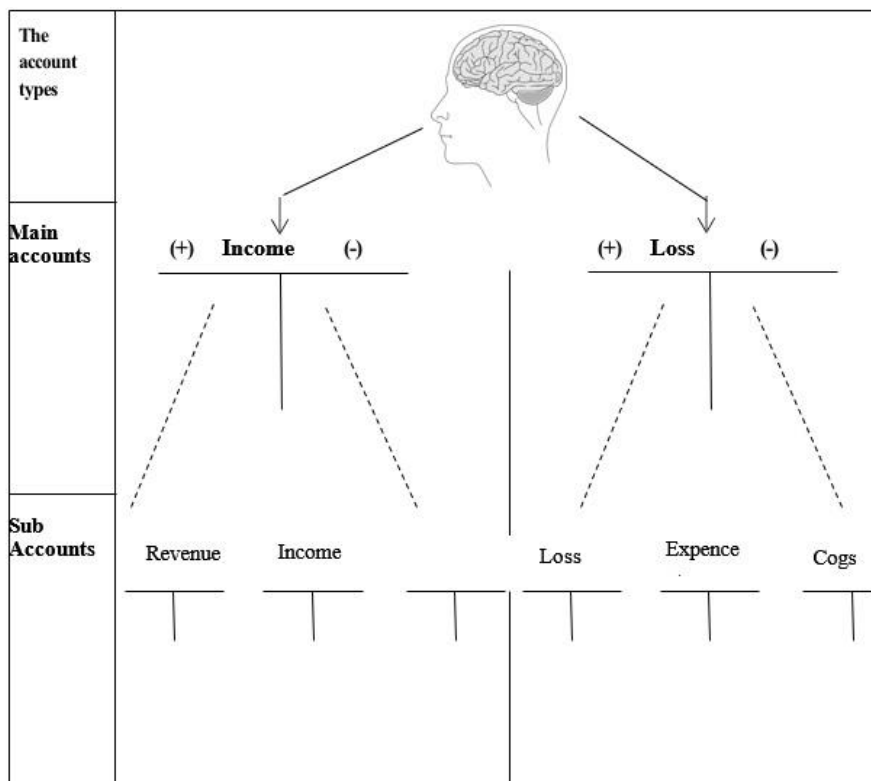

Figure 1: (Murat ATİK, Bülent YILMAZ, Yaşar KÖSE. p 717-730)

Cronbach's alpha coefficient was used in order to measure the degree of reliability of the survey. The Cronbach's alpha coefficient was calculated as 0.714. The survey can be consider reliable when alpha coefficiency measure between $0.71 \leq \alpha \leq 0.899$. So, the realilby degree of our survey is quitly high which is between $0.71 \leq .714 \leq 0.899$. The survey questions were designed in order to measure the psy we created similiar questions in order to examine the psychological The below mentioned question is to define the psychological impact on people, regarding the partly or single income/loss however the total result is equal. Asmar has bought gold while Ali bought USD in order to appreciate cash amunt. The value of gold purchased Asmar decreased by AZN 1200 in 15 days and AZN 300 more the following 3 days. On the other hand, the value of USD purchased by Ali was decreased by AZN1500 due to the fluctuations of the economy during the month. Who is not even happier?

() Asmar

() Ali

The GAP analyses were used to asses the level of emotions in the brain based on the social status on individuals during financial decision making process. The general profile of 95 participants of the survey is divided as following below. Thus, from the total survey participants: education level : 77.89% - master, 22.11%-Ph.D, gender: male - 53.68% and female - 46.32%, and regarding the marital status: 43.16%- married and 56.84%- single, social (profession) status : 69.47%-student 30.53% - lecturer and professor, and age groups: 60%-22/28 age, 25.26%-29/34 age, 7.36%-35/40 age, 5.26%-41/46 age, 2.12%-above 47 years old.

Figure 2: The general profile of 95 participants of the survey

The first hypothesis will test the level of feeling by the result of source of money and its spending

- H_0 - There is no significant correlation between the anxiety level and source and spending of money
- H_1 - There is significant correlation between the anxiety level and source and spending of money

The respondednt were asked a question in associated with an expensive shoes. However, there is a thought about not buying an expensive shoes, we examined the emotional level of population by asking question about the occasion of making a cash or bonuses collected with bank cards payment.

Table 1: Paired Samples T test on level of emotions after expenses depending on the source of money

Source of money	Mean	N	Std. Deviation	df	t	Sig. (2-tailed)
bonus	4.54	95	.77	94	10.199	0.00
nəğd	3.33	95	1.08			

Table 1 express the significant correlation between the source and spending of money and the emotional level of a person. ($t(94) = .769, p < .05$), ($t(94) = 1.08, p < .05$). Another hypothesis is testing to measure the level of emotion while the same assets are valued differently by consumer's brain and sellers. In our study, we used the same question from the study of Murat ATİK, Bülent YILMAZ, Yaşar KÖSE to define the is there any differences between the price of bottle of water sold in the movie theater and price of the same bottle of water that consumer would like to pay in the market located inside the shopping mall.

- H_0 - There is no significant correlation between the value of the same assets formulated in consumers mind and places where it is sold
- H_1 : There is a significant correlation between the value of the same assets formulated in consumers mind and places where it is sold

Table 2: Paired T Test Results on the prices of assets and places where it sold

Place	Mean	N	Std. Deviation	df	t	Sig. (2-tailed)
Market	1.36	95	.85	94	-10.473	0.00
Movie theater	2.49	95	1.16			

According to the analyses from the table 2, there is a significant correlation between the value of the same assets and places where it sold ($t(94) = .85, p < .05$), ($t(94) = 1.16, p < .05$). The other hypothesis is to test the emotional efficiency between the marital and educational status and risk taking. We have an experiential question to measure the risk taking degree. For example, you want to make to make an investment from your savings amounted 50000 AZN. Let us assume, one of the alternative is to invest in foreign exchange (to buy USD) and observation period is 25 days. If the exchange rates for last 25 days was as given below would you still like to invest in USD or not?

Figure 3: Exchange rates for last 25

Days	USD rate (AZN)	Days	USD rate (AZN)
1. gün	1.80	1. gün	1.64
5. gün	1.72	5. gün	1.72
10. gün	1.64	10. gün	1.48
15. gün	1.55	15. gün	1.80
20. gün	1.48	20. gün	1.55
25. gün	?	25. gün	?

4.1. Marital Status vs Risk

- H_0 There is no significant correlation between the marital status and taking or not taking risk
- H_1 : There is significant correlation between the marital status and taking or not taking risk

Table 3: Chi-Square test results on relationship between marital status and risk taking coefficient

	observed frequency	%	Estimated frequency	Asymp. Sig. (2-sided)	df
Married	41	43.16	47.5	.43	1
Single	54	56.84	47.5		

0 cells (0.0%) have expected count less than 5. The minimum expected count is 18.13.

According to the Table 3, it is analysed that, there is a statistical correlation between the marital status and the level of taking risk of participants. When people make financial decisions, they take into account their marital status and responsibilities, before formulating the risks in their brain. That is why in most cases married people do not have a tendency in risky decision, on the other hand, single people have a great tendency on risky decisions.

Table 4: Chi-Square test results on relationship between marital status and not risk taking coefficient

	observed frequency	%	Estimated frequency	Asymp. Sig. (2-sided)	df
Married	41	43.16	47.5	.36	1
Single	54	56.84	47.5		

0 cells (0.0%) have expected count less than 5. The minimum expected count is 16.83.

According to the table 4, it is found that there is no relationship between the marital status and not taking risk.

4.2. Education vs Risk

- H_0 There is no significant correlation between the level of education and risk taking factors
- H_1 There is no significant correlation between the level of education and risk taking factors.

Table 5: Chi-Square test results on the correlation between the education level and risk taking

	observed frequency	%	Estimated frequency	Asymp. Sig. (2-sided)	df
Master	74	77.89	47.5	0.72	1
Ph.D	21	22.11	47.5		

0 cells (0.0%) have expected count less than 5. The minimum expected count is 9.28.

According to the analyses resulted in table 5, there is a correlation between the level of education and risk tolerance factor. Thus, master students are more tolerant on risk while making financial decisions.

Table following on the next page

Table 6: Chi-Square test results on the correlation between the education level and not taking risk

	observed frequency	%	Estimated frequency	Asymp. Sig. (2-sided)	df
Master	74	77.89	47.5	0.89	1
Ph.D	21	22.11	47.5		

0 cells (0.0%) have expected count less than 5. The minimum expected count is 8.62.

Table 6 express that, there is a significant correlation between the level of education and non tollerancy for risk. Thus, while making financial decisions, people decide all risk factor and try to diminish it 0 level, as level of education goes up. So, Ph. D students making less risk.

4.3. Separation of Gains and Expenses

Moreover, the next hypothesis that we tested in our research is to define the influence of single or partial gain or loss on people psychology

- H_0 there is no significant correlation between the occupation and psychological impact of people regarding the partial and single gain and expense
- H_1 : there is a significant correlation between the occupation and psychological impact of people regarding the partial and single gain and expense

Table 7: Chi-Square test result on correlation between the separiton of partly gaining and occupational status of people

	Observed frequency	%	Estimated frequency	Asymp. Sig. (2-sided)	df
Partial	57	60	47.5	0.36	1
Once payment	38	40	47.5		

Table 7 discovered that there is a significant correlation between the occupation and psychological impact of people regarding the partial and single gain and losses. Thus, partly makin a gain has a positive effect on people. In addition to that, without depending on the total level, the partly obtained gain also has a positive effect on people unregarding their occupational status.

Table 8: Chi-Square test result on correlation between the separiton of partly expenses and occupational status of people

	Observed frequency	%	Estimated frequency	Asymp. Sig. (2-sided)	df
Partial	57	60	47.5	0.45	1
Once payment	38	40	47.5		

Table 8 expresses that there is a significant correlation between the occupational status and emotional factor of people regarding the partial and once payment of expences. Although expence is partial the total amount is equal there is a negative influence on people unregarding their occupation.

5. CONCLUSION

Overall, in mental accounting as a process formulated by people behavioral and emotional factors, the previously coded data in human brain are used in making financial decision. All individuals can make a right or wrong decision on financial issues due to signals formulated on their brain. This trend can be followed with the logical or rational decision. The emotions or feeling has a significant role in mental accounting while making a right decision.

According to the questionnaire that conducted in this research, it was found that, the social status, education level, and some other factors has a postivie correlation between the emotions created in their brain and behvaiour of poeple while making financia decision. The reaserch examined the influence of risk tolerance of peeple, mkaing gain or loss on human behaviour from the mental accounting point of view. And the estimated result was found.

ADVERTISING MANAGEMENT IN BUSINESS STRATEGY SELECTION

Nigar Guseynova L.

Azerbaijan State Economic University

ABSTRACT

Any ad (no matter what format it takes) is a paid, public (meaning non-personal) announcement that is a persuasive message made by an identifiable sponsor of a company, organization, or person to existing (or potential) customers or a non-profit member base. Advertising is only one component of the overall marketing process. Advertising is that part of marketing that involves directly getting the word out about your business, product, or service to those you want to reach most. Nearly all ads will have the name of the sponsor (and very often a recognizable logo). Advertising includes the placement of an ad in such mediums as newspapers, magazines, direct mail, billboards, TV, radio, and online. Increasingly, as the world of print advertising shrinks, people are finding more creative ways to advertise, such as displaying signs on top of taxis. Advertising, because it involves so many layers—including art and design, ad placement, and frequency—is the most expensive part of all marketing plans. Public relations (because it is very labor intensive) is the second most expensive marketing component, and market research is the third most expensive. Marketing is the systematic planning, implementation, and control of a mix of activities intended to bring together buyers and sellers for the mutually advantageous exchange or transfer of products or services. For our purposes, let's use the terms buyers and sellers loosely. Even if you run a non-profit environmental organization you still have to sell people on the idea that wind is a good power source for clean energy. Think of marketing as a step-by-step process that begins with a unique selling proposition—a short compelling sentence that describes your business. This proposition (or message) then acts as a guiding theme that helps you identify target clients who are interested in what you're selling. If you think of marketing as a pie, the whole marketing pie can be divided into advertising, market research, media planning, public relations, community relations, customer support, and sales strategy. Advertising, while the most in-your-face slice of the pie, is still only one slice of the marketing pie. All marketing elements must work independently but they also must work together toward the bigger goal of one unified marketing campaign with a common message.

Keywords: *Advertising campaign, advertising strategy, main role of advertising, stages of advertising management*

1. INTRODUCTION

Marketing is a process that takes time and can involve hours of research in order for a marketing plan to be effective. Think of marketing as everything that an organization does to facilitate an exchange (or a conversation) between the company and the consumer. Of course, before you buy ad space in any format (or hire a PR pitch person) you must conduct your market research to determine who your target audience is—and the best way to reach them. It may end up that a social media platform like Instagram is the best way to reach your client base or it may end up your client is better served by penning a series of traditional print media op-ed columns. However, once your research is complete you can start developing your marketing strategies, and then all the other dominos fall into place. Advertising is the best way to communicate to the customers. Advertising helps inform the customers about the brands available in the market and the variety of products useful to them. Advertising is for everybody including kids, young and old. It is done using various media types, with different techniques and methods most suited. Four main Objectives of advertising are trial, continuity, brand switch, switching back. Advertising plays a very important role in today's age of competition.

Advertising is one thing which has become a necessity for everybody in today's day to day life, be it the producer, the traders, or the customer. Advertising is essential for some stakeholders such as customers, seller and companies and society. While identifying advertising role in society, we should consider on both economic and social role of it. For example advertising has a significant influence on product price, value, costumer's demand and our value system.

2. OBJECTIVES AND IMPORTANCE OF ADVERTISING

2.1. Main Objectives of advertising

The most important objectives of advertising are:

1. Trial
2. Continuity
3. Brand switch
4. Switching back

Let's take a look on these various types of objectives:

1. Trial: the companies which are in their introduction stage generally work for this objective. The trial objective is the one which involves convincing the customers to buy the new product introduced in the market. Here, the advertisers use flashy and attractive ads to make customers take a look on the products and purchase for trials.
2. Continuity: this objective is concerned about keeping the existing customers to stick on to the product. The advertisers here generally keep on bringing something new in the product and the advertisement so that the existing customers keep buying their products.
3. Brand switch: this objective is basically for those companies who want to attract the customers of the competitors. Here, the advertisers try to convince the customers to switch from the existing brand they are using to their product.
4. Switching back: this objective is for the companies who want their previous customers back, who have switched to their competitors. The advertisers use different ways to attract the customers back like discount sale, new advertise, some reworking done on packaging, etc.
5. Basically, advertising is a very artistic way of communicating with the customers. The main characteristics one should have to get on their objectives are great communication skills and very good convincing power.

2.2. Importance of Advertising

Advertising plays a very important role in today's age of competition. Advertising is one thing which has become a necessity for everybody in today's day to day life, be it the producer, the traders, or the customer. Advertising is an important part. Lets have a look on how and where is advertising important: Advertising is important for the customers. Just imagine television or a newspaper or a radio channel without an advertisement! No, no one can any day imagine this. Advertising plays a very important role in customers life. Customers are the people who buy the product only after they are made aware of the products available in the market. If the product is not advertised, no customer will come to know what products are available and will not buy the product even if the product was for their benefit. One more thing is that advertising helps people find the best products for themselves, their kids, and their family. When they come to know about the range of products, they are able to compare the products and buy so that they get what they desire after spending their valuable money. Thus, advertising is important for the customers. Advertising is important for the seller and companies producing the products. Yes, advertising plays very important role for the producers and the sellers of the products, because

- Advertising helps increasing sales
- Advertising helps producers or the companies to know their competitors and plan accordingly to meet up the level of competition.

- If any company wants to introduce or launch a new product in the market, advertising will make a ground for the product. Advertising helps making people aware of the new product so that the consumers come and try the product.
- Advertising helps creating goodwill for the company and gains customer loyalty after reaching a mature age.
- The demand for the product keeps on coming with the help of advertising and demand and supply become a never ending process.

Advertising is important for the society Advertising helps educating people. There are some social issues also which advertising deals with like child labour, liquor consumption, girl child killing, smoking, family planning education, etc. thus, advertising plays a very important role in society. Advertising is praised but also criticized by critics in their own ways. Advertising has many positive impacts along with its negative pictures. As the President of American Association of Advertising Agencies, John O' Toole has described advertise is something else. It is not related to studies, but it educates. It is not a journalist but gives all information and it is not an entertaining device but entertains everyone.

3. THE ECONOMIC AND SOCIAL ASPECTS OF ADVERTISING

3.1. Economic role of advertising

It is a fact that there are several economic role of advertising and the most known ones are value of product, effect on prices, effect on costumer demand and choices and effects on business cycles.

3.1.1. Value of Products

The advertised products are not always the best products in the market. There are some unadvertised products also present which are good enough. But advertising helps increase value for the products by showing the positive image of the product which in turn helps convincing customers to buy it. Advertising educates consumers about the uses of the products hence increasing its value in minds of the consumers. For e.g. mobile phones were first considered as necessity but nowadays the cell phones come with number of features which makes them mode of convenience for consumers.

3.1.2. Effect on Prices

Some advertised products do cost more than unadvertised products but the vice versa is also true. But if there is more competition in the market for those products, the prices have to come down, for e.g., canned juices from various brands. Thus some professional like chartered accountants and doctors are not allowed to advertise. But some products do not advertise much, and they don't need much of it and even their prices are high but they are still the leaders in market as they have their brand name. e.g., Porsche cars

3.1.3. Effect on consumer demand and choices

Even if the product is heavily advertised, it does not mean that the demand or say consumption rates will also increase. The product has to be different with better quality, and more variety than others. For E.g., Kellogg's cornflakes have variety of flavors with different ranges to offer for different age groups and now also for people who want to loose weight thus giving consumers different choices to select from.

3.1.4. Effect on business cycle

Advertising no doubt helps in employing more number of people. It increases the pay rolls of people working in this field. It helps collecting more revenues for sellers which they use for

betterment of product and services. But there are some bad effects of advertisements on business cycle also. Sometimes, consumer may find the foreign product better than going for the national brand. This will definitely effect the production which may in turn affect the GDP of the country. The economic aspects are supported by the Abundance Principle which says producing more products and services than the consumption rate which helps firstly keeping consumers informed about the options they have and secondly helps sellers for playing in healthy and competitive atmosphere with their self-interest.

3.2. Social role of advertising

There are some positive and some negative aspects of advertising on the social ground. They are as follows.

3.2.1. Deception in Advertising

The relation between the buyers and sellers is maintained if the buyers are satisfied with what they saw in advertise and what they got after buying that product. If seller shows a false or deceptive image and an exaggerated image of the product in the advertisement, then the relation between the seller and buyers can not be healthy. These problems can be overcame if the seller keep their ads clean and displays right image of the product.

3.2.2. The Subliminal Advertising

Capturing the Minds of the consumers is the main intention of these ads. The ads are made in such a way that the consumers don't even realizes that the ad has made an impact on their minds and this results in buying the product which they don't even need. But "All ads don't impress all consumers at all times", because majority of consumers buy products on basis of the price and needs.

3.2.3. Effect on Our Value System

The advertisers use puffing tactics, endorsements from celebrities, and play emotionally, which makes ads so powerful that the consumers like helpless preys buy those products.

These ads make poor people buy products that they can't afford, people picking up bad habits like smoking and drinking, and buy products just because their favorite actor endorsed that product. This affects in increased the cost of whole society and loss of values of our own selves.

3.2.4. Offensiveness of advertising

Some ads are so offensive that they are not acceptable by the buyers. For example, the ads of denim jeans showed girls wearing very less clothes and making a sex appeal. These kinds of ads are irrelevant to the actual product. Btu then there is some ads which are educative also and now accepted by people. Earlier ads giving information about birth control pills was considered offensive but now the same ads are considered educative and important. But at the last, there are some great positive aspects which help

- Development of society and growth of technologies
- Employment
- Gives choices to buyers with self interest
- Welcomes healthy competition
- Improving standard of living.
- Give information on social, economical and health issues.

4. THE ELEMENTS OF ADVERTISING STRATEGY

The importance of marketing in today's business environment is undoubtedly immense. No firm can sit back and watch their competitors take over the market.

The right time to launch a product is an essential factor to decide the fate of a new launch. Marketing strategies govern the success of products and advertising forms the subset of a marketing plan. For achieving successful marketing strategies we need to fulfill all of the elements accurately. Below we identify these elements or stages:

4.1. Market research

Market research is a process of the systematic collection of data, about a particular target market, competitors, customers, market trends, etc. The aim of market research is to obtain an in-depth understanding of the particular subject. Rising competition has compelled many organizations to conduct market research. Organizations may conduct market research themselves, by appointing a market research team to work on the same. Or else, they may get it done via a market research consultancy or an agency. Market research is vital for business organizations looking out for opportunities to tap the market, for firms which have come up with an improvised product and want to evaluate its demand and for companies planning to introduce their products into the market. However, before conducting market research, it's vital to have the research objectives defined. Once the objectives have been outlined, market research can be carried out in different ways: primary research and secondary research. In primary research, data is collected directly from the source. For example, if the objective of the research is to understand the demand of a particular product, then collecting feedback directly from the customer by talking to them, is called primary research. Primary research involves the collection of crucial data via interviews, surveys or focus group sessions. It's time consuming and expensive. However, it is suited for gathering specific data. Primary research can be further categorized into the qualitative and the quantitative type. Quantitative Primary Research: This type of primary research involves the collection of numerical data via surveys. The most frequently used quantitative technique is the 'market research survey'. The numerical or quantitative information obtained is then statistically analyzed. Such surveys comprise of questionnaires with closed ended questions. In a close ended question, a respondent is needed to answer by ticking one of the options given. People generally agree to cooperate, when surveys are less time-consuming. Qualitative Primary Research: This type of research involves gathering data via interviews or focus group sessions. In this type, open ended questions are included. This means the questions cannot be answered with a yes or a no. They include in-depth interviews, wherein a trained executive interviews one or more respondents. The interviewer may carry out the interview on a one to one basis, with two, triad or even 4-5 respondents. Such open ended interviews enable the researcher to receive data about the likes-dislikes, requirements, positive-negative feedback, trends and emotional motivators of the primary market. Unlike the quantitative type, this type does not comprise of a fixed set of questions. In secondary research, the analysis of information that has been collected for some other purpose, is carried out. This means, that secondary research is carried out by gathering data from sources such as government publications, libraries, internet, magazines, chambers of commerce, etc. The data required may be in the form of demographic or statistical data, set of articles or some studies. Firms can analyze their target markets, evaluate competitors, assess social, political and economic factors.

4.2. Marketing Mix Strategy

A vital part of an effective advertising campaign is to adopt the method of marketing mix strategy during the planning phase, and implementing at the right time in an ordered manner. Marketing mix involves considering various elements of marketing like product, price, promotion and place. While product, price and promotion are easier to understand, place refers to the logistics and transportation costs of goods. The marketing teams and advertising agencies make use of the variables of marketing mix, for the success of a product.

You may read more on successful marketing strategies. It is said, that 'customers are the kings' and indeed they are. The marketing departments of every firm fight tooth and nail to lure customers and increase the sales of their products. Marketing promotional methods are important and efficient marketing strategies of various companies. While millions of dollars are spent on advertising methods, promotional marketing methods are relatively less expensive and can be more effective

4.3. Promotion Strategies

There are basically two promotion strategies; the push strategy and the pull strategy. According to the push strategy, the marketers give generous discounts and benefits to the customers, so that, the sales can be increased drastically. One of the most successful strategies, the method of giving discounts is often successful for most of the firms. In the push strategy, main focus is on reducing costs of the advertising. The other strategy, the pull strategy minimizes the use of different channels and the major focus is on advertising the product. Its goal is to create a potential market for the products of the firm. Advertising is an expensive method of promotional marketing, wherein, the products are made to reach a large number of people. For example, by using electronic media, TV, radio, press and outdoor hoardings, advertisers target the audience and try to create an impact on customers. Every business empire has earned its name, fame and money through hard work and by catering to customer's demand with quality and quantity. However, every small organization needs to make its name in the market by, first, catching the buyer's eye. It is at this juncture, that, promotional advertising ideas play a huge role, in defining the market for small businesses. Every business uses some sort of a promotion idea to strike their target audience. Promotional advertising is a tool used to harp the buyer with the idea of buying the product. Promotional advertising ideas, are used to instigate the user about the product, arouse interest about the product and create demand for the product. There are many ways of promotional advertising for businesses. The most effective ways of promotional advertising is promotional gifts and promotional giveaways. Promotional Advertising Gifts We all feel good when we receive gifts, thus, promotional gifts are the most effective way of creating a feel-good factor among the buyer about the company. Promotional advertising gifts open the buyer's mind to the brand, company name and the slogan. The buyer, with the help of these promotional advertising gifts, gets acquainted to a particular logo and a brand name. Moreover, as the promotional advertising gifts are given away for free, the potential buyer readily accepts it. Promotional Advertising Giveaways Promotional advertising giveaways are interactive promotional advertising ideas. These are similar to promotional advertising gifts, but not the same. These giveaways are distributed in the form of prizes to prospective customers. Some prizes are meant for practical purposes and some are just for fun. Everyday office supplies, stationary printed with company name, calenders, caps, t-shirts, towels, shopping vouchers for a particular brand are some of the examples of promotional advertising giveaways. Personal Selling One of the oldest ways of direct marketing promotion is to sell the products by direct interaction between the seller and buyer. It is believed to be the most difficult form of marketing, as it requires skills of persuasion and excellent communication skills. You may be a person who does not like to negotiate, but often ends up in positions where negotiation becomes necessary. Most people wrongly think that negotiation skills are only for salespeople. But, imagine a situation where you are planning to sell your house. Now, without negotiation you might end up getting a price that's much lesser than what your house deserves. Think of the losses you might have to incur, just because of poor negotiating skills. Thus, reasonably good negotiation skills can benefit you greatly, even if you are not in the sales business. For people in sales businesses, excellent negotiation skills are a must. Your sales depend upon your 'sales talks' and the price you fetch for your product, entirely depends upon your negotiation skills.

I consider following guidelines for effective sales negotiation skills and techniques. Contests is one of the effective, popular and most preferred form of promotional methods is to arrange certain contests for the customers. We all will agree to the fact that winning surprise prizes in a shopping mall or fashion store is simply exciting. One of the most attractive marketing strategies, organizing contests among the customers is a brilliant way to promote the products. In the quest to attract more customers, companies distribute coupons and pamphlets about the products. The customers are either given basic information about the newly launched products or they are provided with discounted coupons on the purchase of some accessories/apparels. Coupons make for an effective marketing plan for small business units. Free Samples The idea of freely distributing products, sounds weird and crazy for any company, however, there is a certain element of truth in the fact that marketing firms have gained substantial promotion through the idea of free samples. While, it is not logical to just distribute your products, you can devise a strategy, so that, the idea of free samples doesn't incur losses for your firm.

5. EFFECTIVE ADVERTISING TECHNIQUES

There are different types of advertising techniques and it's due to the effectiveness of these techniques, people are come to know about the different products in the market, besides the services provided. Newspaper and TV advertisement are some of the oldest advertisement techniques used. With the advent of internet modern advertisement methods like social networking websites, search engine advertising and internet affiliate marketing has gained popularity. Let's take a look at each of these techniques and their effectiveness in today's world. Internet Advertisement Advertising in the sponsored links of major search engines, has become one of the most effective method of internet advertising. The reach of the internet has become so huge that every person in any nook and corner of the world can view the advertisement of your products. Moreover, if you own a website, you can use search engine optimization techniques, wherein your website would be in the top 10 results of search engines. Getting to the first few rankings helps you to get a wider audience, which in turn can lead to more sales. Other forms of advertising include pay per click advertising and email advertising, which can also be tried out. Newspaper Advertising Advertising in newspapers have been used for several generations now and has been one of the most effective means of communicating with the audience. To create a successful advertisement in the print medium, you need to know some of the most effective print advertising techniques, like creating catchy slogans, inclusion of an offer, promotional advertising, etc. These techniques need to be used in other forms of advertising as well, as the amount of time spent on an ad by the end user is very less. Mail Advertising Direct mail advertising is a common advertising techniques and has also become a popular means of connecting to a wide range of audiences. In this technique, you get the mailing addresses of as many people as possible in a particular locality and send them a flier or brochure of your products. You can also send postcards, but make sure that there is enough content, as content is read. TV Advertising Advertisement on the television gives a semblance of a brand, and so it's important that you use this medium to the hilt. However, it's not that without advertising in this medium, a brand would not be created, there are several companies which don't use this medium and still are huge. The most important thing is having a compelling offer, which the audience would be interested in. Moreover you need to give your contact information be it your website address, telephone number, in that short period of time. Other than these, there are other mediums which you can use, and these include banner advertising, public relations, radio advertising and word of mouth advertising. What are Banner Ads? Banner ads are in many ways similar to the traditional printed advertisements in magazines. However, they do differ in several ways from the traditional mode of advertising. When a banner advertisement is placed on any particular website, a click on the ad directly transports you to the website of the product that is being advertised.

This means, you are saved the time of going to a store to purchase the product that has been advertised. Moreover, a banner ad is definitely more attractive than a regular printed ad, because a lot of graphics and animation can be added to it, to make it eye-catching and visually appealing. The location of the ad, however, is limited to one single place. There are, of course, instances of banner advertising where the graphics and animation are simply overdone. When a customer clicks on a banner ad, he is directed to the website of the product that has been advertised. Banner advertisements are based on the concept of pay per click advertising. This gives the publishing website income every time the ad is clicked, as a customer has been directed to the advertiser's website. Whether or not this click on the ad gets converted into a sale is immaterial. The publishing website will be given a payment, on the basis of the prevalent banner advertising rates. However, the banner advertising effectiveness will be determined for the advertising website, only when the click gets converted into a sale. If the web surfer does not click on the advertisement, the banner ad does try to ensure that the image of the promotional product has been registered, and that the web surfer will sometime in the future, visit the website directly. Then, the effectiveness of banner advertising is measured by the number of times the ad has been clicked, the number of times a visitor has been directed to the advertiser's website, and the ratio of the clicks to the page views. This gives them an exact idea of whether a visitor has been directed by a banner ad, or by some other medium. This rate ranges around only .1% and is rarely higher. Lastly, whether or not a visit to the website through the banner ad was converted to a sale is calculated. This gives an actual measure of banner advertising effectiveness.

6. FORMING AN ADVERTISING STRATEGY

Advertising strategy is a plan of an advertising campaign developed by a company that stimulates consumers to purchase its good or service. When forming an advertising strategy, advertisers should pay attention to four key elements, which are target audience, product concept, advertising message, and communications media. There are five steps in forming an advertising strategy: conducting advertising research, setting advertising goals, formulating budgets, creating advertising messages, and selecting media (Clow & Baack 2014; Shimp 2010.).

6.1. Conducting Advertising Research

Before implementing any advertising strategy, the first step that advertisers should bear in mind is conducting and reviewing advertising research. Advertising research is carried out to collect and analyze information necessary for making and evaluating advertising decisions. One of the functions of advertising research is to identify the target groups of consumers for a company or a brand. In this step, companies gather information on how consumers perceive the products, what consumers want to purchase, what they want from the products, and the insights into their purchasing behavior. In fact, consumers do not always purchase a product just because of its attributes. For example, when consumers buy a cosmetics product, they may not care about its ingredients, but what they might be more concerned with is how they look and smell when they use that product. In addition, advertising research also provides knowledge of how a company's consumers think of its competitors; what brand image is suitable; and what advertisements could be most attractive and effective.

6.2. Selecting Advertising Goals

According to Clow & Baack (2014), an advertising is built to attain five primary goals, including establishing brand awareness, providing information, persuading, supporting other marketing functions, and stimulating consumers to take action. These goals are also called communications objectives of an advertising strategy.

First of all, building brand awareness is the key goal of advertising as it is the starting point of forming brand image and brand attitude. Brand awareness takes place when a consumer recognizes and memorizes a brand, and when a need occurs, the consumer recalls the brand that can satisfy his/her need. Secondly, advertising is responsible for providing consumers information about store working hours, location or even product specifications. Information makes the process of purchasing become easier for consumers, which induces them to make their purchasing decisions. In the third place, the nature of advertising is to persuade people to buy products, services or ideas. Therefore, an advertisement is considered valid only when it is able to convince consumers to choose the advertised brand. To summarize, the five goals of advertising include forming brand awareness, which later leads to brand image and brand attitude; giving information; persuading; supporting other marketing functions; and encouraging purchase and consumption. These goals connect with each other in some way, for instance, building brand awareness and informing are part of persuasion; and company should not leave out any of them when establishing an advertising strategy (Clow & Baack 2014, 146.).

6.3. Formulating Advertising Budget

After setting suitable goals, the next step that needs to be considered is formulating advertising budget. There are several methods for allocating advertising budget, and it depends on different business models and situations to apply pertinent methods. In this thesis, the author would like to introduce four basic budgeting rules of thumb, which are the percentage-of-sales, the competitive parity, the affordability, and the objective-and-task methods.

6.4. Creating Advertising Messages

Advertising message presents a company's value proposition through verbal and visual elements that are appealing and meaningful to the target consumers. Specifically, an advertising message is formed by three components: advertising appeals, value proposition, and slogan. Advertising appeal is the theme of an advertisement that can attract the attention of the target audience (Kotler 1997, according to Lin 2011). There are seven most popular types of advertising appeal: fear, humor, sex, musical appeals, rational appeals, emotional appeals and scarcity appeals. Normally, only one of them will be the theme of an advertisement and the chosen appeal must be consistent with the advertising goals. In this sector, the author would like to concentrate more on explaining three most common appeals: fear, humor and sex. (Clow & Baack 2014, 169-183.) Additionally, sexual appeals are normally accepted when it is used for sexually oriented products. In contrast, when it is used for other types of products, debates may arise. Further, sexual appeals are criticized for encouraging dissatisfaction with one's body. Models in magazines or other media sources are normally thin, which indicates that in order to be beautiful, women have to be skinny and this causes many problems. Researchers also point out that women think they are too fat and feel unhappy after watching an advertisement endorsed by thin models. Besides, these above types of appeals, musical, rational, emotional, and scarcity appeals are also effective in attracting people's attention.

6.5. Selecting Media

The last step in developing an advertising strategy is selecting the suitable medium to deliver the message to consumers. Especially, there are relationships between the selected media form and other aspects of the advertising strategy. Specifically, the media chosen by the company must meet the right target audiences; must be suitable with the advertising goals and the budget of the company; and must be able to deliver the brand message. In other words, the relevant media requires a company to understand the habits of the target consumers in using media, and to combine that information with the profile of the audiences using that kind of media. Media is categorized into two main types: traditional and digital media.

Traditional media consists of print media (newspapers and magazines), electronic media (television and radio), out-of-home media (billboards; street furniture – bus shelters advertisements; transit – advertisements at airports or on the bus; and others), exhibitiv media (product packaging), and supplementary media (specialty advertising – promotional products with an advertised brand, message, or logo; and others). Digital media are any types of media that exist in a machinereadable format. However, there are some kinds of traditional media that is merged into a digital form, such as digital out-of-door media – mobile billboards (Outdoor Advertising Association of America 2015).

7. CONSLUSION

Advertising is the best way to communicate to the customers. Advertising helps informs the customers about the brands available in the market and the variety of products useful to them. It has a significant influence on product price, value, costumer's demand and our value system. . The trial objective is the one which involves convincing the customers to buy the new product introduced in the market. Continuity objective is concerned about keeping the existing customers to stick on to the product. Brand switch objective is basically for those companies who want to attract the customers of the competitors. Switching back objective is for the companies who want their previous customers back, who have switched to their competitors. Advertising is one thing that has become a necessity for everybody in today's day to day life, be it the producer, the traders, or the customer. Advertising is praised but also criticized by critics in their own ways. Advertising has many positive impacts along with its negative pictures. As the President of American Association of Advertising Agencies, John O' Toole has described advertise is something else. It is not related to studies, but it educates. It is not a journalist but gives all information and it is not an entertaining device but entertains everyone. It is a fact that there are several economic role of advertising and the most known ones are value of product, effect on prices, effect on costumer demand and choices and effects on business cycles. advertising helps increase value for the products by showing the positive image of the product which in turn helps convincing customers to buy it. Advertising educates consumers about the uses of the products hence increasing its value in minds of the consumers. Some advertised products do cost more than unadvertised products but the vice versa is also true. But if there is more competition in the market for those products, the prices have to come down, for e.g., canned juices from various brands. Advertising no doubt helps in employing more number of people. It increases the pay rolls of people working in this field. It helps collecting more revenues for sellers which they use for betterment of product and services. But there are some bad effects of advertisements on business cycle also. Moreover advertising has several social role such as deception in advertising, the subliminal advertising, effect on our value system and offensiveness of advertising. Marketing strategies govern the success of products and advertising forms the subset of a marketing plan. For achieving successful marketing strategies we need to fulfill al of the elements acurately. Market research is a process of the systematic collection of data, about a particular target market, competitors, customers, market trends, etc. The aim of market research is to obtain an in-depth understanding of the particular subject. A vital part of an effective advertising campaign is to adopt the method of marketing mix strategy during the planning phase, and implementing at the right time in an ordered manner. Marketing mix involves considering various elements of marketing like product, price, promotion and place. While product, price and promotion are easier to understand, place refers to the logistics and transportation costs of goods. There are basically two promotion strategies; the push strategy and the pull strategy. According to the push strategy, the marketers give generous discounts and benefits to the customers, so that, the sales can be increased drastically. Advertising strategy is a plan of an advertising campaign developed by a company that stimulates consumers to purchase its good or service.

When forming an advertising strategy, advertisers should pay attention to four key elements, which are target audience, product concept, advertising message, and communications media. There are five steps in forming an advertising strategy: conducting advertising research, setting advertising goals, formulating budgets, creating advertising messages, and selecting media.

ABSTRACT

The intensity of economic and political changes in the globalized economy requires significant changes in the exchange rate policies of the developing countries. This has led the determination of transmission channel from exchange rate volatility to the economy to be much more complex for researchers. Different approaches have been put forward explaining the transmission channel in various countries. The short and long-run, direct and indirect channels of the transmission have been studied in the existing literature. The study examines and defines the transmission channel from exchange rate volatility to the share of agriculture in GDP of Azerbaijan Republic. Key research variables of the study have been chosen among the main macroeconomic variables of the country. Quarterly data from 2007 to 2018 is taken for the econometric analysis. The paper uses a cointegrated VAR model, VECM model for Azerbaijan in order to study the response of the share of agriculture in GDP to non-oil real effective exchange rates in Azerbaijan. Empirical analysis shows that, for Azerbaijan there is a short-run statistical significant relationship between the non-oil real effective exchange rate and agriculture share in GDP getting its basis from the increasing trade in the country in a short-term. Besides, there have been found a long run relationship running from Imports; Inflation and GDP to share of Agriculture in GDP; and from Imports; Inflation and GDP to non-oil real effective exchange rate in Azerbaijan as well. In conclusion, decreases in trade (exports and imports) are transmitted to higher non-oil real effective exchange rate that also affects the share of agriculture in GDP negatively in a short-run and they relate with each other in a long-run as well.

Keywords: *Exchange rate volatilities, VAR model, VECM model, agriculture share, GDP to share of Agriculture*

1. INTRODUCTION

Oil revenues are very important source of an income for most of the oil exporting countries. Due to that importance and also dependence, other main spheres of the economy such as agriculture lags from development. Most of the times, these development lags are difficult to recover depending on the level of dependence of the economy on the specific natural resource. At the end of 2000, the "natural resource curse" resulted in the oil dependence of oil exporting countries, as well as Azerbaijan. In this regard, the non-oil sector started to weaken and be replaced by imports. The growth of and dependence on oil revenues in the oil exporting countries led to the strengthening of the national currency against other currencies as well. It showed its negative effects when the local currency got devaluated suddenly. Likely to other emerging economies, Azerbaijan has taken a number of economic and political steps to improve

the exchange rate and stabilize the economy in order to avoid the negative effects of those sudden shocks of the exchange rate. Thus, recently there have been some laws and regulations passed by the government based on the international experience mainly to improve the non-oil sector in the country. Due to the urgency of the issue the paper aims to investigate the relationship between exchange rate volatility and agriculture sphere. While investigating the issue, some of the recent existing literature have been reviewed both for Azerbaijan and other countries. Exchange rate fluctuations have a positive impact on the export of agricultural products in Nigeria, in particular, cocoa and agrarian loans. The relative prices of agricultural products, especially cocoa products, have been determined to be related to significant quantities of export. As a result, currency fluctuations have a positive impact on Nigeria's export of cocoa and it is recommended that agricultural loans be restructured in order to increase the production capacity of farmers by meeting their needs. In short, the value of cocoa exports in Nigeria should be determined by free market (Essien, E.B., Dominic, AU and Sunday, E.R., 2011, pp.1-10.). In another study, the impact of fiscal and monetary policies on the Brazilian economy has been assessed using a structural model. The results state the significant role of non-oil production, especially manufacturing in the economic development of the country while having a competitive exchange rate. (Sonaglio, C.M., Campos, A.C. and Braga, M.J., 2016, pp.77-95.) The study conducted by Gebeyehu, A.B. (2015) analyzes the volume of trade in seven of Ethiopia's major agricultural products considering the impact of exchange rate devaluations. Various methods have been used throughout the paper to clarify the issue. Impulse response results show that Ethiopia's trade balance follows J-curve pattern as the real currency depreciates. The study findings point out that the depreciation in real terms improves the BoP within a short period of time. The relative insignificant impact of the industrial production index on the BoP in Ethiopia is also stated using the VECM model. Another method of the autoregressive distribution lag (ARDL) was used to test the hypothesis that there is no short-term and long-term relationship between the exported oilseeds and the explanatory variables in Ethiopia. As a result, exports have shown that oilseeds exports have a negative relationship with exchange rate fluctuations. At the same time, the null hypothesis was denied by confirming that there were long-term relationships between the independent variables included in the model and exports of oilseeds (Mehare, A. and Edriss, A.K., 2012., 3 (11)). Oye, OO, Lawal, AI, Eneogu, A. and IseOlorunkanmi, J. (2018) in their research have had a detailed analysis of the relationship between the exchange rate and agricultural output in Nigeria. Using the Vector Error Correction Model (VECM) the study points out that the real effective exchange rate (REER) has negative linkage with agricultural production in the country. There is also found to have a direct link between REER and export prices. Hence, it also leads to the conclusion that exchange rate volatility is related to export revenues of the country as well. Since the significant effects of lagged effects of export prices on agricultural production are also revealed during the model analysis, the previous export prices can be used to predict the current agricultural output. Among the studies conducted for Azerbaijan in the sphere of agriculture, there are some have to be mentioned while reviewing the existing literature. Tahmasib Huseynov (2014) has analyzed the new approaches required in the growth of agricultural production in Azerbaijan concluding that opportunities in the agricultural share of GDP in the country are not fully used. Relevant statistical methods have been used to reveal the inefficiency in agricultural production of the country. Another related study has been done by Ali Rustamov (2017) about the evaluation of the Marshall-Lerner condition via the ARDL econometric model in Azerbaijan. The findings point out that depreciation in the real effective exchange doesn't have any statistically significant long-run and short-run effects on BoP variable (X/M). These have been found to be due to relatively inelastic import and exports in Azerbaijan against the REER. Consequently, Marshall-Lerner condition doesn't hold for Azerbaijan and there is no sufficient elasticity of exports and imports to improve the trade balance.

Following chapters have been added to the paper. Chapter 2 describes the data and methodology for the econometric framework used throughout the study. Chapter 3 depicts the cointegrated VAR and VECM to estimate the relationship between exchange rate volatility and share of the agricultural sphere in GDP and interpretation of the findings. The conclusion part is given in Chapter 4.

2. METHODOLOGY

The study applies the quarterly data from 2007 to 2018 since using quarterly data in the VAR model is much efficient and avoids the inaccurate conclusion on the lagged effects for the longer period such as in annual data. The following factors have been chosen to be included in the paper: Exports, Imports, Real effective exchange rate for non-oil sector (REER for non-oil), Agriculture share in GDP, Inflation (GDP deflator) and nominal GDP. The data on Exports, Imports (in US million dollars), Agriculture share in GDP (in %) and nominal GDP (in US million dollars) are from Azerbaijan State Statistical Committee. Inflation rate (GDP deflator) and REER for non-oil sectors information are obtained from the Central Bank of Azerbaijan. Due to the long-running fixed nominal exchange rate in Azerbaijan for the period studied, REER for non-oil sectors is included in the model. The study aims to analyze the impact of exchange rate volatility on the share of agriculture in Azerbaijan. The transmission channel of the relationship includes exports, imports, GDP and the inflation rate in it. In order to achieve the proper results and analyze the transmission channel between the variables in detail, the study applies Vector Autoregressive (VAR) model. The model is utilized for forecasting time series and evaluation of the responses to the shocks by interested variables. Some steps in the model building have been taken throughout the paper in order to investigate the transmission channel between the interested variables. The number of lags to be included in the model is defined first due to determine the lagged effects of interested variables on the dependent variable. As the number of lags is chosen, the VAR model is set for the mentioned variables.

2.1. The VAR process

The function of the VAR model is as follows (Enders, 2004):

$$x_t = A_0 + \sum_{i=1}^n A_i x_{t-i} + e_t$$

Where: x_t is an $(n \times 1)$ vector containing each of the n variables employed in the VAR, A_0 is an $(n \times 1)$ vector of intercept terms

$$\begin{bmatrix} x_{1t} \\ x_{2t} \\ \vdots \\ x_{nt} \end{bmatrix} = \begin{bmatrix} A_{10} \\ A_{20} \\ \vdots \\ A_{n0} \end{bmatrix} + \begin{bmatrix} A_{11}(L) & A_{12}(L) & \cdot & A_{1n}(L) \\ A_{21}(L) & A_{22}(L) & \cdot & A_{2n}(L) \\ \cdot & \cdot & \cdot & \cdot \\ A_{n1}(L) & A_{n2}(L) & \cdot & A_{nn}(L) \end{bmatrix} \begin{bmatrix} x_{1t-1} \\ x_{2t-1} \\ \vdots \\ x_{nt-1} \end{bmatrix} + \begin{bmatrix} e_{1t} \\ e_{2t} \\ \vdots \\ e_{nt} \end{bmatrix}$$

Where: x_{it} are the variables employed in the VAR, i

A_{i0} are the intercept terms

$A_{ij}(L)$ are the polynomials in the lag operator

e_{it} are white-noise disturbances that may be correlated.

The n -equation VAR derived from Enders (2004),

A_i are $(n \times n)$ matrices of coefficients

e_{it} is an $(n \times 1)$ vector of error terms

The observation matrices for the paper are $x_t = [\text{Azerbaijan's Inflation, real effective exchange rate for non-oil sector, imports, exports, agriculture share in GDP and nominal GDP}]$. The methodology of the VAR process has also been reviewed in the chapter. Firstly, the stationarity of the included variables should be checked. Unrestricted VAR is available for the stationary variables. However, the variable has to be differenced by the order until it is stationary if it is not stationary. Stationarity of the variables allows the cointegration test to be applied to the model. As the cointegration among variables is present, the process may continue with VECM (Vector Error Correction Model) method. If there is no cointegration, then the process stops with VAR in differenced data (Enders, 2004). Phillips Perron stationarity test is used in order to test stationarity. Based on the test results, the first differences of the variables have been taken in need. Economic models are built based on the first differences and level variables.

2.1.1. Cointegration test

Stationary variables are needed to perform cointegration analysis for the long run relationship among the variables. Since some of the variables are differenced to be stationary, the VECM method is required to be applied to the model. Lag order is selected before the cointegration test in order to implement the further steps of the process. Several methods of choosing the optimal lag order may be seen while determining the optimal lag order. The lag order satisfied by most of them or by the author is chosen for the further processes. A cointegration test based on Trace statistic and Maximum Eigenvalue statistic by Johansen (1988) and Johansen-Juselius (1990) has been used throughout the paper. 5% significance level is chosen for the test to define their statistical significance. The test aims to reveal the number of cointegrated vectors among the variables. Having not any cointegration vectors in the model also states about the absence of long-run relationship among the variables.

2.2. Vector Error Correction Model (VECM)

As the cointegration test states about the presence of the cointegration vectors, that is the presence of the long-run relationship, VECM method is used to reveal the long-run relationships among the variables. The equation of the VECM model is as follows:

$$\Delta x_t = \pi x_{t-1} + \sum_{i=1}^p \pi_i \Delta x_{t-i} + \varepsilon_t$$

The equation may be explained by its three parts: The short-run coefficient matrices, the long run cointegration matrix and the matrix of the speed of adjustment terms. The correctly specified model has to have the negative and statistically significant coefficient of the speed of adjustment as it states the correction of deviation from the long-run equilibrium.

3. RESULTS

As it is mentioned in the methodology part, Phillips Perron stationarity test is used to determine whether the variables are stationary. Due to nonstationarity, the first differences of Exports, GDP and REER variables have been taken and then included to the models.

3.1. Lag order selection process

The results of the lag order selection criteria for VAR, the final prediction error (FPE), likelihood ratio, AIC information criteria, and Hannan-Quinn criterion show that the appropriate number of lag is 4 lags. Since other criteria have close values at this lag level to their lowest, 4 lags is chosen to be the optimal lag structure of the model and to be included in the Johansen test of cointegration.

Table 1: VAR Lag Order Selection Criteria (EViews econometric software)

VAR Lag Order Selection Criteria						
Endogenous variables: AGRICULTURE_SHARE D_EXPORTS D_GDP D_REER IMPORTS INFLATION						
Exogenous variables: C

FPE: Final prediction error						
AIC: Akaike information criterion						
SC: Schwarz information criterion						
HQ: Hannan-Quinn information criterion						

3.2. Cointegration test

Cointegration test for the model states about three valid cointegration vectors in the model. The processes are gone through testing the number of cointegration vectors starting from 0:

- $H_0 : r = 0$ is rejected at the 5% level ($159.1416 > 95.75366$).
- Then the case of $r = 1$ is tested and since the trace statistic is greater than its critical value ($91.62506 > 69.81889$), we reject the null hypothesis again.
- Then the case of $r = 2$ is tested and since the trace statistic is greater than its critical value ($54.25090 > 47.85613$), we reject the null hypothesis again.
- Continuing with $r = 3$, it is found that the trace statistic is less than its critical value ($24.45172 < 29.79707$). Thus, the null hypothesis is accepted. It results that there are three cointegration vectors in the model.

The presence of cointegration vectors (three cointegration in our model) is also explained as the existence of a long run relationship between the variables and hence, VECM (Vector Error Correction Model) methodology should be implemented for the model.

Table following on the next page

Table 2: Cointegration test (EViews econometric software)

Date: 12/01/18 Time: 23:55				
Sample (adjusted): 2008Q3 2018Q2				
Included observations: 40 after adjustments				
Trend assumption: Linear deterministic trend				
Series: AGRICULTURE_SHARE D_EXPORTS D_GDP D_REER IMPORTS INFLATION				
Lags interval (in first differences): 1 to 4				
Unrestricted Cointegration Rank Test (Trace)				
Hypothesized No. of CE(s)	Eigenvalue	Trace Statistic	0.05 Critical Value	Prob.**
None *	0.815095	159.1416	95.75366	0.0000

At most 2 *	0.525256	54.25090	47.85613	0.0111
At most 3	0.329765	24.45172	29.79707	0.1820
At most 4	0.124640	8.446639	15.49471	0.4189
At most 5	0.075078	3.121830	3.841466	0.0772
Trace test indicates 3 cointegrating eqn(s) at the 0.05 level				
* denotes rejection of the hypothesis at the 0.05 level				
**MacKinnon-Haug-Michelis (1999) p-values				

As the results of cointegration tests have been obtained, the VECM model may be built. Throughout the VECM estimation, the main points such as the short-run coefficients and long-run relationship between the variables are estimated.

3.3. Short run analysis

In order to conduct a short-run analysis, the VECM estimation has been established first. Since there are six variables included in the model, there have been six equations under the VECM estimation model. Out of them, the ones with dependent variables of the share of agriculture in GDP and non-oil real effective exchange rate (REER) is chosen to be studied, since the paper aims to analyze their relationship with other variables in order to explain the transmission channel empirically. Thus, chosen equations are estimated again with OLS method in order to interpret the short-run coefficients of the lagged variables on the dependent variables. There are also cointegration equations which help to identify the speed of adjustment terms. In other words, they are error correction terms. If there is a deviation from the long run equilibrium, it will be corrected gradually through short run adjustment:

1. $CointEQ1 = AGRICULTURE_SHARE(-1) + 6.00E-06* IMPORTS(-1) - 7.32E-06*INFLATION(-1) + 2.81E-06*D_GDP(-1) - 0.065151$
2. $CointEQ2 = D_REER(-1) + 0.001901*IMPORTS(-1) + 0.157894*INFLATION(-1) - 0.002331*D_GDP(-1) - 20.76314$
3. $CointEQ3 = D_EXPORTS(-1) + 0.040540*IMPORTS(-1) + 4.735712*INFLATION(-1) - 0.181549*D_GDP(-1) - 521.6191$

The Wald test also has been conducted in order to analyze the short-term effects of the chosen independent variables together with its lags on dependent variables. Considering that the quarterly data is used for the paper, then the analysis of 4 lags together may be considered as a short-run analysis as well.

Table 3 states about the short-run analysis of the VECM equations (the ones with dependent variables of the share of agriculture and non-oil real effective exchange rate). While conducting the analysis, the significance of the joint effects of the lagged coefficients of each including variable has been tested in each equation via the Wald test. From the first equation, it may be seen that the lags of the non-oil real effective exchange rate and share of agriculture have statistically significant short-term relationships with the share of agriculture variable. In the meantime, the second equation states that there are statistically significant short-term impacts of the lags of exports and imports variables on the non-oil real effective exchange rate.

Table 3: Short-run analysis of the model (EViews econometric software)

<i>Variables:</i>	Share of agriculture	Non-oil real effective exchange rate	Exports	Imports	Inflation (GDP deflator)	GDP
<i>1st equation (dependent variable is share of agriculture)</i>						
Wald test (p-value)	0.0000***	0.0888*	0.7707	0.2005	0.2129	0.5033
<i>2nd equation (dependent variable is non-oil real effective exchange rate)</i>						
Wald test (p-value)	0.2113	0.2862	0.0028***	0.0073***	0.1664	0.1049

*** - significant at 1% significance level;

** - significant at 5% significance level;

* - significant at 10% significance level.

The above mentioned short-run econometric values state about the short-run transmission channel of the relationship between non-oil real effective exchange rate and share of agriculture in GDP in Azerbaijan. Starting from the second equation the transmission channel from non-oil real effective exchange rate to the share of agriculture in GDP can be explained in detail. There are statistically significant short-run effects of exports and imports on the non-oil real effective exchange rate. The signs of these effects are negative for both variables. That means the more increase in the exports and imports is the less non-oil real effective exchange rate. Since the non-oil real effective exchange rate is the non-oil nominal effective exchange rate adjusted by inflation that shows the value of a currency against a basket of the currencies of the main trading partners, the increase in the imports decreases the nominal effective exchange rate (nominal exchange rate against the currencies of main trading partners) and hence the non-oil real effective exchange rate. The increase in exports also affects negatively to the non-oil real effective exchange rate. The changes in exports are mainly (more than 90%) about the oil and gas products. Thus, the increase in the exports of oil and gas products also increases the oil and gas production in the country and demotivates the production in non-oil sector directly. Since the non-oil real effective exchange rate determines the real exchange rates in non-oil sectors against the currencies of main trading partners, the significant increase in exports of goods make the non-oil real effective exchange rate to decrease as the focus of the trade is oil products in that case. The first equation states about the negative relationship between the non-oil real effective exchange rate and the share of agriculture in GDP - most of the non-oil products in the country are from the Agriculture sector. It is because the more valuable the non-oil products against its trade partners is the less competitive non-oil products both in the local and international market. Since the country is dependent on imported goods, expensive non-oil local products will be substituted with the imported non-oil products. It will also make it less competitive in the international market due to its value against the goods of its main trading

partners. These are enough reasons for agriculture share in GDP to decrease when the non-oil real effective exchange rate increases. Concluding above findings, there is a short-run statistical significant relationship between the non-oil real effective exchange rate and agriculture share in GDP in Azerbaijan getting its basis from the increasing trade in the country in a short-term. It is proved econometrically as shown above.

3.4. Long Run Analysis

The long-run relationship in the VECM model is analyzed through cointegration equations. The order of variables is set based on what to analyze due to the placement of the variables in the cointegration equations. Since the paper aims to analyze the long-run relationship between agriculture share in GDP and non-oil real effective exchange rate, the order of variables put in the model is as follows: Share of agriculture; non-oil REER; Exports; Imports; Inflation and GDP. In this chapter, the order of restrictions is set to analyze the impact of Exports; Imports; Inflation and GDP to the Share of agriculture and non-oil REER in a long run. Although there are three cointegration vectors, the first and the second cointegration equations are chosen to be analyzed. However, the Johansen test automatically restricts three restrictions in each cointegration equation.

Table 4: Johansen normalization restrictions imposed (EViews econometric software)

Cointegrating Eq:	CointEq1	CointEq2	CointEq3
AGRICULTURE_SH ARE(-1)	1.000000	0.000000	0.000000
D_REER(-1)	0.000000	1.000000	0.000000
D_EXPORTS(-1)	0.000000	0.000000	1.000000
IMPORTS(-1)	6.00E-06 (9.2E-07) [6.53096]	0.001901 (0.00083) [2.29052]	0.040540 (0.09861) [0.41111]
INFLATION(-1)	-7.32E-06 (6.3E-05) [-0.11587]	0.157894 (0.05708) [2.76638]	4.735712 (6.78308) [0.69817]
D_GDP(-1)	2.81E-06 (6.3E-07) [4.48601]	-0.002331 (0.00057) [-4.12322]	-0.181549 (0.06720) [-2.70169]
C	-0.065151	-20.76314	-521.6191

Considering the two short-run equations from previous paragraphs, the coefficients of the cointegration equations should be reviewed. In order to conclude for the long-run causality, the coefficients should be negative and statistically significant, since they are error corrections for the long run relationship. The analysis shows that coefficient of cointegration equation 1 in the short-run equation with the dependent variable of the share of agriculture and cointegration equation 2 in the short-run equation with the dependent variable of non-oil real effective exchange rate have negative and statistically significant (at 10% and 5% significance levels, respectively) values. So it states that there is a long-run causality running from Imports; Inflation and GDP to share of Agriculture in GDP, and from Imports; Inflation and GDP to non-oil real effective exchange rate. The coefficients of the cointegration equation show the speed of adjustment in case of any deviation from the long-run equilibrium.

4. CONCLUSION

By using the VECM model, the impact of exchange rate volatility on agriculture sphere in Azerbaijan and its transmission channel has been analyzed in the paper. Both long and short-run relationships among the variables have been considered during the analysis. The short-run findings states about the negative statistical significant relationship between the non-oil real effective exchange rate and agriculture share in GDP in Azerbaijan. Besides, the long-run causality running from Imports; Inflation and GDP to share of Agriculture in GDP, and from Imports; Inflation and GDP to non-oil real effective exchange rate are also found throughout the econometric analysis. In 2015 Azerbaijan national currency devaluated against the foreign currency and it had a positive impact on the share of non - oil share especially agricultural share in GDP. Based on academic literature the devaluation stimulates exports of the country. Thus, devaluation in Azerbaijan increased the country's export possibilities in a number of sectors, especially in the non-oil sector. At the same time, after the devaluation prices of the non-oil products in the country rose and led to an increase in local market prices. It also had a positive impact on the supply of local products, especially agricultural products. Besides, recent governmental regulations, especially Azerbaijan Republic President's decree on Strategic Road Map dated to 6th December 2016 played stimuli for the development of agriculture in Azerbaijan. The main strategic goals of Strategic Road Map have been directed to the development of agriculture in Azerbaijan Republic which covers sustainable provision of food security, increasing institutional base for the agricultural sector, building information and monitoring system of population's food availability, increasing agricultural production based on supply chain management, developing export and local agricultural products production. These objectives will result in the increase of the share of agriculture in GDP and reduction of dependence on imports. Furthermore, the paper opens a path for the future research of the focus area and use of applied econometric model in the countries with similar characteristics such as Khazakhstan, Nigeria. The economic linkage between the exchange rate volatility and agriculture sphere in those countries is believed to state some interesting findings that will let the authors investigate the relationship between exchange rate and agriculture in oil exporting countries much in detail.

THE ROLE OF THE ENERGY CHARTER TREATY IN FOSTERING AND PROMOTING ENERGY EFFICIENCY AND SUSTAINABLE DEVELOPMENT

Naimeh Masumy

University College London

Gower St, Bloomsbury, London WC1E 6BT, UK

ABSTRACT

The paper aims to critically analyze whether the Energy Charter Treaty (hereafter "ECT") can be considered a viable instrument to foster and safeguard the concept of sustainable development, whilst simultaneously promoting foreign investment. First, an overview of the investment protection regime under ECT will be set out, assessing whether or not the ECT ensures that investments are in line with environmentally sound practices. Secondly, this study examines whether references to energy efficiency and environmental concern could signify that this treaty does not only place importance on investment protection, but also considers energy efficiency an equally important objective. Subsequently, this paper will argue that whilst the ECT can be read as promoting sustainable development, this goal is often not realized when the ECT provisions are applied in reality. Finally, the article will propose some reforms that could be made to the ECT which ensures observing key issue related to energy efficiency and sustainable development

Keywords: *Energy Efficiency, Environmental Concern, Accountability, Regulatory Measures, Sustainable Development*

1. INTRODUCTION

The ECT provides a legal framework that creates predictability for foreign investment in developing countries. The ECT espouses predictability and non-arbitrariness (associated with the rule of law doctrine), which are cornerstones of a positive investment climate.¹ The current framework of ECT provides a secure and balanced investment climate for foreign investment to grow. The purpose of this instrument was to regulate states in their investment activity, and to protect and promote foreign direct investment. Promoting substantial rules on energy regulation arguably increases foreign investment in developing countries.² The key aspects of this framework promote transparency, stability and predictability in investment, with appropriate contract enforcement mechanisms, allowing business to operate efficiently.³ Equally, the ECT, amongst other international regulatory instruments, aimed promote sustainable development in investment activities. This ought to ensure that those affected by foreign direct investment projects benefit from sustainable practices.⁴ The inadequacy of the customary and international law governing states' duties in relation to alien property in developing countries prompted the international community to set minimum standards, governing states' investment activity. The paper examines whether or not ECT has, in reality, promoted sustainable development in investment practice. While the paper does not make a claim regarding the legal status of the principle of sustainable development, it will scrutinize whether the current articulation and reference of SD in the ECT effectively promotes the components of sustainable development.

2. GENESIS AND OBJECTIVES OF THE ECT

This section briefly remarks on the genesis and objectives of the ECT. The legal protection regime set out in the ECT will be discussed. The investment protection regime enshrined in the ECT framework offers extensive protection against the risk of regulatory changes, however, certain aspects of the ECT are weighted more so in favour of investor interests over state interests and the principle of sustainable development.

2.1. The Energy Charter Treaty's principles and objectives

The ECT is a unique multilateral treaty which was designed to consolidate the Former Soviet Countries with the rest of Europe by forming a common ground for foreign energy investment practice.⁵ It aimed to create long-term cooperation between the former soviet countries and European countries.⁶ Those countries were oil-rich but economically impoverished, and therefore in dire need of capital investment to bolster their economic growth.⁷ The end of the cold war granted an unprecedented opportunity to European countries to forge stronger economic bonds with Russia and its neighboring countries to support those states in their transition to market economies.⁸ Hence, The ECT has retained a distinctively European flavor and the provisions enshrined in the treaty have their roots in investment liberalization.⁹ Some scholars have even argued that the far-reaching investment protection regime contained in the ECT demonstrates how this regime was set out predominantly to protect the European countries' outward investment.¹⁰ The ECT focuses principally on the characterization of energy investment,¹¹ which makes this instrument markedly different from other treaties or bilateral agreements formed to protect and promote foreign investment. Article 2 of the ECT encapsulates the central theme of the treaty where it is explained that the treaty was formed "[...] to promote the long-term cooperation in the energy field, [...] in accordance with the objectives and principles of the Charter".¹² There are a number of objectives associated with the ECT, the most important one, which is claimed to be the cornerstone of the treaty, is the legal protection of foreign energy investment.¹³ In light of this regime, the ECT's provisions on investment issues attempt to ensure the creation of a "level playing field" for energy sector investments throughout the Charter, with the aim of reducing to a minimum the non-commercial risks associated with energy-sector investment in foreign countries such as discrimination, nationalization, damages due to war and exc. The ECT's deference to the principle of state sovereignty is enshrined in Article 18, 'Sovereignty over State Resources', wherein it is stated: "(1) The Contracting Parties recognize state sovereignty and sovereign rights over energy resources.¹⁴ They reaffirm that the state sovereignty "must be exercised in accordance with and subject to the rules of international law."¹⁵ It attempts to balance the desire of investors for extensive protection mechanisms and the need of the state to acknowledge its sovereignty over its natural resources and its discretion to regulate as it sees fit.

However, whether or not the inclusion of the principle of state sovereignty into Article 18 imports real obligations on investors remains unclear. This essay will further scrutinize in the next section whether or not article 18 has struck the optimum balance between investor protection and the principle of state sovereignty the promotion of sustainable development is another agenda that ECT pursues.¹⁶ It must be noted that the aim of promoting efficient energy and heightened environmental practices is well-grounded in the original intention of the treaty.¹⁷ References to energy efficiency and environmental concerns signify that this treaty does not only place importance on investment protection, but also considers energy efficiency an equally important objective.¹⁸ Crucially, the issue on climate change has been included in the treaty's preamble. This reference in the preamble indicates that the ECT at the time of its creation was wary of the implications of energy investment on the environment.¹⁹ It could also be argued that the inclusion of the Energy Charter Protocol on Energy Efficiency and Related Environmental Aspects suggests that the treaty's environmental agenda is not devoid of any meaning, nor does the ECT pay mere lip service to the concept of sustainable development. This principle requires states to formulate a clear policy for improving energy consumption and productions and reducing negative energy cycles.²⁰ The ECT Article 19 includes in the pursuit of sustainable development and taking into account its obligations under those international agreements concerning the environment to which it is party, each Contracting Party shall strive to minimize in an economically efficient manner harmful Environmental Impacts.²¹ Therefore, it can be argued that ECT serves an important role in ensuring that investments are in line with environmentally sound practices. However, as it will be discussed in the next section, whilst the ECT can be read as promoting sustainable development, this goal is often not realized when the ECT provisions are applied in reality.

3. THE LACK OF SPECIFICATION OF THE STATE SOVEREIGNTY PRINCIPLE IN THE ECT

Article 18 (1) of the principle of state sovereignty over the use of energy resources into the treaty. This principle aims to allow a state to fully or partially to regulate its energy resources as it sees fit.²² The subsequent provisions of Article 18 elaborate upon some of the specifications of this principle. Article 18(2) provides that the Treaty shall not prejudice contracting parties, or the rules governing their systems of property ownership and energy resources.²³ Article 18 (4) provides that each state continues to hold the right to decide the geographical areas to be made available for exploration and development of its energy resources and the rate at which they may be depleted or otherwise exploited.²⁴ The open-textured nature of Article 18 has led some scholars to question whether or not the invocation of this principle is practically possible or even conceptually plausible under the treaty.²⁵ The lack of a clear formulation of this principle means that state sovereignty lacks any real force, practically speaking. The provision proves difficult to read alongside provisions such as article 10 (1). It appears to be declaratory of general international law principles, and it does not clearly define how a state can derogate from

its obligations enumerated in earlier parts of the treaty. It seems to state the inherent right to legislate issues related to public policy²⁶, however, it is not explained how this should apply in reality. The subsequent statement of the ECT secretariat where he stated “this right must be exercised subject to the rules of international law”²⁷ did not shed light on what would be clear scope of this principle’s application. Essentially, the treaty does not specifically address in the event of conflict between the expropriation measures defined in Article 10 and the state sovereignty principle in article 18 which one would trump.²⁸

3.1. The Importance of the Principle of Sovereignty in Ensuring Sustainable use of Natural resources

The principle of sovereignty is a well-established principle, based in international law. This principle implies that states have a wide discretion to manage their own natural resources. Further, as McCaffrey would argue, the principle also dictates that states are under the duty to manage natural resources within their own jurisdiction in a sustainable and effective way, so as to conserve natural resources appropriately.²⁹ This author would argue that the lack of specification in international law as to the scope of state sovereignty has significantly undermined the pursuit of sustainable development goals, when balanced against the aim of increasing foreign investment. In addition, ECT does not impose any obligation on states to manage their natural resources in “ a rational, sustainable and safe way as to contribute to the development of their peoples.”³⁰ In fact, the ECT is generally agnostic towards the quality or potential negative effects of FDI. More importantly, it can be argued that ECT regulatory scheme does not grant states a discretion to determine the investment as being non-sustainable based on any specific qualitative or quantitative criteria. This constitutes a major pitfall of the ECT regime in fostering and promoting the notion of sustainable development.

4. THE NEGLECT OF THE CONCEPT OF SUSTAINABLE DEVELOPMENT IN INTERNATIONAL LAW

The issue of the sustainable development has now been situated on the forefront of the energy discourse.³¹ New international instruments attempt to embody this concept within their structures in order to be more responsive to the contemporary needs of the energy market.³² The energy market is rapidly evolving and there is a radical shift in the approach of energy production and consumption. The concept of sustainable development has been incorporated into many international legal documents and has captured some of these changes within the energy market. However, the ECT fails to attend to such non-commercial interests making the instrument unable to respond to the needs of the market. There is a cursory reference to the concept of the sustainable development within the ECT which has rendered it devoid of any real meaning. As discussed earlier, the ECT regime creates favourable conditions by imposing binding obligations on states with respect to their treatment of foreign investment. To this end, a wide asset-based definition of investment was adopted in this framework.³³ The term “investment” is envisioned in Article 1(6) which encompasses every kind of asset, owned or

controlled directly or indirectly by an Investor and includes: (a) tangible and intangible, and movable and immovable, property, and any property rights such as leases, mortgages, liens, and pledges.³⁴ This definition under the ECT is essentially a broad and open-ended list of every conceivable right or interest connected with investments.³⁵ The only limiting factor contained within the definition is that an investment ought to be closely related to an “Economic Activity in the Energy Sector”.³⁶ However, the association with such activity and the necessary degree of such association that must exist for a dispute to fall under the ECT dispute mechanism is not yet clearly articulated.³⁷ The tribunals in the *Yukos*³⁸ arbitration read article 1(6) (b) of the ECT as containing the widest possible definition of an interest in a company with no indication that the drafters of the ECT intended to limit ownership to “beneficial” ownership. In *Petrobart limited v the Kyrgyz republic*,³⁹ the tribunal considered that the claimant’s claim for payment under an ordinary sales agreement for gas condensate constituted an “investment” within the meaning of article 1(6) (f). This broad and commercially oriented definition does not include nor specify any qualitative criteria, nor refer to any social purpose of the investment in question.⁴⁰ It can be argued that ECT fails to encompass the notion of sustainable development by including whether or not the investment in question is environmentally or socially destructive. In essence, based on the current articulation of the ECT regime, a given investment is not disqualified from the benefits of ECT protection if it fails to meet sustainability criteria. However, this author acknowledges that making distinctions between sustainable investments and unsustainable investments is a task to be borne by states rather than international instruments. It is evident that the exercise of making determinations with respect to the sustainability of investments is fraught with conceptual uncertainty. It is suggested that there is no legal consensus on how various components of sustainable development can be optimally balanced and exercised. Provided that investments are invariably contextual and project specific, one is unable to strike an optimal balance between economic, environmental and social impacts of large investments in any legislation. A subjective assessment as to the sustainability of a given investment is required. Devising qualifying criteria to ascertain the sustainability of one given investment would amount to significant uncertainty and potential unfairness.

4.1. The Significance of Reconceptualization of Sustainable Development Within the treaty

The future drafters of treaty should be mindful that the cursory reference to the concept of sustainable development undermines sustainable development as a legal norm - it becomes more of an aspirational notion, devoid of any legal effect. No clear delineation exists as to what constitutes criteria for sustainable development at present within the ECT. It appears that the ECT adopted a formulation of sustainable development based on a reconciliation between economic growth and environmental protection, as opposed to a stand-alone concept in and of itself.⁴¹ The ECT regime failed to delineate what constitutes sustainable development. Reference to the three components of sustainable development: economic development; social development and environmental protection, as interdependent and mutually reinforcing concepts⁴² would go some way to remedy this deficiency.

⁴² Plan of Implementation of the World Summit on Sustainable Development, U.N. Doc./Conf.199/20 (2002) Para 4

As suggested by Duncan French, a leading scholar in the field of sustainable development, a new conceptualization of sustainable development is required within the ECT framework. Future revisions of the ECT should reflect and acknowledge the three main subsidiary principles by including social, economic and environmental impact assessments of any specific investment project, to be assessed at a local level.⁴³ This new pragmatic reconceptualization of sustainable development, by contextualizing it in the form of social, economic and environment impact assessments, overcomes the conceptual difficulties associated with defining what constitutes sustainable development. This articulation gives the concept teeth, and provides local and affected groups with the authority to balance environmental, economic and social concerns against the goal of increasing foreign investment in a particular area.

4.2. Propositions to streamline the sustainable development process

As Thomas Waelde and Stephen Dow assert there is a need to incorporate innovative investment promotion to stimulate investment specifically geared towards sustainable development goals.⁴⁴ Environmental protection is stipulated in terms of the ECT.⁴⁵ There is no friction or conflict between the investment protection regime and sustainable development goals. This author would argue that the ECT could be used to promote environmental concerns consistent with the sustainable development agenda. While, the ECT is cognizant of its broader position within the international realm to promote energy efficiency and sustainable development⁴⁶, however, this treaty has not been effective in shaping up the decisions on how the energy must be produced and developed in consistent with the sustainable development agenda. A number of steps could be taken to ensure the smooth operation of the concept of sustainable development. The following measures are proposed by this author to help the application of sustainable development goals to the ECT regime.

- a) Instead of setting out objective criteria to gauge the sustainable nature of investments, the ECT regime could establish sustainability impact assessments. Any given investment must undergo this assessment prior qualifying for the benefits contained in ECT. This process can include, for example, avoiding wasteful use of natural resources and promoting efficient waste minimization policies. Muchlinski's writings suggest that the best way to guarantee that state's comply with the results of such assessments is to impose specific contractual obligations on states.⁴⁷
- b) The ECT ought impose more onerous reporting requirements on investors. This could constitute reporting guidelines on economic, environmental and social performance of any given investment. The reporting system could operate prior to any investment being made and the reporting could be designed to monitor the social and environmental performance aspects of one investment. If the reporting requirement is not met to a satisfactory standard, then the host states will have the discretion to impose fines on investors, or revoke their right to continue with the investment project.
- c) The ECT could introduce a new framework for investor conduct that is inconsistent with the principle of sustainable development. The ECT arguably reinforces what is acceptable, with respect to the conduct of investors. The ECT could expressly include best practice norms, standards and guidelines in the treaty text. If investors violated the standards contained in the provisions, a host state could institutes proceedings to have the investors' rights abrogated.

5. CONCLUSION

As it stands, the ECT regime does not impair the concept of sustainable development. Indeed, aspects of the ECT framework actively promote sustainable development. The ECT is problematic, however, in that it only partially integrates the concept of sustainable development. The ECT lacks specification as to how to best promote sustainable development in practice. If the regime were to be revised, this author would argue for the integration of sustainable development principles by clearly delineating the scope of investment obligations and providing consistent and coherent mechanisms to promote sustainable development. The above suggestions highlight how the concept of sustainable development can have real effect, through an incorporation in the treaty of impact assessments, reporting requirements and a code of conduct for investors. The ECT should refer to all aspects of sustainable development, social, economic and environmental. Social development in particular should be referred to in future drafts of the treaty - as a concept, it includes good governance, respect for human rights and the promotion of human health. Future treaty drafters should be mindful of evolving international standards in order to a treaty optimal for the sustainable development agenda.

THE MAIN DIRECTIONS OF MONETARY SUPPORT OF MACROECONOMIC STABILITY IN MODERN CONDITIONS

Nigar Ashurbayli-Huseynova

Azerbaijan State University of Economics (UNEC), Azerbaijan
ah.nigar@mail.ru

ABSTRACT

The article considers the concept of sustainable development, the main directions of sustainable development concept. Particular attention is paid to the peculiarities of monetary assurance of macroeconomic stability in the context of globalization for sustainable development. By analyzing its impact on transmission mechanisms of monetary policy, the direct effect of financial globalization on influence of this policy is traced. The paper further notes that globalization can affect the incentives for central banks to control inflation and, more directly, inflation processes in the short and medium term. Investigating the materials, the author draws the conclusion that, theoretically, globalization can affect inflation and monetary policy through several channels. First, globalization can directly influence the MCP by changing the environment in financial markets. First, globalization can directly influence the MCP by changing the environment in financial markets. Secondly, financial globalization, i.e. higher international mobility of capital may have an imbalance, forcing central banks to pursue sound money-credit policies for sustainable economic growth.

Keywords: *Sustainable development, macroeconomic stability, globalization, financial globalization, integration, money-credit policy*

1. INTRODUCTION

"Achieving sustainable human development is the most significant problem facing the world community". This statement was made in 1987 by the UN General Assembly. Since then, it has not lost its relevance - the concept of sustainable development is actively discussed by world leaders today [1]. Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. The very concept was adopted at the United Nations Conference on Environment and Development, held in Rio de Janeiro in 1992. The concept of SD was formulated by means of relations of three directions: economic, ecological and social.

2. RESEARCH

Over the past 20 years, the interconnection and interdependence of countries has increased significantly. This is manifested in all spheres, including trade, production and financial markets. The processes taking place in economies of some countries are rapidly transferred to the economy of other countries in one form or another. The concept of globalization is used to describe the growing interdependence of countries. The processes taking place in the world and in neighboring partner countries have not bypassed our country. As, in December 2015, 20 year-long financial stability reacted to a sharp decline in oil prices and a continued weakening of the currencies in the main trading partner countries by transition to floating exchange rate regulated by the Central Bank. After transition to the new regime, the stability of the financial markets has been restored as a result of the successful financial policy of the state in pursuit of manat's equilibrium. For comparison, it was not possible to reduce the ardor in the financial markets of Russia or Kazakhstan in such a short period of time after transition to floating currency regime. The process of melting the Central Bank's strategic currency reserves was stopped only through fiscal strain and monetary support measures. Although monetary policy has achieved its ultimate targets and controlled manat's exchange rate and inflation, the impact

of unfavorable conditions in world markets has not been neglected by the real sector and banks. "Standard & Poor's " (S & P) agency has lowered Azerbaijan's credit rating from BBB to BB +. At the same time, the rating of different commercial banks operating in our country has been downgraded. In March 2016, was established the Financial Markets Supervision Chamber public legal entity- mega regulator, which was able to respond the calls from current financial markets more effectively and flexibly. In addition, in order to consolidate the stability of banking sector further steps have been taken by the Central Bank, and currently there are 37 banks operating in our country. It is already possible to notice the benefits of economic reforms in Azerbaijan in the financial sector. In particular, the policy of economic inculcation through the banking sector is successfully implemented in the context of manat and price stability. Rapid economic reforms and good infrastructure form the basis for economic growth and sustainable growth. With the purpose of sustainable development and monetary assurance of macroeconomic stability in the context of globalization, it is necessary to trace the direct impact of financial globalization on the MCP impact, analyzing its effect to transmission mechanisms of the policy. Attempts to synthesize various theoretical approaches to monetary policy led to the fact that several channels of this policy with impact on economic activity have been allocated:

- interest rate channel;
- exchange rates channel;
- credit channel;
- a channel associated with asset prices

Transmission mechanisms are the channels through which the decisions of the MCP affect the economy. Probably the most famous of them is the interest rate channel. Although the MCP instrument is a very short-term interest rate, long-term rates have a greater impact on savings and investment decisions. The direct channel is linked to the interest rate on the basis of the IS-LM model. The channel related with the exchange rate shows the effect of changes in exports and imports. The credit channel takes place when banks react to monetary policy mainly by changing interest rates and lending. The channel associated with asset prices shows how the level of investment and consumption changes as a result of a change in the share price. In the first approach, proceeding from what has been said, the process of globalization is connected with the exchange rate. The channel effect associated with the exchange rate can be complicated by the fact that the exchange rate, in addition to the interest rate, is set by the central bank within the country, depends on many other factors, including the state of foreign trade, economic situation in the trading partner countries, changes in the mood of market actors and confidence in the policy of authorities. In modern conditions the exchange rates are characterized by relatively high volatility (changes in interest rates). the channel activity associated with the interest rate in those countries where financial markets (including bond markets) are underdeveloped and the banking system is based on external financing, providing mainly short-term domestic loans is particularly complex. This situation is common to many developing countries. International integration of financial markets is called financial globalization. This definition implies an increase in cross-border capital flows and the trading of financial assets in the financial-global world. The global nature of financial markets has created a favorable area for the growth of financial innovation, which in turn has made financial markets more closely integrated and complex. Lucas Papademos stated in his speech that financial globalization, measuring both the amount of stocks of foreign assets and the external liabilities of the entire economy as a percentage of GDP, tripled in the advanced economies from the early 1990s to 2004 and only in the Euro area the amount of outstanding foreign assets and liabilities increased from 190% of GDP in 1999 to 280% in 2005 [3]. In Azerbaijan, GDP in real terms decreased by 3.9% to 43.4 billion manats. GDP per capita amounted to 4512.5 manats [4].

Another statistical indicator of financial globalization is the correlation between financial variables in different countries. A high correlation between short and long-term interest rates and asset prices indicate a higher financial globalization. Correlations between variables in financial markets increased with increasing financial interdependence. High rates between financial variables are due to the growing secondary effects of national financial markets on other countries. In the context of financial globalization, the task of developers of monetary policy becomes more and more complicated. They may also need to take into account international developments when making decisions in the area of monetary policy. The integration of financial markets can affect the transmission mechanism of monetary policy, making some channels more important, and some others less effective, in contrast to the case in the past with less integrated financial markets. MCP operates through the control of short-term interest rates. Changes in the short-term interest rate affect the conditions in financial markets, affecting long-term interest rates, bank loan offers, capital and asset prices and the exchange rate. Expectation theory of the timing structure states that long-term interest rates represent the average of the expected future short-term interest rates. Thus, in the international integrated financial markets, the sensitivity of the long-term interest rate and the price of long-term assets to a short-term interest rate may decrease due to the influence of international market conditions on long-term interest rates. Does this mean that monetary policy has lost its effectiveness in the context of financial globalization? The discussion is not resolved, and the number of studies is growing on this issue, especially after the financial crisis of 2007. Some authors argue that the ability of central banks to monitor monetary policy depends on enhancing financial globalization. For example, Rogoff argues that even large central banks have less direct control over the medium and long-term interest rate at present than it could be in the case of less integrated financial markets [5]. Inflation in the period of globalization. Inflation is a deterioration in the purchasing power of money. This happens when the central bank carries out money issuance in a volume larger than the demand from the market. The result is a possible increase in all prices and salaries. And while the discrepancy between supply and demand for money remains, prices and salaries will grow. Globalization can complicate the process of inflation only if it somehow disrupts the work of the central bank, but this seems unlikely. In fact, some scientists believe that globalization has actually improved the behavior of central banks, punishing those whose currencies do not have a stable purchasing power. Average annual inflation in Azerbaijan in 2016 was 13.3% [4]. Indeed, world inflation was moderate in the 1990s, as the global integration of financial markets accelerated. For example, according to the IMF, from the early 1970s to the early 1990s, world inflation averaged about 16% per year. Since the mid-1990s, world inflation has averaged slightly less than 5% [6]. Most of the recent improvements have come from developing and emerging countries with market economies - groups that previously did not have monetary and political discipline. By the middle of the 1980s, central banks in key developed countries, especially in the US, Britain, Japan and many European countries, had regained confidence in what they lost in the 1970s. In these countries, residents benefit both from direct consequences of low and stable inflation, and from the indirect influence of having a currency with an international reserve status. Ultimately, as long as the central bank has an independent monetary policy, that is, it is not tied to a fixed exchange in which its hands are tied - the level of inflation is determined by money-credit policy. Kenneth Rogoff argues that globalization has led to greater price flexibility, which has reduced the ability of central banks to use inflation surprises to increase output [5]. As a result, central banks will have less interest in trying to use a short-term trade-off between inflation and unemployment. Globalization, as it makes markets more competitive, also has the potential to stimulate productivity growth. Higher productivity growth can lead to lower inflation, since it directly reduces prices if the MCP does not become more expansionary. In addition, such growth facilitates monetary regulation institutions permission to reduce inflation, as production

growth will continue at a rapid pace when inflation decreases. Since globalization increases competition, it can also reduce margins, and this reduction can lead to a drop in relative prices. However, lower mark-ups and price levels should only have a temporary effect on inflation. In addition, forecasting lower margins as a result of globalization, appears to be contrary to the high rates of corporate profitability, which we are seeing now in the world. One of the characteristics of globalization is that it has brought more than a billion new workers into the world economic system from China and India. Some observers argue that, thanks to the sale of cheap goods, developing Asia, and especially China, "exported deflation" and will continue to do so until salaries in these countries increase.

2.1. Relative price changes

Of course, prices can change not only because of inflation. Prices are constantly adjusting to changing pressure from supply and demand. Economists call this the adjustment of the relative price, and it is fundamentally different from inflation. Relative price changes reflect important information about the deficit of specific goods and services. The rise in the relative price indicates that demand is higher than supply (or that the supply lags behind demand), while a fall in the relative price indicates exactly the opposite. Inflation, on the contrary, does not provide any information useful for our consumption, production and choice of labor. In any case, inflation can add noise to the price signals that inform us of our decisions, and can lead people to erroneous economic choices. Worse, inflation can cause people to divert time and resources from activities conducive to production and long-term economic growth, and to activities that serve only to protect their wealth, and not to expand it. Globalization is not detrimental to the central bank's ability to control inflation, but history shows that it can sometimes increase relative price changes by exerting more pressure on global demand and supply from individual countries. Some of them directly affect the purses of consumers, as well as the prices of imported and exported goods. Many domestic industries use foreign resources, so domestic costs can grow and fall with global price shocks. Similarly, external competition will affect the pricing strategy of domestic firms and the salary requirements of domestic labor organizations. Some of the beneficial effects of globalization are even harder to see. Developing specialization, global integration on the market slowly increases productivity and reduces unit costs, thereby supporting lower inflation. Risks associated with a sharp decline in global financial imbalances. Incomplete financial globalization, reflecting the low level of financial market development in other fast-growing emerging market countries combined with the hypothesis of "excessive saving," can partially explain the current level and evolution of global net foreign assets and liabilities. Participants in the financial market may eventually question the sustainability of some of these policies and change their behavior in anticipation of their final consequences. There is no doubt that financial globalization contributes to the international division of risks, promotes economic growth and reduces macroeconomic instability. However, the size and specific asymmetry of the positions of net foreign assets observed since the late 1990s are associated with potential mid-term and long-term risks to financial stability. Main and sharp corrections to asset prices associated with the disorderly elimination of global financial imbalances can become the main mechanism for dissemination of financial instability. At the same time, practice demonstrates the persistence of a significant number of countries, mainly developing ones, seeking to regulate the rates of their currencies. One of the brightest manifestations of this trend is the significant growth of world foreign exchange reserves in recent years. These processes support the world monetary system, indirectly based on the prevalence of the US dollar, primarily as a reserve currency. If the world monetary system changes to bipolarity, first of all, in terms of substantial enhance of the role of the euro as the currency of reserve assets, the national currency policy will face new significant external risks.

Bogomolov O.T., emphasizing the influence of globalization on the stability of national financial systems, states that even in situations where financial crises can be triggered by internal causes (for example, erroneous state policy), the presence of significant short-term speculative capital flows and its possibility of rapid exit from the country increases the impact of these crises [7]. Improvements in information and communication technologies have become important factors of globalization. Consequently, in a globalized world where goods and services can easily be obtained from low-cost suppliers, access to foreign financial markets is readily available, and capital flows across national borders can have important implications for MCP. Changes in the economic environment due to global forces can change the relative importance of the channels through which MCP operates. The theory suggests that the key elements of the MCP structure, such as the inflation process and the transmission mechanism, can be affected by the global integration of financial and commodity markets through various channels. Moreover, globalization can have a permanent impact on prices. The importance of globalization consequences MCP is emphasized by central banks and scientific researchers [8]. It is generally recognized that MCP bodies can no longer ignore international developments in the context of globalization. Consequently, the adoption of MCP has become a complex task. Theoretically, globalization can influence inflation and monetary policy through several channels. First, globalization can directly affect MCP by changing the environment in financial markets. In integrated financial markets, MCP transmission mechanism can be affected by changing the relative importance of transmission channels. Moreover, the response of the long-term interest rate to short-term rates may decrease due to the impact of international market conditions on the long-term interest rate. Secondly, financial globalization, i.e. higher international mobility of capital, may have an imbalance, forcing central banks to pursue sound money-credit policies. Globalization can affect domestic inflation through trade. Trade integration can have a direct impact on inflation through the import price channel and the indirect effect through increased competitive pressures. Cheap imports from China and other developing countries put downward pressure on prices, when this import is used as a contribution to the production process. However, the effects may not be in one direction. Reducing pressure on prices due to lower imports can increase the purchasing power of consumers, which they will use to buy other products that increase the pressure on the prices of these products. In addition, the growth of international trade is associated with high productivity growth in developing countries, such as China and India. The high demand for raw materials from these countries increases the pressure on the prices of manufactured goods. These compensating effects may be one of the reasons for skeptical and mixed empirical data on the impact of globalization on domestic inflation.

3. CONCLUSION

Certainly, the ongoing global economic integration is a phenomenon of the greatest importance that will contribute to the formation of the Azerbaijani economy for decades. Globalization did not have a significant impact on the ability of the CBAR to affect the financial state in the country and did not lead to substantial changes in the process that determines the level of inflation. However, to adopt an effective MCP, it is now necessary to consider a variety of global influences, many of which have not yet fully understood. The CBAR continues to give high priority to understanding the influence of globalization on the economy of the country as a whole and on conducting of the transmission monetary policy of Azerbaijan in particular.

THE ROLE OF ICT IN TOURISM GLOBALISATION

Nigar Abdullayeva

Azerbaijan State University of Economics (UNEC)

abdullayeva.n@gmail.com

ABSTRACT

Nowadays, tourism is a global computerized (digitalized) business, including participation of airline companies, hotel chains, and travel corporations. Globalization has become not only the real basis for the formation of mass tourism, but also has a tremendous impact on innovative activities in the socio-cultural sphere. Tourism uses advanced technologies, which include new products, microprocessors, media and communication technology. Given that approximately 1/7 of the world's population are involved in the tourism activity yearly, we can confidently discuss the actuality of challenges in tourism. The emergence of modern means of media and communication (ICT) has a profound impact on economic production and people's daily routine activities. Contemporary tourists' activities, the work of tourism companies and organizations cannot be imagined without ICT. Currently, customized technologies tailored for individual tourism are demanded and being developed at a rapid pace. The aim of the study is to examine Azerbaijan's potential in the implementation of innovative technologies in the sphere of tourism. The research of tourism companies and organizations' activities countries shows that they achieve success not only through ICT, but also through an individual approach to building an innovative model of managing the tourism business. The possibility of implementing innovative models of tourism business management is regulated exclusively by the state. State policy, legislation, environmental protection, healthcare, the level of development of human and natural resources are indicators that determine the effectiveness of the country's tourism sphere. Based on this, the study attempted to identify the impact of these indicators on the efficiency and optimal level of performance of the tourism business in Azerbaijan. As a result, innovation in tourism should be aimed at creating a new or upgrading and customizing existing products and services, improving transportation and logistics infrastructure, hospitality and other services, developing new niche markets, as well as implementing advanced ICT into organizational and management activities within the industry. With the introduction of advanced technologies in the field of tourism, the term "globalization" began to have a more fundamental role, providing access to data recreation types, prices, online accessibility to accommodation details and purchase of tour packages. This kind of new approach had a great influence not only in the sphere of tourism on the global scale but also exerted an influence on the development in the respective countries. Considering Azerbaijan's historical sightseeing places, one of the ideas recommended to be realized is the implementation of Augmented Realities (AR) in the tourism industry. Unfortunately, over the past few years, we have witnessed a significant decrease in the numbers of tourists visiting the museums. Through the help of the integration of AR in the application, the process of viewing the exhibits can be made more interactive, resulting in the hands-on experience, which will make the country's history more memorable for tourists. Consequently, innovations in tourism should be considered as permanent, global, and dynamic processes.

Keywords: *Augmented Reality, Information Communication Technology, innovation, tourism*

1. INTRODUCTION

Tourism is an information-enhanced sphere of the economy. It influences economics, ecology, social factors, religious relations, cultures, and other scientific categories in the field of human activity (Smeral E., 1996: 395). In Azerbaijan, the direct contribution of tourism related activities generated 4.2% of total GDP in 2017.

Tourism industry has been highly impacted by the globalization of information and the advent of information and communication technology (ICT) particularly during last decade. McGrew states that globalisation consists of a multitude of interconnections and a mutuality of influences between countries and societies making up the current global system (McGrew A.,1992). New patterns have evolved by globalization of information, technological convergence and open innovation. Contemporary tourists' activities, the work of tourism companies and organizations depend on ICT. Information and communication technologies play crucial role in developing sustainable tourism within the country. Since the tourist product is not tangible for the consumer, the role of timely submission of relevant, comprehensive, reliable and high-quality information is important. The tourism and hospitality industry in Azerbaijan is developing from year to year and is a source of income in the country's economy outside the oil and gas industry. The development of innovation and related processes in tourism is necessary both at the state level and at the level of tourism enterprises. So, as a sustained high level of innovation in this area contributes to the competitiveness of tourism organizations and enterprises at the micro level, which in turn leads to the prosperity of the regional economy.

2. ICT IN TOURISM INDUSTRY

Tourism is a complex phenomenon that plays an important role in socio-economic development of a region. The development of tourism in a certain direction includes many stakeholders, for whom it represents a source of economic and social progress as well as causes negative consequences at social, environmental and economic levels. It is for this reason that the tourism industry should pay attention to ensure sustainable growth, which is the creation of an innovative environment that provides tourism business projects that do not bring added value only for tourists, rather for stakeholders. Today, it is difficult to imagine tourism industry without the use of the Internet, given that it has following advantages:

- effective and relatively less costly advertising
- access to up-to-date information on rates and prices of accommodation, restaurants, political and economic environment in different countries, newsletters/updates regarding legislation on tourism in countries, etc.
- promotion and marketing of product and services in tourism industry
- access to online reservation systems and platforms

Innovations are not limited to the travel system, they can relate to a small boutique family hotel, which launched its first website, or simply a restaurant that will enrich its offer with new menu - innovation is an improvement and a desire to develop an enterprise and adjust it to fulfill market needs. Sources of innovation in the tourism industry can occur outside of the industry itself. One such example is information and communication technology (ICT), which is primarily fostering the innovative development within tourism (online services such as electronic registration and online booking systems). On a functional basis, information and communication technology (ICT) in travel agencies are divided into three classes:

1. main technological systems that ensure the implementation of customer orders (reservations)
2. support systems that provide automation of the work of tour operators on the formation of documents - bills, vouchers, tickets and business trips of mutual settlements with the main computer and transport systems
3. management systems that update the data on the activities of firms and provide managers with information.

New systems should integrate all these functionalities on the basis of global telecommunication networks or specialized computer systems for booking travel services.

Partially, as a result of implementation of ICT in the tourism industry in Azerbaijan, the number of tourists in recent years in our country has increased significantly. Based on the chart, we can see that in 2017 and 2018, most of the visitors were from Russian Federation, while least from Asia.

Figure 9: Number of foreign tourists (thousands) from 6 countries / regions in 2017 and 2018 (Azerbaijan Tourism Board (ATB), 2018)

Nowadays, tourists are becoming more self-sufficient thanks to the ease of access to wide range of information in various online platforms and social media. ICT triggers faster transfer of information and boost networking activity that strengthen the effect of globalization. Fundamental shifts in human information flows is associated with the rise of social media. Internet services such as Instagram, Facebook, Twitter, YouTube are being utilized increasingly, enabling exchange of experience and information. For instance, any individual may utilize online search engines, social networks to plan desired trip and minimize services charges and other related expenses. On the other hand, abundance of information triggered by emergence of new technologies makes consumers demanding more individualistic and customized services and products in tourism industry. Thus, currently, customized technologies tailored for individual tourism are demanded and being developed at a rapid pace.

3. AUGMENTED REALITY (AR) IN TOURISM INDUSTRY

Higher demand for more customized and creative products and services requires creative tourism. The term was first defined by Richards and Raymond as an extension or a reaction to cultural tourism offering visitors the opportunity to develop their creative potential through active participation in learning experiences of the holiday destination. (Richards, G., Raymond, C., 2000). While, UNESCO defines creative tourism as participative learning in the arts, heritage, or special character of a place that provides a connection with those who reside in this place and create this living culture. In the context of tourism, smart applications of technologies (e.g. cloud computing, location-based services, virtual reality, augmented reality) enhance the tourism experiences and services and generate creative tourism business models. Augmented Reality might be related to one of such technology application in the tourism industry, supporting visitors in obtaining precious information and enhancing their knowledge regarding sightseeing places while improving the tourist experience and offering more amusement throughout the process. In general, Augmented Reality refers to the enhancement of the real environment by computer-generated content, which is up to date mostly supplemented with graphical content (Hyun et al., 2009). The application of Augmented Reality is quite wide: from industry and medicine to education and culture. Today, in various areas of the tourism industry, almost all combinations of VR/AR devices and applications can be found.

Hotels may begin using 360-degree photos and videos to promote themselves. Many museums may use technologies like AR to “install” large virtual objects in their premises, for example, a ship or an airplane. Booking accommodation might be one of the most challenging activities in traveling. Selecting by photographs alone, it may not be easy to remotely choose a hotel or resort. Even in the case of professionally taken and processed photos on the hotel's website, the risk of their deceptiveness is inevitable. But if you could see 360-degree photos or videos of the accommodation, then it would be more difficult to hide the shortcomings of the room from the potential client. Of course, a person is unlikely to enjoy looking at a stained carpet during a virtual tour, but at least he/she will not be misled and will be able to look for a best alternative. Besides, Augmented Reality can help to make a decision regarding the trip. Even before the departure to the destination country, a person can see the landscapes and sightseeing places of selected region, country and a city. Thanks to augmented reality, there is a unique opportunity to travel in time. By utilizing AR tourists have an opportunity to learn and enhance their experience in historical places including castles, state reserves, settlements and artifacts in the museums. Now tourists can see how the buildings, streets, and cities looked like many years ago. Plunging into the atmosphere of past eras, tourists become full participants in various events of the past. National Reserve Park and museums may potentially increase number of visitors by attracting more visitors with the help of AR. Gobustan State Reserve, Shirvanshah's Palace and many other historical place of Azerbaijan Republic can harness in the future benefits of AR application. Furthermore, AR has potential to face translation challenge that tourists often face during their trips to foreign countries. Implementation of AR technology facilitating real time immediate translation of street and transportation signs, magazine headlines, restaurant menu and others makes the trip more pleasant and consequently the place more attractive for the tourists. In addition to Augmented Reality customized applications may be created. Imagine, a person is walking around the old city. Instead of just taking photos as ordinary tourists do, he/she would like to get unique experiences. A person can create a customized tourist application, where it shows a route according to preset preferences. For example, if a tourist would like to see 40% romantic, 10% historical and 20% restaurants, consequently the application will be showing the route that is fully responsive to his/her desires. A visitor can easily find excellent restaurants and cafes, and at the same time, and not need to worry that he/she will miss the most desirable sights since those have already been indicated them the preferences.

4. CONCLUSION

Nowadays, tourism is a global computerized industry, including participation of airline companies, hotel chains, and travel agencies and related organizations. Globalization has become not only the real basis for the formation of mass tourism, but also has a tremendous impact on innovative activities in the socio-cultural sphere. Certainly, the creative tourism is one of the newer forms of tourism that are particularly attractive for contemporary tourist. Carrying out a study of the Azerbaijan's tourism market, it is worth highlighting that the region is at the crossroads of Europe and Asia. As trade routes of the Great Silk Road passed through Azerbaijan caravanserais were built in all major cities to accommodate the merchants. Some of the surviving caravanserais in Baku and Sheki are still used as hotels or recreational sites. Tourists may have memorable and valuable experience as the country has many particularities such as geographical diversity, favorable and diverse climate, a unique combination of natural and recreational resources, rich cultural and historical heritage, extensive sanatorium-resort base, exquisite national cooking, etc. Thus, in order to attract more visitors in today's competitive conditions, it is crucial to rejuvenate authentic places in innovative ways offering unique cultural experience to the tourists visiting it.

Furthermore, the subsequent steps should be followed for sustaining favorable environment for tourism industry:

- focusing on online marketing, integrating into globally utilized platforms such as Booking.com, Trivago, AirBnB and etc. In addition, it is necessary to promote the distribution of not only luxury hotel chains in large cities, but also budget hotels and hostels, as well as rental of private houses. In addition to benefiting from existing online platforms, develop conditions for online accommodation bookings and many other services in medium and inexpensive hotels. The presence of applications and websites in such hotels, in the first place, will make them easily accessible, as well as create many jobs for programmers and people with technical background and skills.
- In order to better familiarize tourists with local cultural traditions and experiences, advertisements must be allowed to help guests learn about local crafts: carpet weaving, making pottery and wickerwork, visiting local events and businesses that can make their holidays more memorable.

Last but not least, it is essential to establish and implement particular strategic plans for development of tourism in the country at national, and to then move towards more scrutinized and customized agenda in the development of creative tourism, which will lead to the positive outcome. Along with other issues, agenda should tackle the challenge of suppliers within tourism industry who are sometimes not heterogeneous and not always rare in line with globally accepted quality standards.

THE IMPACT OF THE FLUCTUATION OF GLOBAL OIL PROCES ON AZERBAIJAN'S BUSINESS DEVELOPMENT

Nijat Mursalli

*Department of Economics and Business Administration at UNEC Business School,
Azerbaijan State University of Economics (UNEC)
The Republic of Azerbaijan
nijat.mursalli@unec.edu.az*

ABSTRACT

According to statistics, Azerbaijan's exports were valued at US \$15,5 billion in 2017. This puts Azerbaijan at 76th spot among 224 countries in the world. Oil contributes 90% of all exports. Thus, oil prices in the global market have a significant effect on the economy of Azerbaijan. After gaining independence and the realization of "the Contract of the Century", signed in 1994, a new stage in the development of the country began. This led to the establishment of global companies in Azerbaijan. They not only invested in the economy but also brought their innovative corporate management culture. A cadre of modern managers began to form. Starting from 1995, with the cash flow generated by the oil industry, economic revival has been observed in the country. Not surprisingly, a large portion of Azerbaijani population is employed by the companies started after 1995. During the time period between 2003 and 2015 there had always been an increase in oil prices, with an exception of a short decline period in 2008-2009. In 2003-2015, during the period of high oil prices in the global markets, there was a boom in the construction industry; and large-scale state level projects were implemented in Azerbaijan. The buying power of the population was quite high. For this reason, the local businesses, making an ever-increasing profit, did not see any issues with their management system. The drastic fall in oil prices in 2015, resulted in The Central Bank of Azerbaijan switching to the floating exchange rate regime. Because of a steep devaluation, US dollar saw a rise from 0.78 to 1.70 manats. This resulted in a change in the population's income, which, in its turn, caused a change in the purchasing behavior of the customers. Consequently, the businesses suffered a significant loss of income. The crisis has revealed some critical issues in the management of the local businesses. The following problems have been identified:

- *Incorrect operation of a company's management system.*
- *Poor management of storage for finished goods and raw materials.*
- *Failure of a timely renewal of a product portfolio.*
- *Lack of price strategies.*

Business owners have started the implementation of reforms in the management shortly after the crisis. These include the following:

- *Recruitment of professional managers.*
- *Recruitment of consultants to make changes in the management structures.*
- *Studying the experience of the world's leading companies.*
- *A close collaboration with universities.*

Keywords: *Azerbaijan's exports, Steep devaluation, Business Environment of Azerbaijan s, Low oil prices, Azerbaijan's economy and business*

1. INTRODUCTION

Over the past decade, Azerbaijan has been amongst the top countries in terms of the economic growth rate. With the income generated through the successful oil strategy, the infrastructure

has been modernized, non-oil sectors have been developed, the social well-being has been improved, the state assets have been increased, and the strategic currency reserves have been accumulated in excess of GDP volume. As a result of the sharp fall in oil prices of 2014, Azerbaijan and its major trading partner countries were hit by a crisis. This caused an economic slowdown in the country. (Strateji Road Map, p. 4) The balance of payments and non-oil budget deficits were created. The decline in financial and banking sectors has led to a necessity of transition to a new economic development approach. By focusing on new “high-end” sectors, which will ensure sustainable development, the structure of economy will be re-balanced through higher growth of non-tradable sector versus tradable sector, processing versus production, private business versus public business, high technology intensive sectors versus low technology intensive sectors, sectors based on highly qualified labor versus low qualified labor, high return markets versus low return markets and high value added generating sectors versus low value added generating sectors. The structure of national economy may be renewed through the improved business environment, establishing fiscal institutes within medium term expenditure framework, recovery of the financial and banking system and improvement of the monetary system based on floating exchanges rate, as well as enhanced access to foreign markets.

2. EXISTING MACRO ENVIRONMENT IN AZERBAIJAN

According to 2017 statistics, Azerbaijan’s exports were valued at US \$15 billion. This puts Azerbaijan at 76th spot among 224 countries in the world (Azerbaijan Statistic Committee). Oil contributes 90% of all exports. Thus, oil prices in the global market have a significant effect on the economy of Azerbaijan. The Azerbaijani economy will develop in an environment exposed to the effects of various changes in the medium and long-term perspective. Observing and understanding such effects is crucial to coping with the difficulties that they cause and exploiting the benefits they have. While the probability of occurrence of unpredictable processes is high, the first signs of some of the global trends that will be affecting the global economy over the next decades have already been seen. It is expected that four of these effects will be important for Azerbaijan: displacement of the global economic power center to emerging markets in Asia, significant impacts of technological innovations, changing geopolitical configuration, and oil and gas prices. Over the past years, oil prices have fallen and volatility in the prices has risen: while the price per Barrel was close to US \$150 in 2008, it dropped even below US \$30 at some point in 2016. (Source: Economist Intelligence Unit) Such a global decline in oil prices has had an impact on the Azerbaijani economy. Hence, according to The State Statistics Committee of Azerbaijan Republic, the rate of economic growth in 2010-2014 slowed down and amounted on average to 2.7% a year. Decline in the state budget revenues and the volume of exports in 2015 resulted in an increase of unemployment rate by 2% compared to the previous year. Due to low oil prices, the tensions on the Balance of Accounts increased pressure on manat exchange rate and in 2015, the national currency suffered a twofold devaluation. The forecasts reveal that the growth in global oil demand will decrease annually by approximately 0.7% by 2050 (30 percent less than the previous forecasts indicated) and the share of fossil fuels in the overall energy sector will decline. Under these conditions, oil prices are not expected to return to their previous high levels. Thus, it will not be feasible to restore sustainable growth with oil revenues in the near future. The International Monetary Fund predicts that Azerbaijan's economy will grow by 2-3% per year by 2025. This tempo is consistent with the observed growth rate over the past few years. However, this low level of growth is not sufficient to reach the goals of the economy, including the creation of jobs for the current and future generations. Therefore, under the conditions of low oil prices, Azerbaijan will achieve higher rates of growth by laying new foundations for the economy (Strategic Road Map, p.6).

As the potential of the oil and gas industry is weakening, the countries rich in natural resources, like Kazakhstan, Saudi Arabia, and Russia, face difficulties and seek to diversify their economies. The same situation exists in Azerbaijan. The country has strong political will and means to further strengthen its positions in the global economy on the basis of its base created over the past decade.

3. BUSINESS ENVIRONMENT OF AZERBAIJAN

In order to reduce the negative impact of low oil prices on the business environment, the Azerbaijani government has prepared a Strategic Roadmap on National Economic Perspectives. Improvement of the business environment in the country is a major topic of the document. However, in the globalizing world, domestic businesses operate under the competitive environment. Competitiveness depends on the company itself. Under the conditions of high oil prices business owners in the country felt very comfortable. In the past, Azerbaijani business could be characterized with the following words: "fast, uncontrolled and dangerous growth". Companies used to grow geographically, financially, and physically; this was dangerous because human resources, the most significant investment in business, did not grow at the same pace. The issue was that companies could not digest their growth. As a consequence, the short-term success of the firms was the reason of their long-term failures. As a result of sharp decline in oil prices in 2015, businesses came to realize that, besides sales and accounting, there are other strategic areas such as human resources management, motivation, relationship with customers and individual approach to them. Therefore, business owners have begun to hire more professionals. Fortunately, the role of management of human resources in companies has been increasing (Strategic Road Map, p.9). While earlier HR's role was only being involved in the most primitive forms of recruitment and meeting the needs of the sales department, these days HR has already started to occupy a worthy place in many companies. The characteristics of managers have started to change: today's business manager is an expert who can focus on issues such as efficiency and productivity, has the ability to maximize the profit with the resources available as well as unite the team with his/her leadership skills. The focus of all these alterations is customer. In his famous "The Competitive Advantages of Nations", Michael Porter wrote, "A nation's companies gain competitive advantage if domestic buyers are the world's most sophisticated and demanding buyers for the product or service. Sophisticated, demanding buyers provide a window into advanced customer needs; they pressure companies to meet high standards; they prod them to improve, to innovate, and to upgrade into more advanced segments. As with factor conditions, demand conditions provide advantages by forcing companies to respond to tough challenges". Today's Azerbaijani consumers can be characterized as follows: "rational, demand the best quality and service for their payment, knowing their rights and how to demand them". In a period of increasing competition, companies have become more serious about closer cooperation with their customers and have become more active in their sales activities. One paradoxical point should be mentioned: during the periods when sales in the country were increasing, sales did not have a classic sense of sales, as our sellers did not sell; rather it was the customers who were willing to buy. These days, the situation has changed; and companies are not only creating active sales teams, but they are also checking how effective these specialists are. The approach of businesses to the topic of profit has also changed, meaning that they do not just work on increasing the profits, but control the costs as well. Moreover, this is an infinite process since there are always possibilities to optimize expenses, which is one of the key priorities of top managers. The businesses began to understand that the strategy of the company should not only be based on short-term goals, as long-term objectives and a strong team that has gathered around the same values are needed (Fakhri Aghayev, 13 February, 2018). There is a saying that: If there were no crises? They world have to be created.

In Chinese, the word “crisis” can be expressed with two characters: danger and opportunity. Along with the damage it has inflicted, the decrease in oil prices has had a positive impact on the business development in the country. Due to the lower sales of the companies, the business owners were forced to move out of their comfort zones. The crisis gave business owners expensive but positive lessons. It has considerably extended the lifetime of surviving companies. Positive lessons learned from the crisis can be summarized as follows:

1. Companies began to value their customers more since they realized that it was becoming increasingly difficult to find new customers in the shrinking market; and thus, they became content with the existing ones. As a result, many of the businesses started to invest in CRM programs and systems.
2. Awareness of rationality, cost optimization, and efficiency was raised at both the company and individual levels.
3. The companies realized that the competition they face during the crisis could be turned into their own advantage.
4. Business owners understood that the crisis has not really started with the decline in oil prices and devaluation. The actual crisis began because they were not ready
5. It is more difficult to make a real difference in the market when everyone is in good condition. In this sense, crisis is an opportunity for those companies who can make a difference.
6. The crisis broke down the stability syndrome in many companies. They had the chance to make radical changes that they could not make for a long time. Conservative workers have accepted those changes more willingly.
7. The crisis has once again confirmed that business models required by a modern business environment are needed. More traditional, obsolete business models are more prone to failure during critical times.
8. The companies have come to the realization that it is necessary not to delay building a sustainable system. In the crisis, only the companies with sustainable systems started applying for business consulting.

In the book, *Navigating Through Crises: A Handbook for Boards*, created by the IFC in 2010 it is stated that good corporate governance may be of great value to any organization’s ability to prevent negative events from affecting the company or escalating to a crisis or disaster level. Crises have many causes, sometimes external, sometimes internal; some come suddenly, while others evolve over time; some affect whole economies and others only a specific company or even just one department or business unit. It would be hubris to claim that good corporate governance can prevent all corporate crises. But a good board of directors can at least help a company minimize its risk by doing the following:

- Setting the right strategy with an appropriate risk appetite for the company (e.g., an investment bank has a very different risk appetite than a retail bank).
- Overseeing the implementation and execution of risk-management systems.
- Scanning the environment and understanding the drivers of business in order to help detect and comprehend crises earlier.
- Ensuring better preparedness and more robust response to crises (e.g., through the creation and testing of crisis-response plans).
- Demonstrating leadership in thinking through better decisions and avoiding panic.
- Eliminating certain reasons for internal crisis (e.g., by having a CEO succession plan in place in case of a sudden departure).
- Giving external stakeholders, especially investors and employees, confidence in the future of the company. (IFC, 2010, p 11)

4. SUMMARY

The development of management in Azerbaijan may be conditionally divided into two periods: before and after serious changes in the economy of Azerbaijan. Before the crisis, the country's economy was rapidly growing, which naturally influenced the management in the country. Until 2015, management had three key features. The first one is volume of operations. The managers were accustomed to making transactions with large amounts of money. The second feature was that top managers paid attention only to the profitability of the activity and the costs were usually a secondary matter. This resulted in the productivity being damaged. Another major feature of the Azerbaijani management was the delusion of success. Successful outcomes of the management led to them being in their comfort zones. Changes in the economy have had a direct impact on the business and management style in companies. Nowadays, the concept of productivity is at the forefront. Secondly, the managers began to realize that the most important capital of the company is the human capital and started to focus more on this issue. At the same time, Azerbaijani businesses became more attentive to their clients and potential consumers. The leaders understood that the consumer had an impact on the success of businesses. Most importantly, the businesses started to attract professionals for HR, marketing, and communications with consumers. It is safe to conclude that the crisis is not related to the external environment. Sometimes it stems from the management of companies. The drop in sales in Azerbaijani companies was associated with a decline in oil prices and devaluation. However, when the company heads came out of their comfort zones, they realized that the crisis for them had begun long before the drop in oil prices: 1) Most of the capital remained in the form of finished products and raw materials. 2) Failure of a timely renewal of a product portfolio that resulted in customers not buying products since with reduced purchasing power, demands of the customers for a product are higher than before as they want to spend the money on more useful products. 3) Ignoring cost optimization. 4) Lack of pricing strategies. Low oil prices forced business owners from Azerbaijan to get out of their comfort zones they were so used to. They reinforced the control over company structures, process and procedure updates, and ensured proper operation not just on paper but in practice as well. They aimed to keep the raw materials and finished products in their warehouses at a minimal level. In this regard, they started studying and applying Just in Time and Lean Production systems. Large domestic companies established collaboration departments with universities. These departments are closely cooperating with the institutions in the nation. Selected university students are offered internships at these companies. Universities, in their turn, initiated practice classes of the large companies. Currently, most such classes are at UNEC. To sum up, low oil prices have had both negative and positive influence. The fundamental problem of the companies was management issue. Under the conditions of high oil prices, due to the lack of financial complications, they were not able to recognize the problems with management. Since 2014, a new stage for Azerbaijan's economy and business has begun. This new stage shaped favorable conditions for companies to become stronger, more durable, and competitive in the future. These qualities carry enormous significance, since, in this globalizing world, the competition is also intensifying.

ABSTRACT

Recently, great importance has been attached to the development of domestic tourism along with international tourism by the countries throughout the world. Because domestic tourism is a very important factor both for the mobility of the economy and for the development of the sector. In this regard, Azerbaijan, having strong tourism infrastructure, has taken a number of important measures to further develop domestic tourism in recent years. The peculiarity of perceptual maps is that they provide a visual representation of the market to the decision maker. Perceptual maps are a tool needed by the businesses to recognize their competitors, identify their positions in the market, and see the gaps in the market. The main purpose of the research is to investigate Azerbaijan's domestic tourism potential in different regions, how these regions that have already proved themselves in the field of tourism are positioned as a brand and, most importantly, how this positioning is assessed by the residents of the country traveling within it. The research revealed that Azerbaijan, proved itself in the field of tourism in recent years, has a strong domestic tourism potential. Especially, there is a strong competition for leading positions in the market among the regions, tourist destinations of the country. For this purpose destinations are trying to position their products in the best way possible, to create a positive image in the minds of tourists and to attract more and more tourists. However, the research revealed that although the leading destinations in the country tend to turn their products into a popular brand and maintain a proper positioning policy, their positions in the minds of tourists are somewhat different. When choosing destinations, tourists who pay more attention to service say that the service in certain destinations of the country is not at the desired level, that is, unsatisfactory, but the prices are slightly higher.

Keywords: *Destination, Domestic tourist, Perceptual maps, Positioning*

1. INTRODUCTION

For many years now, domestic tourism has started to come to the forefront in developing countries. According to the World Travel and Tourism Council, 7 out of every 10 dollars spent on tourism are spent domestically. This means that in most countries around the world, the money spent by local citizens is a much more important source of Travel and Tourism GDP. Some countries also use domestic tourism as a means of supporting international tourism. Domestic tourism has less sensitivity to crises. There is also a great deal of social and cultural benefits of domestic tourism, as it allows people to get closer to their country's history and culture. In addition, the development of domestic tourism significantly stimulates the employment in the country. Thus, the benefits of domestic tourism to the country's economy are countless. The unique climate, flora and fauna of Azerbaijan, as well as the ancient history and architectural monuments and modern buildings that meet world standards, allow us to say that there is a strong tourism potential here. Along with international tourism, domestic tourism is also experiencing its period of prosperity in Azerbaijan, as in other developing countries. One of the main reasons for this is the strengthening of tourism infrastructure, introduction of new

tourist destinations and creation of a strong network of tourist routes in the regions, along with the capital Baku as a result of adoption of the "State Program on Socio-Economic Development of Regions of the Republic of Azerbaijan" in 2004. The opening of Shahdag Winter-Summer Tourism Complex, which is distinguishable from its competitors in the world by its uniqueness in 2011, and the introduction of Tufandag Winter-Summer Tourism Complex, which is not behind it for its popularity, are also among the most important steps. As a result of these events, tourist destinations of Azerbaijan have already become brands.

2. POSITIONING AS AN ELEMENT OF DESTINATION MARKETING

Positioning should be in the same direction or the services should be formed in the same direction that a destination wants to be known, recognized and remembered for. The first thing to do with destination positioning is to decide on the desirable and the most relevant position possible for the destination and to make an effort to determine what that destination means (du Rand and Heath, 2006).

2.1. STP and positioning

A marketing strategy consists of three vital components: segmentation, targeting and positioning (STP). Companies can produce revolutionary products or services while trying to create a space for themselves in the market. However, that is not enough. They also need to carefully identify who, among the population, would purchase this product or service, and what they expect from such shopping. A well-executed and implemented STP program will help the company to produce the right marketing mix - to sell the right product at the right place at the right price and in the right way (Natter and others, 2008). In order to apply STP, first, the customer is determined, then the customer to be served and finally the positioning to be used in communication to better present the product and make it stick in mind (Buhalis, 2000). Positioning of a tourist destination is the expression that describes the position in which the destination is when compared with similar destinations in regional, national and international scale. The purpose of this process is to create a unique image for the potential customers. Additionally, positioning is defined as one of the stages of destination branding. According to Pike and Ryan, the effective positioning in the customer's mind provides an advantage for the destination, as it facilitates the decision-making process of tourists and helps customers link the core attributes to the destination (Pike and Ryan, 2004, p. 3-4).

2.2. Positioning tools and period

The key marketing tools used to do positioning are product qualities, brand, packaging, price, consumer features, product usage areas, image, competitive products, distribution method, perceived value, tools used to position the product in the consumers' minds (Buhalis, 2000). Specific qualities and benefits of the product include its taste, quality, healthiness, durability, reliability, prestige, luxury and so on (Pike and Ryan, 2004). During the positioning process, targeted market structure, consumers' profiles should be reviewed and consumers who have different wants and needs should be divided into segments to ensure that they get the best benefit and satisfaction from the brand. During the positioning process, the brand-owner company must recognize the competitors, know how and by which consumers the competitors are perceived and recognized, and determine the wants and needs of the consumers along with the competitors' brand positioning activities (Pike and Ryan, 2004, p. 5-6).

3. PERCEPTUAL MAPS

Companies that want to successfully position their brand should know its position in the market and in the minds of the consumers. Although a number of measurement methods are used for that, the most widely used ones among them are perceptual maps.

The peculiarity of perceptual maps is that they provide a visual representation of the market to the decision maker. Perceptual maps are a tool needed by the businesses to recognize their competitors, identify their positions in the market, and see the gaps in the market. (Li and Stepchenkova, 2016, p. 3).

3.1. Perceptual maps and their benefits

After positioning activities, businesses should identify, analyze and evaluate how their products or brands or their competitors' products or brands are perceived and positioned in the minds of the consumers. By doing so, they can evaluate whether the strategies they apply to distinguish and position their products or brands in the consumer mind are correct or not. For this purpose, businesses mainly use a perceptual map, one of the most important methods of measurement and analysis (Li and Stepchenkova, 2016, p. 4). Perceptual maps help marketers determine which features of the market brands are more perceivable and important for the consumer and why they are purchased when compared with the competing brands. Perceptual maps represent the visualization of the results obtained by comparisons of the product or services of the companies targeting the same market segment by a group of consumers who are capable of representing the real and potential consumers that form a particular market segment (Claveria, 2016).

3.2. Creating perceptual maps

Use of information that reflects the consumers' thoughts by gathering together for many features forms the basis of the perceptual maps. Perceptual maps are the tools that show the correlational positions, similarity and proximity of the variables such as product, service, brand, destination or business in the coordinate system and they are used whenever there is a need for correlational visual contact information of the variables. Perceptual maps provide a visual illustration and visual understanding of mixed information that contains multiple factors and multiple variables on the maps (Li and Stepchenkova, 2016, p. 4). Since it is a concept that shows the relationships between the variables, similar variables that are likely to be in the same group are closely labeled and variables that are not similar to each other are placed in different groups and away. Thus, perceptual maps enable businesses to see their positions in comparison with competitors' positions, densities and gaps in the marketplace. These maps can reflect the comparisons with two or more dimensions, but these dimensions are decreased to two in terms of clarity and visuality (Claveria, 2016).

4. MEASURES USED IN THE RESEARCH

Questionnaire survey on Azerbaijani tourists' thoughts consists of thirteen questions in total. The first five questions have been asked to determine the demographic characteristics (sex, age, marital status, educational qualification and monthly income) of those surveyed. The next five questions are the questions asked to get the information on the number of trips made by the survey participants within the country, the factors that affect their travel choice, the first three regions come to their mind when they hear about going on holiday and the three regions they most recently went on holiday within Azerbaijan. The last three questions are the evaluation of the seven destinations surveyed directly on particular criteria.

4.1. Analysis of the data and illustration of the results using perceptual maps

Demographic characteristics of the survey participants, such as sex, age, marital status, educational qualification and monthly income are summarized in the following tables.

Table following on the next page

Table 1: Gender distribution of survey participants

	Frequency	%
Female	113	56.5
Male	87	43.5
Total	200	100

(Table has been created by the authors)

As shown in the table, a total of 200 people participated in the survey, of which 56.5% were women and 43.5% were men. It is clear that there is not a big difference in the number of participants in terms of gender.

Table 2: Age range distribution of survey participants

	Frequency	%
18-25	54	27
26-35	63	31.5
36-45	40	20
46-55	32	16
56 +	11	5.5
Total	200	100

(Table has been created by the authors)

As can be seen from the table, 54% of respondents are in 18-25, 63% in 26-35, 40% in 36-45, 32% in 46-55 and 11% in 56+ age groups.

Table 3: Monthly income distribution of survey participants

	Frequency	%
0-300 \$	59	29.5 %
301-600 \$	75	37.5 %
601- 900 \$	38	19 %
901-1200 \$	21	10.5 %
1201 + \$	7	3.5 %
Total	200	100 %

(Table has been created by the authors)

It is shown in the table that 29.5% of the respondents have monthly 0-300 USD, 37.5% 301-600 USD, 19% 601-900 USD, 10.5% 901-1200 USD, 3.5% 1201+ USD income.

Table following on the next page

Table 4: Information on the trips made by the survey participants within Azerbaijan

		Frequency	%
How many times have you travelled throughout Azerbaijan?	1	3	1.5 %
	2	7	3.5 %
	3	13	6.5 %
	4	20	10 %
	5+	157	78.5 %
2. With whom have you travelled within Azerbaijan?	With family	173	86.5 %
	With friends	156	78 %
	With girlfriend/boyfriend	0	0 %
	With fiancée/fiance	0	0 %
	Alone	9	4.5 %
	Other	0	0 %
Factors influencing your choice of destination	Service quality	123	61.5 %
	Price	176	88 %
	Variety of entertainment venues	111	55.5 %
	Brand	119	59.5 %
	Image	113	56.5 %
	Friend or relative recommendation	162	81 %
	Advertisements	31	15.5 %
	Hospitality of local people	31	15.5 %
	Richness of cuisine	47	23.5 %
	Other	20	10 %
Total		200	100 %

(Table has been created by the authors)

It is clear from the respondents' answers that 1.5% of them have been travelled within Azerbaijan once, 3.5% twice, 6.5% 3 times, 10% 4 times and 78.5% having the most important indicator and being significantly different from the other indicators have been travelled within the country more than 5 times. 86.5% of the respondents prefer to travel with their family, 78% with friends, and 4.5% to travel alone. No one travelled with a fiancée/fiance or a girlfriend/boyfriend, and the other option has not been answered. The quality of service factor affects to their destination choice 61.5%, price 88%, variety of entertainment venues 55.5%, the fact that this destination is a brand or not 59.5%, confidence in that brand 56.5%, friend or relative recommendation 81%, advertisements 15.5%, hospitality of the local people 15.5% and richness of the cuisine 23.5%. The other factors affect 10% and they are marked as nature and distance.

Table following on the next page

Table 5: The score given by an average tourist for the quality of service in each region
 (Table has been created by the authors)

Regions	The score given by an average tourist for the quality of service in each region
Gabala	4.49
Guba	4.355
Sheki	4.245
Gusar	4.23
Ismayilli	3.81
Ganja	3.475
Nakhchivan	3.3
Regions	The score given by an average tourist for the price in each region

Table 6: The score given by an average tourist for the price in each region

Gabala	4.63
Guba	4.45
Gusar	4.23
Sheki	3.88
Nakhchivan	3.555
Ismayilli	3.26
Ganja	3.05

(Table has been created by the authors)

It is also clear from the tables that there are certain differences between the quality of service and price rankings in each region. The visual description is shown on the perceptual Figure 1.

Figure 1: Evaluation of the seven regions by the survey participants for the quality of service and price

(Figure has been created by the authors)

Table 7: The first three of the seven regions (Sheki, Gabala Ismayilli, Guba, Gusar, Ganja, Nakhchivan) that tourists want to go on holiday in the summer

For summer rest	Frequency	%
Guba	99	49.5 %
Sheki	96	48 %
Gabala	94	47 %
Gusar	91	45.5 %
Ismayilli	82	41 %
Ganja	78	39 %
Nakhchivan	60	30 %

(Table has been created by the authors)

Table 8: The first three of the seven regions (Sheki, Gabala Ismayilli, Guba, Gusar, Ganja, Nakhchivan) that tourists want to go on holiday in the winter

For winter rest	Frequency	%
Gusar	107	53.5
Gabala	94	47
Guba	87	43.5
Ismayilli	83	41.5
Ganja	79	39.5
Nakhchivan	77	38.5
Sheki	73	36.5

(Table has been created by the authors)

As it is clear from Table 7 and Table 8, in the summer the tourists firstly want to go on holiday respectively to Guba (99%), Sheki (96%) and Gabala (94%) and in the winter to Gusar (107%), Gabala (94%) and Guba (87%). The other indicators are noted in the tables. Also, the indicators of those who want to go on holiday to all the regions in the summer and winter are described on the perceptual Figure below for a comparative analysis.

Figure following on the next page

Figure 2: The choice of the survey participants among Sheki, Gabala, Ismayilli, Guba, Gusar, Ganja and Nakhchivan to go on holiday in the summer and winter

(Figure has been created by the authors)

5. CONCLUSION AND RECOMMENDATIONS

The research revealed that Azerbaijan, proved itself in the field of tourism in recent years, has a strong domestic tourism potential. Especially, there is a strong competition for leading positions in the market among the regions, tourist destinations of the country. For this purpose, destinations are trying to position their products in the best way possible, to create a positive image in the minds of tourists and to attract more and more tourists. But one of the most important factors for that is to know the thoughts of the local tourists travelled within the country. Because a destination owner can position his touristic product as he wishes, but the key thing is what this product means to the tourist, as a result the one who is using this product is the tourist himself. However, the research revealed that although the leading destinations in the country tend to turn their products into a popular brand and maintain a proper positioning policy, their positions in the minds of tourists are somewhat different. When choosing destinations, tourists who pay more attention to service say that the service in certain destinations of the country is not at the desired level, that is, unsatisfactory, but the prices are slightly higher. Also, the research found that most destinations have been developed on a high level for summer tourism, but the number of the destinations developed for winter tourism is few. In some regions there is a need to create a strong winter tourism infrastructure and attract more tourists to the region. The suggestions to eliminate the problems encountered are as follows:

- An effective management system should be created to fully utilize the domestic potential, existing opportunities of Azerbaijan.
- To have the desired position in the market, to conduct a strong positioning policy in order to gain advantage over competitors and most importantly, to know the outcome of this positioning, it is necessary to learn about the opinions of the tourists and to know their feedbacks.

- The quality of the service should be increased. To achieve this, personnel shortage problem, one of the most actual problems should be solved. Although a number of measures have been recently implemented in this area, this problem has not been completely eliminated. Carrying out more awareness activities for the solution of the issue, launch of educational institutions and participation in the important training and seminars held abroad can help solve this problem.
- Strong mechanisms should be used to create a balance between services and prices, and appropriate analyzes should be made.
- In order to meet the growing demand of tourists and to fulfill their desires, types of tourism should be increased and new types of tourism should be developed.

ABSTRACT

Within the context of the fourth industrial revolution the global labor markets are undergoing major transformation, characterized by growing skill instability, and a reskilling imperative. This together with the way practitioners interact with and consume information in the workplace, and the distinct trends showing how employees are learning differently, as well as the dramatically changed expectations of the digital learners demanding an effortless learning experience, challenges the classical ways Learning Development Organizations address professional practitioner development. Digital technology and Computer Supported Collaborative Learning (CSCL) on the other hand provides a series of new affordances that enable learning process designers to virtually scaffold the Post-Experiential practitioners learning (Szoboszlai, Velencei, Baracska, 2014). For this to happen it is argued that the introduction of technologies is not enough in itself, a series of paradigm changes are also needed. Technology can be, and is used in didactical pedagogy as well, but this talk explores how in order to become the truly efficient scaffold of the digital learners' collaborative learning process and capitalize on its the affordances, a fundamental change in pedagogy - from didactic to a reflexive - is also needed. The novelty of the presentation lays in suggesting a transdisciplinary approach to computer supported collaborative knowledge-building, compared to the classical multi- and interdisciplinary approaches. Different definitions of transdisciplinary are presented and it is argued that in order to maximize the affordances presented by digital technologies and becoming valuable artificial complements to the practitioner intelligence, the research of computer supported collaborative (CSCL) should transcend the disciplinary and interdisciplinary levels. It is further argued that due to the complexity of the problem, solutions should be investigated not within the realms of educational technologies, cognitive computational sciences and organizational learning management but transcending them, new points of convergences related to practitioner learning should be defined, and thematic knowledge integration tentative validated based on (1) consistency, (2) relevancy, (3) applicability.

Keywords: *Computer Supported Collaborative Learning, Professional Practitioner Development, Technology Enhanced Learning, Transdisciplinarity*

1. INTRODUCTION

Classically, professional practitioner experts are trained within their profession's standards of education – guaranteed by accredited educational institutions - with the particular knowledge and skills necessary to perform their specific role within their profession. They are expected to perform their work applying the acquired knowledge in accordance with the strict codes of

conduct, and professional standards of practice and ethics for their particular field which are typically set and maintained through widely recognized professional associations. However, the rapid pace of knowledge production has altered the context for professional training and work as well, practitioners of today are invited to engage in knowledge practices in ways that go beyond contexts of application. They participate in activities related to exploring, testing, validating, archiving and sharing knowledge. For instance, professionals are increasingly involved in documenting practices to safeguard the continuity and quality of work (Callon, 2002). This undertaking is often not a straightforward process but requires a critical focus as well as analysis of recently performed tasks. It typically involves the intellectual and analytical practices and engagement characteristic of knowledge-intensive work (Alvesson, 2004). Also included are responsibilities for selecting, validating and in other ways safeguarding knowledge in the context of everyday work, for keeping issues open to investigation, and for taking active steps to explore opportunities for improvement. Rather than leading to a sense of subjugation or deskilling, the requests for performativity and accountability described above may facilitate active engagement with knowledge, thus providing the grounds for a contemporary form of professionalism. Therefore practitioners “in the face of multiple kind of knowledge and stamp of uncertainty are charged with solving problems and safeguarding individual interests. Never has their potential access to knowledge and information richer and - paradoxically- never has their collective knowledge been subject to greater challenge” (referenced by Jensen, Lahn, Nerland eds.), 2012). In these conditions it is necessary to understand the dynamic interplay of epistemic cultures and practices to understand contemporary conditions for professional practitioner learning. On the other hand, the way practitioners interact with and consume information in the workplace and their expectations have dramatically changed as well. Based on a Learning and Development Digital Learner Survey (CEB, 2016) conducted in 2016 by Gartner with 24,000 employees globally, the above mentioned changed expectations translated to learning showed some distinct trends in how employees are learning differently. One major finding was that “Employee expectations and behaviors regarding organizational learning distinctly mirror their experiences in digital channels outside of work (L&D Digital Learner Survey, 2016). This new “Digital Learner” is: Empowered: 76% of employees report that they will do what they need to do to learn effectively; Networked: 69% of employees regularly seek out new ways of doing their work from their coworkers, and Impatient: 66% of employees expect to learn new information “just-in-time.” Overall the learning application is mostly impacted by the effortlessness of the learning experience. While traditionally content creation and efficient training organization is the main focus of Learning and Development organizations, based on these findings a paradigm change is needed in workplace learning where focus is shifted from content creation and making the training organization process more efficient, to minimizing the effort required of learners to develop by providing relevant and just in time applicable-to-job-situation content, easily accessible knowledge, and user friendly easily consumable materials. Apart from these new trends disrupting the classical way of organizing professional practitioner learning in organizations, there seems to be an urgency and magnitude change in the requirements for re and upskilling of learners in organizations. According to a state-of-the-art Future of Jobs Report 2018 (World Economic Forum, 2018) containing the views of 313 business executives—principally Chief Human Resources Officers (CHROs), representing more than 15 million employees, the vast majority of employers expect that, by 2022, the skills required to perform most jobs will have shifted significantly, widening the skill gaps. Based on a metric introduced by the report called Global average skills stability and defined as the proportion of core skills required to perform a job that will remain the same, expected to be about 58%, the report forecasts an average shift of 42% in required workforce skills over the 2018–2022 period. Based on the finding of the above-mentioned report by 2022, no less than 54% of all employees will require significant re- and upskilling in the workplaces.

Of these, about 35% are expected to require additional training of up to six months, 9% will require reskilling lasting six to 12 months, while 10% will require additional skills training of more than a year. This mass demand increase challenges the organizations' capacity of fulfilling its employees re and upskilling needs. The skills continuing to grow in importance by 2022 include analytical thinking and innovation as well as active learning and learning strategies, but are likely to change further together with the technology advancements positively affecting business growth. The four specific technological advance which are set to dominate the 2018–2022 period as drivers positively affecting business growth are: ubiquitous high-speed mobile internet; artificial intelligence; widespread adoption of big data analytics; and cloud “technology (World Economic Forum, 2018). Within this context of the knowledge society significantly challenging the different professions' classical modes of operation – a widely used term for this phenomenon is disruption - and requiring of them to reconstruct themselves in a manner which is more powerful in the emergent epistemic landscapes, does the present paper discuss embracing technology and constructing cultures for knowledge and learning which consider both the “unfolding” character of professional expertise in a complex world and address the high re and upskilling need of practitioners in organizations.

2. COMPUTER SUPPORTED COLLABORATIVE LEARNING (CSCL)

2.1. Computer Supported Collaborative Learning (CSCL)

Computer Supported Collaborative Learning is an emerging branch of the learning sciences which has fast risen in 'popularity and despite its young age it “is considered as one of the most promising innovations to improve teaching and learning with the help of modern information and communication technology (Lehtinen, Hakkarainen and Lipponen, 2013). According to a widely accepted definition Computer Supported Collaborative Learning (CSCL) is an interdisciplinary research field that includes a branch of the learning sciences and educational technology research concerned with studying how people can learn together with the help of computers (Stahl, Koschmann and Suthers, (2006). Research in CSCL focuses on learning as a cognitive and/or social process and studies learning designs, learning processes and pedagogic practices that support technology-mediated coordination, communication collaborative processes in communities of learners (Miyake, 2006). The new field of study is rooted in the concept and process of co-constructivist model of learning originating from the socio-cultural perspective of Vygotskian theory (Vygotsky, 1962). Computer Supported Collaborative Learning (CSCL) embraces a virtual situated social learning perspective, where learning takes place through the interaction and transaction between people and their environments. Despite the fact that there is “no precise and widely accepted definition of co-construction in psychological and educational literature [...] common to most theoretical contexts of co-constructivism are the implication of some kind of collaborative activity “. This collaboration from a situated cognition perspective, can be seen as having two or more individuals collaboratively construct a shared understanding, or a solution to a problem, which neither partner entirely and necessarily possesses beforehand (Chi 1996). It is in this social collaboration interactions that Computer Supported Collaborative Learning (CSCL) has a recognized tradition of generating insights about how to support collaborative learning with both hard and soft technologies (Thang, Tsai, Lin, 2014). In the cultural history of the Computer Supported Collaborative Learning (CSCL) study “large multilayer research efforts such as CSILE (later Knowledge Forum) (Hewitt, Scardamalia, 1998), and the Knowledge Integration Environment (Linn, Davis, Bell, 2004), or CAMILE and associated efforts (Guzdial, al. 1997). incorporated multidisciplinary teams of researchers that not only studied, but also designed, built, and enacted CSCL environments. Their work also highlights the designated place of the Computer Supported Collaborative Learning research as bridging the epistemologies of different disciplines.

2.2. Paradigm Shift Imperative

In order for the technology affordances to efficiently scaffold the practitioner professional learning a paradigm shift is needed. The learning architectural design changes can lift the former constraints of classical educational settings and “could support the most fundamental change in ecologies of learning since the invention of the modern school and its mass-institutionalization in the nineteenth century” (Cope, Kalantzis, 2016, p. 7), however without the paradigm change “technology has changed, but not in any fundamental way, the pedagogy. To say it again, technology is pedagogically neutral.” (Cope, Kalantzis, 2015, p. 7) the introduction of technologies in learning is not enough in itself. The shift according to Cope and Kalantzis should happen from ‘discursive form of didactic pedagogy’ to ‘reflexive pedagogy’ fostered and enhanced by the architectural affordances and characteristics of educational technologies (Cope, Kalantzis, 2015, 2016). The first is characterized by “direct instructional guidance, balance of control of [...] learning environment [...] with the instructor, [...] focus on cognition, [...] long term memory [...] of individual learner, [...], demonstrate[d] replicate [ion of] disciplinary knowledge. The former having the following characteristics: “shift in the balance of agency between an instructor and a learner, where the learner has considerable scope and responsibility for epistemic action albeit within the frame of reference of an activity sequence that has been scaffolded by the instructor [...], the focus is on the artifacts and knowledge representations constructed by the learner and the processes of their construction [...], the focus is on the social sources of knowledge [...], a wider range of epistemic processes. It is by this mindset change in pedagogy, Kalantzis posits, that the transformative opportunity which lays in the design of integrated learning technologies can act as a pull system mode and scaffold a ‘person driven learning’ in the context of “cognitive apprenticeship, whereby learners become increasingly accomplished problem-solvers given structure and guidance from mentors who scaffold students through coaching, task structuring, and hints, without explicitly giving students the final answers” (Hmelo-Silver, Duncan, and Chinn 2007: 100, 105). Reviewing the literature of the past decade on e-learning ecologies - a “metaphor because a learning environment is in some senses like an ecosystem, consisting of the complex interaction of human, textual, discursive and spatial dynamics- the research take a coherent, systemic form. Traditional classrooms, with their linear arrangement of seating and desks, their lecturing teachers, their textbooks, their student workbooks, their classroom discussions are also learning systems. Moving from one of these classrooms to another, the modes of interaction are familiar and predictable because they are so systematically patterned” (Cope, Kalantzis eds., 2016). Since the introduction of computer-mediated and online learning, a wide range of key educational technologies that emerged have been validated. (1) Learning management systems (examples: Moodle, MOOC platforms like Coursera, etc.) as well as (2) e-textbooks are widely used and accepted forms of learning in organizational settings as well. The new pedagogical method of (3) Flipped classrooms platforms, has been analyzed (Bishop and Verleger, 2013). (4) Different aspects of intelligent tutors, games and simulations have been analyzed (Aleven Beal, and Graesser, 2013; Conrad, Clarke-Midura, and Klopfer, 2014; Koedinger, et al., 2014), and (5) Discussion Boards have been studied (Speck, et al, 2014). (6). Web workspaces and e-Portfolios have been researched (Cope and Kalantzis, 2013; McCarthey, et al., 2014). (7). Adaptive, Personalized and Differentiated Instruction were studied (Koedinger et al., 2013; Shute and Zapata-Rivera, 2012; Wolf, 2010. (8). Machine Assessments. Cope, Kalantzis, McCarthey, Vojak, and Kline 2011). As seen above, the topic of technology and learning has seen an abundant research during the last decade, and vast amount of data has been produced on the role of educational technologies scaffolding collaborative learning. These researches address dominantly the topic from a pedagogical and/or computing technology point of view, looking at collaboration between teacher-and-student, peer-to-peer or computational technology point of view.

The vastness and consistency of the findings validate internally the subject of educational technologies supporting learning processes, and even though contextual differences should be taken into consideration - the majority of the researches were set in a non-organizational learning setting, which may open discussions regarding the relevance and applicability of the findings in professional practitioner development -, they can provide valuable insights for professional practitioner learning as well.

3. ADVOCATING FOR A TRANSDISCIPLINARY APPROACH

Being a problem focus discipline, Computer Supported Collaborative Learning (CSCL) cannot easily be “decompose[d] into existing traditionally disciplinary epistemologies. The problem itself could neither be called simply an engineering problem, or a psychological problem nor an educational problem, nor a system design problem” (Hoadley, 2009). In order for the technology affordances to scaffold the practitioner professional collaborative learning in a way that the challenges of capability development imperative of the knowledge age are efficiently addressed, the aspects of different disciplines or interdisciplines - transdisciplinarity can be complementary with (inter)disciplinary approaches –should be considered in such way, that what they pull in common goes beyond what each of them could have produced internally. Therefore, the quest for new solutions is transversal, and disciplines should be there to serve as knowledge bases located within the problem space. Due to the complexity of the problem and the investigated context, it should be investigated how to define new points of convergences related to practitioner learning that go beyond the existing thinking and confront existing presumptions or practices from new points of view.

3.1. Why Not Multi or Interdisciplinary

The epistemological knowledge source of both professional practitioner learning and development and computer supported collaborative knowledge creations is built on multiple disciplines. Organizational Learning and Development incorporates Human Resource Management - therefore Business Economics-, Cognitive and Motivational Psychology and Pedagogy. Computer Supported Collaborative Learning (CSCL) shares some of these epistemological backgrounds – pedagogy and Cognitive and Motivational Psychology – but has additionally a dominant Computational theory with close links to Neuroscience - therefore Biology. Insights into Cultural Anthropology on one hand and understanding Complex Systems on the other are also indispensable for the thorough understanding of these fields. In a disciplinary approach the problems of professional computer mediated practitioner re- and upskilling could be analyzed in only one of the above-mentioned disciplines, and would be limited to the discipline’s own knowledge and epistemology level. However, the complexity of the problem transcends this. Studied in a multidisciplinary approach the research of the problem would still follow the disciplinary logic - where several objectives can be studied under several different perspectives – but to the objective breakdown a common objective would be added. However, the new problems that are being faced - also within the scope of this paper -, are due to the divisional interpretation of the reality. Practice shows the difficulties appear in the open spaces between the disciplines, and in some cases this can lead to the explosion of a discipline’s classical frame and creation of new interdisciplinary disciplines. “Some fields [...] develop epistemological strength anchored by shared thematic principles, unifying core concepts, and a new community of knowers with a common interlanguage.” Interdisciplinarity builds bridges between two or more disciplines taking into account several perspectives so that reality can show itself in its full complexity. Interdisciplinarity is therefore viewed as a combination of different disciplinary knowledge and different methodologies and tools to resolve a common objective within the very scope or subject areas of the disciplines involved. An example of an interdisciplinary discipline is educational learning technologies which incorporates pedagogy,

cognitive and motivational psychology and computation. Resolving problems within the subject areas of the disciplines involved in an interdisciplinary field has also its limitations. Considering the professional practitioner learning optimization in the workplace which incorporates organizational management, pedagogy, cognitive and motivational psychology and computation, the problems that arise are resolved from a Learning and Development departments point of view which optimizes for enhanced organizational KPIs - increased training hours per employee while decreasing training costs, fulfilling annual training plans, etc. - instead of focusing on employee capability development demands - building just in time, applicable skills required on the job -, thus fail to bring about lasting solution to the overall complexity of the problem.

3.2. Why a Transdisciplinary Approach

Over the past few decades, many researchers have concluded that adequately addressing issues in the knowledge society requires a major transformation of research, away from disconnected disciplines toward socially engaged, transdisciplinary approaches. Despite the significant increase of the transdisciplinary terms' popularity in the last decades which caused a noteworthy broadening of its usage, the term is still ambiguous and difficult to grasp, its meaning being largely dependent on the field and purpose of research in connection with which it is used. The term was first mentioned in a major interdisciplinary typology published in 1972, created for an international conference held in France in 1970 and co-sponsored by the Organization for Economic Cooperation OECD (Apostel et al., 1972). This early definition offered by "The Nuffer Foundation in London identified two basic metaphors of interdisciplinarity – bridge building and restructuring. Bridge building occurs between complete and firm disciplines. Restructuring detaches parts of several disciplines to form a new coherent whole. The Foundation also noted a third possibility that occurs when an overarching concept or theory subsumes the theories and concepts of several existing disciplines, akin to the notion of transdisciplinarity (Apostel et al., 1972). Presently there are several major trendlines of definition that have gained attention since the 1980s, three major one are presented below shortly. A holistic approach to defining transdisciplinarity is the well-known approach of Nicolescu, B. founder of the CIRET (Centre International de Recherches et Etudes Transdisciplinaires). According to this, transdisciplinary is the unifying principle for knowledge integration, which is determined by the universal formal structures or patterns at the bases of pluralistic processes and their dynamics." (Nicolescu, 2002, 2015). In his Manifesto of Transdisciplinarity and the essay "New Vision of the World", Nicolescu identified three pillars of transdisciplinarity: complexity, multiple levels of reality, and the logic of the included middle. In this holistic approach aiming to (re)integrate western scientific thinking with holistic spiritual thinking "transdisciplinarity offers some methodological guidelines for scholars. Following these guidelines, we (can) distinguish between various levels of reality (Nicolescu, 2010), similarly to Russell's logical types. On each level of reality, bivalent logic may be valid; however, transdisciplinary also transcends bivalent logic. This means that something and the opposite of something can hold true at the same time. Using the notations of logic this means that something can be A and non-A at the same time; Nicolescu call this third possibility T, the 'hidden third'. T is obtained by the synthesis of A and non-A, as Fichte did in his thesis-antithesis-synthesis cycle, and this is what we can see in the Taoist tradition of Yin and Yang. This synthesis enables moving between the levels of reality." (Nicolescu, 2010). Another holistic approach is the trans-scientific approach of Brier where the "core of the biosemiotics enterprise is to establish another inter and transdisciplinary wissenschaft than the received view of 'science'." (Brier, 2015) In his work on cybersemiotics, Brier presents "a transdisciplinary approach to information, cognition, and communication studies, through an integration of Niklas Luhmann's Communication Theory with C.S. Peirce's Semiotics" (Brier, 2008).

Another major trendline of definition for transdisciplinarity, the one that is most prominent in Europe (Bergmann et.al, 2013) emerged from a Swiss and German collaboration at the end of the 1980s and beginning of the 1990s in environmental research. It is safeguarded by institutions like SAGUF (The Swiss Academic Society of Environmental Research and Ecology). At the conceptual bases of this type of transdisciplinarity definition is problem solving and integrates non-scientific knowledge and stakeholders in the process of problem solving. Transdisciplinary research in the German context is driven by solving societal, real-world problems, and emphasizes the usefulness of knowledge to addressing real-world issues as opposed to the search for fundamental scientific understanding. A third trendline is referred to in literature as the North American notion of transdisciplinary science and is connected with the broad areas such as cancer research, is defined, as a collaborative form of 'transcendent interdisciplinary research' that created new methodological and theoretical frameworks for defining and analyzing social, economic, political, environmental, and institutional factors in the health and well-being (Stokols et.al 2008). This trendline of transdisciplinary is referred to as encyclopedic understanding in the Swiss-German literature (Pohl, Hadorn, 2007). The transdisciplinary research approach suggested by this paper to reframe the professional practitioner development within the complex context of re and upskilling imperative, digital learners demand and other challenges posted by the knowledge society on the disrupted classical modes of profession operation is the Swiss and German approach, involving stakeholders from various disciplines to go beyond disciplinary boundaries and engage in a joint problem solving process in an attempt to explore and absorb new viewpoints. This paper proposes to use the term knowledge in a workspace environment in the definition proposed by Polanyi (Polányi 1962), in a post-experiential learning setting (Szoboszlai, Baracscai, Velencei, 2014), where the emphasis needs to be put also on how to become competent in the application of tools. According to Polanyi's original idea published in the frequently cited book *Personal Knowledge* (Polányi 1962), competence implies the ability of expertise within a certain domain and the ability to not only submit to the rules but also by reflection influence the rules creation of the domain or the tradition. Competence is thus not a property but a relation between individual actors and a social system of rules. Knowledge allows actors to generate a product or some other outcome. But knowledge is only a necessary and not a sufficient condition for capacity to act. In order to set something into motion or generate a product, the circumstances within which such action is contemplated to take place must be subject to control of the actors." (Bechmann, Gorokhov, 2009). Based on these definitions the value that resides in knowledge is connected to its capacity to set something in motion, and in order to do that an active actor is required who appropriates it by interpreting it, possesses the skills to act on it, while having the command of the situation. In this definition knowledge is (cognitive) doing. "It demands that something to be done in within a context that is relevant beyond the being in situation within which the activity happens to take place." (Bechmann, Gorokhov, 2009). Within this complex context a transdisciplinary approach may open up a series of new questions related to educational design in professional practitioner learning, for example if the scope of the learning, and the KPIs measuring its outcome are not the learning and assessment of the leaning in itself – which is the case in majority of the educational learning-, but the efficient application of the learnt material in very specific problem-solving situations, what should be the driver of the learning design process? How can learning be optimized for metacompetence development in a problem-solving perspective? The L&D Digital Learner Survey (CEB, 2016) mentioned earlier in the introduction section, presented 69% of employees regularly seeking out new ways of doing their work from their coworkers. How can professional practitioner educational design integrate and nurture this networking in its learning processes, and? The same survey related that 66% of employees expect to learn new information "just-in-time." How can the present content creation in classical settings evolve to an overall knowledge structuring and

management making available just in time information and acting as an artificial complement to his/her intelligence in problem-solving of the learner? The questions above if analyzed from one or several disciplinary or interdisciplinary perspective the solutions that they may offer could bring along further fragmentation of the problem instead of investigating integrated knowledge on their possible solutions. For example, from a computational point of view most of the CSCL solutions are built on closed platforms which may capitalize on technology support for collaborative learning but may create other problems – accessibility, integration - due to system closeness, therefore they might be part of a solution but do not necessarily integrate all the available knowledge in searching for solutions to the problem. In professional practitioner learning from a pedagogic point of view the focus may be on the content or curricula creation, but the focus may be too narrow on content development and fail to address the ease of use, applicability to the job situation requirement, etc. Looking from disciplinary perspectives the complexity of the issues is oversimplified and can only operate within the inertia of the existing systems and structures. A transdisciplinary approach promotes a complex problem-solving approach with involvement of different system point of view, questioning underlying structures, and going deeper in investigating the value system of the stakeholders involved, designing learning rather from a value creation mindset rather than from a simple discipline operational point of view.

4. CONSLUSION

Computer Supported Collaborative Learning research has fast risen in popularity in the last decades, as the boundaries between the physical and digital interactions and learning space are diminishing and social interactions are changing shape due to the wide range of digital communication opportunities. The profession's forecast is that CSCL technologies will become more flexible and tailorable for multiple collaborative settings, conditions and contexts. Due to their architecture characteristic, they may provide learning analytics data which make possible the creation and embedding of feedback loops in the design of learning processes, offering affordances of manipulating the learning processes in way unknown before. They may also offer just-in-time, accessible and visualized input to learners about their learning progress, improving the learners' reflection on their learning and influencing behavior change. Further research in the field therefore should focus on analyzing successful Computer Supported Collaborative Learning practices in organizational settings, determining effective conditions for successful collaboration in the workspace, and extending the transdisciplinary approach in optimizing learning process design in CSCL.

ABSTRACT

Ever since second half of 20-th century national economies are constantly changing and the laborers are migrating among different economic sectors. Those changes are pushed forward by the bilateral free trade agreements at the beginning, and fueled by multilateral trade agreements later on. Foundation of international trade institutions made the world boundless and transformed it into one single market. Such environment made foreign direct investments and foreign outsourcing even more easier and transformation of national economies became more rapid and more radical. The growth rates achieved by developing countries in years 1990. and 2000. are until then unprecedented. The models of such transformations so far had similar pattern, but now is the question whether or not will such patterns be repeated or are there whole new model to be applied in volatile and fast changing world. International trade agreement, which so far used to be leverage of faster development, are being suspended by the countries who used to be leaders in foundation of such agreements and international organizations, and, furthermore, integration processes who strongly marked second half of 20-th century, are slowing down and, even more, are changing direction into disintegration processes whose further repercussions are hard to anticipate. Despite new relations who are yet still appearing in the world, process of national economies' transformations is unrestrainable, but the question is what kind of transformation it shall be. Therefore, a secondary research of available literature is performed, in order to anticipate possible models of economic transformations, and to anticipate preconditions that the national economies are to fulfil and provide in order to achieve further economic growth.

Keywords: *development, growth, statistic analysis, transformation*

1. INTRODUCTION

In the period between year 2000. and 2017. great role in general world GNP growth played the emerging countries, especially in Brazil, Russia, India, China and South Africa. Based on similarities amongst the mentioned countries Truman (2006) coined the term BRICS which have became common for them as the group of countries. Those similarities are:

- They are developing countries with relevant global economic performance and high potential;
- They are countries with systemic importance for the world economy; in this respect their national performances have profound implications both regionally and globally;
- They are able to exert influence on the governance of the global economy.

Growth of GDP in BRICS is shown in Figure 1.

Figure 1: Growth of GNP in BRICS countries

Growth in most developed countries in the world, G6, is shown in Figure 2.

Figure 2: Growth of G6 in BRICS countries

Source: Authors, based on data available on www.worldbank.org

In the observed time frame world GNP have grown for showed following Figure 3.

Figure following on the next page

Source: Authors, based on data available on www.worldbank.org

In year 2017. China have become second largest economy in the world by surpassing Japan. US economy remained the largest in the world, but it is less than doubled within 17 years, and the BRICS countries have multiplied their economies, aiming to become leading countries in the world, especially China who is about to become largest economy in the world in short time. American Nobel Prize winner in 1993. Robert Fogel calculated that China shall have GDP of 123 trillion dollars by 2040, what is easy to conclude regarding that within last 17 years Chinese economy have grown for more than 1.000 % (10 times) and all they have to do is to maintain such growth rate. But, is it possible? By definition of the World Bank, High income economy is the one with GNP per capita of 12.056 \$ and more. China still did not reach such level of GNP per capita. Experience of the other countries who did reach such level, shows significant slowing down of GDP growth rate as they came closer to GNP per capita of 12.000 \$, as shown in Table. Such slowing down of Chinese economic growth can also be expected, what brings us to conclusion that such high GNP as predicted by Fogel (2010) shall hardly be achieved in the time frame as predicted.

Table 2: GNP growth rates after reaching 12.000 \$ per capita

Year	Republic of Korea	Singapore	Slovak Republic	Brazil
1990	8,73	5,85	-	-4,83
1992	5,08	3,92	-	-2,13
1994	8,11	7,50	5,79	3,64
1996	6,57	3,25	6,53	0,59
1998	-6,15	-5,49	3,87	-1,21
2000	8,02	7,03	1,35	2,61
2002	6,81	3,26	4,56	1,68
2004	4,48	8,19	5,28	4,47

Further prove that predictions of economy sizes in future is nothing but wild guess are the statements of highly respected economists in the past. Adam Bergson, American economist, member of American Academy of Science and Arts stated in 1961. That USSR GDP shall surpass USA GDP in 1980-ies. Those predictions were based on trends in 1950-ies, but the growth rate have slowed down in years to come, as shown in Table 3. This decline of growth rate Bergson (1978) explained with the technological failures, relativizing his previous predictions about USSR becoming the leading economy, regarding GDP, at the same time. Another Nobel Prize winner, Paul Samuelson, author of "Economics: An Introductory Analysis" (Samuelson 1961, p. 830) As we know, USSR did not catch up with USA in 1984. furthermore, USSR disintegrated on former soviet republics in 1992. before catching up with USA.

Table 3: Soviet GNP growth rate 1928-1990.

Time frame	1928-1940	1950-1960	1960-1970	1970-1975	1975-1980

2. OVERVIEW OF BRICS COUNTRIES

Brazil, India and South Africa entered WTO in year 1995. China in year 2001. and Russia as the last of them in year 2012. Even do BRICS countries have a lot of similarities, there are a lot of differences in strategical development approach. Before entering WTO, they passed different paths, and entrance in WTO affected differently on their GNP growth rates. Growth rates are shown in Table 4.

Table 4: GNP growth rate before and after entrance in WTO

Years	Brazil	Russia	India	China	South Africa
1990	-3,1	-3,0	5,5	3,9	-0,3
1991	1,5	-5,0	1,1	9,3	-1,0
1992	-0,5	-14,5	5,5	14,2	-2,1
1993	4,7	-8,7	4,8	13,9	1,2
1994	5,3	-12,6	6,7	13,1	1,2
1995	4,4	-4,1	7,6	10,9	3,1
1996	2,2	-3,6	7,6	10,9	3,1
1997	3,4	1,4	4,0	9,2	2,6
1998	0,3	-5,3	6,2	7,8	0,5
1999	0,5	6,4	8,8	7,7	2,4
2000	4,1	10,0	3,8	8,5	4,2
2001	1,4	5,1	4,8	8,3	2,7
2002	3,1	4,7	3,8	8,5	4,2
2003	1,1	7,3	7,9	10,0	2,9
2004	5,8	7,2	7,9	10,1	4,6
2005	3,2	6,4	9,3	11,4	5,3
2006	4,0	8,2	9,3	12,7	5,6
2007	6,1	8,5	9,8	14,2	5,4
2008	5,1	5,2	3,9	9,7	3,2
2009	-0,1	-7,8	8,5	9,4	-1,5
2010	7,5	4,5	10,3	10,6	3,0
2011	4,0	5,3	6,6	9,5	3,3
2012	1,9	3,7	5,5	7,9	2,2
2013	3,0	1,8	6,4	7,8	2,5
2014	0,5	0,7	7,4	7,3	1,8
2015	-3,5	-2,8	8,2	6,9	1,3

 Year of entrance in WTO

Source: Authors, based on data available on www.worldbank.org

2.1. Brazil

Brazilian GNP growth rate remained to be volatile after WTO membership, but, unlike before being WTO member, the rate was not negative, with small exception of year 2009. until 2105. when Brazil has sunk in deep recession caused by extremely high costs of summer Olympic and football world cup (Bin, 2017). Further reason for Brazilian economic downfall is corruptive scandal connected to Petrobras, the largest Brazilian company. A study published in Forbes estimated that 27.1 billion \$ was expected to have been lost in GDP this year [2015] because of Petrobras' corrupt, little ways (Rapoza, 2015). This equals to 1% of total GDP, Brazil's GDP is close to \$2.2 trillion, that was simply burned by the greediness and self-indulgence uncovered throughout this scandal. Federal funds will need at least R13.6 billion to cover layoffs in construction. OAS and Galvao, important construction companies that were involved with Petrobras, did not have another alternative other than filing for bankruptcy (Rapoza, 2015). The negative effect on GDP in 2015 does not fully account for all the economic losses that this scandal continues to unveil. The end consequences of this scandal are not about to be estimated yet, but anyhow, as Mauricio Santoro, a political science professor at Rio de Janeiro State University said: "I've never seen my countrymen so angry [and] we have this sense that the dream is over" (Segal, 2015). Ever since, Brazilian economy did not recover, furthermore, as shown in Table 4, Brazil is sinking into deep recession.

2.2. Russia

Russia entered in WTO in 2012. It was preceded with 10 years long period of economic prosperity (1999-2008) in which Russian Federation doubled its GDP. Global financial crises in 2008. caused significant fall of GDP, but the economy recovered one year later. Entrance in WTO have not resulted with return of growth rates as it was in golden period between 2000-2008. After Russian military involvement in Ukraine and annexation of Crimean Peninsula, USA, EU and many more countries proclaimed sanctions against Russian Federation, and international trade was banned in many aspect, what caused recession (Overland 2015.). India entered WTO in 1995. and ever since have positive GDP growth rate, even do volatile, but more than average in Developed Countries. Russian economy is strongly depending on exporting of raw material, especially on crude oil and its prices. In Figure 4 is shown crude oil price movement in time frame 1990-2015.

Figure 4: Movement of crude oil prices 1990. - 2015.

Source: <https://www.macrotrends.net/1369/crude-oil-price-history-chart>

If we compare the GNP growth rate in the same time frame, we can conclude that Russian economy is growing when the crude oil price is higher than 80\$ per barrel. With lower price, economy stagnates, or, even more goes, into recession. Prices of crude oil in time frame from year 1990 till 2015. is shown in Figure 4. During his presidential inauguration in 2008. Dmitry Medvedev stated that “Russia should modernize its economy and get rid of humiliating dependence on natural welt” (Levy, 2009). Despite that attitude, not much have changed. Russian economy is still extremely depending on row material prices. More than 80% of Russian exports are crude oil, natural gas and timber, so Russian economy is example of resource based economy (Ellman, 2006). According to prediction by PricewaterhouseCoper (PWC, 2015) in 2015. Russia shall surpass German GDP by 2030. but the latest figures does not confirm that prediction. According to data’s available at World bank, Russian GDP in 2017 is 1,578 trillion \$, and German is 3,677 trillion \$. In order to surpass German economy, Russia should grow about 6% yearly in average in order to reach Germany, with the precondition that German dos not grow at all. So, prediction by PWC is unlikely to be possible.

2.3. India

Similar to all socialist countries, including USSR, India adopted planning economy model after the World War II. The growth rates in socialist environment are showed in Table 5. After the fall of communism and unsustainability of planed economies in general on the global scale, India 1990. introduced economic reform in order to shift on market orientated economy instead planed economy.

Table 5: India GNP growth rates in planed economy:

Decade	Growth rate (%)
1950-1959	3,3
1960-1969	4,4
1970-1979	2,9
1980-1989	5,6
1990-2000	6,5

Source: Bhalila (2009)

Those changes have resulted with higher growth rates, but entrance in WTO and integration in global economy, have brought sensitivity on global crises, so India was affected by all of the regional and global crises ever since entrance in WTO trough economic slowdown. Economic recovery also accorded to global recovery trends. The largest problem India need to face is the fact that more than 30% of adult population is illiterate (Katiyar, 2016) what is huge obstruction of countries competitiveness and obstacle to implement high technology on larger scale in national boundaries.

2.4. China

China have developed its economy step by step, but in short time, coordinated by state and with substantial state incentives with final goal to became leading economy in the world. China will set up a world order that will be fair to China, a world without American global supremacy, and revise the U.S.- dominated economic and geopolitical world order founded at Bretton Woods and San Francisco at the end of World War II (Pillsbury, 2015). Fast development in early 1990. China started with resource based products Competitive advantages in these products arise generally from local availability of natural resources in order to inshore energetic independence. Second step was Low technology products relocation from rich to poor countries, with assembly operations shifting to low wage sites and complex design and manufacturing functions retained in developed countries. This relocation has been the engine of export growth in industry. Last step was High technology products have advanced and rapidly-changing technologies, with high R&D investments and prime emphasis on product design. The most advanced technologies require sophisticated technology infrastructures, high levels of specialized technical skills and close interactions between firms, as well as between firms and universities or research institutions (Wei, Chunming, 2012). China applied for membership in GATT on 19.06.1987. During the negotiations, GATT self dismissed, and transformed into WTO, so China applied for membership in WTO on 12.07.1995. Several years later, on 12.11.2002. China became full member of WTO, more accurate, 143. member of WTO. In next several years Chinese economy accelerated and reached all time highest growth rate of 14,2% in year 2007. After reaching all time high, Chinese GNP growth rate is constantly slowing down. This may be caused by implementation of strict WTO rules according to state incentives which China needed to apply in order to become full member of WTO a to have approach on global market. Second reason for such slowdown could be that process of shifting national economy from low technology to high technology demands structural changes which generates high costs.

Significant is that Chinese GDP growth rate and average yearly wages are inversely proportional, as showed in Figure 5.

Figure 5: Correlation between Chinese GDP growth rate and average yearly wages years 2000-2016.

Source: <https://www.tradingeconomics.com>

2.5. South Africa

South Africa was exposed to international economic sanctions due to implementation of “Apartheid”, systematized racial discrimination officially implemented in 1948 (Worden, 1994). Such system resulted with arm embargo adopted by United Nations in early 1960-ies, oil embargo adopted by OPEC in 1973. and at the end with multilateral trade sanctions in mid-1980-ies, which led to final downfall of Apartheid (Manby, Bronwen, 1992). Abolition of racial laws have not integrated previously disillusioned social groups. Heavy burden of segregation remained trough large amount of excluded social groups due to weaker education, or no education at all, extreme poverty in suburban regions due to multiply lower wages of segregated groups, and general exclusion of segregated groups of management. Society with economy heavily wounded by international sanctions faced huge problems with social inclusion. In order to overcome this situation, South African government proclaimed six goals in 2004. (SAFC,2004):

- Development of Human Resources - Investing in training of black managers. Goal – 25% blacks in higher management (with 4% women) and 50% in lower management until 2008.
- Purchasing- the aspiration to increase share of suppliers owned by black people for 50% until 2008. and 70% until 2014.
- Access to financial services- the obligation to expand transaction products and services on 80% among black people until 2008.
- Financing of strengthening- setting quantitative targets for transaction financing and investing in strengthening of the economic power of the black people
- Ownership- Goal: minimum 25% of ownership share by black people in every financial institution till 2010.
- Supervision- Goal: share of 33% black people in every board until 2018.

3. CONCLUSION

BRICS countries have achieved unprecedented growth in history, especially China who, according to data by World Bank, multiplied its GND ten times within 17 years, respectively, more than 1000%. In the same time frame global economy have grown form 33,6 trillion \$ to 80,6 trillion, respectively for 240%. Of all BRICS countries only South Africa have grown with the same rate as world, all others rates where far higher, as shown in table 6.

Table 6: Comparisons of BRICS countries GNP growth rate with global growth rate

Country	Cumulated GNP growth 2000/2017 in %	Indeks to the global GNP growth
Brazil	313,62	130,68
Russia	607,42	253,09
India	562,05	420,94
China	1.010,26	234,19
South Africa	256,24	106,77

In the same time frame economies of G6 countries, most developed countries of the world have grown with far lower rates than was global GNP rate, as shown in table 7.

Table 7: Comparisons of G6 countries GNP growth rate with global growth rate

Country	Cumulated GNP growth 2000/2017 in %	Indeks to the global GNP growth
Germany	188,59	78,58
Italy	169,46	70,61
Japan	99,69	41,54
France	189,58	78,99
Unted Kingdom	159,13	66,30
United States	188,54	78,56

So, the conclusion is that BRICS countries have played very important role in global economy. Comparing the absolute figures, world economy, accordingly to data of the World Bank have grown from 33,6 trillion \$ in year 2000. to 80,6 trillion in year 2017. respectively, it has grown for 47 trillion \$. In this growth BRICS countries contributed with 16,092 trillion \$, respectively, 34,24%, and G6 countries with 13,805 \$, respectively, 29,37%. So, more than half of global growth have been achieved in only 12 countries. Important stimulus to GNP growth was entrance in WTO, respectively, on open global market, considering the fact that GNP growth rate in BRICS countries have accelerated after this entrance. Participation on opened global market brought also vulnerability on global trends, so global financial crises in 2008. negatively affected on all BRICS countries, but the economies recovered soon after. Obstacles to further growth are referring each BRICS country differently and they are considering strictly national policies. Brazilian main problem is widespread corruption and high crime rate. Russian main problem is dependence on additional wealth. In order to achieve further growth, Russia must transform its economy from economy of resources to High technology economy. Further Russian obstacle is foreign policy towards neighbouring countries, above all Ukraine, who causes international trade sanctions and absence from global market despite being full member of WTO. Indian main problem is massive illiteracy and further growth demands thorough social reforms, above all in educational system. China is in transforming its economy into High technology economy what is long term process and includes increase of domestic consumption as initiator of further growth.

Chinese households are spending about 25% of their incomes, unlike American, who are spending more than incomes are (Kuijs, 2006). South African main problem is inclusion of social groups excluded during Apartheid regime, what is long term process.

4. FURTHER RESEARCHES

BRICS economies have played significant role in past two decades, but all of them came to the point on which further development demands different reforms, individual by each of them. Main question is which economies are about to be drivers of the global economy in decades to come.

ABSTRACT

The cooperation of multicultural teams is an organic phenomenon of globalized work. Multicultural team ill-functioning without trust. In the absence of trust, dialog and community of practice are ponderous. Nevertheless, when two cultures meet, the distrust is an involuntary reaction. Encounter and collision of cultures are present in the age of globalization, but the methodology of a single discipline is not able to describe and solve the emerging issues. Transdisciplinary approach (go beyond the disciplinary boundaries) and the reconceptualization of knowledge help to understand the operation of this phenomenon and provide the solution. To operate on the foreign market means a significant risk (cultural differences, asymmetric information between domestic and foreign-based labor, lack of transparency, foreign exchange risks, political risks, corporate governance differences). However, to minimize the cost of capital and systematic risk, to maximize the market access and to achieve diverse global human capital mean an enormous advantage for multinational enterprises compare to the local one. Each foreign country has a unique culture, history, and the institutional practice is different. Multinational management requires an understanding of these differences. The limited knowledge of the decision makers influences cooperation and creates a high risk of the operation. The cultural understanding and connection are crucial for knowledge management, especially how produced and how to keep within the organization, reflects the importance of trust. The benefits of international portfolio diversification are intelligible, but on the other hand, the effect on the individual human capital is not unequivocally. When the primary aim is the cost optimization, the international enterprises have to provide sufficient tools to increase the productivity of the human capital and keep their knowledge in the organization, but if they do not invest significantly to the development further, it makes them vulnerable.

Keywords: *diversification, globalization, human capital, multinational team, trust*

1. INTRODUCTION

In the last three decades, a significant change was observed in the world financial and economic model. As the market became more complex, and the global landscape changes, all stakeholders face a challenging environment. If companies operate in only their home market, they have limited (and more expensive) access to different resources. The companies are motivated to move foreign markets to minimize their cost of capital and maximize their market (Shapiro, 1978). While the cost of the production of the internationally active enterprises decreased, at the same time, the systematic risk increased. (Čaušević, 2014). The benefits of international portfolio diversification are intelligible, but the effect on the individual human capital is not unequivocally. These changes in the global trends influence individuals who are employees of the multinational companies. Each foreign country has a unique culture, history, and the institutional practice is different. The international enterprises have to provide sufficient tools to multinational management to understand these differences.

The limited knowledge of the decision makers influences cooperation and creates a high risk of the operation. The cultural understanding and connection are crucial for knowledge management, especially how produced and how to keep within the organization. Cultural fragmentation is one of the key principle of every culture, and he investigates the effect of the meeting of culture in the modern world. As far as Nicolescu (2014) concerns, neither the intercultural nor the multicultural do not assure communication between all cultures, but they certainly contributed to steps toward the act of transcultural communication. This phenomenon leads to the problem, where the language and meaning receive a higher weight: people use same – not native - words which can have different meanings through culture and representation. (Nicolescu 2017, Brier, 2015).

2. THE MAIN MOTIVATION OF THE COMPANIES TO BECOME GLOBAL

One of the first multinational business organizations, the East India Company, was established in 1600. The decision whether a company move abroad is driven by strategic direction. Move to abroad is a huge opportunity and a big challenge as well. "I define globalization as producing where it is most cost-effective, selling where it is most profitable, and sourcing capital where it is cheapest, without worrying about national boundaries" (N. Murthy, Founder and Executive Chairman of the Board, Infosys; Moffett, 2016, pp:2). Their strategic considerations lead by different motivations (Moffett; 2016, pp:32.). Market seekers produce in foreign markets either to satisfy local demand or to export to markets. The Raw-material seekers motivated to find cheaper resources including raw materials, for export or for further production (oil, gas, forest is the most significant) or knowledge. The Productivity is the main keyword for firms so to reduce cost on labour is highly motivate companies to move new countries (Production Efficiency seekers) This strategic direction is true not only for labour-intensive production but for their, it is the one of the factors of reducing cost. Labour-intensive production of electronic components in Taiwan, textile industry movement to China or car industry moves to Asia or Eastern Europe are the main proof of this motivations. The Knowledge seekers moves to countries to gain access to technology or knowledge or managerial expertise. Nowadays well-educated formal MBA students are available in India or Chine, so a lot of companies work with them with a lower cost. And finally, the Political Safety seekers establish new operations in countries that are considered unlikely to expropriate or interfere with private enterprise. The movement of the industrial trends observed in the comparison of the Largest Global companies (Milford, 2018). While in 2008 oil company (Raw-material seeker) was the leader of the list of global companies, now the industrial change is obvious. The technology companies dominate the list which has the most benefit from globalization through access of knowledge on low cost.

2.1. The main risks of the international enterprises

Multinational financial management requires an understanding of cultural, historical, and institutional differences such as those affecting efficiency and sustainability. Each foreign country has unique culture, history, and institutions. The country risk is significant if someone invest or operate a business in a foreign country. The country risk is different from country to country, but it includes political risk, exchange-rate risk, transfer risk, economic risk, regulatory risk. In general, the country risk is the degree to which political and economic situation influence the securities of the business in a particular country. (Moffett, 2016. 363-366). It is not always understood by exported management of multinational enterprises, which influence cooperation and effectiveness. The countries' regulations and institutional practices are all different, and the lack of knowledge of the decision makers can create a high risk of the operation. This phenomenon raises the question, whether the classical trade model, the general principle of comparative advantage is still valid or not. The comparative advantage of the twenty-first century is based more on internet facilitated services than on the classical resources

in the seventeenth-nineteenth century when countries specialized only on the products that they most efficiently produced. The modern factors are more complex when the companies operated worldwide and the operating facilities like managerial skills, research and development competence, educational levels of available workers, access to capital or supporting infrastructure. (Moffett, 2016. pp:29-30).

2.2. The effect of the portfolio diversification on the risks of the international enterprises

Beyond the access to the market and the resources of the countries, the potential benefits to companies to operate on global markets are based on international portfolio theory, as the benefits of international diversification. The company can reduce non-systematic risk by maximizing the security of the operation, but it cannot influence systematic risk. In the CAPM model, a fully diversified domestic portfolio would have a beta of 1.0. This is Standard Domestic Financial theory. If the company is represented on the domestic and international market as well, this diversifies the portfolio more than only domestic and the beta will be lower than one. The International CAPM (ICAPM) says that there is a global market where the firms trade. International portfolio theory typically concludes that adding international securities to a domestic portfolio will reduce the portfolio's risks. Although the firm operating on the market has significant risks, but they have a lower cost of capital than their domestic counterparts and effective tools – not to ignore but - to minimize the risk level of the optimal capital budget. All of these factors lead to the fact, that “the multinational corporation (MNC) becomes the norm rather than the exception, the need to internationalize the tools of domestic financial analysis is apparent.” (Shapiro, 1978).

3. CAPTURE THE KNOWLEDGE OF THE HUMAN CAPITAL IN THE MULTINATIONAL COMPANIES

The changes in global trends influence individuals who are employees of the multinational companies. Encounter and collision of cultures are present in the age of globalization, but the method of a single discipline is not able to describe and solve these emerging issues. The cultural fragmentation is the heart of every culture. When two people try to communicate their prejudices, convictions, and language appear on the sub-conscious level. The dialog is difficult as sub-conscious "fights" against sub-conscious. As this confrontation is sub-conscious, they drifted conflict is not obvious. The process is the same for cultures, where dogmas, beliefs meet with each other.

3.1. Transdisciplinarity, the unity of knowledge

More and more scientific areas arrived at the limits of their discipline which had a far-reaching consequence, not only the given discipline but for community and society as well. As the knowledge of the human beings developed and specialized, the fragmentation of disciplines was released (Montuori, 2005). Now, the separated disciplines – even sub-disciplines - are not able to answer to burning topics, which influenced not only the scientists but practitioners as well. Discoveries on many fronts were also leading scientists to think big systems. Multidisciplinary seems like a solution to this problem, which investigates a research topic in several simultaneous disciplines, not in only just one. Multidisciplinary brings an extra value in question, but this is "in the exclusive service" of the home discipline and not inclusive (Nicolescu, 2010, pp:22). The goal and the method of Interdisciplinarity are different than multidisciplinary, as it transfers methods from one discipline to another. Bernstein (2014) emphasizes that multidisciplinary overflows the disciplines, but the goal remains within the disciplinary research framework. In fact, there is no transdisciplinarity without disciplinarity. The goal of Transdisciplinarity is the understanding of the present world, the closest one to the real-life experience, where the central imperative is the unity of knowledge.

The transdisciplinarity concerns at once between the disciplines, across the different disciplines, and beyond all disciplines (Nicolescu, 2010, pp.:22). As Piaget said (1970) „succeeding to the stage of interdisciplinary relations a superior stage, Transdisciplinarity is the most comprehensive and abstract synthesis of disciplines, "the coordination of all disciplines in the education and innovation system by a generalized axiomatic (introduced from the purposive level down) and an emerging epistemological pattern" (Jantsch, 1972, pp.:7). The "transdisciplinarity identifies with new knowledge about what is between, across, and beyond disciplines (the meaning of trans)." (Bernstein, 2015, pp.:6). This is the scientific approach which initiates a dialogue between minority and majority cultures, includes scientists and practitioners from different areas, and strives to transcend the traditional borderline between objective and subjective viewpoints. In this fast-moving, ambiguous, complex world, the concept of transdisciplinarity focuses on a fundamental feature of reality, on different levels and dimensions of reality, and on what it calls the logic of the included middle (Nicolescu, 2010). This trend is the same for the cooperation, trust and cultural challenges in the multinational teams, where the single disciplinary approach is not able to get through the definition of knowledge and knowledge management.

3.2. Challenges of the knowledge management

The knowledge management, the organizational learning, and build the community of practice through trust are the main topics for business administration and management also as for psychology, sociology or knowledge science. Hard to define, specify, measure, and keep knowledge in the organization but from organizational cooperation point of view, the understanding of the concept of tacit knowledge and effect on Knowledge management is crucial. Breinstein (2014) uses knowledge management as "the toolbox of techniques intended to maximize the value and impact of employees' knowledge by converting tacit knowledge into explicit knowledge, thereby making it actionable." (Breinstein, 2014, pp.:17) He uses Davenport and Prusak's (1998, pp.:5) definition of it as a justified personal belief that increases an individual's capacity. Based on this approach, knowledge, is a commercial product, a resource for the organization, and human capital. Machlup uses a definition of human capital as "increased productive capacity of persons." (Machlup, 1984, pp.:419). Knowledge management is a tool to capture knowledge of employees of the firms and make it available to others is the primary goal of the enterprises, to use this knowledge to create better products or respond to market needs. In the age of globalization, especially regarding how it is produced and how to keep knowledge within the organization reflects the importance of transdisciplinarity. The evolution of communication in the 'digital galaxy' has been changed. Not only the access to the knowledge but the way of communication changed in digital society. As the majority of the multinational teams are working remotely, the knowledge management and practices in a virtual world is a specialized area of this topic. Brier (2015) appoints that Shannon's model was successfully used over the years, "in providing terminology for describing aspects of communication systems, but it tells us nothing about how messages and meanings shape and ultimately determine the nature of human communication events" (Danesi, 2008, pp.: 18).

3.3. Communication, trust, and culture in the cross-cultural team

As we saw, the humankind develops more and more knowledge, which influence the cooperation of labor and division of labor. Disciplinary fragmentation is the result of increasing specialization. The globalization speeds up this process. As multinational enterprises maximize the benefit of diversification, local firms become part of the global community. It is a real cultural shift in attitude and cooperation which effects everyday practices and has long-term consequences and importance.

Cultural differences slow down or even block the development of trust and reduce the willingness of sharing tacit knowledge. It not only hinders the limit the informal cooperation but reduce the effectiveness of formal knowledge transfer (makes it longer or less effective) as well. It is critical for multinational teams where the member works in a virtual team. While cultural differences across countries through diversity expected to increase the number of learning, it is blocked, if the organization is not able to improve the trust. Far beyond technology, this influence social behavior and influence on the cultures. From the transdisciplinary approach, this explanation based on technology and science, but social science, semiotics, psychology on the other hand. This is the reason for the problem of networked knowledge in organizations in a different culture and these influence on people behavior is an interesting question for transdisciplinary. Not possible to have a theory of information, cognition, and communication without a concept of meaning. The Meaning is not a simple question, as this is related to life, language, consciousness, and unconsciousness. The meaning is part of the culture and like it, part of the "collective metaphysical framework" (Brier, 2008, pp.:128) which is a fundamental issue for an organization. The industrial organization used the division of labor and specialization, to increase, articulate, and facilitate production, and the production of knowledge has followed the same organizational model (Montuori, 2005). Each organization's goal to create unity within a diverse team, while the relationship between the people in diversity is contradictory and raise many challenges.

4. THE PROMISE OF TRANSCULTURAL APPROACH

As far as Nicolescu (2014) concerns, neither the intercultural nor the multicultural do not assure communication between all cultures, but they certainly contributed to steps toward the act of transcultural communication. As a starting point, use Nicolescu framework about cultural interaction. (Nicolescu 2010). He investigated the effect of the meeting of culture in the modern world. The modernity leads to an establishment between cultures and brings a desire for the need to unite. He adapted the logic and level of multi-inter-trans prepositions and introduced a framework of the three degrees of cultural interaction. In his conception, the multicultural "shows that the dialogue between different cultures is enriching, even if its goal is not real communication between cultures." (Nicolescu, 2014, pp.:22). He brings an example, the study of Chinese and Islamic civilizations influenced the European culture in middle ages. With a corresponding analog, this discernible in the virtual world as strong cultures – which can be even non-existent one - influence other cultures and the behavior. Multicultural as the first level of cooperation, - not unity yet - and the discovery of the different culture is embedded in our cultural understanding. It "helps to discover the face of our own culture in the mirror of another culture" (Nicolescu, 2014, pp.:22). Based on the observation, in the multinational organization, this phenomenon appears is the first step of the cooperation when the persons seem their culture feature and disadvantage more clearly than before. The intercultural level what assisted by Nicolescu as the result of the growth of transportation and communication and economic globalization. Multinational organizations have higher access to the capital included human capital than a local one, but on the other hand, they destroy borders and create a cross-border organization where the cultural understanding and connection is crucial for knowledge management. "A deepening discovery of hitherto badly known or unknown cultures makes unsuspected potentialities burst forth from our own culture. The face of the Other permits us to know our face better." (Nicolescu, 2014, pp.:22). This can lead a learning process or – otherwise, their cultural differences lead to stereotype and untrusty. As far as he concerns, neither the intercultural nor the multicultural do not assure communication between all cultures, but they certainly contributed to steps toward the act of transcultural communication. "The transcultural designates the opening of all cultures to that which cuts through them and transcends them..."

It presupposes a universal language founded on shared values” (Nicolescu, 2010, pp.:23). As we have seen the significant change on the level of disciplines – thanks to the development of scientific methods and approaches – that this kind of change has been realized as an inner need, those of cultural modes remain the domain of ephemera. “Culture today appears more and more like some monstrous rolling garbage can in which strange defenses against the terror of non-meaning proliferate. Of course, as always, the new is hidden in the old, but it is slowly but surely being born. Beyond all the different cultural modes, a new cultural way of being is taking shape” (Nicolescu, 2010, pp.:22).

5. SUMMARY

The multinational enterprises and the cooperation in multicultural teams are an organic phenomenon of globalized work. Transdisciplinary approach (go beyond the disciplinary boundaries) and the reconceptualization of knowledge help to understand the operation of this phenomenon. Besides of, this is the reason that the problem of networked knowledge in organizations in a different culture and the influence on people behavior is an interesting question for transdisciplinary research. The recognition and the understanding of the problem with a transdisciplinary approach, and find the common language is challenging, so the misunderstanding and disagreement in transdisciplinary cooperation are more common. (Dodig-Crnkovic at all. 2017). Each person has his/her prejudices, his/her convictions. We discussed the importance of meaning earlier and put this into the consideration of the two-culture problem. The language receives a higher weight: people use same but not native words which can have different meanings through culture and representation. This is the reason why transdisciplinarity can be the method of dialogue between cultures. (Nicolescu 2017). To adapt the ontological axiom of transdisciplinarity, the A is the culture on a personal level, the non-A the different culture and the hidden-T which appear on an organizational level as A and non-A at the same time. These two systems – cultures – generate the system of the system: the culture of culture. "The included third does not mean at all that one could affirm one thing and its opposite... in a logic based on the assumption "both this one and the other one," or rather "neither this one nor the other one." (Nicolescu 2014, pp.:170). “Thus, the philosophy of the included third appears as a philosophy of freedom and tolerance” (Nicolescu 2014, pp.:181).

ABSTRACT

Partial Least Square method works similarly to the standard regression model as each of these are often used for determining a relationship between certain variables that can influence the marketing strategies in general. The reason why PLS is considered is because of its advantages such as its lower size sample, easier to test and implement and capabilities to handle formative indicators. This is considered to be ideal in scenarios which are often related with international marketing as it could be difficult for an individual to adopt marketing strategies that are well suited for that country or region. This is especially true for Arab countries due to the complexities in this region due to a deep interconnection between their religion and their vast culture. This assessment will primarily focus on understanding and evaluating the uses of Partial Least Square in international business literature towards helping in understanding the benefits of using it to develop strategies for marketing research that are well suited for Arab countries. For this, PLS software such as SmartPLS will be used in order to run the tests to determine the viability of the marketing strategies that will be used for this.

Keywords: *Structural equation modelling, Partial least squares, PLS-SEM*

1. INTRODUCTION

Partial Least Square modelling is defined to be a type of structural equation modelling which has become a main standard for marketing research. Researchers primarily use this as a way to understand and assess the latent variables that are understood at an observational level (Hair, Sarstedt, Ringle & Mena, 2011). Along with that, these are primarily used in order to test relationships between the latent variables that are to be tested in a theoretical level (Hair, Sarstedt, Ringle & Mena, 2011). The use of this is considered to be useful in the context of understanding or predicting the output of values that are able to help in making a marketing strategy that is as effective as it can be (Shackman, 2013). This can include the likes of using probability tools such as linear regression, and correlation that can use to evaluate the relationships that can help in understanding it in a theoretical level (Hair, Sarstedt, Ringle & Mena, 2011; Shackman, 2013). This can be useful in evaluating or understanding how one can conduct a marketing research in Arab countries. The reason why Arab countries are considered for this assessment is because Arab countries are considered to be a great market for marketing and for an organization to gain a competitive edge in a selected industry (Mahajan, 2013). According to the assessment done by Mahajan, Arab countries are different from similar markets like India, China and Brazil is their intertwined relation between their religion Islam

and the Arab culture (Mahajan, 2013). It can be seen that while Arabs are willing to adopt new and modern settings and environment, they do not want to trade their religion for it. As such, the marketing strategies and research that needs to be done for this needs to consider this criteria along with the strategies that can be taken for conducting a marketing research. The purpose of this assessment is to utilize Partial Least Square to determine and find marketing research methods that can be utilized in Arab countries. This can help in making sure that the work done with this is able to develop marketing research strategies in Arab countries. Doing this could help in making sure that those strategies are being used that can help in getting better results when developing marketing strategies for these. To help with this, PLS software will be used in order to reduce the effort and calculations for this assessment. For this, the tool that will be used is SmartPLS which is one of the much software that are used for this work. It can help in the research phase as it reduces the amount of time that it would be required to calculate each variables for it.

2. LITERATURE REVIEW

According to the assessment presented by various scholars, it can be seen that the structural equation modelling is considered to be one of the most used and known models that are used in the international business literature by its researchers (Hair, Sarstedt, Ringle & Mena, 2011; Shackman, 2013; Sarstedt, Ringle, Smith, Reams & Hair, 2014). The lesser known modelling technique that is considered as an alternative of structural equation modelling is partial least square model (Shackman, 2013). The partial least square model works similarly to a structured equation modelling in the context of understanding the relationship present between two or more variables and determining the influence of it on one another (Shackman, 2013). It has seen a widespread usage among applied researchers starting from 1960s to late 1970s (McIntosh, Edwards & Antonakis, 2014). PLS is gaining a strong following in fields such as marketing and information systems research due to the benefits that it presents and the inherent advantages that it presents (McIntosh, Edwards & Antonakis, 2014). This makes it a better alternative to the likes of structured equation modelling, linear regression, correlation, and simultaneous equation estimators (McIntosh, Edwards & Antonakis, 2014). This can be useful when determining the marketing research that can be taken for Arab countries. This is because Arab countries have a different opinion and culture that sets them apart from the rest of the countries (Mahajan, 2013). It is seen that the Arabs, while have adopted modern benefits and environment, still considers intertwining their religion and culture together (Mahajan, 2013). This can become a crucial problem when trying to do a marketing research for Arab countries as missing out religion or their customs could present to be threatening for any organization that wants to invest in this region (Mahajan, 2013). As such, the marketing research that is needed to be done needs to consider the factors and variables that are made to suit for Arab countries and their specific regions. When forming the research, care is to be taken towards making sure that the marketing research conducted from it is able to achieve the expected result or that result that is able to justify the strategies that can be used for Arab countries.

3. WHY PLS?

One of the purpose of using PLS-SEM is prediction thus, researcher must report the predictive relevance of the model. Table 1 schematizes the guidelines to validate the structural model using PLS-SEM.

Table following on the next page

Table 1: Structural Model Validation

NO	Assessment	Name of Index	Level of Acceptance	Literature Support
1.	Lateral Collinearity	Variance Inflator Factor (VIF)	VIF < 3.3 VIF < 5.0	Diamantopoulos and Siguaw (2006) (FMI Alnaser, Ghani, & Rahi, 2017; F Alnaser, Ghani, & Rahi, 2018; Hair Jr, Hult, Ringle, & Sarstedt, 2016)
2.	Path Coefficient	Path Coefficient	p value < 0.01 t value > 2.58 (two-tailed) t value > 2.33 (one-tailed) p value < 0.05 t value > 1.96 (two-tailed) t value > 1.645 (one-tailed)	(F. Alnaser, M. Ghani, S. Rahi, M. Mansour, & H. Abed, 2017; Hair Jr et al., 2016; S Rahi, Ghani, Alnaser, & Ngah, 2018; S Rahi, Ghani, & Ngah, 2018; S. Samar, Ghani, & Alnaser, 2017)
3.	R^2	Coefficient determination	0.26- substantial 0.13- moderate 0.02- weak 0.67- substantial 0.33- moderate 0.19- weak 0.75- substantial 0.50- moderate 0.25- weak	(F. M. I. Alnaser, M. A. Ghani, S. Rahi, M. Mansour, & H. Abed, 2017; Cohen, 1988; S. Rahi, 2017, 2018) Chin (1998); (Samar Rahi & Abd. Ghani, 2018a, 2018b; R. Samar & Mazuri, 2019a, 2019b) Hair Jr et al. (2016) (S Rahi, 2017; S Rahi, Ghani, & Muhamad, 2017)
4.	(f^2)	Effect Size to R^2	0.35- substantial 0.15- moderate 0.02- weak	Cohen (1988)
5.	Q^2	Stone-Geisser Q^2 Predictive relevance	Value larger than 0 indicates that exogenous constructs have predictive relevance over endogenous construct	Hair Jr et al. (2016) (Samar Rahi, Ghani, & Alnaser, 2017); Stone (1974) Geisser (1974); (Samar Rahi, 2016; Samar Rahi & Ghani, 2018a, 2018b; R. Samar, Notjaya, & Feras, 2017)

Source: Adopted from Ramayah, Cheah, Chuah, Ting, and Memon (2016)

4. DATA AND METHODS

The data that is collected for this research is primarily done through the use of the data collected from a set of steps that are used for this research. These are often used during PLS as a way to ensure that the data collected is according to the requirements set by the researcher that is conducting the marketing research. The data that is collected for this is from multiple countries that has a majority of Arabs in it. The countries that are included in this research are Bahrain, Egypt, Jordan, Kuwait, Libya, Morocco, Oman, Qatar, Saudi Arabia, and the United Arab Emirates (UAE). The reason why these countries were considered is due to the fact that these countries are considered to be ideal for any organization to invest in when considering expanding to an Arab country. The figure below shows that the majority of the population is of the working class, which makes it ideal for any outside organization trying to do business over there.

The Arab Middle Class

COUNTRY Population	TOP OF PYRAMID	MIDDLE CLASS	BOTTOM OF PYRAMID
ALGERIA 36 million	17%	55%	28%
BAHRAIN 1.1 million	7%	60%	33%
EGYPT 80.4 million	13%	34%	53%
JORDAN 6.3 million	20%	41%	39%
KUWAIT 3.7 million	22%	57%	21%
LEBANON 4 million	10%	60%	30%
LIBYA 6.5 million	15%	35%	50%
MAURITANIA 3.5 million	3%	30%	67%
MOROCCO 32.2 million	13%	32%	55%
OMAN 3.1 million	6%	63%	31%
QATAR 1.8 million	8%	70%	22%
SAUDI ARABIA 28.2 million	13%	65%	22%
SUDAN 32.7 million	8%	46%	46%
SYRIA 20.8 million	3%	57%	40%
TUNISIA 10.7 million	22%	52%	26%
UAE 5.4 million	11%	60%	29%
YEMEN 25.1 million	4%	60%	36%

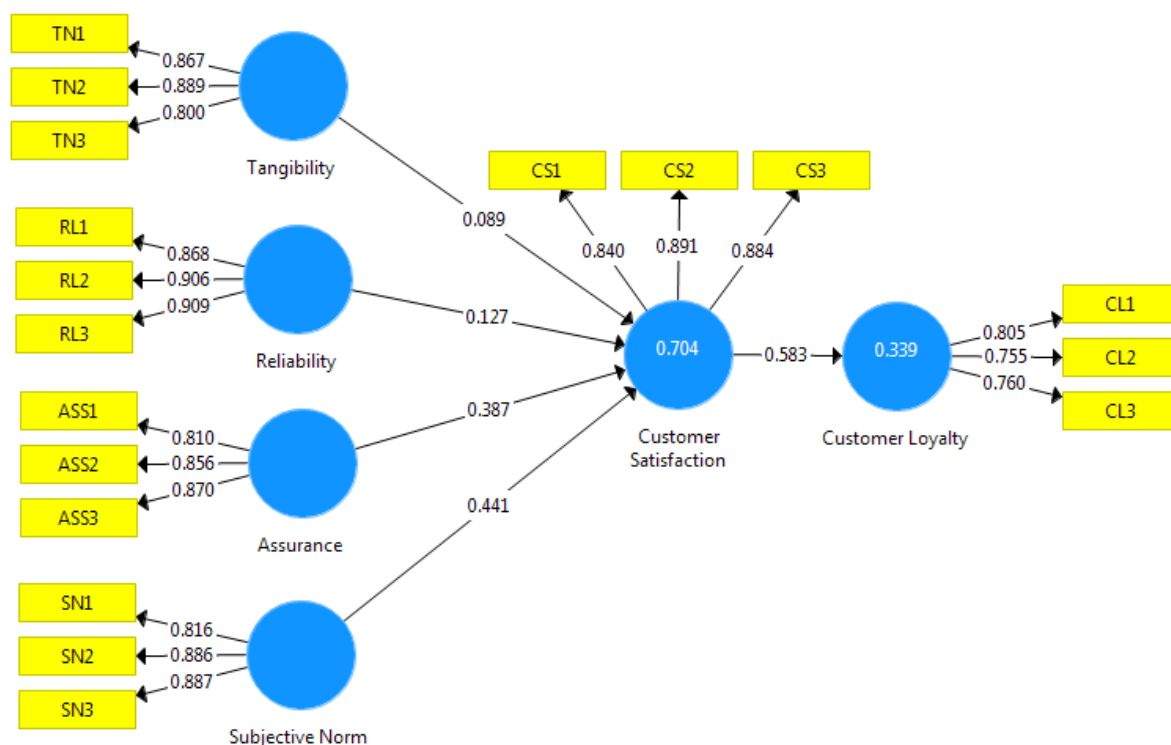

Figure 1: chart depicting what constitutes the population in the Arab countries
 (Mahajan, 2013)

Since we are using Partial Least Square for determining the marketing strategies, a software tool can be used as a way to ensure that minimum errors are made from the researcher's side and the result is able to determine the practices that are effective for it. For this, SmartPLS will be used as it is used commonly for this work and it is able to do it in an efficient way.

5. HOW TO USE PLS-SEM

When applying PLS-SEM, researchers should follow a multi-stage process that involves various attributes of the inner and outer models along with its data collections. The study that we have taken for an example about PLS-SEM has planned to examine service quality in Islamic banks of Palestine by extending SERVQUAL model with subjective norms and customer satisfaction. The criticism on SERVQUAL model, however, needs to be considered as it could lead to researcher using the three dimensions of SERVQUAL model as suggested by (Raajpoot, 2004).

Figure 2: Measurement Model for the taken study

6. CONTRIBUTION

Common technique variance is a typically encountered source of bias specially whilst analysing survey research, and is constantly scary interest among IS researchers. In structural equation modelling equipment exist for controlling method bias, however most of them are advanced for CBSEM and are not immediately relevant to different strategies. These observe introduces a method for controlling common method variance in PLS path modelling context. The proposed method changed into examined underneath several conditions the usage of Monte Carlo simulation. The consequences propose that the proposed method can drastically decrease the bias because of common method variance in estimates while the use of PLS. The quantity to which this technique is beneficial depends on the extent of common approach variance present in facts. If the counselled remedies are introduced whilst not unusual method variance does now not exist in reality, the consequences have a tendency to come to be biased. Therefore is considered as a necessity to diagnose the quantity to which commonplace technique variance is present earlier than using this method and always jogging the model with and without the

approach factor. The quantity of marker variables blanketed have to replicate the sample size and complexity of the records: for big sample sizes and massive method variance stages, extra signs appear to provide better effects. In a few occasions, it is even affordable to include as many marker variables as there are noticeable variables within the version. When the use of the proposed method, it is recommended to use marker variables which are correlated most effective due to technique impact. However, as this situation is seldom fulfilled in exercise, it is recommended to affirm that no excessive correlations exist amongst marker variables, and if necessary, exclude rather correlating variables from the facts, finally this study is the first one in it is nature that target the beginner users in Arab region.

7. LIMITATION

This research has its own fair share of limitation. The reason these limitations exist due to the design of the research and what variables were considered for it. The first variable that is considered for this is the criteria that are set for this. For this research, the main settings and the criteria set for this were the factors that were considered for this, i.e. the preference of Arabs for incorporating their religion and culture together. This is primarily because it could limit the amount of marketing research that can be done for it (Wolfsfeld, Segev & Sheafer, 2013). Conducting a marketing research for Arab countries is considered to be a significant challenge in itself due to the difference in environment that is found. The difference in the culture is primarily fuelled with. For this, several research strategies can be made in order to ensure that more variables can be utilized during the research of this. In addition to this, it can be seen that the other factor that hinders the viability of the marketing strategy is the amount of data that is being used for this. This is because having a lower number of data does not help in finding an accurate result when performing an analysis. Ideally, it is required that a large number of data is used for analysing as it could help in making sure that the results generated from the model or the research methods is able to bring a result that is as close to accurate as it can be. Lastly, other limitations that are found in this research methodology are the lack of social media in this. This reason why these criteria can be crucial is because social media can help any organization to deliver their message to people across the world, including the countries and states that are within the Middle East region, where Arabs are mostly located. It is also seen that it has changed how people trade and do business as well (Cordeiro and Krempels, 2013). By not considering this, it can present a drawback that will not be able to answer what marketing strategies can be employed in order to target the Arab people (Cordeiro and Krempels, 2013; Wolfsfeld, Segev & Sheafer, 2013). Further researches that can be done on this can be made to utilize marketing research to determine the variables that can yield effective results for when utilizing social media for marketing in Arab countries.

8. CONCLUSION

From the research that was conducted, it can be seen that the results are able to determine the effectiveness of each of the variables that can be used for marketing research. This can help the marketing researcher to determine those values and variables that are able to determine what marketing research can be done for Arab countries. The limitations that are found in this research strategy can be mitigated in future researches as it could be made to primarily focus on expanding the result from this research to illustrate what further strategies can be used by the marketing researcher when conducting a marketing research for an Arab country.

ABSTRACT

Statistical analysis of data becomes an integral part of the management system at all levels — from a small firm to the national economy as a whole. The article investigates the scientific views on forecasting the development of regions. In modern conditions of economic development, the implementation of a long-term national program is impossible without taking into account the specifics of regional development. This explains the importance of forecasting at the regional level. Regional forecasting represents the prospects for the functioning of the region at some point in the future. By means of the forecast the possibility of realization of the directions of the state social and economic policy in various spheres and at different levels is estimated. It is important to note that the state forecasting is based on the use of statistical data in the forecast period and recommendations of the subjects of the state, taking into account the opportunities and interests of the region. At the same time, the forecasts of socio – economic development of the regions are on the one hand an integral part of the state forecast, on the other determine the quality of the programs of socio – economic development of the region. The increased interest in this problem is explained by the fact that the forecast makes it possible to determine the probability of crisis situations in different regions of the country, and this in turn will contribute to the adoption of timely decisions in order to avoid negative consequences. Thus, regional forecasting performs analytical, diagnostic and foresight functions and is a mandatory tool for the development of the region's development prospects. This study focuses on the need for scenario forecasting and modeling, which take into account the influence of the main external and internal factors on the development of the regional economy and make it possible to obtain forecasts that reflect alternative development options. The algorithm of development of the regional forecast on the basis of scenario approach is described. Three scenarios of economic development in the region-optimistic, pessimistic and realistic. Taking into account the stated vision of the three scenarios of the regional economy development, the substantiation of certain provisions of the regional economy development strategy and specific mechanisms for solving the actual problems of its economic growth are considered. The problems arising in the process of forecasting are also identified, and recommendations for improving its efficiency are formulated.

Keywords: *forecasting, modeling, region, scenario analysis*

1. INTRODUCTION

The economic development of the country's regions is characterized by significant inter-regional differentiation, so the working out regional development policy should be based on the implementation of systemic regional forecasts, differentiated by areas, sectors and terms. Therefore, the formulation and implementation of national tasks must necessarily consider their territorial aspect, should take into account not only national but also regional priorities (Bystrov et al., 2017; Litvinenko, 2017). Namely the basis of the methodology of scenario regional forecasting is the knowledge and use of those laws that operate not only at the level of the whole state, but also its components. Forecasting of social and economic regional development is the object of increased attention of both scientists and Central and local authorities. This necessity is determined by the duration and complex nature of the solution of regional problems (Chistova, 2013). At the stage of the development of new market conditions in our country, an important role is played by the choice of methods of strategic economic management, which are based on the timeliness and reliability of the economic forecasts. Forecasting enters a fundamentally new stage of its development (Glotova et al., 2018; Titova et al., 2018). It is impossible to obtain accurate forecasts for solving increasingly complex problems which our state is facing without mastering modern scientific methods of modelling and forecasting. A serious problem of forecasting the priorities of social and economic development of the regions is the lack of formal procedures to achieve multidirectional and multi-quality objectives of the functioning of the individual regional subsystems. Information incompleteness and inability to quantify the goals and priorities of economic and social policy reduces the effectiveness of management decisions and the rationale for the choice of strategies (Aksyanova et al., 2011). As a result, there is a need for simultaneous implementation of many options for forecasting future situations. This principle is basic in the transition from traditional extrapolation to scenario approaches. The scenario method involves the creation of scenario development technologies that provide a higher probability of working out an effective solution in situations where this is possible, and minimizing the expected losses in situations where losses are unavoidable. Thus, the aim of the research is to use the scenario forecasting tool for social and economic development of the regions.

2. MODELLING OF PROCESSES OF REGIONAL SOCIO-ECONOMIC DEVELOPMENT

The algorithm of modelling and scenario forecasting of socio-economic development of the region is based on the following steps:

- First step - The choice of factors that INFLUENCE the development of the region's economy, and the resulting indicators, the values of which should be increased or decreased.
- Second step - With the help of correlation analysis definite factors are identified that have the strongest impact on the results.
- Third step - The construction of regression equations that will allow to establish the value of the dependence of the increase in the values of factors and their impact on the resulting indicators (Mamedsupiyev et al., 2008; Okhlopkov; 2013).
- Fourth step - The identification of possible scenarios for the forecasts of key indicators.

As indicators characterizing the level of socio-economic development of the region, the gross regional product and per capita income of the population were chosen. The definition of indicators that have a priority impact on GRP and incomes of the population will answer the question of priority measures in the economy of the regions, their priority for each region and the region as a whole, to accelerate its economic development. Let us identify the factors that affect the change in the resulting indicators. In our opinion, the basic determinants are demographic indicators, which play an important role in the formation of demoesocial

prerequisites for the effective use of the labor potential of the population, followed by reflection in the results of the use of labor (Mhitaryan et al., 2008; Parshutich et al., 2017). The quantitative assessment of the demographic indicators of the region indicates favorable trends, but the question arises as to how effectively this socio-demographic potential is used in the labor resource sphere. Therefore, employment indicators play a very important role in the system of determinants of economic development. Employment is not only a sign of the effectiveness of the human factor (Petrov, 2011; Skotarenko, 2013). All spheres of life, including economic are under its influence, and they acquire new qualities-flexibility, dynamism, stability. The quantitative aspect of employment in qualitative terms reveals the indicator of income per person (Nizhegorodtsev et al, 2011). A comprehensive assessment of the factor impact on the economic development of the region requires taking into account educational indicators. The educational factor is traditionally considered from the standpoint of its social, cultural, spiritual and educational functionality; however, more attention is paid to its economic role, the effectiveness of which depends on whether the striking discrepancy between the productivity of education and the expectations of the economy in relation to its importance will be eliminated (Borisov et al., 2014). An important group of indicators that form the model of analysis of economic development of the region, are innovative ones. During the period 2000-2016 in the region there is an increase in the volume of innovative goods, works and services. To carry out forecast calculations, we denote the corresponding variables (table 1).

Table 1: Variables for the analysis of socio-economic development of the region

Variable	Indicator
x1	Population of the region, thousand people
x2	The average annual number of employed in the economy, thousand people.
x3	The volume of innovative goods, works, services, mln. rubles.
x4	Exports, million dollars USA
x5	Imports, million dollars USA
x6	Average monthly salary, rubles.
x7	Release of specialists by the higher professional institutions, thousand people.
x8	Investments in fixed capital, mln. rubles.
x9	Fixed assets in the economy, mln. rubles.
x10	Consumer price index, %
y1	GRP, mln. rubles.
y2	Average per capita income of the population, rubles.

Based on the selected indicators of socio-economic analysis of the region (table 1) and taking their dynamics for 2000-2016, we get the correlation matrix, the analysis of which allowed to identify the factors that have the greatest impact on the resulting indicators. These factors included: investment in fixed capital and the average annual number of employees in the economy. The final form of the table for the construction of step-by-step regression is obtained from the values of the factors (table. 2).

Table following on the next page

Table 2: Data for regression construction based on the values of the main indicators of socio-economic development of the Belgorod region

Years	y1	y2	x1	x2
2000	44440,4	1555	9242	671,3
2001	53707	2121	14031	677,5
2002	62404,4	2762	10830	673,4
2003	76054,5	3357	15336	668,3
2004	114409,3	4070	22685	670,7
2005	144987,8	5276	35022	674,7
2006	178846,1	7085	52073	677,4
2007	237013,3	9404	83510	678,7
2008	317656,3	12758	104218	679,9
2009	304345,3	14117	78033	681
2010	397069,9	16993	96313	693,5
2011	507839,8	18800	125994	698,1
2012	546151,5	21659	136820	700,1
2013	569006,4	23735	129405	700,2
2014	619677,7	25372	120658	699,1
2015	686357	28331	147214	754
2016	730562	29579	143802	756,8

At the next stage, we will use step-by-step regression to obtain equations for the GRP indicators of the region and population income (table. 3).

Table 3: The results of the regression analysis

Regression results for the dependent variable y1: R=0,982025, R2=0,964374, F=189,48							
	Coefficients		Standard Error	t Stat	P-value	Lower 95%	Upper 95%
Intercept	-1736879		477767,5	-3,63	0,0027	-2761589	-712170
X Variable 1	3,420304		0,367967	9,29	2,29E-07	2,631094	4,209514
X Variable 2	2601,933		722,4113	3,60	0,0028	1052,515	4151,351
Regression results for the dependent variable y2: R=0,977557, R2=0,955617, F=150,7182							
	Coefficients		Standard Error	t Stat	P-value	Lower 95%	Upper 95%
Intercept	-73046	21812,64		-3,34	0,0047	-119829	-26262,5
X Variable 1	0,137678	0,0168		8,19	1,03E-06	0,101647	0,17371
X Variable 2	109,4291	32,981		3,31	0,0050	38,68987	180,1683

Thus, the equation of step-by-step regression for the GRP indicator of the region, taking into account the results of correlation and regression analysis, will have the following form:

$$y1 = -1736879 + 3,420304x1 + 2601,933x2$$

For the indicator of income:

$$y2 = -73046 + 0,137678x1 + 109,4291x2$$

From the obtained equations it is clear that the relationship between the dependent and independent variables is adequately described, the model parameters are statistically significant with probabilities of 0.95 and 0.97, the value of t-statistics modulo exceed the table values of the Student's criterion. From the first equation we can make a conclusion that every significant increase of the first factor to one point will lead to the increase of the grp of the region to 3,5mln. rub., the second- to 2601 mln. rub. From the second equation there comes the increase in population income respectively to 0,14 rub. and 109 rub.

3. SCENARIO FORECASTING OF SOCIAL AND ECONOMIC DEVELOPMENT OF THE REGION

On the basis of the obtained regression models, we will build a forecast of socio-economic development of the region for the next three years, highlighting three scenarios: basic, optimistic and pessimistic. Using trend models, separate forecast values for each factor were obtained. Thus, based on the data for 2000-2016, the following results were obtained (Figure 1, 2).

Figure 1: Dynamics of investments in fixed assets, mln. rubles

Figure 2: Dynamics of the average annual number of employed in the economy, thousand people

Table 3: Scenario forecast of GRP and per capita income of the region in the 2017-2019 biennium

Years	Scenarios		
	Base	Optimistic	Pessimistic
Investments in fixed capital, mln. rubles.			
2017	142309,4	156540,4	128078,5
2018	140493	154542,3	126443,7
2019	137212	150933,2	123490,8
Average annual number of employed in the economy, thousand people			
2017	777,4	855,14	699,66
2018	802,9	883,19	722,61
2019	831	914,1	747,9
The gross regional product, mln. rubles.			
2017	772559,7	1023504	521615,7
2018	832696,8	1089654	575739,1
2019	894589,9	1157737	631443
Average per capita income of the population, rubles.			
2017	31948,2	42447,62	21448,78
2018	34484,37	45237,41	23731,33
2019	37100,01	48114,61	26085,41

Consequently, in the pessimistic version of the forecast in the future the decline in indicators characterizing the socio-economic development of the region, and as a result, the slowdown in the growth of GRP and per capita income are expected. This process can be improved by the development of factors that influence the results. The optimistic scenario provides not only for the preservation of modern trends in economic development, but also their activation in the coming years, which will be accompanied by rapid regional economic growth, the formation of a modern effective structure of spatial development of the region's economy. The basic scenario is the most probable, it is connected with the extrapolation of the modern tendencies of the development of the economy of the region for the nearest time period. This is confirmed by the results of the development of the region in 2017. Based on the report "on the results of The Department of economic development of the Belgorod region for 2017 and the tasks for 2018" GRP in 2017 is 774, 7 billion rubles, which distinguishes it from the projected value to 0.3 %, and this indicates good quality of the model.

4. CONSLUSION

The process of scenario building is realized on the basis of diagnostic analysis and is closely connected with the forecasting process. It provides an opportunity to assess the most likely course of events and possible consequences and is designed to highlight key points in the development of the studied object and develop qualitatively different options for its dynamics on this basis , as well as for a comprehensive analysis and evaluation of each of the options, the study of its structural features and possible consequences of its implementation. The region, as a complex dynamic system, at any time can carry out its movement in one of the possible directions. In such cases, the scenario approach is used. It makes it possible to characterize the behavior of the region as an economic entity in the implementation of certain socio-economic hypotheses, since the development of scenarios will clarify all the positive and negative phenomena and events that may occur if one or another hypothesis is adopted. The probability of both an optimistic and a pessimistic scenario is extremely low. The most likely is a combination of " positive "and" negative " events, so the most likely scenarios are considered. Thus, scenario analysis showed that sustainable socio-economic growth of the region is possible only with a stable increase in the values of the considered indicators.

ABSTRACT

Information society is the new stage of development of a civilization, concept of post-industrial society. Improvement of the main characteristics of information and communication technologies, is considered a necessary step for satisfaction of important conditions of democracy in information society. The research of sustainable development of information society is important in terms of the solution of global problems. To characterize these aspects it is necessary to conduct a complex research. In this case, advantages of information society have to be defined and also influences of information society on global problems are estimated. The main essence of this article is made by a research in terms of sustainable development of the main priorities and aspects of development of information society. In article are characterized the visible contours of information society, and are revealed its advantages and threats. It is also estimated influence of information society to global problems. Functions of information society from a point sight of ensuring sustainable development are specified. Possibilities of sustainable development of information society are opened, its potential opportunities for the solution of global problems are investigated. Are characterized a view from Azerbaijan of aspects of sustainable development of information society and the taken steps.

Keywords: *global problems, information society, asymmetry of information, sustainable development, advantages, model, ecology, infrastructure, competitiveness, threats*

1. INTRODUCTION

The study of sustainable development aspects of information society is of crucial importance from viewpoint of solving global problems. There is a need for complex research to characterize those aspects. In this case, advantages and threats of information society to the development should be identified and impact of information society on global issues should be assessed. Sustainable development opportunities should be detected in the information society, and existing potential should be explored for the realization of those opportunities. From the standpoint of sustainable development, it should be commented on priorities of the information

society. These and other factors turn the sustainable development aspects of information society into pressing issue.

2. VISIBLE FEATURES OF INFORMATION SOCIETY

Information society, is a new stage in development of civilization, the concept of post-industrial society. The success of the information society concept, as seen from the experience, depends on what extend the stakeholders supporting it cover all population groups. In other words, there is a close correlation relationship in the information society between the success and the positive attitude of the majority. But the positive attitude spoken about, of course, is related democratic principles not contradicting with the democratic principles. An important condition for democracy in the information society is to get free and honest information. The role of the technological factor is growing day by day in undistorted dissemination of free and honest information, and in ensuring free accessibility of stakeholders. Therefore, to meet the essential conditions of democracy spoken about in the information society, the improvement of relevant characteristics of information-communication technologies is a necessary step. At the same time, it should not be forgotten that the communication is a key element of the information society and its development is accompanied by the decline in mass information services. Otherwise, it is impossible for more and more people to deal with information technology and knowledge transfer. Information society is created in the process of bounces and evolution. In our opinion, considering the invention of writing and book printing, development of communication tools and invention of computers information revolutions in the history of mankind does not reduce the role of evolution in the formation of information society. It should be noted that the formation of paper currency did not play a significant role in the development of information relations, either from the "revolutions" or from the formation of virtual money. It should be noted, that the advent of paper money did not play a little role neither than above listed revolutions nor than formation of virtual money in the development of information relations. Linking the establishment of economic basis of information society with the invention of computers and technical means of organization is basically the service of scientific publicity rather than academic science. However, specially starting from that time not only change in production, but also in lifestyle of people, increase in demand for creativity and knowledge and clear apperance of features of information society has come the reality. The information society has to be able both to eliminate information hunger and overcome information flow in the the world where the size of information is doubled after each 3 years. At the same time, the information society is most likely able to expand potential opportunities for reducing the asymmetry of market information. Let's just point out that the high percentage of semantic crossings in the news on multiple repetitions and analogical situations in information exchange can increase the opportunities for equal distribution of information among market participants. The networking of the information society has a positive impact on these opportunities by accelerating economic integration, in spite of economic barriers, including economic frontiers. Information has direct impact on competitiveness of economic agents after being converted into economic resource and mass consumable product. The economic purpose of the information society is to increase the competitiveness of material and non-material production with certain prerequisites, including the service oriented to appropriation of the benefit. Thus, the visible signs of the information society my include formation of information economy, culture, infrastructure, legislation and so on. can be attributed to the formation. The emergence of e-government is regarded as the development and support of digital markets, and e-farming network, while popularization of e-democracy value is regarded as signs of institutional development of information society. The information society expands the possibilities of using research outputs in the solution of global problems. While the increasing importance of knowledge in this society increases the role of science, it reduces groundless claims to

fundamentalism in scientific theses. One of the important reasons stipulating such situation is the prevalence of experimental summaries in formation of technological knowledge rather than scientific- theoretical. In other words, there is a decline in scientific evidence to be proven in the information society. In each case, technological knowledge that requires actual justification and verification is almost exclusively related to technological skills. Thus, the information society requires the status of a highly skilled specialist, as well as the necessary professional skills at the professional level. The fact that regular attempts to repeat the best practice in the information society do not justify itself, it creates a vicious circle effect. It leads to formation of such a "science" which requires to pursue what is ahead from technological viewpoint. This leads to the inertia of technological thinking and enhances undesirable technological dependence. For instance, a person who cannot build "smart kitchen" will never think to build "smart city. The phrases like "who lag behind don't repeat the mistakes " can be regarded as provisions of this "science". The principles of global information society like-ensuring fair competition, free access to national and world information networks, promoting private investments in the development of these networks and so on. should serve the developing countries to get out from a magic circle like " always pursue what is ahead". At the same time, it is well known that in the case of high technological activity, requests for certain information can be restricted and copyright protection issues will remain as pressing issues. It is expected that the issue of minimizing the impact of these factors restricting e-democracy will be resolved through the technological and social development of the information society. The Information Society is able to support the careful and emotional approach of the public to the problems of social importance by ensuring access to quality information on these problems. For this, the information society, in the absence of economic motivation, also supports "the transformation of the information into public consciousness and into public opinion as particular type of it, as well as the existence of social institutions interested in this or that situation" (Braliyev, 2008, pp.19). In the information society, bringing competitive economic activity into line with sustainable development requirements, including into its environmental regulations requires formation of substantial internal potential. This potential can be expressed in transformation of non-economic resources. For example, the popularity is an important resource for information society. On the other hand, the hypothesis that in the near future machines will primarily deal with material and energy production, and people will deal with management of technological and economic process as well as with information process, does not give reason to optimism about sustainable development prospects. In the information society, there are the following problems threatening sustainable development:

- inequality in distribution of information resources. Such a situation, contrary to the requirements of sustainable development, does not serve to reduce the gap between developed and developing countries (civilizations);
- strengthened information flow aggravates the problem of selecting precise and high quality information;
- virtualization of public relations, makes the personal space of any member of society narrow;
- the dependence on global networks, almost irrespective of its nature always accompanies innovation searches;
- domination signs in unification of cultures create unclear resistance in developing countries (civilizations), the attitude towards sustainable developmental values gets complicated
- the trust to mass media decreases;
- cybercrime represents a serious threat to network economy and becomes a tool of international terrorism.

Though information society has more potential advantages, their potential opportunities in terms of sustainable development should primarily include the following:

- information society intensifies globalization processes and its existence in a separate country is almost impossible.
- limiting relations of digital economy with global information and economic processes within the national framework does not look real;
- the support of state and national traits in this process does not conform to the fundamental principles of the information society;
- information society should serve to create a single information environment for all humanity;
- the unification and simplification of the requirements for the network structure in the digital economy expands its capabilities to support sustainable development.

In order to answer the question of which problems does the information society create or aggravate, let's consider the problems of humanity before the establishment of that society: social inequality, refugees, IDPs, migrants, terrorism, environmental contamination reaches at catastrophe level, biodiversity reduction, global warming, drugs, etc. Following are mentioned problems of mankind that get aggravated in the process of establishment of information society: social inequality, refugees, IDPs, migrants, terrorism, drugs, global warming. Apparently, the information society has not diminished the list of human problems, and some of them are even aggravated in that society. In the fight against ecological crisis, the possibilities of the information society are relatively actively used, and the signs of some are becoming appear. The point is that, the humanity struggling with the nature for hundreds thousand years eventually began to understand the importance of dialogue and cooperation with the nature. It should be noted that, the expectations from the information society in the solution of global ecological problems have been greater in the last century. (Orlov, 1999, pp. 112). Information society has always been able to keep the ecological disruptions on the agenda by ensuring the reliability and sustainability of the alarms on the increasing role of technogenic factors in environmental issues. The increase of social inequality is also observed in information society. However, probability to weaken this tendency may rise just as the vital importance of sustainable development is understood (Tomas Piketty, 2016).

3. SUSTAINABLE DEVELOPMENT IN THE INFORMATION SOCIETY

Sustainable development that ensures meeting the needs of current generation without diminishing opportunity to meet needs of future generations, envisages agreed efforts to build inclusive, sustainable and reliable future on global scale. In this case, economic growth, inclusive society and the environmental protection should be promoted and ensured. Currently, the main models of information society are mainly Finland, Singapore and Silicon Valley models. Information society developing on the basis of social community and controlled publicly – a (Finnish) model; an authoritarian information society based on market relations-a ("Singapore") model; and an open information society activated by market forces- (Silicon Valley (USA) model. It should be noted that these countries currently occupy the top three positions in the world in development of information society technology. It is interesting to note, that Finland, US and Singapore with high technology development index calculated by UN also present the highest economic competitiveness index in the world. For example, Finland after getting out of the 1990-1993 crisis on account of the state support to innovations, preferred public-controlled open model of innovation society. Finland has embarked on integrating the information economy into the global financial markets after joining the European Union. It is not difficult to see that the listed models of regulation national economies of the listed countries have not remained ineffective on the nature of information models.

Therefore, it is likely that in the future, the number of information society models will increase, i.e. there is a high likelihood of creating original models by developing countries. However, it is possible to say that The model of social character seems more promising in terms of sustainable development requirements than open information society model activated by market forces, and the authoritarian information society model that develops on the basis of market relations (Manuel Castells and Pekka Himanen, 2002). The point is that the social aspect of sustainable development of information society, directly depends on the effectiveness of the social inequality reduction policy In this regard, the Finnish model of information society is remarkable. Jeanie's coefficient in this country is almost lower than in the majority of the countries (Jeanie's coefficient over the countries from <https://theworldonly.org>). Apparently from the latest history, gaining sustainable development through evolution seems more realistic. However, it is required to take radical steps for sustainable development which is required to prevent global environmental crisis.. Whereas, to achieve sustainable development goals countries may only be recommended to take a number of radical steps. The National Information Infrastructure Program, which provides government support to information resources developers and any user who applies to them, operates in the US. This program supports access to the state information resources, information resources of libraries, information resources of education, health care and the environment. The works done within the National Information Infrastructure program also serves improving condition of use of world information resources. Sustainable development considers that if climate change is out of the focus of attention , the community will not only lose the achievements gained, but will not also be able to make progress in the future. In the United States National Climate Assessment Report (2018), despite the fact that this threat is self-evident, the time will show in what extent it will be considered in making political decision. However, it is possible to reduce emissions of greenhouse gases in order to reduce the negative effects of climate change. In terms of sustainable development, information society has to ensure – the joint solution of economic, social, technological and environmental problems as non-alternative solution; environmental regulation of technological development without exception; keeping the issues on information security and preventive measures in its improvenet always on the agenda. From this point of view, the issues of legal regulation of the activities of information service providers are especially urgent. The point is that there are a lot of issues like information search, distant education, e-commerce and a series of activities like this to be resolved in the legal field and require legal regulation. Unreasonable delay in the formation of the relevant normative and legal framework and absence of support to international cooperation may strengthen undesirable trends. The issues of implementation of technological capacities in support of sustainable development of information society are on the agenda. Development of biometrics, including the creation of automated machines knowing people, application of international and internal passports with biometric identification mass utilization of cryptography should be noted as part of work done in this direction. By the way, the massive use of cryptography (for example, cryptographic protection of payment by SIM card) has provided the mass use of mobile communication. The education has the growing role in realization of sustainable development opportunities of information society. High dynamism characteristic for this society, rapid reduction of life cycle of innovations (product and process innovations) require formation of a system enabling realization of qualitatively new, faster, uninterrupted and cohesive personnel training and re-training. Information society helps to make education accessible to more people by improving distance education. The impact of information society on urbanization processes should not be neglected in order to achieve sustainable development goals (UN Azerbaijan. 2030 Agenda for Sustainable Development, 01.01.2016), which will ensure the openness, safety, sustainability and environmental sustainability of urban and rural areas.

Technological opportunities of the information society in terms of supporting sustainable development are expanding through the integration of action. The level of this integration is many times higher in big cities which emerge as active economic area, initial polygon of formation of information society and as economic consequence of urbanization processes. "The integration of activities strengthens the creative elements, leads to integration colorfulness, which, in turn, serves to innovation. In the last decades of technologicalization of knowledge, a new demand for each stage of continuous activity is formed. Their realization can be met in an adequate information society and in urban environments that are a showcase of this community" (Balayev, 2007, pp. 65). However, it is difficult to say justified opinion since the studies on differences in the role of information society in sustainable development of economy of cities and regions have not been carried out.

4. VIEWS FROM AZERBAIJAN AND STEPS TAKEN

Systematic and continuous measures are being taken in the Republic of Azerbaijan to achieve the formation of an information society and achieve sustainable development goals. As a result of implementation of the "National Strategy for Information and Communication Technologies for the Development of the Republic of Azerbaijan (2003-2012)" approved by the decree of the President of the Republic of Azerbaijan of February 17, 2003, and state programs adopted on its realization, the level of use of information technologies has increased in social and economic spheres, as well as in the life of peoples. More than 75 percent of the country's population are internet users, including 65 percent of broadband internet users. . The range of e-services in Azerbaijan has been expanded many times and e-Government projects are being implemented. "National Strategy for the Development of Information Society in the Republic of Azerbaijan for 2014-2020" (Decree of the President of the Republic of Azerbaijan dated April 2, 2014 № 359) has been approved , and in order to ensure its execution "State Program for the implementation of the National Strategy for the Development of Information Society in the Republic of Azerbaijan for 2016-2020" (Order of the President of the Republic of Azerbaijan dated September 20, 2016) has been implementing. Through the implementation of the program, the achievement of the following outcomes is envisaged which are of particular importance in terms of sustainable development goals (UN Azerbaijan. 2030 Agenda for Sustainable Development, 01.01.2016): meeting increasing demand of population for r safe, cheap and high-quality ICT services; creation of favorable conditions for citizens, especially low-income and socially sensitive populations, to benefit from the resources of information society; reduction of "digital distinction" between different groups of population, urban and rural settlements; Offering all necessary facilities to ensure rights of citizens access to information; extending researches on space, nano and nuclear technology, biotechnology, electronics and new information technologies and the application of their results; enhancing competitive, export-oriented and innovative economic potential in the high-tech sector; raising the level of citizens' e-health card coverage; expanding the application of distance education, electronic science, e-commerce, tele-health and other forms of business; protection of the security of the country's information space and, so on. In Azerbaijan, which joined the list of cosmic countries, access to information society potential in terms of sustainable development has increased. Measures taken in the formation of information society in the republic yields a positive result. Azerbaijan ranked 53th out of 139 countries in the "Global Information Technologies-2016" report of the World Economic Forum by the "Network Readiness Index". One of the most noteworthy points is the inclusion of Azerbaijan among the top ten countries in the world according to pace of development, in "Information Society Measurement" reports developed by International Telecommunication Union. In order to achieve Sustainable Development Goals, there should be a comprehensive approach in terms of economic, social, institutional and political aspects.

Taking this into account, the President of the Republic of Azerbaijan signed the Decree on the establishment of the National Coordinating Council on Sustainable Development of Azerbaijan (October 6, 2016) to coordinate the implementation of the responsibilities of the state bodies in relation to the commitments arising from the agenda on sustainable development until 2030. As stated in the 2030 Agenda for Sustainable Development, "the use of global indicators for monitoring and analysis of the development goals, development of national indicators by the government to provide support to monitoring process" (UN Azerbaijan. 2030 Agenda for Sustainable Development, 01.01.2016) is of importance. own national indicators to support the monitoring process". Thus, thematic workshops are held in the State Statistical Committee of Azerbaijan on "Transformation of our world: to provide the information needed to monitor activities at various levels of (national, regional, and global) on goals and targets defined in the Agenda on sustainable development until 2030. Various issues are discussed at different events that include but are not limited to food loss, crop and animal genetic resources for agriculture and food, agricultural lands suitable for sustainable development, price anomalies in food market, level of load on water resources, production and exchange of information on available indicators for monitoring and evaluation in the field of sustainable forest management (In the State Statistical Committee are held the thematic seminars about indicators of sustainable development goals, 26.09.2018).

5. CONCLUSION

The economic target of the information society is to increase competitiveness of material and non-material production, including the service oriented to assimilation of benefit. The Information Society is capable of expanding potential capabilities for mitigating the asymmetry of market information, and highlighting the high specific weight of semantic crossings in news reports on the analogical situation in information exchange by enhancing the capability of providing equal distribution of information among market participants. The fact that persistent attempts to repeat the best practice in that society creates a vicious circle effect. It leads to formation of such a "science" which requires to pursue what is ahead from technological viewpoint. This leads to the inertia of thinking and enhances technological dependence. In our opinion a socially-oriented model of information society is more promising in terms of sustainable development requirements. From the viewpoint of these requirements, information society has to ensure – the joint solution of economic, social, technological and environmental problems as non-alternative solution; environmental regulation of technological development without exception; keeping the issues on information security and preventive measures in its improvement always on the agenda.

ABSTRACT

The present study aims to provide a brief guideline to novice researchers that how to develop research questionnaire, research paradigm and theory in a survey based research. Using pragmatic approach, this study has discussed questionnaire development process in detail including questionnaire wording and formatting. Extending to this research paradigms and theory levels have been discussed. This study goes a step further and described sampling issues such as selecting appropriate sample size. Moreover, research methods for instance quantitative and qualitative research methods have been discussed. The main contribution of this study was to examine the sampling size issue. A meticulous review has bared the exact sample size that is supported by different researchers. Banking sector has been used for the development of questionnaire and sample size selection. Overall this article is designed to give beginner researchers advice and support to help them to design good questionnaires, to maximize their response rate, and to undertake appropriate data analysis.

1. INTRODUCTION

According to Rowley (2014) questionnaire is used where the researcher wants to profile the sample in terms of numbers or to be able to get the frequency of beliefs, opinions, process, behaviors, experience or prediction. Questionnaire should not only suit with the research and the researcher but also to respondents (S Rahi, 2017; S. Rahi, 2017; Rowley, 2014). Extending to this, Zikmund (2000) stated that in data collection process usage of questionnaire is the most efficient method, especially in a situation where researcher know exactly what should need to be asked and how to measures the factors. As the research method is quantitative it seems perfect to use survey questionnaire for inquiry mode (Rahi, 2018a, 2018b; Zikmund, 2000). There are certain steps that involved in questionnaire development process and suggested by Zikmund (2000). These steps can be summarized as:

1. Set up clear objectives: The study objective should be clear and relevant with research question (S. Rahi & M. A. Ghani, 2018b; Zikmund, 2000). Thus, following above argument questionnaire was developed with pre-defined instrument adopted from previous research work. Furthermore, these research questions contained necessary information that required for answering the question or testing the hypothesis. Research instrument was reported in previous section.

2. In line with previous research: Questionnaire must be relevant with variables (S. Rahi & M. A. Ghani, 2018a; Zikmund, 2000). Thus, a detailed literature review was conducted. Moreover, the research items were linked with proposed constructs. Lastly, questionnaire items were adapted in internet banking context in order to get relevant response.
3. Compare Questionnaire Design: The design of the questionnaire was also compared with previous research work by Martins, Oliveira, and Popović (2014) and (Ho & Lin, 2010). The main objective of this comparison was to detect the easiness in questionnaire formatting to ascertain the correct vocabulary and respondent point of view towards internet banking adoption.
4. Use of multiple items: In order to achieve maximum perception of the respondents towards question, multiple item measures should be used (Churchill & Iacobucci, 2006). Thus, in this study each construct has used three or more than three items. According to Churchill and Iacobucci (2006), multiple item measures must be used because a single item cannot provide a perfect representation of the concept.
5. Expert Comments: Questionnaire should be reviewed by experts those belongs to same research domain (F. M. Alnaser et al., 2018; S. Rahi & M. Ghani, 2018; Zikmund, 2000). Thus, in order to fulfill this requirement, research questionnaire was reviewed by one academic professor belongs to e-commerce domain and two bank managers.
6. Pre-test of the questionnaire: Pre-test and pilot-test must conduct before actual data collection in order to validate the instrument and ensure that the questionnaire is free from errors and ambiguities (Rahi, 2015; Zikmund, 2000). Thus, in this study pre-test was conducted in order to check the comprehensibility of the questionnaire.
7. Pilot-testing: Pilot test should be incorporated in order to assess the psychometric properties of the measures (Rahi, 2016a, 2016b; Zikmund, 2000). By following above argument a pilot study was also conducted in order to measure the reliability and validity of the questionnaire.

Authors like Pinsonneault and Kraemer (1993) have stated, there are three main objectives for conducting research with survey questionnaire at first when data of the research is based on quantitative methods; second, instruments are used in research must be pre-defined and lastly research work that requires to analyze finding of a sample to whole population. In this study, researcher made utmost effort to keep the questionnaire simple, easy to read and unambiguous. The question items and response categories were designed in such a way so that it motivates the respondents to participate in this study. According to K. Malhotra (1999) and Rowley (2014) questionnaire should be designed in a way to try to obtain accurate and complete information about the research problem. Thus, questionnaire development process was considered respondent to understand the questions easily, kept their interest alive and reducing chances of misunderstanding (S. Rahi & M. Ghani, 2016; S. Rahi & M. A. Ghani, 2016). In this study, the researcher has developed a questionnaire in order to meet the aims and objective of the study. Pre-define instruments derived from previous theories and construct were used for data collection. By following convenience sampling a data set of internet banking users was drawn from the population. The survey questionnaire is comprised in two parts. In the first part respondents were asked to provide demographic information such as age, gender, education, employment and know how about internet usage. In the second part, scale items of different constructs linked with research framework were drafted.

1.1. Questionnaire Content

In line with the objectives i.e. intention to adopt internet banking, this study collects the data from respondents based on their opinions and beliefs. Therefore, the questionnaire contents were kept simple and easy to understand. The good questionnaire development process is

incorporated principle of design, brief contents and positive questions (F. Alnaser, M. Ghani, S. Rahi, M. Mansour, & H. Abed, 2017; D. Cooper & Schindler, 2001; Ghani, Rahi, Yasin, & Alnaser, 2017). The questionnaire should be understandable for all respondents so that they would not feel any difficulty to complete the questionnaire (Rahi, Ghani, & Muhamad, 2017; Rowley, 2014).

1.2. Questionnaire Wording

The questionnaire wording was kept simple, easy and understandable. The questionnaire wording principles was used as suggested by D. Cooper and Schindler (2001). Researcher has strictly followed the standard wording process during the whole design of questionnaire. The wording as well as technical impression of the questions was kept easy and supported by literature. The simple formatting and wording of the questionnaire was helped to minimize the respondent's biases and measurement error (F. M. I. Alnaser, M. A. Ghani, S. Rahi, M. Mansour, & H. Abed, 2017; D. Cooper & Schindler, 2001; Rahi, Ghani, & Alnaser, 2017).

1.3. Questionnaire Language

The questionnaire was developed in English language for the sake of easy understanding. The reason for doing this is the respondent language. In Pakistan English is the 2nd largest known language. Furthermore, banking websites are also in English language. According to Rahi and Abd. Ghani (2018b) most of the communication of banks such as brochures, billboards, and the websites has been introduced in English language.

1.4. Response Formatting

The researcher has incorporated close ended question in order to obtain individual perception about internet banking adoption in Pakistan. The close ended questionnaire help to eliminate researcher's bias. In addition to that, this format reduce the amount of thinking and effort required by respondent in answering the question (Joseph F Hair, 2010; R. Samar, Norjaya, & Feras, 2017). According to Lorelle Frazer and Lawley (2000) close-ended questions in the survey questionnaire keep the context of the question same for all respondents. Thus, the researcher used the close-ended responses to avoid response bias that associate with the way respondent respond to question (F Alnaser, Ghani, & Rahi, 2018; Alreck & Settle, 1994). Moreover, questions were grouped by constructs and placed in logical sequence by using funnel approach as suggested by (Lorelle Frazer & Lawley, 2000).

2. RESEARCH PARADIGMS

The term 'paradigm' described as essential collection of beliefs shared by scientists, a set of agreements about how problems are to be understood, how we view the world and thus go about conducting research (FMI Alnaser, Ghani, & Rahi, 2017; Creswell, 2003). Thus, these paradigms contains a basic set of beliefs or assumptions that guide our inquiries for a particular research (Guba & Lincoln, 2005; Rahi, Ghani, Alnaser, & Ngah, 2018). In views of this, author like Myers and Avison (2002) have stated that for defining a valid research the most recommended method is to follow the research paradigm. This is essential because by selecting a specific paradigm researcher does not dwell in his own philosophical know-how and get a better stance chosen in relation to other alternatives. There are mainly four paradigms that have been widely used in information system research include Positivism, Interpretive, Advocacy and Pragmatism (S. Samar, Ghani, & Alnaser, 2017; Willcocks & Mingers, 2004). Positivist, Interpretive and Advocacy paradigm are discussed below as Pragmatism is the combination of Interpretive and Positivism. Table 1 depicts key functionalities of all paradigms posited by (Creswell, 2003; Rahi, Ghani, & Ngah, 2018).

Research Paradigm/Knowledge Claim Positions	
Positivist	Constructivism
<ul style="list-style-type: none"> • Determination • Reductionism • Empirical Observation and measurement • Theory Verification 	<ul style="list-style-type: none"> • Understanding • Multiple participant meanings • Social and historical construction • Theory Generation
Advocacy/Participatory	Pragmatism
<ul style="list-style-type: none"> • Political • Empowerment issue-oriented • Collaborative • Change-oriented 	<ul style="list-style-type: none"> • Consequences of actions • Problem-centered • Pluralistic • Real-world practice oriented

Table 1: Research Paradigm/Knowledge Claim Positions

2.1. The Positivist Paradigm

The supporters of this paradigm believe that true knowledge can be obtained through observation and experiment (Guba & Lincoln, 2005). So Positivists normally select scientific method to produce knowledge. Positivism is also called Scientific Method, Empirical Science, Post Positivism and Quantitative Research (Guba & Lincoln, 2005). Levine, Sober, and Wright (1987) discussed that in positivism reality remains stable and can be observed or described through an objective. A strong debate is available on the issue of using positivist paradigm that whether it is appropriate for social sciences or not (Hirschheim, 1985).

2.2. The Interpretive Paradigm

The supporter of interpretive paradigm believes on the deep understanding of a concept and explores the understanding of the world in which they live. They develop subjective meanings of their experiences or towards certain objects or things. This paradigm is also called Constructivism, Social Constructivism or Qualitative Research paradigm (Guba & Lincoln, 1994). Interpretive believe that true knowledge can only be obtained by deep interpretation of subject.

2.3. The Advocacy/Participatory Paradigm

The supporters of advocacy paradigm claim knowledge through an advocacy paradigm. This paradigm is also known as critical paradigm. A debate started during the 1980s and 1990s from individuals who felt that positivist paradigm does not adequately address on social and political issues (Creswell, 2003). In views of this, authors like (Fay, 1987; Kemmis & Wilkinson, 1998) have arose the importance of advocacy paradigm in their studies. These researchers believe that inquiry needs to be entangled with political and social issues. In accession of this research should contain the agenda of reform that ultimately address the issues of empowerment, inequality, oppression, domination, suppression, and alienation (Creswell, 2003).

2.4. The Pragmatism Paradigm

The aim of this paradigm is to find the weaknesses in the study and to strengthen it by using mix method approach (Johnson & Onwuegbuzie, 2004). The supporter of this paradigm believes that true knowledge can be obtained by mix method approach. Instead of method being important, the problem is most important and researchers should use all approaches to understand the problem statement (Tashakkori & Teddlie, 1998). Pragmatism is not affiliated to any system or philosophy. The researchers are free to use both quantitative and qualitative approaches; the essential is to find the best techniques and procedure of research that solve problem statement (Creswell, 2003).

3. PHILOSOPHICAL ASSUMPTIONS

There are seven different philosophical assumptions comprise Ontology, Epistemology, Axiology, Rhetoric, Methodology, Strategies of Inquiry and Methods that follows all four paradigms. Ontology deals with the nature of reality about the concept of knowledge whereas Epistemology deals with the connection between the researcher and that being researched (Creswell & Clark, 2007; Rahi & Abd. Ghani, 2018a).

3.1. Levels of Theory

Theory is a standardized principle on which basis we can explain the relationship between two or more concepts and variables (Creswell & Clark, 2007). There are two levels of theory first abstract level that follows inductive theory approach and second is empirical level that follows deductive theory approach.

3.2. Inductive Level

Collis and Hussey (2013) defined inductive approach this approach elaborate a process where theory is developed by observation that what researcher has observed during his research more over it may called a process where you induce or inferences your thought about a specific object or variable. In accession to this Collis and Hussey (2013) have explained the induction process in which a relationship between meanings and actions of human subjects are used to be observed and investigated.

3.3. Deductive Level

According to (Collis et al., 2003(R. Samar & Mazuri, 2019a)) deductive approach where you don't get theory from observation theory already existed and proved by researchers moreover you can explain a research that based on empirical observation and theory generated on conceptual and theoretical structure. Generally researcher intends to test a theory by collecting the fresh data from respondents and observe the findings by applying various statistical tests. This method is generally recommended for specific studies in which researcher work on particular concept by creating assumptions and then verifying those assumptions(Collis & Hussey, 2013; R. Samar & Mazuri, 2019b).

4. RESEARCH METHODS

Despite the existence of many research method classification quantitative and qualitative methods are the most dominating methods (Johnson & Onwuegbuzie, 2004). Detailed descriptions of these two methods are stated below.

4.1. Qualitative Method

Qualitative method is used to collect the in-depth details on a particular topic. This approach assumes a single person represents the group feelings and emotions of a person are equally important to interpret which are ignored by the quantitative method. This approach is usually used by the interpretive. Authors like Tashakkori and Creswell (2007) have explained that this approach is used when researcher wants to observe or interpret an environment with the intention to develop a theory.

4.2. Quantitative Method

Quantitative method is a scientific method and its grounds can be identified in positivist paradigm (Grinnell Jr & Unrau, 2010). This method focuses on fresh data collection in accordance to the problem from large population and analysis of the data but ignore an individual's emotions and feelings or environmental context (Creswell & Clark, 2007). Similar to this (Tashakkori & Creswell, 2007) have discussed that the quantitative strategy works on

objective and measure it through the actions and opinions which helps researcher to describe the data rather to interpret the data.

4.3. Research Objectives and Classification

There are three basic forms of research objectives that includes exploratory research, descriptive research, explanatory research (Creswell & Clark, 2007). The purpose of exploratory research is to seek new insights and find out what is happening. There is an attempt to ask questions and asses phenomena in a new light. This type of research is usually adopted in early stages of research where the concepts are not clear enough to develop an operational definition (Tashakkori & Creswell, 2007). A more qualitative approach often underpins this sort of inquiry and the focus is on obtaining new insights into current situations and issues (Myers & Avison, 2002). Descriptive method of research refers to the type of research that aimed at obtaining information on current state of phenomena. This type of research sets out to provide an accurate profile of situations, people or events (Creswell, 2003). Similar to this accession author like Polit, Beck, and Hungler (2001) have stated that descriptive research seeks to observe and document an occurring phenomenon which cannot be ascribed an objective value. Cohen, Manion, and Morrison (2013) have posited that explanatory research helps this type of study for instance explanatory research helps to find out the reasons behind the occurrence of a particular phenomenon. Explanatory research explains a situation or problem usually in the form of casual relationships. This type of research helps one to get fresh insight into a situation in order to build, elaborate, extend or test a theory (Creswell & Clark, 2007). The prime objective of explanatory research is to identify issues and key variable in a given research problem. This approach is much relevant to quantitative.

4.4. Research Strategy

Research Strategy defines it is a process of collecting and interpreting of data with a clear objectives. Easterby-Smith, Thorpe, and Jackson (2012) have stated that, research strategy is a general plan like how to answer the research question that has been set by researcher. Yin (1994) has posited that, based on three conditions-research question, control on behavioral events, focus on contemporary events there are five key research strategies in social sciences. These are: experiment, surveys, archival analysis, histories and case studies.

4.4.1. Experiments

The experimental method involves the process of variable testing where the impact of one variable can be seen with other variables. Similar to this accession N. K. Malhotra, Agarwal, and Peterson (1996) have opined that this strategy is used when researcher examine cause and effect relationships among variables.

4.4.2. Survey

The survey strategy is popular in social sciences and associated with deductive research approach (Mark, Philip, & Adrian, 2009). In this research strategy information is collected by interviews or pre-designed questionnaire (Yin, 1994).

4.4.3. Archival Analysis

The archival strategy reports the incidence and prevalence relates to a specific phenomenon (Mark et al., 2009). However it is difficult to use this strategy when it comes in research area (Mark et al., 2009).

4.4.4. History

This research strategy is used to explore past issues. This strategy is adopted especially when no relevant person is alive to give answer or to report about particular issue (Mark et al., 2009).

4.4.5. Case Study

The case study strategy is a written description of a problem or a situation. It presents small group problems or focus on a particular issue. Case study preferred when researcher has little control on events (Mark et al., 2009).

5. POPULATION AND SAMPLING

Population can be defined as all people or items that one wishes to understand while sampling is the process of selecting segment of the population for investigation (Creswell, 2003). It is a process of selecting a sample of units from a data set in order to measure the characteristics, beliefs and attitudes of the people (J.F. Hair, 2003). Sampling survey involves structured questionnaire to evaluate people beliefs and attitudes. Collected data via structured questionnaire can be enumeration of a selected population or subgroup. Authors like N. K. Malhotra and Birks (2007) have explained that a smaller group of population has ability to make an inference about a larger group of population. This type of selection is also beneficial to reduce the work burden and cost that would have been involved in studying the whole target population. Similar to this D. R. Cooper, Schindler, and Sun (2003) have posited, there are several reasons for sampling including: better speed of data collection, results accuracy and cost efficiency. Selection of sampling method depends on the nature of the research study. It may include theoretical and practical issues. There are broadly two types of sampling methods, probability sampling and non-probability sampling (J.F. Hair, 2003). The following describes the main sampling techniques and sampling method usually used in business studies.

5.1. Probability Sampling

Probability sampling is a sampling approach in which each unit has an equal chance of probability to be selected (Creswell, 2003). Probability sampling is further divided into four categories including: simple random sampling, systematic random sampling, stratified random sampling, cluster sampling and Multi-stage Sampling.

5.1.1. Simple Random Sampling

In line with the definition of randomization, it is a sampling process in which each unit of the population has an equal probability of inclusion in the sample (Creswell, 2003). It can be calculated with sampling fraction that is n/N where n stands for sample size and N for the population size. In this method researcher develop a numeric list of all sample size and by using computer program generate random numbers.

5.1.2. Systematic Random Sampling

Probability sampling technique where initial sampling point is selected at random and then the cases are selected at regular intervals (Creswell, 2003). For instance in this method researcher systematically choose the first number that is 5 and then the other cases will select at regular interval- 25, 35,45,55 so forth.

5.1.3. Stratified Random Sampling

It is a process of sampling in which each subgroup called strata is given equal chance to be selected randomly. It gives equal proportionate representation to each stratum (Creswell, 2003).

5.1.4. Cluster Sampling

Sampling technique where researcher derive sample out of aggregations of population that are geographically dispersed and possibly unable to access at the same time (Creswell, 2003). It could be 10 banks in cluster from all around the world.

5.1.5. Multi-stage Sampling

Multi-stage sampling or Multi stage cluster sampling involves a sequence of stages (Joseph F Hair, 2007). First stage is to select the random sample of the entire region in cluster. The second stage is to select a specific region and at final stage to select relevant objects for sample size.

5.2. Non-Probability Sampling

Non-probability sampling is the sampling approach in which the chance or probability of each unit to be selected is not known or confirmed (Joseph F Hair, 2007).

5.2.1. Convenience Sampling

Convenience sampling defines a process of data collection from population that is close at hand and easily accessible to researcher. Convenience sampling allows researcher to complete interviews or get responses in a cost effective way however they may criticized from selection bias because of the difference of the target population (J.F. Hair, 2003).

5.2.2. Snowball Sampling

In snowball sampling technique the researcher makes initial contract with a small group of people who are relevant to the research topic and then uses them as referrals to contact with others (Creswell, 2003).

5.2.3. Quota Sampling

It defines the strata of the population and to set a quota for sample element from each stratum. The findings from this type of sampling technique cannot be generalized because the elements is not selected by using a probability sampling method (J.F. Hair, 2003).

5.2.4. Judgment Sampling

Defines a process where researcher use own judgment to select a group of people who knows about the problem. Judgmental sampling is also called purposive sampling because it involves a particular purpose. This type of sampling technique is convenience and cost effective (J.F. Hair, 2003).

5.3. Sampling Frame

Sampling frame defines a frame where a sample of target population can be drawn (Joseph F Hair, 2007). Similar to this accession authors like (Creswell & Clark, 2007) have stated that, a sample frame can be defined as a list of all units in the population from which research sample will be selected.

5.4 Determine Sample Size

There is an extensive discussion existed in academic literature on sample size. Selection of a correct sample size is still a big challenge for researchers (Joseph F Hair, 2007). Sample size needs to be carefully considered as statistical techniques are strongly affected by it (Joseph F Hair, 2007). Similar to this accession authors like Collis and Hussey (2013) have posited, sample size which is based on analysis method for instance structural equation modeling that further analyze confirmatory factor analysis, casual modeling with latent variables, structural path analysis and multiple regression analysis must be treated carefully.

In light with these arguments, sample size for this study was selected by following most important rule of thumb quoted in academic literature. Authors like Krejcie and Morgan (1970) have stated that if the given population was 1000000 then the required sample size would have to be 384. Further, If this rule is applied in abc study which deals a population of 1800000 units then, the sample size would have to be 384.

$$s = X^2 NP(1 - P) \div d^2 (N - 1) + X^2 P(1 - P).$$

s = denote required sample size.

X² = denote the table value of chi-square for 1 degree of freedom at the desired confidence level (3.841).

N = denote population size.

P = denote population proportion (assumed to be .50 since this would provide the maximum sample size).

d = denote the degree of accuracy expressed as a proportion (.05).

$$S = \frac{3.841 (1800000 \times 0.50) (1 - 0.50)}{0.50(1800000 - 1) + 3.841 \times 0.50 (1 - 0.50)}$$

$$S = \frac{1728450}{4500} = 384$$

Authors like Cochran (1977) proposed a sampling formula. Stated that of the population is larger an ideal sample size would have to be 267. Following is the detail description of mathematical formula proposed by (Cochran, 1977).

$$n_0 = \frac{z^2 \times p(1 - p)}{e^2}$$

Where

n_0 = is the sample size

Z= is the two tailed area under the normal curve where $\alpha = 0.05$ and the z value is 1.96

e = is the acceptable sampling error

p= is the population of a proportion with a desired attribute (assumed to be 0.5 which maximizes the sample size to be determined)

Given these values and an acceptable sampling error of 6.5%, the sample size is determined as: This gives the acceptable sample size to be approximately 267.

In case of analysis method research where structural equation modeling applied following recommendation should be in account. According to Schikorski and Stevens (1997) 15 cases per construct are ample when multiple regression analysis is required. If this formula applies in this study, 10 constructs multiplied by 15, equals to 150 sample size. Whereas Bollen (1989) stated that ration of five sample per variable. Jöreskog and Sörbom (1996) Stated that sample size must be 10 observation per parameter to perform CFA. Another study by Tabachnick and Fidell (2007) suggested that sample size should be 300 valid responses for factor analysis study. According to Joseph F Hair (2007) and Rahi (2018a) stated, research that required factor analysis procedure in order to determine the dimensionality for the employed items, the sample size that should be obtained is five times greater (minimum) or ten times greater (maximum) than the items that want to be analyzed.

Similar to this Joseph F Hair (2010) posited that a minimum sample size of 200 is required for structural equation modeling. In light of this simple random sampling approach was used and data collected via online survey. Finally, Comrey and Lee (1992) stated that sample size of 50 is very poor, while 100 is poor, 200 is reasonable, 300 is good, 500 is very good and 1000 is brilliant for structural equation modeling.

6. CONCLUSION

This study accomplishes a systematic review on research paradigms, questionnaire development and sampling issues. A set of beliefs of different researchers on paradigms was weighed up in detail. Meanwhile, the research methods were also explored with different supporting arguments. For quantitative study, levels of theory are the most important factors so in this regards researcher has enlightened inductive and deductive approaches of a theory. Sampling is the critical issue in every study that has been conducted with primary data so to overcome on this, following study proposed two formulas to determine sample size. Furthermore, opinions of different authors have been quoted regarding selection of sample size.

ABSTRACT

Competition plays key driving force for economic development in the efficient market economy. To achieve competitive advantage at the international level, each country needs to improve competitiveness on different economic indicators at the national level. The Global Competitiveness Report 2018 of World Economic Forum calculated the competitiveness index of countries under 98 sub-indexes. The goal of the research is econometric assessment of the impact of competitiveness to economic development in the oil rich countries, such as Azerbaijan. For the purposes of this research, the global rating of Azerbaijan was determined through calculating the volume of GDP, as well as, oil and non-oil GDP. The research was conducted by applying systematic and statistical analysis and running Excell and Eviews8 calculations. As a result, the impact of competitiveness index to the GDP (oil and non-oil GDP) at the oil rich countries, such as Azerbaijan was calculated and following outcomes were achieved:

- The semi-elasticity coefficient is above 1 on the volume of non-oil GDP on the competitiveness index. That means, if the competitiveness of Azerbaijan increases on the global rating then the next year non-oil GDP increases more than 1%. The improvement of the competitiveness indicators in the current year in Azerbaijan increases non-oil sector the following year. It takes time to attract investments to a country, so this outcome is expected.*
- The semi-elasticity coefficient of the GDP volume on the competitiveness index is smaller than the semi-elasticity coefficient of the non-oil GDP at the oil rich countries.*

The practical importance of the research: this study can motivate other scholars to conduct research on the area. The innovativeness and uniqueness of the research: the impact of the competitiveness indicators on the economic growth has been assessed in Azerbaijan.

Keywords: *Competition, Competitiveness Index, Economic Growth, Econometric Assessment, Oil Rich Countries*

1. INTRODUCTION

Under the condition of increasing of globalization and liberalization, raising the competitiveness of the countries' economy is the most important problem. In high globalized and competitive world markets, states has great role in increasing the competitiveness of products. It is no coincidence that, the protection of competition - implementation of anti-monopoly policies is one of the main economic functions of the government (Brue, McConnell, and Flynn. 1996, pp. 88-94). Education-science-technology and innovation-oriented competitive strategy enhance the global competition force of countries and enable them to achieve sustainable development. The goal of the research is econometric assesment of the impact of competitiveness on GDP, including oil and non-oil GDP which are the main indicators of economic growth for oil-rich countries, including Azerbaijan. It has been found that countries with science-technology-innovation oriented competitive strategies have sustainable competitiveness and long-term development. Competition is one of the driving forces of economic development. It is the main principle of markets' activity and is involved in innovation, productivity and economic growth, at the same time reducing of poverty. However, markets do not always work well and economic growth is not a lasting one in unfavorable markets. Relationships between economic development indicators and competition have been investigated by a number of researchers. (Gellhorn, Ernest, and William E. Kovacic,1994. Sutton, J.,1991). Economic development, macroeconomic stability and the role of factors influencing its indices (inflation, unemployment, etc.) including competition were conducted in a number of studies (Almas Lal K., Hajiyev Nazim, 2014. Muradov A and Hajiyev N. (2014). p. 5-20., Hajiyev N., pp.97-117, Imanov G., Hasanli Y., Murtuzaeva M. pp. 223-229, Sadik-Zada Elkhan, Loewenstein Wilhelm, Hasanli Y p.21. Hasanli Y., Ismayilova S. 2017. pp. 11-15). However, the impact of the Global Competitiveness Index on economic growth has not been estimated by using econometric models.

2. DATA SET OF RESEARCH AND ITS PROCESSING

World Economic Forum annually publishes a report on Global Competitiveness Index (GCI). The Global Competitiveness Index has been calculated using 12 Pillar and 98 indicators from World Economic Forum's report for 2018 and the countries' rating has been determined (Klaus Schwab, World Economic Forum, The Global Competitiveness Report, 2018 <http://www3.weforum.org/docs/GCR2017-2018/05FullReport/TheGlobalCompetitivenessReport2017%E2%80%932018.pdf>). It should be noted that, the indicators used in calculating this index are constantly improving. The place of Azerbaijan on that index was 69 among 140 countries in 2018. It should be noted that, Azerbaijan was ranked 35th among 137 countries in 2017. The reason for the decline of Azerbaijan was changes that took place in the methodology of calculation of the GCI as mentioned above. Because of the fact that in the 2018 report, some indicators were excluded from the GCI indicator system. The dynamics of Azerbaijan's Global Competitiveness Index score as well as the volume of GDP (oil and non-oil) are given on the table 1.

Table following on the next page

Table 1: Azerbaijan's Global Competitiveness Index score, its place in Global Competitiveness Index ranking and the dynamics of the volume of GDP (oil and non-oil) (Statistical Year Book of Azerbaijan, 2018, p.37-43; (Klaus Schwab, World Economic Forum, The Global Competitiveness Report, 2018, p.83-85)

<i>Years</i>	<i>GDP, million manat</i>	<i>Non-oil sector in GDP, million manat</i>	<i>Oil sector in GDP, million manat</i>	<i>Global Competitiveness Index in Azerbaijan rank</i>	<i>Global Competitiveness Index in Azerbaijan score</i>
<i>abbreviation</i>	<i>GDP</i>	<i>Non oil_GDP</i>	<i>Oil_GDP</i>	<i>GCIAR</i>	<i>GCIAS</i>
2003	7,146.5	4,447.6	2,698.9		
2004	8,530.2	5,242.5	3,287.7		
2005	12,522.5	6,055.1	6,467.4		
2006	18,746.2	7,630.0	11,116.2	64	4.06
2007	28,360.5	10,576.1	17,784.4	62	4.02
2008	40,137.2	15,197.3	24,939.9	69	4.10
2009	35,601.5	16,726.0	18,875.5	51	4.30
2010	42,465.0	21,363.8	21,101.2	57	4.29
2011	52,082.0	25,431.5	26,650.5	55	4.3
2012	54,743.7	29,262.0	25,481.7	46	4.4
2013	58,182.0	33,213.6	24,968.4	39	4.5
2014	59,014.1	36,189.2	22,824.9	38	4.5
2015	54,380.1	37,920.5	16,459.6	40	4.5
2016	60,425.2	39,975.8	20,449.4	37	4.6
2017	70,135.1	44,061.9	26,073.2	35	4.7
2018				69	3.8

As can be seen from the table, the place of Azerbaijan in the GCI ranking in 2017 was the highest - the 35th.

3. ECONOMETRIC MODELING

3.1. Econometric evaluation of the impact of Global Competitiveness Index score of Azerbaijan on its place in the ranking among the countries

The following econometric model was obtained from evaluating the regression equation in the Eviews application package (Eviews, <http://www.eviews.com/EViews10/ev10main.html>) to identify the relationship between Azerbaijan's place in Global Competitiveness Index ranking and Global Competitiveness Index score of Azerbaijan.

$$GCIAR = 254.955591646 - 47.2549918297 * GCIAS \quad (1)$$

Here, GCIAR – shows Azerbaijan's place in Global Competitiveness Index ranking and GCIAS- Global Competitiveness Index score of Azerbaijan. The main statistical characteristics of the model (1) are given on the table 2.

Table 2: The main statistical characteristics of the model (1)

<i>Dependent Variable: GCIAR</i>				
<i>Method: Least Squares</i>				
<i>Sample: 2006 2018</i>				
<i>Included observations: 13</i>				
<i>Variable</i>	<i>Coefficient</i>	<i>Std. Error</i>	<i>t-Statistic</i>	<i>Prob.</i>
<i>C</i>	254.9556	19.74042	12.91541	0.0000
<i>GCIAS</i>	-47.25499	4.564718	-10.35222	0.0000
<i>R-squared</i>	0.906913	<i>Mean dependent var</i>		50.92308
<i>Adjusted R-squared</i>	0.898450	<i>S.D. dependent var</i>		12.58611
<i>S.E. of regression</i>	4.010803	<i>Akaike info criterion</i>		5.756498
<i>Sum squared resid</i>	176.9519	<i>Schwarz criterion</i>		5.843413
<i>Log likelihood</i>	-35.41724	<i>Hannan-Quinn criter.</i>		5.738633
<i>F-statistic</i>	107.1686	<i>Durbin-Watson stat</i>		1.592587
<i>Prob(F-statistic)</i>	0.000001			

Statistical indicators given on the table 2 and relevant tests show that the model (1) is adequate (Marno Verbeek, p.29-87). The model (1) shows that the growth of the Global Competitiveness Index of Azerbaijan by 0.1 units can contribute to the advancement of its place in the ranking among countries by about 5 steps.

3.2. Econometric evaluation of the impact of Azerbaijan's place among the world countries on competitiveness index on the country's GDP, including the oil and non-oil GDP

To assess the impact of changes in the place of Azerbaijan among world countries on the competitiveness index on country's GDP (including oil and non-oil GDP), the following econometric model was obtained on the basis of data from Table 1:

$$LOG(GDP) = 18.5331453239 - 0.0167762907672 * GCIAR \quad (2)$$

Here, GDP – shows the volume of GDP of Azerbaijan. GCIAR – shows the place of Azerbaijan in Global Competitiveness Index ranking

The main statistical characteristics of the model (2) and the adequacy tests are given on the table 3.

Table following on the next page

Table 3: The main statistical characteristics of the model (2) and the tests

Dependent Variable: LOG(GDP)				
Method: Least Squares				
Date: 11/23/18 Time: 01:43				
Sample (adjusted): 2008 2017				
Included observations: 10 after adjustments				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	18.53315	0.180485	102.6853	0.0000
GCIAR	-0.016776	0.003771	-4.449152	0.0021
R-squared	0.712178	Mean dependent var		17.74969
Adjusted R-squared	0.706200	S.D. dependent var		0.219984
S.E. of regression	0.125178	Akaike info criterion		-1.141298
Sum squared resid	0.125357	Schwarz criterion		-1.080781
Log likelihood	7.706491	Hannan-Quinn criter.		-1.207685
F-statistic	19.79496	Durbin-Watson stat		1.989715
Prob(F-statistic)	0.002142			
Heteroskedasticity Test: Breusch-Pagan-Godfrey				
F-statistic	0.238989	Prob. F(1,8)		0.6381
Obs*R-squared	0.290071	Prob. Chi-Square(1)		0.5902
Scaled explained SS	0.350088	Prob. Chi-Square(1)		0.5541

As can be seen from table 3, the change in the explanatory variable GCIAR can explain the change in the explained variable LOG(GDP) by 71% (because of R-squared=0.712178). Estimates of the t-Statistic (4.449152) and Prob (F-statistic) tests show that the value of the determination coefficient is qualitative and significant. The fact that the adjusted coefficient of determination (Adjusted R-squared=0.706200) is close to the coefficient of determination and values of t-Statistic (4.449152), Prob(F-statistic) given in table 3 (t-Statistic=4.449152, Prob.=0.0021; F-statistic=19.79496, Prob(F-statistic)= 0.002142) show that the value of the coefficient of determination is qualitative and significant (Damodar N. Gujarati. 2003. pp.212, 217,2 58, 267). The actual, fitted derived from the model (2) and residual dynamics of GDP of Azerbaijan are given on Figure 1.

Figure 1: The actual, fitted derived from the model (2) and residual dynamics of GDP of Azerbaijan

As we can see from the Figure 1 actual and fitted GDP values are very close (with the exception of 2009). The difference of Actual and Fitted Values of GDP derived from model (2) of Azerbaijan in 2009 can be explained by world the financial crisis.

Logarithmic linear model (2) shows that, the semi-elastic coefficient of GDP in Azerbaijan in relation to GCIAR equals to 0.0167762907672. In other words, the growth of the Global Competitiveness Index of Azerbaijan by 1 step increases GDP by 1.7 %. To assess the impact of changes in the position of Azerbaijan among world countries on the competitiveness index on non-oil GDP, the following econometric model was obtained on the basis of data from Table 1:

$$LOG(Non-oil_GDP) = 11.616918448 - 0.0270612179539 * GCIAR \quad (3)$$

Here, Non-oil_GDP – shows the volume of the non-oil GDP of Azerbaijan.

The main statistical characteristics of the model (3) and the adequacy tests are given on the table 4.

Table 4: The main statistical characteristics of the model (3) and tests

<i>Dependent Variable: LOG(Non-oil_GDP)</i>				
<i>Method: Least Squares</i>				
<i>Date: 11/23/18 Time: 01:14</i>				
<i>Sample (adjusted): 2009 2017</i>				
<i>Included observations: 9 after adjustments</i>				
<i>Variable</i>	<i>Coefficient</i>	<i>Std. Error</i>	<i>t-Statistic</i>	<i>Prob.</i>
<i>C</i>	<i>11.61692</i>	<i>0.207370</i>	<i>56.02032</i>	<i>0.0000</i>
<i>GCIAR</i>	<i>-0.027061</i>	<i>0.004225</i>	<i>-6.405757</i>	<i>0.0004</i>
<i>R-squared</i>	<i>0.854269</i>	<i>Mean dependent var</i>		<i>10.31798</i>
<i>Adjusted R-squared</i>	<i>0.833450</i>	<i>S.D. dependent var</i>		<i>0.319056</i>
<i>S.E. of regression</i>	<i>0.130208</i>	<i>Akaike info criterion</i>		<i>-1.046233</i>
<i>Sum squared resid</i>	<i>0.118679</i>	<i>Schwarz criterion</i>		<i>-1.002405</i>
<i>Log likelihood</i>	<i>6.708047</i>	<i>Hannan-Quinn criter.</i>		<i>-1.140813</i>
<i>F-statistic</i>	<i>41.03373</i>	<i>Durbin-Watson stat</i>		<i>1.819891</i>
<i>Prob(F-statistic)</i>	<i>0.000365</i>			
<i>Heteroskedasticity Test: Breusch-Pagan-Godfrey</i>				
<i>F-statistic</i>	<i>0.141131</i>	<i>Prob. F(1,7)</i>		<i>0.7183</i>
<i>Obs*R-squared</i>	<i>0.177868</i>	<i>Prob. Chi-Square(1)</i>		<i>0.6732</i>
<i>Scaled explained SS</i>	<i>0.145295</i>	<i>Prob. Chi-Square(1)</i>		<i>0.7031</i>

As can be seen from table 4, the change in the explanatory variable GCIAR can explain the change in the explained variable LOG (GDP) in the studied years by 85.4% (R-squared=0.854269). Estimates of the t-Statistic (4.449152) and Prob (F-statistic) tests show that the value of the determination coefficient is qualitative and significant. The actual, fitted derived from the model (3) and residual dynamics of GDP of Azerbaijan are given on Figure 2.

Figure following on the next page

Figure 2: The actual, fitted derived from the model (3) and residual dynamics of GDP of Azerbaijan

As we can see from the Figure 2 actual and fitted GDP values are very close (with the exception of 2009-2010). The difference of Actual and Fitted Values of GDP derived from model (3) of Azerbaijan in 2009-2010 years can be explained by the fact that the financial crisis of 2008 beginning with the falling of oil prices negatively affected the non-oil sector in Azerbaijan in 2009-2010 years. Logarithmic linear model (3) shows that, the semi-elastic coefficient of non-oil GDP in Azerbaijan in relation to GCIAR equals to 0.0270612179539. In other words, the growth of the Global Competitiveness Index of Azerbaijan by 1 step increases Non-oil_GDP by 2.7 %.

4. CONSLUSION

The results of implemented econometric models shows that the growth of the Global Competitiveness Index of Azerbaijan by 0.1 units can contribute to the advancement of its position by about 5 steps. Growth of the Global Competitiveness Index of Azerbaijan by 1 step increases GDP by 1.7% and Non-oil_GDP by 2.7 %. That is, the effect of the GCIAR change by 1 step on Non-oil_GDP is more than n GDP. We should note, that effect of the change in position of GCIAR on oil GDP turned out to be insignificant during econometric estimation. More precisely, the model did not work out adequate. We can explain such result by the fact that the production and export of oil is made on the basis of long-term contracts (for exaple, The Contract of the Century) is not closely related to GCIAR. This can also be seen on the example of other oil rich countries. Since, despite the fact that the positions of Nigeria (Klaus, Schwab, 2018, pp.435-437), Saudi Arabia (Klaus, Schwab, 2018, pp.491-493), Russia (Klaus, Schwab, 2018, pp. 483-485), Iran (Moghsoudi N., Hasanli Y. 2011. pp.399-409) and others on the Global Competitiveness Index are not high, the GDP of the oil sector of these countries in recent years continued to grow.

ABSTRACT

Economic growth in the economy, can be measured by an increase in the amount of production and in national income for goods and services over time. Economic development can be defined as a process of structural change in economic, social, cultural and political areas as well as increase in the production and income in a country. However, it is clear that, the approaches which increase the quality of life of goods and services only enhance the quality of life. For this reason, examining the economic growth from environmental, social and economic point of view is vital in order to ensure the sustainability of development but this also requires the development of the concept of social and cultural aspects. In this study, the relationship between the domestic credit volume and the gross domestic product in the public and deposit banks were analyzed by using the quarterly data covering the periods of 2006-2017 for Azerbaijan. The reason for selection of 2006-2017 period is to release process of the New Azerbaijani Manat in the Republic of Azerbaijan in 2006. As a result of the analysis, it was concluded that each of them was first-order stationary series and there was no long-run relationship between them. Eventually, the result of Granger causality test which is applied for credit volume and economic growth, has a bidirectional causality relationship between two series.

Keywords: *Structural Break, Financial Development, Economic Growth, Causality*

1. INTRODUCTION

Economists have different views on the importance of the financial system for economic growth. The first view related to given topic is the supply predecessor which argues that financial development has a positive effect on economic growth. Joseph Schumpeter alleges that the well-functioning banking system encourages technological innovation by financing entrepreneurs who can successfully implement innovative product and production processes, and provides economic growth (Levine, 1997: cited in: Tuna and Bektash, 2013: 140). The existence and direction of the relationship between financial development and economic growth has been gained importance by economists. Financial development is expressed as the expansion of financial services and the growth of financial institutions (Ahmed and Ansari, 1998). Financial development enables the transfer of savings to investment by providing the transfer of funds to the productive units in need of the surplus in the financial system and economic growth. In addition, economic growth provides financial development by increasing demand for financial services (Robinson, 1952). In the literature, the studies on this subject are based on Joseph Schumpeter and there are different opinions about the direction of the mentioned relationship. These views were led by Schumpeter, Robinson and Lucas. While Joseph Schumpeter (1912) stated that the direction of the relationship was from financial development to economic growth, Joan Robinson (1952) suggested that it was from economic

growth to financial development (Levine, 1997). Lucas (1988) stated that there is no causal relationship between financial development and economic growth. According to another opinion there is a two-way causality relationship between the two variables (Tuna and Bektaş, 2013. p.140). In this article, the relationship between credit volume and economic growth in the Republic of Azerbaijan will be analyzed by applying tests that take into account the impact on the data sets that examine structural breaks. In the scope of the study, studies on similar topics will be discussed. In the research part, the research method, the data sets which have been used and the findings will be included. In the conclusion part, the findings of the analysis will be interpreted.

2. LITERATURE REVIEW

Tuna and Bektas (2013) study, for the period 1998-2012 with Turkey by using quarterly data bank deposits of domestic credit volume was analyzed the relationship between gross domestic product. It was determined that there was no causal relationship between the two series after Granger causality test. In the analysis by Demetriades and Hussein, different outcomes came into stage for 16 countries. The causal relationship between financial development and economic growth was found for three countries - Honduras, Spain, and Sri Lanka. King and Levine (1993) used different bank development measures for many countries. It has been determined that the development of the banking sector can promote economic growth in long term. When Jayratne and Strahan (1996) loosened interstate branch restrictions in individual states in the US, the lending quality of the bank increased significantly, leading to higher growth. Acemoğlu and Zilibotti (1997) have evolved a theory of financial development that develops endogenously in the growth process. Levine (2002) emphasizes the critical importance of the banking system in economic growth and the fact that banks know the conditions in which they can actively promote innovation and future growth and finance productive investments. There are different opinions and analyzes about causality relation. For me there are a great deal of variations in different opinions.. An alternative explanation for the causal relationship between financial intermediation and growth is attempted by researchers. Fundamentally, financial means can be regarded as a causal factor for economic growth. According to a study by Bayoumi and Melander (2008), a 2.5% decrease in total loans leads to a 1.5% decrease in GDP. This is usually the case when the level of development in the economy is responsible for promoting the growth of the financial system. In 2003, Favara survey showed the percentage of the GNP and the economic growth rate after checking the effect of domestic loans and other financial inflation on banks. On the other hand school, the openness to GNP, black market premium and the variables of legal origin also affect the strong relationship between them. The sample consisted of 85 countries for the period of 1960-1998. Beck and Levine (2004) built a panel that was averaged at five-year intervals. This study shows that both financial markets and banks have a significant positive effect, and even if control variables are added, they play an important role in economic growth.

3. STRUCTURE OF AZERBAIJAN BANKING SYSTEM

Having gained its independence in 1991, Azerbaijan has targeted the transition from a central planned economy to a free market economy and has started work in this field. The new legal arrangements have been accelerated as the transition from the communist system to the economic transition process is not possible. Regulations on banking and central banking system, which constituted as one of the most important steps towards transition to free market economy, were put into effect without delay. Thus, the central bank in the first section and the commercial banks in the second section were composed of two-part banking system. The structure of the newly formed Azerbaijani banking system consists of the Central Bank of the Republic of Azerbaijan (ACMB), the Interbank Foreign Exchange Market, State and Private

Banks (Mukhtarov, a.g.e., p.10). As a result of the studies carried out in the field of development of the banking system between 2013-2015, the banks had been continue attracting foreign capital. By 2016, there were 43 foreign banks with a total of 43 banks. In 2015, the opening of new regional centers and branches of banks continued. The number of district centers reached 750 and the number of branches reached 164. As a result of the restructuring in 2016, the license of 11 banks was canceled and the number of banks decreased from 43 to 32, from regional centers 164 to 131 and branches from 750 to 513; centers rose from 131 to 137 and their branches increased from 513 to 556 (See Chart 1).

5. EMPIRICAL DATA AND ANALYSIS

In this paper the relationship between credit volume and economic growth has been taken into account and three months time series data has been used which covers the period between 2006 and 2017 . The credit volume granted by banks (LNKREDI) and economic growth (LNGSYIH) data of the Central Bank of the Republic of Azerbaijan - Electronic Data Distribution System (<https://esasodi.cbar.az:9804/obiee/>) and the Statistics Committee of the Republic of Azerbaijan . Logarithm of all variables was used in the analysis. In the literature, Engle and Granger (1987) and Johansen (1988,1991) cointegration tests are frequently used to determine the long-term relationship between the two series. In order to investigate the cointegration relationship between the two series, the studied series must be in the same stationary . In this study, it was found that both series In are stable with change values as seen in Table 2 and Table 3.

Table 2: LNGSYIH Augmented Dickey-Fuller test statistic

Null Hypothesis: LNGSYIH has a unit root				
Exogenous: Constant				
Lag Length: 5 (Automatic - based on SIC, maxlag=9)				
			t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic			-4.777408	0.0004
Test critical values:	1% level		-3.596616	
	5% level		-2.933158	
	10% level		-2.604867	

Figure 2: LNGSYIH

Table 3: LNKRED Augmented Dickey-Fuller test statistic

Null Hypothesis: LNKREDI has a unit root				
Exogenous: Constant				
Lag Length: 0 (Automatic - based on SIC, maxlag=9)				
			t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic			-5.300214	0.0001
Test critical values:	1% level		-3.577723	
	5% level		-2.925169	
	10% level		-2.600658	

Figure 3: LNKRED

Table 4: VAR Granger Causality/Block Exogeneity Wald Tests (2006Q1 2017Q4)

The direction of the relationship	Df	Chi-sq	Prob.
LNGSYİH → LNKREDİ	2	12.59967	0.0018
LNGSYİH ← LNKREDİ	2	13.43234	0.0012

Consequently, the results of the tests conducted in the study, determined that there is a long-term relationship between LNGSYİH which represents economic growth and LNKREDİ series representing financial development, and also there is a causal relationship between these series. In other words, in Table 4, the null hypothesis of an lam Granger cause of Change in Credit Volume hip is the Granger cause of “Change in Loan Volume ir and GS Change in Loan Volume’ is accepted as 5%. That is, credit volume and GDP affect each other. Therefore, Loan Volume → GDP and GDP → Loan Volume Change was found as a bidirectional relationship.

6. CONCLUSION

According to this study, it has been concluded that the data examined are first-order stable and have a long-term relationship between them. However, as a result of the Granger causality test, the causality relationship between these two series was not found as bidirectional. Within the framework of the strong strategic way map of the national economic sector in the Republic of Azerbaijan, the steps taken towards the development of non-oil sector and the programs implemented in practice are indisputable. In this study, it can be concluded that commercial loans given by banks are used for the right purpose and as a result, they also have a positive effect on GDP.

ABSTRACT

The devaluation shock experienced by the economy of Azerbaijan in 2015 actually put an end to the socio-economic model that has been cultivated since the start of the implementation of large oil projects. The new model, the parameters of which are announced, should lead the country and society to a qualitatively new level of development. New instruments of social and economic policy are required, in particular, for investment incentives for the development of non-oil sectors of the economy. Such a tool could potentially be a public-private partnership (PPP). PPP should become not just a set of various projects, but become a powerful factor in the development of public relations and institutions. The issue of financial support of such a partnership is one of the most difficult. The level of investment potential and the effectiveness of PPP as a national movement depends not only on how this issue is resolved. This also determines the possibilities for developing the potential of domestic banks, increasing their contribution to the industrialization of the country, expanding the banking business instruments, increasing banking influence on capital markets, approving the practice of targeted pooling of banks' efforts and resources, for example, in the form of banking consortia. The development of bank financing of PPP can help solve the problem of increasing the level of capitalization of local banks, the lack of reliable points of application for bank capital, the expansion of the range of banking products, and the permanent improvement of banking technologies.

Keywords: *public-private partnership, financial support for PPP, bank financing of PPP*

1. INTRODUCTION

The modern state has a wide range of instruments of influence on the economy. One of them is a public-private partnership. In his monograph Sazonov V.E. notes that in a number of countries around the world "the history of public-private partnership projects ... has several centuries" (Sazonov, 2012) and cites as an argument confirming this thesis by French author Xavier Besançon, author of the book "2000 years of public-private partnership for the construction of systems and public facilities "(Besançon, 2004). But we will not go into history. We are interested in modernity. With the integration of the national economy of the post-Soviet republics, structural changes are gaining new momentum, reaching a qualitatively new level. In particular, due to closer interaction of the state and the private sector. Already in a number of countries, by combining the resources and capabilities of public and private, serious social and economic problems can be effectively solved. World leaders in the field of PPP are the highly developed countries of the West - the United States, United Kingdom, France and Germany. In the UK alone over the past 20 years, more than 600 major projects have been implemented. The practice of PPP is also successfully developing in Japan, Italy, Ireland and Israel.

The latest World Bank study, covering 135 countries, revealed a direct correlation between the level of a country's income and the quality of regulation and provision of the main stages of launching and managing public-private partnership projects. In this study, it is noted that for a group of high-income countries, the average value for such criteria as pre-project preparation, selection of a private partner, management of PPP agreements and a private initiative mechanism was 8 points higher than for a group of countries with incomes above average, 14 points - compared with lower-income countries, and 19 points compared with low-income countries (Procuring Infrastructure PPPs, 2018).

2. WHO AND HOW DETERMINES PPP?

As supporters of a pragmatic approach to the question of the relationship between law and economics, we do not give an unequivocal priority to one or another. But we believe that in order to form the most unambiguous understanding of the essence of this or that phenomenon, it is advisable to refer to its legal and economic characteristics. From a legal point of view, PPP is a form of medium- and long-term relationships of the state in the face of a certain public law education and business in the face of specific private (legal and physical) persons to solve socially important tasks on mutually beneficial terms. The PPP is based either on a concession agreement or on a public-private partnership agreement concluded between the participants. Usually, PPP assumes that it is not the state that is connected to business projects, but, on the contrary, the state invites business to take part in the implementation of socially significant projects. A broad public interpretation implies constructive interaction between government and business in all areas of social development: not only in economics, but also in politics, ideology, culture, science, art, sports, ecology, etc. (Delmon, 2010) As supporters of just such an interpretation, let us take the opportunity to emphasize that there is not and cannot be unequivocally primary, and unequivocally secondary areas of the development of society. It is doubtful that success in the economy will be fundamental without adequate progress in non-economic areas, and vice versa. A number of foreign studies define PPPs as relations between the state and an individual based on the implementation of the project, executed in accordance with the law (Bult-Spiering, Dewulf, 2006). The position of international institutions is formed as follows.

- The IMF defines public-private partnerships as a combination of private and public capital resources to improve public property management and the provision of public goods, which offers a more complex and cost-effective approach to risk management, in contrast to the traditionally used public procurement (PPPPartnerships, IMF, 2016).
- The World Bank defines a public-private partnership as a long-term contract between a private and public partner on the provision of public goods, in which the private party assumes significant risks and is rewarded depending on the success of the contract (PPPPartnerships, World bank, 2016).
- In the Guidelines on Public-Private Partnership for Infrastructure Development ”of the UN Economic Commission for Europe, PPP is defined as “a form of cooperation between government authorities and business, whose main goal is to provide financing, construction, reconstruction, management and maintenance of infrastructure facilities” (Guidelines UN/ECE, 2000).

3. POSSIBLE EFFECTS OF PPP AND PRECONDITIONS FOR THEIR IMPLEMENTATION

What are the positive effects of the implementation of ppp, based on the experience of the world? This, in particular, the strengthening of innovative characteristics and improvement of the institutional support of economic development, due to:

- positive transformation of property relations;

- implementation of more advanced and effective management methods;
- expanding the quantitative and qualitative characteristics of private capital participation in the country's economy;
- tangible for consumers to improve the quality of goods and services;
- strengthening the competitiveness of not only the economy as a whole, but also the domestic business;
- introduction of new efficient models and financing mechanisms.

It is important to emphasize the important fact that the very possibility of implementing the idea of PPP in a particular society depends crucially on the presence of a minimally adequate institutional environment in the society. Effective implementation of PPP as an institutional and organizational alliance of state power and private business is possible if there are appropriate prerequisites. The prerequisites for successful implementation of a PPP program are defined as follows (Yescombe, 2015):

- political will.
- relevant regulatory framework.
- facilities with significant initial investment and long-term maintenance requirements throughout the life cycle.
- similar in size projects for comparing costs with the costs of organizing public procurement.
- permanent guaranteed appearance of projects that can interest private companies to create technological, investment and financial opportunities.
- institutional capacity to manage both the entire PPP program and individual projects.

4. SIGNS AND FORMS OF PPP

Among the basic features of public-private partnerships in the narrow (economic) interpretation, the following are distinguished (Green Paper, 2004; Amunz, 2005):

- PPP participants are the state and private business;
- interaction of participants is fixed on the official, legal basis;
- The interaction of the participants is long-term. This is explained by the fact that PPP is usually embodied in projects in the infrastructure sector. And here the payback period of projects is much higher than similar projects in the commercial sphere;
- The interaction of participants is of equal nature. At the same time, the participants are guided by their own interests when concluding an agreement. But the common denominator is that participants have a joint task;
- PPP has a clearly defined public, social orientation. The need to solve them in favor of the society should relate to the responsibilities of the public partner - otherwise his participation loses meaning;
- it follows from the above that in the process of implementing projects on the basis of PPP, the resources and contributions of the participants are consolidated;
- one of the key attributes of a PPP is the possibility of risk sharing. But not only the risks, but also the costs, as well as the results achieved, are distributed among the participants in predetermined proportions.

The main forms of PPP in the economy can be attributed (Amunz, 2005; PPP EU, 2006; Closing the Infrastructure Gap, 2006; Varnavsky, 2010):

- any mutually beneficial forms of interaction between the state and business
- management and lease contracts
- projects involving new construction

- financial lease (leasing)
- public-private enterprises
- partial privatization of assets
- production sharing agreements
- concession.

There is no ideal scheme that best takes into account the conditions of all countries, industries, projects, the content of each specific problem being solved (Delmon, 2009).

5. PPP IN AZERBAIJAN

In Azerbaijan, there are a number of systemic problems that prevent us from realizing the potential of PPP. Immediately it should be noted that there is no profile legislation on public-private partnership in Azerbaijan. For example, in the Russian Federation there is a Federal Law "On Public-Private Partnership, Municipal-Private Partnership in the Russian Federation and Amendments to Certain Legislative Acts of the Russian Federation". In Kazakhstan, in 2015, the Law "On Public-Private Partnership" was adopted. The same in the Belarus. In the Kyrgyz Republic, a similar Law was adopted in 2012. However, this does not mean a complete lack of legislative conditions for the practice of PPP in Azerbaijan. Moreover, such a practice exists in the country. For example, in 1994, in the field of oil production, Azerbaijan signed the first contract of the PSA type (Production Sharing Agreement). Laws of the Republic of Azerbaijan "On investment activity", "On investment funds" and "On protection of foreign investments", "On budget system", "On special economic zones", "On subsoil", "On state assistance to small business" and a number of other regulatory acts, including the Civil Code, form the legal basis of a public-private partnership in Azerbaijan. Strategic road maps of the national economy and the main sectors of the economy of Azerbaijan have become a new stage in building up the legal basis of PPP. Nevertheless, these and other regulatory acts cannot fully compensate for the lack of a comprehensive legal framework in Azerbaijan that defines the principles and essence of the functioning of PPP. Institutional manifestation of the actual PPP in Azerbaijan can be considered the National Fund for Entrepreneurship Support, the Azerbaijan Investment Company, the Council of Entrepreneurs under the President of the Republic of Azerbaijan. All this allows the use of specific government forms of private investment support. It is known that after two devaluations of manat in 2015, the dynamics of Azerbaijan's GDP in 2016 and 2017 was negative. For the first 9 months of 2018, this figure was only 0.8%; in the non-oil sector, according to the results of the same period, the increase was 1%, that is, within the statistical error. In other words, there is practically no GDP growth in Azerbaijan. This is a particularly depressing fact against the background of more or less positive indicators of the CIS countries (stat.gov.az; cisstat.com). The central issue of economic development is diversification, all-round stimulation of the non-oil sectors of Azerbaijan, a fundamental reduction in the country's economic dynamics from commodity dependence. How to achieve this under the conditions when in the first half of 2018 the volume of investments in the non-oil sector increased by 21.5%, including investments in the non-oil industry increased by 72.8%, and for total investments in fixed capital from all financial sources figure was 14.1% less than the same period in 2017? This suggests a logical conclusion: the formation of the total volume of capital investments in Azerbaijan still falls on the oil and gas industry. Indeed, capital investments in the oil sector of Azerbaijan in 2017 amounted to 54.3% of all investments. And this fact outweighs the effect of growth in the share of the non-oil sector in the country's GDP (62.8% in 2017). Moreover, the share of non-oil exports in January-May 2018 is slightly more than 10%. In addition, in 2017, against the background of a 5% decline in value added production in the oil sector, the same indicator in the non-oil industry grew by 3.8%, and in the entire non-oil sector - by 2.7% (stat.gov.az).

Figure 1: Dynamics of Azerbaijan's GDP (tradingeconomics.com)

According to the results of the first half of 2018, 52.8% of total investments in fixed assets were funds of enterprises and organizations, 24.4% - budget funds, 14.7% - bank loans, 6.2% - personal funds of the population, 1.3% - funds of extra-budgetary funds, 0.6% - other funds (stat.gov.az). What can explain the current structure of investment sources? In our opinion, the reduction of investment opportunities of the state. With the exception of the oil and gas sector and infrastructure projects, the development of the rest of the economy remains the function of the private sector. There is much to invest in the framework, but there is no certainty that the costs will be effective. Which sectors of the non-oil sector in Azerbaijan are attractive for investors? We believe that there is currently no clear answer to this question. During the years of high oil prices in the world, the state in Azerbaijan managed without its private sector for its growing financial opportunities. Now the situation has changed fundamentally. In 2011, the Government of Azerbaijan announced the start of preparations for the exit from major projects, a reduction in state budget investment commitments, a transition to a system of financing major investment projects focused on international standards for such financing, including through public-private partnership projects (Ministry of Finance Azerbaijan, 2011). In 2015, the Government of Azerbaijan states that it is necessary to attract additional capital, motivating it with the limited financial capabilities of any state. It is also emphasized that the model of public-private partnership is one of the ways to solve this problem. And first of all, it is necessary to solve the problem of the lack of relevant legislation and understand the rules for implementing PPP (Azerbaijan invested, 2015). Since then, more than 3.5 years have passed and the relevant legislation on public-private partnership in Azerbaijan is still absent. The lack of an appropriate regulatory framework in the field of PPP indicates that in Azerbaijan there is no such prerequisite for the successful implementation of the PPP program as the interest of the state itself. Another question: what kind of PPP is needed in order not only to achieve high economic growth, but also to bring the country and society to a qualitatively new level of development? We believe that within the framework of the new model of development of PPP in Azerbaijan should be not just a set of various projects, but also become a powerful factor for development. For this, PPP in Azerbaijan should become a national movement, and therefore should not be limited to the public services sector and, in particular, in the social infrastructure. PPP can also cover production infrastructure. Following the example of Japan's post-war experience of building relations between the state and business, which received the world-famous name Japan Incorporated, Azerbaijan needs to develop its Azerbaijan Incorporated model, which implies the unity of the state and business in upholding national interests before the outside world by

achieving and strengthening permanent constructive dialogue, focused on finding and finding mutually acceptable solutions that take into account the positions of both parties.

At the moment, we have to state that the state in Azerbaijan is making new attempts to stimulate the exit of local business from the shadows. The concentrated expression of the new efforts of the state to improve the business climate in the country and strengthen discipline among taxpayers was the introduction of 240 changes to the Tax Code of Azerbaijan. If we add to this the fact that Azerbaijan ranked 1st among 28 countries in the latest ranking of the largest shadow economies in the world (Emerging from the shadows, 2017), this means that the existing relations in the "business-state" line in Azerbaijan are lining up ineffectively.

6. BANKING PARTICIPATION IN PPP

The economy of Azerbaijan, first of all, its non-oil sector needs large-scale investments. We are deeply convinced that advanced technologies and modern equipment should become the basis for the development of non-oil industries, the creation of new industries and enterprises. Considering the current state of the national economy, the goals and objectives of its development for the coming years, in order to achieve sustainable economic growth, we consider it expedient to use the resources of Azerbaijan's commercial banks, which means that they must be included in the PPP participants. The participation of local banks in covering the gap between the available economic entities and financial needs in specific projects in the PPP regime will strengthen the position of banks among financial intermediation institutions in Azerbaijan, and increase the efficiency of transforming financial resources into real investments. The qualitative characteristic of the desired institutional alliance of the state and the banks of Azerbaijan in the form of PPP can and should be to ensure access of small and medium-sized businesses to banking resources and services. For banks, this can provide an opportunity to direct their resources to finance investment projects and programs to diversify and modernize the economy of Azerbaijan. We believe that the stimulating contribution of the state can be:

- provision of state guarantees for loans
- loan interest subsidies
- co-financing projects

The need for off-budget financial support for the development of small and medium-sized businesses may stimulate interest in small savings and savings outside the banking sector and contribute to their fuller involvement in the economic cycle. Additional effects may be the strengthening of the resource and capital base of local banks, the acceleration of the processes of concentration and centralization of capital in the banking sector of the Azerbaijan economy.

7. CONCLUSION

We believe that the new model of development of Azerbaijan will be untenable without the full implementation of the practice of PPP. Azerbaijan has significant potential for the implementation of public-private partnership projects, but the limiting factor here is the lack of a developed body of specialized legislation and a single public policy in the sphere of PPP. The introduction of PPP practice in Azerbaijan as an integral part of the implementation of national projects and programs of social and economic development of society can have a positive effect only if the interests of the state are combined on the one hand, and the rest of society represented by local business, science, education, on the other. The institutional base of such an alliance can make banks. The current state of the banking system of Azerbaijan continues to be difficult. Forecasts of global financial institutions in the banking sector of Azerbaijan remain largely negative. Attracting banks to participate in public partnerships will create the preconditions for the qualitative improvement of their participation in the development of society.

Biruta.Sloka@lu.lv*

ABSTRACT

More and more higher education institutions have started to use data from rankings for analysis, strategic planning and policy making to attract more financing for international research and enrolment of foreign students. The importance for universities in deciding which indicators are of greatest interest in accordance with their strategic priorities, and in focusing on these alone has been underlined and important is attitude of academic staff and their willingness and motivation for activities supporting higher level of their university rankings. Many methodologies of rankings testify, that various indicators can be brought together – for example, on reputation, research, teaching, resources, the international dimension of university; co-operation with employers. On great importance is management to reflect the performance and success of university including each member of academic staff. Many investigations have performed in this field and research results usually are used for management decision making on different levels: on university level, on higher education and science level and for country level. Research aim is to evaluate the significance of the attitude of the members of academic staff towards rankings and different indicators and their motivation to improve them to support management decision making of higher education institutions. Research methods used: analysis of scientific publications on university rankings aspects related to academic staff importance and attitude; expert survey on university organisation and used ranking indicators aspects supporting university rankings. Expert survey is designed with use of evaluation scale 1 – 10, where 1 – fully disagree with the statement and 10 – fully agree with the statement. For expert data analysis indicators of descriptive statistics (indicators of central tendency or location and indicators of variability) are used. Expert survey results are used in development of survey of academic staff. Main results and findings of the study: members of academic staff have big influence on university rankings have significant role in the development of university. It is important to motivate members of academic staff to work in directions important for university international rankings and foresee those motivating factors of academic staff to be included in the strategy of university – as in the scale of the world, as in the regional and national scale.

Keywords: *University rankings, performance indicators, academic staff, experts*

1. INTRODUCTION

More and more higher education institutions have started to use data from rankings for analysis, strategic planning and policy making to attract more financing for international research and enrolment of foreign students. The importance for universities in deciding which indicators are of greatest interest in accordance with their strategic priorities, and in focusing on these alone has been underlined and important is attitude of academic staff and their willingness and motivation for activities supporting higher level of their university rankings. Many methodologies of rankings testify, that various indicators can be brought together – for example, on reputation, research, teaching, resources, the international dimension of university; co-

operation with employers. On great importance is management to reflect the performance and success of university including each member of academic staff. Many investigations have performed in this field and research results usually are used for management decision making on different levels: on university level, on higher education and science level and for country level. Research aim is to evaluate the significance of the attitude of the members of academic staff towards rankings and different indicators and their motivation to improve them to support management decision making of higher education institutions. Research methods used: analysis of scientific publications on university rankings aspects related to academic staff importance and attitude; expert survey on university organisation and used ranking indicators aspects supporting university rankings. Expert survey is designed with use of evaluation scale 1 – 10, where 1 – fully disagree with the statement and 10 – fully agree with the statement. For expert data analysis indicators of descriptive statistics (indicators of central tendency or location and indicators of variability) are used. Demand of the information about the quality and efficiency of higher education institutions grows, when market of the higher education becomes more open and competitive, when number of students and state funding to the higher education decreases and in the influence of other factors. The role of measuring of the institutional quality of the higher education grows due to interaction of many factors. Affordable way is the strengthening of the research aspect of the higher education institutions: both international and state financed research, and the participation in the research with local government and industry. Up to now there are not conducted enough such research. There are many academic investigations with practically available suggestions for the facilitating of the research and for the deeper study of the specific aspect. Formation of the ratings of higher education institutions is the way how to compare organizations for their parameters of activity. The role of ratings is to offer the information about the quality of services in the form of the measurable distinctions for the sponsors, clients and policy makers. Ratings are influential. They foster the flow of doctoral students, elite scientists and money of sponsors to the top institutions in ratings. Ratings determine the reputation of the universities. They attract the interest of the society and change the behaviour of the universities and policy makers.

Objective – investigate importance of motivation system for academic staff on active involvement in international research.

Methodology:

Analysis of scientific publications;

Comparison of results of leading Baltic universities in different international higher education institution rating systems in 2017 and 2018, analysing the role of performance indicators in the formation of rating position:

1. QS World University Rankings
2. The Times Higher World University Ranking
3. Academic Ranking of World Universities (ARWU or Shanghai Ranking).

Methodologies of ratings and used indicators of the evaluation of research of universities are compared. Expert survey results are used in development of survey of academic staff. Main results and findings of the study: members of academic staff have big influence on university rankings have significant role in the development of university. It is important to motivate members of academic staff to work in directions important for university international rankings and foresee those motivating factors of academic staff to be included in the strategy of university – as in the scale of the world, as in the regional and national scale.

2. THEORETICAL FINDINGS

Academic researchers in scientific publications discuss different approaches of comparisons of different universities – does one size fit to all (Goglio, 2016, pp. 212-226) but such research results are important to make management decisions in practical university management, as well as development of higher education management decisions. Soo, K.T. (2013). Academic researchers are concerned on aspects - does anyone use information from university rankings (Soo, 2013: 176–190), Aspects of active instruments: on the use of university rankings in developing national systems of higher education are discussed among the higher education researchers in many countries and practical aspects are analysed on different levels and in many countries (Lim, Øerberg, 2017: 91–108). Many countries analyse universities rankings as new marketing tool, like for ranking of Canadian universities: a new marketing tool, (Page, 2000; 59-69). Australia has a big share of higher education export in GDP and the influence of organisational features in high-ranked universities: the case of Australia are on researchers agenda (Uslu, 2017: 471-486). Multivariate analysis – cluster analysis are applied in analysis for multi-authoring and its impact on university rankings: a case study of CERN effect on Turkish universities (Çakır, Acartürk, Alkan, Akbulut, 2017). Demographic aspects are important for academic researchers are counting on demographic equity to transform institutional cultures at historically white South African universities (Booi, Vincent, Liccardo, 2017, pp. 498-510). Researchers discuss on methodologies of global university rankings: metrics, performance, governance (Peters, 2017). In studies of higher education management among the important aspects are analysed the effect of methodological variations on university rankings and associated decision-making and policy (Hosier. Kumar, Hoolash, 2019, pp. 201-214). Political decisions are extremely important for changing higher education practice in many countries also in Malaysia where researchers are paid attention to the conundrum of incentives (Wan, et al, 2017: 2134-2152). An empirical study on credibility of China's university rankings are on great interest among researchers and policy makers in higher education (Ying, Jingao, 2009: pp. 70-80). Many international scientific conferences discuss those aspects involving researchers from many countries world-wide.

3. EMPIRICAL FINDINGS

There are several criteria of indicators in higher education rankings. Indicators must agree to such criteria:

- connected with aims and tasks of institution
- direct (promptly describe what is being measured)
- objective (evident clear what is being measured)
- qualitative (as far as possible)
- comparable (results are similarly interpreted, when different study programmes or types of institutions are compared; institutionally, nationally, internationally etc.)
- practical (the count of indicators must be limited; data describing these indicators must be available).

3.1. QS World University Rankings (I)

(<http://www.topuniversities.com/qs-world-university-rankings>; 01.11.2018) Since the QS World University Rankings were first developed in 2004, they have expanded to rank more than 900 universities in 2017, with over 3,800 assessed. The top 400 universities are given individual ranking positions, and the rest are ranked in groups – starting from 401-410, up to 701+. Based on 6 performance indicators, the ranking assesses university performance across four areas: research, teaching, employability and internationalization:

- academic reputation (40%)
- employer reputation (10%)

- student-to-faculty ratio (20%)
- citations per faculty (20%)
- international faculty ratio (5%)
- international student ratio (5%).

Table 1: Performance of Baltic universities in QS ranking (November 1, 2018)

University	Rank	TOTAL	Academic reputation	Employer reputation	Student-to-faculty ratio	Citations per faculty	International faculty ratio	International student ratio
University of Tartu(EE)	321 (2018)	32,8	20,4	21,6	82,7	18,9	22,4	20
Vilnius University (LT)	488 (2018) 481-490	24,1	16,9	31,8 (2018) 34,9 (2017)	60,2 (2018) 58,9 (2017)	6,1	11,7	6
Tallin University of Technology (EE)	601-650 (2018) 601-650 (2018)	-	-	21,3 (2018) 32,9 (2017)	32,9 (2018) 33,2 (2017)	-	35 (2018) 22,1 (2017)	43,4 (2018) 26,5 (2017)
University of Latvia(LV)	801-1000 (2018) 651-700 (2017)	-	-	-	26,6 (2018) 36,4 (2017)	-	-	-
Riga Technical University LV)	751-800 (2018)			23,9 (2018)	26,8 (2018)		15,9 (2018)	28,7 (2018)
Kaunas University of Technology (LT)	751-800 (2018) 701 - 750 (2017)	-	-	21,2 (2018)	36,7 (2018) 37 (2017)	-	-	-
Vilnius Gediminas Technical university (LT)	581-590 (2018) 701+ (2017)	-	-	36 (2018)	42,4 (2018) 29,7 (2017)	-		29,9 (2018) 23,2 (2017)

3.2. The Times Higher World University Ranking (I)

(<https://www.timeshighereducation.com/world-university-rankings>; 01.11.2018) The Times Higher Education (THES) World University Rankings 2018 list the 1250 top universities in the world, making it the biggest international league table to date. It is global university performance table to judge world class universities across all of their core missions – teaching, research, knowledge transfer and international outlook. THES ranking uses 13 carefully calibrated performance indicators. This year's ranking, which includes institutions from 79 countries, represents 5 per cent of the world's higher education institutions.

3.3. The Times Higher World University Ranking (II)

Qualitative indicators / quantitative indicators 50:50%.

The Academic Ranking of World Universities (ARWU) was first published in 2003 by the Center for World-Class Universities of Shanghai Jiao Tong University, China, and updated on an annual basis. ARWU uses 6 objective indicators to rank world universities, including the number of alumni and staff winning Nobel Prizes and Fields Medals, number of highly cited researchers selected by Thomson Reuters, number of articles published in journals of Nature and Science, number of articles indexed in Science Citation Index, and per capita performance of a university. More than 1200 universities are actually ranked by ARWU every year and the best 500 are published. Academic Ranking of World Universities -ARWU or Shanghai Ranking; <http://www.shanghairanking.com>; 01.11.2018). Indicators and weights for ARWU

Table following on the next page

University rankings more and more have influence on choice of policy making at universities, administrations of higher education in countries.

4. CONSLUSION

- None of world popular approaches and methodologies of the evaluation and comparing of higher education institutions are absolutely objective;
- Different methodologies are used in the international rankings, however the evaluation of the research activity has significant proportion in all of them;
- Different indicators of research activity are used, but more significant are:
 - number of publications in respectable journals / per academic staff / in citation data bases
 - index of citation
 - number of highly cited researchers
 - international research awards
 - number of doctoral degrees conferred
 - income from research
 - productivity of research

- income from industry (transfer of knowledge and technology) etc.
- Acquired findings indicate, that the results of research activity of universities have important role in the international ratings of higher education institutions and the improvement of these results facilitates the place of higher education institution in the ratings, thus fortifying, to which aspects of the strengthening of research activity must be drawn special role and attention in the missions and strategies of higher education institutions
- The research indicated that historical habits of respective university have some influence but also material/
- Moral motivators are on great importance with moral or emotional factor significant importance (such as involvement, moral recognition by university management – praised in academic staff meetings, published joint photo with rector at respective university webpage, even symbolic material premiums, support for participation in international conferences etc.).

ABSTRACT

In this research, the dependence of VAT revenues on the factors affecting it in the Republic of Azerbaijan and the Russian Federation was studied. For this purpose, information on the volume of revenues from value-added tax, income tax and profit tax was collected and analyzed. To determine the dependence of VAT revenues on income tax and profit tax revenues, as well as on the difference between the amount of debt and overpaid taxes and the dependence of VAT revenues on the profit tax rate for Azerbaijan and to determine the dependence of VAT revenue on income tax and profit tax revenues for Russian Federation, statistical indicators for 2006–2017 were collected and analyzed, and regression equations were constructed and an econometric evaluation was carried out using the “EViews” application software and the results were analyzed.

Keywords: *value added tax, income tax, profit tax, direct and indirect taxes, econometrics*

1. INTRODUCTION

As it is known, taxes are divided into two parts according to the mechanism of formation: direct taxes and indirect taxes. Direct taxes are taxes that cover the income of taxpayers derived from the use of the main factors of production. As an example of direct taxes, profit tax, income tax, property tax, etc. can be mentioned. Direct taxes are paid by taxpayers who directly have the objects of taxation of these taxes. Indirect taxes are taxes that are included in the prices of goods and services. As an example of indirect taxes, value added tax (hereinafter referred to as VAT), excise can be mentioned. Despite the fact that indirect tax payers are persons providing goods and services, in fact, these taxes are added to the prices of the same goods and services, are collected from buyers and paid to the budget. As well as direct and indirect taxes differ in the formation mechanism, they also perform different functions. Since direct taxes play an important role in the formation of budget revenues, mainly performing a fiscal function. And the main function of indirect taxes is to control the economy. For example, VAT participates in all stages of production by way of calculation and reimbursement, and at the end is withdrawn from the final consumer and paid to the state budget. Such a mechanism makes it possible to control the economy at all stages of production. Given the differences between direct and indirect taxes, it is especially important to determine the relationship between them. The research has carried out an econometric assessment of the dependence of VAT revenues on income tax and profit tax revenues, as well as explaining the results obtained. The research was carried out taking into account the economic indicators of the Republic of Azerbaijan and the

Russian Federation, due to the fact that both of them are post-Soviet states rich in hydrocarbon resources and passed through similar stages of economic development.

2. THE RELEVANCE OF RESEARCH

As it is known, there are four main factors of production: land, capital, labor and entrepreneurial ability. Each of these factors involved in the production process has its share in the value of the goods produced. Since in the value of the produced goods, land participates in the form of rent, capital in the form of interest, labor in the form of wages, and entrepreneurial ability in the form of profit. So, the value added created in the economy can be expressed by the factors of production involved in the production process, in the following form:

$$VA=P+W+I+R+NTP \quad (1)$$

Here: VA- is value added, P-profit, W-wages, I-interest, R-rent, NTP-net taxes on production.

In terms of taxation, it should be noted that despite the fact that each of the main factors of production is subject to direct taxes (In particular, the land is subject to land tax, interest and wages are subject to income tax, and profit is subject to profit tax.), the cost of the final product is subject to value added tax, which is an indirect tax. In both countries, in Azerbaijan and in Russia from indirect taxes, VAT, and from direct taxes, income tax and profit tax have a superior position in state budget revenues. From this point of view, the study and comparative analysis of the existing relationship between these taxes is one of the important tasks.

3. ECONOMETRIC ASSESSMENT OF THE DEPENDENCE OF REVENUES FROM VAT ON INCOME TAX AND PROFIT TAX IN REPUBLIC OF AZERBAIJAN

First, let us try to determine the dependence of VAT revenues on income tax and on the volume of debts and overpaid taxes. For this, the following specification of the regression equation was considered:

$$\text{LOG}(\text{VAT_AZ}) = C(1) + C(2)*\text{LOG}(\text{ITAX_AZ}) + C(3)*(\text{DEBT_AZ}-\text{OVER_PAYMET_AZ}) \quad (2)$$

Here: VAT_AZ-: is the volume of VAT revenues, ITAX_AZ- is the volume of income tax revenues, DEBT_AZ-OVER_PAYMET_AZ – is the difference between the volume of all tax debts and overpaid taxes.

The result of the econometric evaluation of the regression equation (2) in the EViews application package was as follows:

$$\text{LOG}(\text{VAT_AZ}) = -13.0583708808 + 1.99511842046*\text{LOG}(\text{ITAX_AZ}) + 1.34645128028e-07*(\text{DEBT_AZ}-\text{OVER_PAYMET_AZ}) \quad (3)$$

Statistical characteristics of the model (3) are shown in table (1).

Table following on the next page

Prob(F-statistic)	0.000001			

Statistical indicators and tests show that the model (3) is adequate.

Figure 1: The actual, fitted and residual dynamics of VAT revenues in Azerbaijan according to the model (3)

From model (3), it can be seen that the coefficient of elasticity of VAT revenues relative to income tax receipts is approximately 1.99. This means that the increase in income tax revenue by 1 % contributes to an increase in the volume of revenues on VAT by 1.99 % while all other conditions are stable. Also from model (3) it turns out that the coefficient of semi-elasticity of VAT revenues relative to the difference between the volume of debts and overpaid taxes equals to 0.013 %. This result shows that the increase in the positive difference between the volume of debts and overpaid taxes by 1 manat contributes to an increase in the volume of revenues on VAT by 0.013 percent. Even if at first glance it looks paradoxical that growth in difference between the volume of debts and overpaid taxes leads to an increase in VAT revenues, this fact can be explained. Since the growth of the positive difference between the volume of debts and overpaid taxes shows the appearance of an additional tax liability and this in turn leads to an

increase in VAT revenues through control measures and tax administration. And now let us try to determine the dependence of VAT revenues on profit tax revenues. For this purpose, the following specification of the regression equation was considered:

$$\text{LOG(VAT_AZ)} = C(1) + C(2)*\text{LOG(PROFTAX_AZ)} + [\text{AR}(1)=C(3),\text{AR}(2)=C(4),\text{UNCOND}] \quad (4)$$

Here: PROFTAX_AZ – is the volume of profit tax revenues.

The result of the econometric evaluation of the regression equation (4) was as follows:

$$\text{LOG(VAT_AZ)} = 9.29446582474 + 0.313150183664*\text{LOG(PROFTAX_AZ)} + [\text{AR}(1)=1.71162179229,\text{AR}(2)=-0.846894887053,\text{UNCOND}] \quad (5)$$

Statistical characteristics of the model (5) are shown in table (2).

Table 2: The main statistical characteristics of the model (5)

Dependent Variable: LOG(VAT_AZ)

Log likelihood	5.460101	Hannan-Quinn criter.		-0.151488
F-statistic	25.47925	Durbin-Watson stat		1.499119
Prob(F-statistic)	0.000288			
Inverted AR Roots	.86-.34i	.86+.34i		

As can be seen from table (2), the statistical characteristics of model (5) and tests show that the resulting model is adequate. According to the model (5) the elasticity coefficient of VAT revenues relatively to profit tax revenues is approximately 0.31. This means that the increase in profit tax revenue by 1 % contributes to an increase in the volume of revenues on VAT by 0.31 % while all other conditions are stable. And now we will look at the problem of optimality of VAT revenues in relation to profit tax revenues. For this purpose, the following specification of the regression equation was considered:

$$\text{VAT_AZ} = C(1) + C(2)*\text{LOG(PROFTAX_AZ)} + C(3)*\text{LOG(PROFTAX_AZ)}^2 + [\text{AR}(4)=C(4),\text{UNCOND,ESTSMPL}="2008 2017"] \quad (6)$$

Here: PROFTAX_AZ- is the volume of profit tax revenues.

The result of the econometric evaluation of the regression equation (6) turned out in the following form:

$$\text{VAT_AZ} = -1261755740.22 + 174886109.117 \cdot \text{LOG}(\text{PROFTAX_AZ}) - 6050519.60489 \cdot \text{LOG}(\text{PROFTAX_AZ})^2 + [\text{AR}(4) = -0.929549695501, \text{UNCOND, ESTSMPL} = "2008 2017"] \quad (7)$$

Statistical characteristics of the model (7) are shown in table (3).

Inverted AR Roots	.69+.69i	.69+.69i	-.69-.69i	-.69-.69i

The statistical characteristics of the model (7) shown in table (3) and the relevant tests give us reason to say that the model turned out to be adequate. From model (7), it is clear that the coefficient of the parameter with a square power is negative. This shows that the graph of the model obtained from the econometric evaluation is a parabola with the branches pointing down. And this means that the function has a maximum point, in other words, at a certain level of profit tax revenue, VAT revenues reach their maximum. To find this point, one should find the point where the derivative of this function turns into zero. This point is a point of extremum. After carrying out the relevant calculations, it was revealed that the amount of profit tax revenue, at which revenues from VAT reach their maximum, is equal to 1908001.54 thousand manats.

As an economic explanation of the result obtained, it can be shown that with the stability of all other conditions, after the profit tax revenue reaches the level of 1908001.54 thousand manat, the VAT revenue starts to decrease. The reason for this phenomenon is the fact that taxpayers in the case when they cannot evade profit tax, they tend to evade taxes on wages. One of the interesting approaches in studying the dependence of VAT revenues on profit taxes is to determine the profit tax rate at which revenues from VAT reach their maximum. Since the regression equations given above made it possible to determine the amount of profit tax at which revenues from the VAT reach their maximum. And the presence of such a fact made it important to directly determine the optimal rate of profit tax, which contributes to the revenues of VAT to reach their maximum. For this, an econometric estimation of the following regression equation should be made:

$$\text{LOG(VAT_AZ)} = C(1)*\text{PROF_TAX_RATE} + C(2)*\text{PROF_TAX_RATE}^2 \quad (8)$$

Here: VAT_AZ- is the valume of VAT revenues, PROF_TAX_RATE-is the rate of profit tax.

The result of the econometric evaluation of the regression equation (8) was as follows:

$$\text{LOG(VAT_AZ)} = 1.75060631423*\text{PROF_TAX_RATE} - 0.0515957099025*\text{PROF_TAX_RATE}^2 \quad (9)$$

Statistical characteristics of the model (9) are shown in table (4).

Table 4: The main statistical characteristics of the model (9)

Dependent Variable: LOG(VAT_AZ)				
Method: Least Squares				
Date: 01/03/19 Time: 21:22				
Sample: 2006 2017				
Included observations: 12				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
PROF_TAX_RATE	1.750606	0.102689	17.04770	0.0000
PROF_TAX_RATE^2	-0.051596	0.004943	-10.43911	0.0000
R-squared	0.610779	Mean dependent var		14.09623
Adjusted R-squared	0.571857	S.D. dependent var		0.524688
S.E. of regression	0.343317	Akaike info criterion		0.850686
Sum squared resid	1.178665	Schwarz criterion		0.931504
Log likelihood	-3.104119	Hannan-Quinn criter.		0.820765
Durbin-Watson stat	1.075457			

The statistical characteristics of the model (9) shown in table (4) and the relevant tests give us reason to say that the model turned out to be adequate. From model (9) it was found that the optimal rate of profit tax maximizing VAT revenues, with the stability of all other factors, equals to 16.96 percent. It should be noted that currently the profit tax rate is 20 percent. The obtained result of an optimal rate of profit tax from the model equal to 16.96 percent can be explained by the fact that a decrease in the profit tax rate leads to an increase in revenues for

this tax in accordance with Laffer's theory, and this in turn contributes to an increase in VAT revenues.

4. ECONOMETRIC ASSESSMENT OF THE DEPENDENCE OF REVENUES FROM VAT ON INCOME TAX AND PROFIT TAX IN RUSSIAN FEDERATION

We now turn to the question of determining the dependence of VAT receipts on the factors affecting it for the Russian Federation. For this purpose, we will evaluate the following regression equation:

$$\text{LOG(VAT_RUS)} = C(1) + C(2)*\text{LOG(ITAX_RUS)} + C(3)*\text{LOG(PROFTAX_RUS)} + C(4)*\text{DUMMY2008} \quad (10)$$

Here: VAT_RUS – is the valume of VAT revenues in Russian Federation, ITAX_RUS – is the valume of income tax revenues, PROFTAX_RUS – is the valume of profit tax revenues. Note that, taking into account the financial crisis in 2008, a dummy variable (DUMMY2008) was included in the model to increase the adequacy.

$$\text{LOG(VAT_RUS)} = -1.17725496269 + 0.708739278105*\text{LOG(ITAX_RUS)} + 0.496429327574*\text{LOG(PROFTAX_RUS)} - 0.302219332938*\text{DUMMY2008} \quad (11)$$

Statistical characteristics of the model (11) are shown in table (5).

Table 5: The main statistical characteristics of the model (11)

Prob(F-statistic)	0.000000			

The statistical characteristics of the model (11) shown in table (5) and the relevant tests give us reason to say that the model turned out to be adequate.

Figure 2: The actual, fitted and residual dynamics of VAT revenues in Russian Federation according to the model (11)

From model (11), it was determined that in Russian Federation the coefficient of elasticity of VAT revenues relatively to revenues from income tax and profit tax is 0.71 and 0.50, respectively. As can be seen, the growth of income tax and profit tax revenues has a positive effect on VAT revenues. Since the increase in income tax revenues by 1% leads to an increase in VAT revenues by 0.71%, and the increase in profit tax revenues by 1% leads to an increase in VAT revenues by 0.5%.

5. CONCLUSIONS

- The increase in income tax revenue by 1 % contributes to an increase in the volume of revenues on VAT by 1.99 % in the Republic of Azerbaijan.
- The increase in profit tax revenue by 1 % contributes to an increase in the volume of revenues on VAT by 0.31 % in the Republic of Azerbaijan.
- The amount of profit tax revenue, at which revenues from VAT reach their maximum, in the Republic of Azerbaijan, is equal to 1908001.54 thousand manats.
- The optimal rate of profit tax maximizing VAT revenues, in the Republic of Azerbaijan, with the stability of all other factors, equals to 16.96 percent
- In Russian Federation the coefficient of elasticity of VAT revenues relatively to revenues from income tax and profit tax is 0.71 and 0.50, respectively.

ABSTRACT

In this article the integration between science and education has been studied. The number of indexed scientific articles in Azerbaijan is accepted as a explained variable, which is pulled up from SCOPUS scientific bibliographic base and its dependence on the number of admitted PhD students has been assessed running the econometric model. In addition, the dependence of explained variable on the GDP value, education and science has been calculated by running the econometric models. As a result, the ratio of Doctor of Science to Doctor of Philosophy has been calculated.

Keywords: *science, education, integration, PhD, econometrics*

1. INTRODUCTION

It takes time to create and develop a university. The development stages of universities and their mission are categorized as following: a) educational universities (1.0); b) research universities (2.0); c) entrepreneur universities (3.0) (Kaprov, 2017, p.58). Educational universities were the first to be created and they were teaching the religion. In addition, Latin, Greek and other languages were taught at the universities. Bologna Univeristy was created in Italy in 1088, Paris University was created in France in 1150, Oxford University was created in England in 1167 and Istanbul University was created in Ottoman Empire in 1453. These universities are categorized under 1.0. The mission of these universities were education. The universities categorized on (2.0) add research to their core values in addition to teaching. These universities consider research key element to teaching that improves the quality of the education.

The universities categorized on (3.0) add the practical application of research results to the teaching and research elements of education. Therefore their mission statement have three key categories. To feed their mission these universities have created and developed scientific-research labs, business incubation centers and technology transfer centers. The creation of the (3.0) category universities have been established by the establishment of tech parks which first has been created at Stanford University in the United States. The reason for establishing the entrepreneur universities is to create innovation centers that supports research and education. Furthermore, the innovation centers help with the career replacement of students. As a result of establishing Stanford University tech park the Silicon Valley has been formulated as a physical space that companies produce tech products. It worth mentioning that the adoption of Bayh-Dole act in 1980 in the United States institutionalized the establishment of entrepreneur universities model in America (Karpov, 2017, p.58). After the adoption of the act. Before the adoption of the act the universities in the United States would register 250 patent, this number was 1,500 in 1982 and in 2010 there were 4,500 patent registered. The universities in the United States made \$82 million revenues from the sales of licence during 1989-1990 period, while they made \$1.5 billion just in 2009. The abovementioned facts demonstrate the importance of Bayh-Dole act on the establishment of the third category universities. The trends on the educational field have positive impact to Azerbaijan too. Some universities in Azerbaijan, including Azerbaijan State University of Economics (UNEC) have been taking relevant steps to contribute to the development of education too (Muradov A.J. (2017), p.12). In order to increase the number of PhD students the universities and the Academy of Science of Azerbaijan Republic has developed the PhD programs. The Doctor of Philosophy program is about 3 years for full-time candidates, while being 4 to 5 years for part-time candidates. If it takes 5-6 years to defend the dissertation instead of 3-4 years that means, the publication of the dissertation delays for 1-2 years. We have got the results in accordance with these delays. It should be noted that it took 5 or 6 years for PhD candidates to continue their program. During this period the number PhD candidates who finished the program was less than 50%. Usually, this process continued for 6 years for fundamental sciences and technical sciences (3 years for doctoral studies and 3 years after graduating from doctorate) and 5 years in humanitarian and social sciences (respectively 3 years and 2 years) (Bednyy, 2006, p.34). If it took 5-6 years for PhD candidates to defend the dissertation. 59% of the 586 admitted PhD students on economy in 2002 finished their program by 2010 in the United States. While, 37% of them dropped out of the program and 4% were still continuing the program. The result of this study shows that the number of PhD candidates who defended their dissertation were increased by median value from 5.0 to 5.6 during 1996-2000 period (Stock, 2011, p.14). Science and education play key role on the development of the domestic economy in a given country. Therefore, there is a need to develop these fields and to increase the allocated funds for that. The share of science and education is high in developed countries. For instance, this indicator is 1.92% for OECD countries, while being 1.1% for Russia and 0.68% for Kazakhstan (Science &Engineering Indicators 2014. Tabl.4.4. p.4 etc.; Bulatov, 2017, p.266). In 2011 the average share of GDP on the educational expenses was 6.1% in OECD countries, 5.1% in Japan, 7.6% in South Korea, 7.3% in Israel, 4.6% in Russia and 7.3% in Azerbaijan (OECD Education at a Glance. OECD Indicators 2014. Tabl.A1.2a, p.43 etc.; Bulatov, 2017, p.268). In addition, in 2014 the average share of higher education in GDP was 1.6% in OECD countries, 2.8% in Canada, 2.7% in the United States, 2.6% in South Korea, 1.9% in Finland, 1.3% in Germany, 1.4% in Russia. This indicator was 0.85% in Azerbaijan in 2017 (Explanation on the draft law of the Republic of Azerbaijan "On the 2017 State Budget of the Republic of Azerbaijan" (2017), p.20). The Azerbaijani economy has been developed 6.47 times during 1996-2017 period (see Table 1, column 10), which have had a positive impact over the general development of science and education.

One of the key indicators of development science and education in a specific country are the number of indexed scientific articles on the international databases. Another important factor is the average number of citations to an article. The number of international patents are the indicators of innovation. The number of admitted students to the Doctor of Philosophy and Doctor of Science programs and the expenses spent on education have an impact over the development of the science and education in Azerbaijan. There are different indicators that characterize the development of science and education: these include, the number of scientific articles on SCOPUS per 10,000 persons, the number of citations to those articles, the number of students in the higher education, the number of PhD students studying Doctor of Philosophy and Doctor of Science, etc. (<https://www.scimagojr.com/countrysearch.php?country=az>). Therefore, this study focuses on the number of indexed scientific articles on SCOPUS database for Azerbaijan, the number of admitted students to Doctor of Science and Doctor of Philosophy programs in Azerbaijan, the expenses spent on science and education and real GDP value and the econometric assessment of values among these variables. It should be noted that we could not find any scientific articles written on the relationship between the number of PhD students in a specific country and the indexed scientific articles on international databases. Therefore, this study is going to be the first articles in its nature in Azerbaijan.

2. THE DATA SET OF THE STUDY AND THE PROCESSING

There are some econometric models that have been run to assess the indexed scientific articles on international databases during 1996-2007. The number of students studying Doctor of Philosophy and Doctor of Science are accepted as explanatory variables, while the number of indexed scientific articles on SCOPUS are labeled as explained variables. In addition, the expenses on GDP, science and education are labeled as explanatory variables, while the number of indexed scientific articles on SCOPUS database is accepted as explained variables. We also included the number of Doctor of Science and Doctor of Philosophy candidates in order to demonstrate the potential of people who are in the science. The databases are the State Statistics Committee of Azerbaijan Republic and SCImagojr.com scientific portal database. (see Table 1). The explanation for reductions on Table 1 is shown on the Appendices section. Table 1 shows that the number of admitted students to PhD programs have been declined dramatically, it is almost terminated. This was due to the adoption of the new bill on "Science".

Figure following on the next page

Table 1: DATA SET. [1996=100]

Source: (Education, Science and Culture in Azerbaijan. Statistical Yearbook. (2018, 2017, 2016, 2015),; <https://www.stat.gov.az/source/education/>;
<https://www.scimagojr.com/countrysearch.php?country=az> the personal calculations of the authors.

It should be noted that, during that time the National Parliament of Azerbaijan adopted a bill on “about the Science” ([http://science.gov.az/uploads/PDF/Elm_haqqinda Azərbaycan Respublikasının_Qanunu.pdf](http://science.gov.az/uploads/PDF/Elm_haqqinda_Azərbaycan_Respublikasının_Qanunu.pdf)) and the phrase of “Doctor of Philosophy” was adopted.

3. THE SPECIFICATION OF ECONOMETRIC MODELS AND THEIR REALIZATION

The number of indexed scientific articles on SCOPUS for Azerbaijan and the number of admitted students for Doctor of Philosophy program and other indicators that participating on the econometric modelling is studied by applying the unit root (Asteriou, 2016, pp.348-353). The revenues of the state budget, the expenses spent on science and education are the indicators that impact the integration of science and education in the higher education. Therefore, we will assess the impact of those indicators to the number of indexed scientific articles on SCOPUS database. Below is the specification of the econometric model for the educational expenses and its impact on the number of indexed scientific articles on SCOPUS database (Həsənli, 2008, p.29).

$$\text{LOG}(\text{SCOPUS_DOC}) = C(1) + C(2)*\text{LOG}(\text{TEHSILXERCREAL}) + u \quad (1)$$

The results of (1) regression equation is calculated on the Eviews software which is shown below:

Table 2: The main statistical characteristics of the econometric model for the number of articles on scopus to the real educational expenses in Azerbaijan during 2002-2017 period.

Dependent Variable: LOG(SCOPUS_DOC)				
Method: Least Squares				
Sample: 2002 2017				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1.343755	0.615195	2.184274	0.0464
LOG(TEHSILXERCREAL)	0.877837	0.105586	8.313968	0.0000
R-squared	0.831573	Mean dependent var		6.445368
Adjusted R-squared	0.819543	S.D. dependent var		0.414362
F-statistic	69.12207	Durbin-Watson stat		1.011476
Prob(F-statistic)	0.000001			

The main statistical characteristics of the Model (1) on Table (2) shows that our model applied is adequate. Although the value of Durbin-Watson statistics is not satisfactory (the autoregression of the residues is partly available), but it is important for the analysis of the model. It should be noted that the availability of the autoregression of the residues makes the insignificant forecast of the econometric model. Below is the econometric modelling specification of the expenses on science to the number of indexed scientific articles on the SCOPUS database for Azerbaijan:

$$\text{LOG(SCOPUS_DOC)} = C(1) + C(2)*\text{LOG(ELMXERCREAL)} + u \quad (2)$$

Here: LOG(ELMXERCREAL) – the natural logarithm of real expenses spend on science, C(1)– fixed threshold, C(2)- elasticity coefficient.

(2) regression equation has been calculated on the Eviews measurement tool and the results are below:

Table 3: The main statistical characteristics of econometric modelling on the dependence between the number of scientific articles on scopus database and the real expenses in Azerbaijan

Dependent Variable: LOG(SCOPUS_DOC)				
Method: Least Squares				
Sample: 1996 2017				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	3.893831	0.201078	19.36477	0.0000
LOG(ELMXERCREAL)	0.786557	0.068200	11.53316	0.0000
R-squared	0.869293	Mean dependent var		6.144074
Adjusted R-squared	0.862757	S.D. dependent var		0.615620
F-statistic	133.0138	Durbin-Watson stat		1.066467
Prob(F-statistic)	0.000000			

The main statistical characteristics of the Model (2) on the Table 3 shows that the model we applied is adequate. Below is the impact of the GDP value to the indexed number of scientific articles on SCOPUS.

$$\text{LOG(SCOPUS_DOC)} = C(1)+ C(2)*\text{LOG(UDMREAL)} +u \quad (3)$$

Here LOG(UDMREAL) – the natural logarithm of the real GDP value.

The regression (3) equation is calculated on the Eviews measurement tool (Table 4):

Table 4: The characteristics of the econometric modelling on the number of dependent articles on the scopus database to the real value of GDP

Dependent Variable: LOG(SCOPUS_DOC)				
Method: ARMA Maximum Likelihood (OPG - BHHH)				
Sample: 1996 2017				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-1.447742	0.325467	-4.448203	0.0004
LOG(UDMREAL)	0.838829	0.035635	23.53948	0.0000
AR(1)	0.360016	0.161328	2.231580	0.0394
AR(3)	-0.639666	0.164801	-3.881451	0.0012
SIGMASQ	0.013851	0.006454	2.146302	0.0466
R-squared	0.961711	Mean dependent var		6.144074
Adjusted R-squared	0.952702	S.D. dependent var		0.615620
F-statistic	106.7479	Durbin-Watson stat		2.050845
Prob(F-statistic)	0.000000			
Inverted AR Roots	.56-.73i	.56+.73i	-.76	

It worth mentioning that in order to achieve the relevance of the econometric model (3) regression equation is added the AR (1) and AR (3) autoregression factors from the 1st and 3rd compiles. In econometric modelling the stabilization of the residues is important. This is being applied by unit root test. Since there is no unit root ($\sqrt{0.56^2 + 0.73^2} = 0.92 < 1$), we can accept the residuals as stationary. So, the main statistical characteristics of Model (3) show that the model applied is adequate.

What is the relationship between the number of Doctor of Science and Doctor of Philosophy students in Azerbaijan? Table 1 shows that the ratio between the variables is gets the value of 4-5 during the years. Is there an optimal ratio between the variables? We can accept the maximum number of indexed scientific articles on SCOPUS database as an optimum criteria. In order to calculate the optimum criteria the regressions equation gets specification (5) and its results is shown on Table 5 below:

$$ED = C(1) + C(2)*FD + C(3)*(FD)^2 \quad (5)$$

Table 5: The calculation of optimal ratio between ED and FD

Dependent Variable: ED				
Method: Least Squares				
Date: 01/09/19 Time: 19:01				
Sample: 2006 2017				
Included observations: 12				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-838.7940	283.0743	-2.963159	0.0159
FD	0.601611	0.126967	4.738338	0.0011
(FD)^2	-3.70E-05	1.32E-05	-2.803357	0.0206
R-squared	0.991024	Mean dependent var		1105.917
Adjusted R-squared	0.989029	S.D. dependent var		349.4935
S.E. of regression	36.60618	Akaike info criterion		10.25063
F-statistic	496.8396	Durbin-Watson stat		1.564682
Prob(F-statistic)	0.000000			

The (5) equation shows that as an explained variable ED is the parabola of FD. The ED gets the maximum value from the ratio of FD/ED=5.051537. This means, if the ratio between the number of people with Doctor of Science and the Doctor of Philosophy degree is 1:5, then this ratio would be maximum. In order to calculate the maximum number of scientific articles on SCOPUS, we should except it as an explained variable and formulate the econometric model.

We are going to label the indexed articles on SCOPUS as explained variables to calculate its maximum value and the number of PhD candidates as explanatory variables in order to run the model. The specification of econometric model is following:

$$LOG(TOTAL_DOC_SCOPUS) = C(1)*LOG(EDQ) + C(2)*(LOG(EDQ))^2 \quad (6)$$

The results of Model (6) are on the Table 6.

Table 6: The calculation of optimal grade of doctor of science students and the maximum number of scientific articles on scopus for Azerbaijan

<i>Dependent Variable: LOG(TOTAL_DOC_SCOPUS)</i>				
<i>Method: ARMA Maximum Likelihood (OPG - BHHH)</i>

<i>Adjusted R-squared</i>	0.587525	<i>S.D. dependent var</i>		0.615620
<i>S.E. of regression</i>	0.395377	<i>Akaike info criterion</i>		1.343514
<i>Durbin-Watson stat</i>	1.204392			
<i>Inverted AR Roots</i>	.92+.25i	.92-.25i	.67-.67i	.67+.67i
	.25-.92i	.25+.92i	-.25-.92i	-.25+.92i
	-.67-.67i	-.67+.67i	-.92+.25i	-.92-.25i

The characteristics of Model (6) is satisfactory. The equation shows that EDQ=92,46244, which means, the maximum number of admitted Doctor of Science students is 92. In this case, the number of indexed scientific articles on SCOPUS is maximum, in other words it is: 3144,254.

4. THE RESULTS OF ECONOMETRIC MODELS

- The results of Model (1) show that 1% increase on real education expenses increases the number of articles from Azerbaijan on SCOPUS by 0.877% during 2002-2017 period.
- The results of Model (2) show that 1% increase of the expenses on science on current year increases the number of articles from Azerbaijan on SCOPUS by 0.786%.
- The results of Model (3) show that 1% increase of the real value of GDP increases the number of articles from Azerbaijan on SCOPUS by 0.838%.
- The results of Model (4) show that there ratio between the number of students of Doctor of Science against the students of Doctor of Philosophy should be 1:5 in order to acheive the maximum number of articles from Azerbaijan on SCOPUS database.
- The results of Model (5) show that the optimal level of ratio between the number of Doctor of Philosophy students who defended the dissertation and the number of Doctor of Science students who defended dissertation is 5.051537. This means, if the ratio between the people with Doctor of Science degree and people with Doctor of Philosophy degree is 1:5, then the number of articles from Azerbaijan on SCOPUS would be maximum.
- The results of Model (6) show that the number of articles from Azerbaijan would be maximum if the number of admitted Doctor of Science students would be 92. Table 1 shows that the number of admitted Doctor of Science students were 129 in 2017.

5. CONCLUSION

The result of the econometric modelling shows that there is an optimal ratio between the admitted students to Doctor of Philosophy and Doctor of Science and the number of students who defended their dissertation on Doctor of Science and Doctor of Philosophy, which impacts the maximum number of indexed scientific articles on SCOPUS database for Azerbaijan. Such as, the optimal ratio of Doctor of Philosophy students against the Doctor of Science students is 5:1. If the number of admitted Doctor of Science students would be 92, then the number of indexed articles would be maximum on SCOPUS. The real value of GDP, the expenses on education and science was assessed against the number of indexed articles on SCOPUS. Therefore, the ratio of the expenses on science and education to GDP and the increase on the GDP value positively impacts the number of PhD candidates in Azerbaijan. This results in the increased number of indexed scientific articles on SCOPUS database for Azerbaijan.

ABSTRACT

The aim of this paper to analyze an agricultural potential of Azerbaijan in the case of its olive production. Due to widespread of olive products in the Mediterranean countries, people often associate manufacturing of olive oil and preserved olives with such countries as Spain, Portugal, Greece, Turkey, Italy, Cyprus, Malta, France, Slovenia, and others. The goal of this paper to reveal the agricultural potential of the domestic market, provide a SWOT analysis of effective functioning of the olive sector in Azerbaijan, learn the world and domestic trends of olive oil production and consumption. Research shows that sales of olive oil non-producing countries have been growing and olive oil production is under the regulation of the common agricultural policy of the European Union. Because of distinctive flavor and healthy characteristics, olive products occupy a premium position in the mind of consumers. Mathematical analysis of future trends of olive oil system also is reviewed in this study. The held research gives strong recommendations small and medium entrepreneurs for the growing and improving olive oil industry in Azerbaijan, as well as carries out general policy, maintain the general economic sustainability of national agriculture. Azerbaijani farmers should learn and analyze best practice of olive oil producers and using David Ricardo comparative advantage theory develop a common agricultural policy for the country as a whole and along with export of energy resources diversify an export basket by manufacturing consumer superior goods accordance with global market demand, make a new brand "Made in Azerbaijan" prestigious and easily recognizable among different countries in long-term perspective. Marketing strategies for entering international markets also suggested and can draw the attention of local manufactures.

Keywords: *common agricultural policy, brand, marketing strategy, olive oil production, SWOT analysis*

1. INTRODUCTION

One of the major challenges of the 21-st century is an eradication of hunger in the world. This problem is reflected as a number one in the United Nations Millennium Declaration. Agriculture should play a significant role in solving this globally recognized problem. Many different reasons prevent to solve the problem once and for all: for example population growth, global warming, reduction in arable land per capita, lack of water for irrigation, constantly rising prices for raw materials and equipment, shortage of qualified specialists in agriculture and low labor productivity and etc. Unfortunately, agriculture can't provide an instant positive effect, because investors' attention today is more focused toward the extractive industry than wasteful agriculture. After the collapse of the USSR, Azerbaijan slowly, but surely discovered its own way and has built a new strategy for integration into the world economy. The first way was focused on the oil industry. For quick recovery, it was the only way to go. In 2012 a new concept of development "AZERBAIJAN 2020: LOOK INTO THE FUTURE" was adopted. This concept defines the country's economic policy, main vectors of economic diversification, high growth rates of the non-oil sector, regardless of the level of oil revenues and maintaining its export capabilities in near future. Based on the export-oriented economic model, the concept envisages an increase in non-oil exports through improving the competitiveness of the economy and improving the structure of the economy and by increasing the per capita non-oil export to

\$ 1,000 by 2020. After an economic slump of oil prices in 2016, the Azerbaijani government launched eleven strategic roadmaps (SRM) supporting the national economy and its main economic sectors. Among them three roadmaps focused on production and processing of agricultural products, manufacturing consumer goods by small and medium entrepreneurs, improving supply-chain and expanding the international trade geography. The rest about the prospects of the national economy, development of heavy industry and machinery; tourism sector; housing provision at a reasonable price; vocational education and training; financial services communication and information technologies utilities (electricity and thermal energy, water and gas supply). This fact says that Azerbaijan is building a new economic model based not only on crude oil and gas, but stresses focus on the diversification of its entire economy. National agriculture should play a leading role in this direction. However, the official statistics of 2017 indicates that the portion of the non-oil sector in export is very small - 11%. This situation necessitates the expansion of export and diversification through the development of competitive products in the non-oil sector. This paper draws more attention to the optimal production of olive oil, preserved olives, and olive jam. Olive stones are used for house heating in Italy and in some other developed countries. In developed countries, the industrial processing of olives gives marketers the cellulose. Azerbaijani cuisine prepares from green olives a jam for lovers of delicious dessert. In the frame of diversification of the economy and development of small and medium businesses in Azerbaijan, olive products can take a worthy place in the export basket of the country.

2. THE GENERAL VIEW OF OLIVE PRODUCTION IN AZERBAIJAN

The first mentions of olives in Azerbaijan have been known since the 8-10 centuries. As a result of frequent inroads of the Mongolian Golden Horde to Azerbaijan, many olive groves were destroyed. The age of a very old olive tree is about 200 years in Azerbaijan. The first specialized olive state farm (in the past was called sovkhoz) was organized in the settlement Zigh in 1949 (Nabiyeva, 1966, pp. 128). The first and only plant on olive processing was constructed in Baku, near the settlement Mashtaga of Absheron Peninsula. Until the 1980s, the olive industry was one of the leading sectors in the agro-industrial sector of Azerbaijan. Cultivation and processing of olives were carried out in the Krasnodar, Dagestan, Armenia, Georgia and the Crimea. But, in accordance with decisions from Moscow, the mass production of olives in the USSR was recognized as "inexpedient". Over the last 40 years, olive areas have been reduced by more than five times. In spite of all difficulties of the transitional period, Azerbaijan could maintain on a small scale the processing facilities.

2.1. Optimal functioning of olive production flow chart

Optimization of economic activity, improvement of agro-technical services, reduction of cost of production of olives, increasing of economic efficiency of the olive complex is a long process designed for the future and determined by economic conditions and opportunities, as well as the level of development of the region's productive forces. The optimal functioning of the olive complex is inseparably linked with the rational organization and purposeful use of the economic mechanism. The economic mechanism of the olive complex is understood as a combination of methods of planning, economic incentives, organization, and management. For the purpose of investigating the possibilities and interaction of separate elements of the economic mechanism, it is necessary to systematize and classify all elements and parts, and on basis of developing a scheme of the economic mechanism for local use.

Figure following on the next page

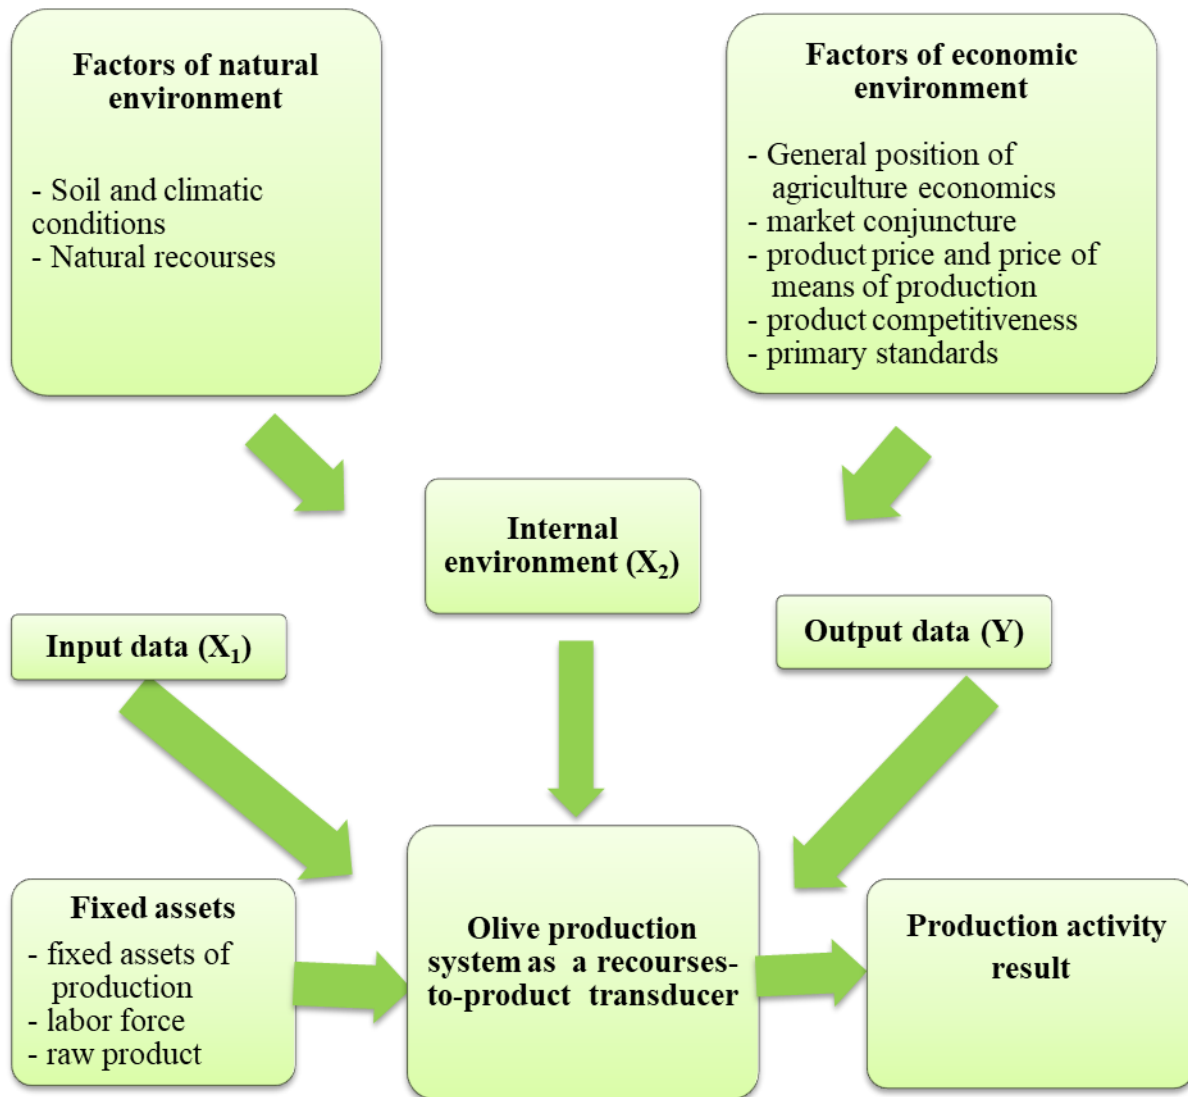

Figure 1: Optimal functioning of olive production flow chart

$$Y=F(X_1,X_2)$$

The present scale of development of olive production specifies the use of an integrated approach and the creation of appropriate conditions for their functioning. In this context, the role of such scientific methods as system analysis, systems approach and factorial method, factor approach, program-target method are increasing. A program-target method is a tool of the deepening system approach and complex analysis and development of economic, scientific and technical, territorial production programs of the olive oil production. Olive system is a complex of interrelated and dynamically interacting components aimed at achieving a common goal. The olive system covers a whole package of economic relations from olives growing to final consumer goods. Olive system quite a complex system with plenty of internal and external interconnections, number of hierarchy levels, decision-making layers, a period of the system's action. (Menesku, 1986, pp. 15-25, Hajizalov, 1995, pp. 53-57). The flow-chart of the optimal functioning of the production, processing, storage, and sale of the product plays a big role in the process of olive production analysis. The chart is the mechanism by which the system behavior is realized, in other words, the inputs are converted into outputs, independent variables into dependent ones.

The flow chart of optimal functioning of olive production is given at flow chart 1. As can be seen, the olive production system is affected by such external factors as the soil and climatic conditions of suburban farms, the availability of skilled labor force, the level of prices for raw materials, the fixed assets of production and etc. In turn, the system has an impact on the environment, changing it, consuming labor force, fixed assets, natural resources, and others. The environment has an influence on the concerned system through the relevant elements, which are called system inputs, and factors of the external environment that implement these effects are called input data. The system of "olive production" in turn affects the environment through specific elements that form the output of the system. The environmental factors of a system are defined as output data. Input data as external influence is called impulse, while output data as a result of an effect is called reactions to relevant impulse. When the model reproduces the interaction between the system and the environment, the system behavior is described through the instrumentality of some number of input and output data, that is, a system of characteristics (input X_i , output Y_i). These characteristics may change over time and should be considered as system variables. Factors of natural environment represent independent variables (X), but system response – function (Y). Formalized model of the system's input and output makes it possible mathematically define the process of its action considering output values as functions of input.

$$Y=F(X)$$

The system is influenced by an infinite variety of external factors and accordingly can respond to them in different ways. In real terms the consideration of all forces is impossible. The research task is to consider a specific phenomenon with a limited number of variables. Conducting the research of the olive production system, the most important factors are the area of olive plantations and the yield per hectare. (Musayev, 1973, pp. 39-45, Andreozzi, 1998, pp. 2357-2364). Based on the use of economic and mathematical methods and computer technology the present flow chart provides a better understanding of the problem of optimizing the functioning of the olive system.

2.2. THE CURRENT STATE OF PRODUCTION OF OLIVES IN AZERBAIJAN

The available data for 2017 indicate that total area of olive orchards in Azerbaijan account about 3351,4 ha. They are concentrated in Baku city (46,8%), Absheron peninsula (42,8%), Ganja-Gazakh economic region (0,06 %), Guba-Khachmaz economic region (4 %), Aran economic region (6,2%), Daghlig Shirvan economic region (0,006 %) and Yukhari Garabagh economic region (0,006 %). Regarding Yukhari Garabagh economic region provided factual information refer only to Jebrayil district because since 1994 most of the Yukhari Garabagh region with the support of Armenian Republic is occupied by the unrecognized Nagorno-Karabakh Republic. Azerbaijan controls only the extreme eastern parts of the Agdam, Terter, and Khojavend districts, as well as most of the Fizuli district too. That's why the full statistics can't be provided. As seen, prevalent part olive orchards are located in the capital – Baku city and two economic zones of Azerbaijan - Absheron peninsula (42,8%), Ganja-Gazakh, because these regions have a temperate climate and suitable soil for their growth. Within the total area of olive orchards (3351,4 ha) olive trees at fruit-bearing age account 2 777,1 ha or 82,7 %.

Figure following on the next page

Figure 2: Olive statistics in Azerbaijan (self compiled on the base of Statistical Committee of the Republic of Azerbaijan)

As shown in Figure 2, in the period from 2000 to 2017 the total area of olive orchards had been increased from 1468 ha to 3351,4 ha, total production had been increased from 952 to 1679,5 tons. However, the yield of olives has been reduced. The following reasons influenced on olive statistics in Azerbaijan over the 17 years:

- occupation of Yukhari Garabagh economic region by Armenian army;
- transition difficulties after the collapse of USSR;
- lack of state support to agriculture;
- lack of agro-industrial complex;
- due to the high prices and lack of knowledge on consumer properties of olive oil weak consumer preferences;
- the financial insecurity of local farmers;
- the arbitrariness of local authorities and buyers;
- lack of Futures Contracts and a system of crediting and others.

In the Soviet times Azerbaijan had good skills for manufacturing preserved olives. Baku grocery stores sold table olives in small jars and even three-liter cans. But manufacturing of olive oil wasn't demanded. People preferred cheapest sunflower oil. After opening a new plant new equipment for pressing oil was purchased from Greece. Consumers began to understand the beneficial properties of olive oil. Unfortunately, olive oil became scarce and was sold to veterans of the Great Patriotic War 1941-1945 and people suffering from diseases of the gastrointestinal tract. In the context of a command economy, Azerbaijan didn't have a possibility to use the D. Ricardos' principle of comparative advantage. This principle is suitable for free trade, and now Azerbaijan may use this theory and sell preserved olives and olive oil to Russian and Iran markets instead of there for example fish and medicaments and other traditional products. The agent will produce more of and consume less of a good for which they have a comparative advantage. Comparative advantages studies show that the geography of Azerbaijan's non-oil exports through the EU (EU) countries can be substantially expanded and its scope can also be substantially increased.

It is known that the political and economic relations between the Russian Federation and the EU have been aggravated by the problem of "Eastern Ukraine", as well as mutual economic and commercial embargoes. All this, namely the ability to replace Russian products in EU markets, can be regarded as a chance to diversify Azerbaijani exports both geographically and commercially. The significant part of Azerbaijan's exports to the European Union belongs to the oil sector. To be able to reduce the dependence of the domestic economy from oil and gas it is necessary to produce non-oil products with comparative advantage and adapt them requirements of EU.

3. THE PERSPECTIVES OF THE OIL MARKET OF AZERBAIJAN

Olives are called "zeytun" in Azerbaijan and due to the suitable soil, the main of orchards are to be found on the Absheron Peninsula. The olive trees are most demanding of water and sun. Olive trees successfully have been cultivated in Azerbaijan for a very long period of time. They can be grown almost at every turn in Baku city. Olives were planted in the metropolitan areas, schoolyards, at roadsides since Soviet times. They are really unpretentious and evergreen plants. And it is no mere chance that during USSR first and the only plant on olive processing was built in Baku, in settlement Mashtaga of Absheron Peninsula. In the 1980s the plant supplied oil and canned olives not only to all former Soviet republics but to Libya and Czechoslovakia too. The plant was most profitable in this period. 2,500 tons of olives were processed annually. Unfortunately, the total area of olive groves significantly smaller, than in the Soviet period. And as a consequence reduction of olive production. Apart from this plant, there is only one more state plant in settlement Hovsan, Absheron. Now, this plant belongs to Gilan Holding. According to the official statistics for the last five years on an average Gilan Holding exported 500-ton olive oil to international markets annually. In other words, 50 % of the total amount was sold to Georgia, 20 % Kazakhstan, 15 % Iraq, and the rest to EU. Of course, import exceeds export and makes up 1100 ton annually. It means that foreign olive products lead in the domestic market. For a newly developing country this is quite understandable because in a market economy every consumer has the right to free choice. Whereas the maximum price of 0,5 liters olive oil of Spain and Italian producers varies between 20-24 AZN (Azerbaijani manat), the price of local producers ranges around 12-14 AZN and it is more normal. Today Azerbaijan oil market mostly is represented by sunflower-seed oil, corn oil, and olive oil. They are imported mainly from Russia, Turkey, Italy, Spain, Greece, and Arabian countries. Rising consumer health problems concentrate people towards olive oil consumption. Providing a domestic market with locally produced olive oil with the support of imports in principle is possible. Well-informed consumers try to use fats and some other oils (such as palm oil) as little as possible. Olive orchards do not require irrigation like many other fruit trees. But the yield of olive must be mechanized and even robotized. Production costs in modern olive orchards are lower than in mountain areas. The mechanization and marketing planning of operations promote time management between harvesting and pressing of the olives, which has a positive impact on the quality in the final analysis. Local manufactures consider that Azerbaijan can increase further production of olives can gain a great profit and make a brand "Made in Azerbaijan" more recognizable. Agronomists have calculated that one ha of olive grove can yield from 2 to 2,5 tons of olives, or 30 kg from one tree. In accordance with international standards, local brands as Gilan Zeytun uses the modern Italian equipment and produce an extra virgin "Jalə" olive oil and "Azərbaycan Zeytunu" canned olives. The minerals and heavy metals in the oil and preserved olives are not allowed. Annually the plant takes about 300 tons of olives from olive groves on the Absheron Peninsula. 100 tons are canned and the rest portion goes for oil extraction. Black olives pressed for oil, green for canning. In case of careful SWOT analysis, Azerbaijan can be specialized on olive oil production in the region.
