The United States is the world's largest insurance business. US insurance companies control up to 50 percent of the world's industrialized markets. Thus, insurance is the only field of activity in this country that is not regulated by antitrust laws. In 1930, the US Congress decided to fund the State Product Insurance Program, which was aimed at reviving the agribusiness system after the Great Recession. Founded in 1938, the State Product Insurance Corporation (FCIC) under the US Department of Agriculture is still operating effectively and is now managed by the Risk Management Agency. With the adoption of the State Product Insurance Act in 1980, subsidies were introduced to attract private insurance companies, and there was an opportunity to increase insurance coverage. Currently, 14 private insurance companies (authorized insurers) employing more than 27,000 insurance agents are engaged in concluding insurance contracts. Authorized insurance companies can develop insurance products and introduce new ones. However, products participating in the program must be approved by the Risk Management Agency (RMA). The participating companies must also submit annual action plans for approval by the Risk Management Agency. The plan includes information on whether the company is able to cover possible losses on its liabilities, as well as on the classification of certain types of risks for subsequent insurance through the Risk Management Agency. In addition, insurance companies receive subsidies through the Risk Management Agency to cover administrative costs, as well as loss management costs. Reinsurance is also carried out through the Risk Management Agency, by transferring part of the risk and insurance premium to the relevant reinsurance funds. The amount of subsidies and the terms of reinsurance are specified in a standard reinsurance agreement signed by all insurance companies participating in the program. The fact that the insurance program is very effective and colorful attracts agricultural enterprises to these programs. Thus, in the United States in 1997, agricultural enterprises insured 73.8 million hectares of arable land, and in 2014 - 88.3 million hectares, or 62% of all arable land [23]. *The Multiple Peril Crop Insurance (MPCI)* program is one of the oldest crop insurance programs in the agribusiness system, providing insurance against most natural disasters such as drought, excess moisture, flooding, hail, and storms, and more than 70 crops. Covers. According to this program, an insurance event occurs when less than the average (expected) product is taken in the previous few years. The minimum insurance amount is paid entirely from the state budget, and when less than 50 percent of the expected product is taken, the damage is compensated at the level of 55 percent of the price applied by the Risk Management Agency. Agricultural enterprises wishing to participate in the program pay an administrative fee of only \$ 100 for each type of plant they insure. This type of insurance is called "Catastrophic Crop Insurance" (CCI).

Extending the insured risks relative to the minimum risk is considered voluntary insurance. Agricultural enterprises can choose the level of risk insurance. Thus, they have the opportunity to choose the insurance coverage of the product (50-85 percent), the price (55-100 percent of the market price). This type of insurance is called Buy-up Coverage (BUP). The Multiple Product Insurance (MPCI) program allows entrepreneurs to protect themselves against the risk of production failure due to unfavorable climatic conditions. However, it is important for entrepreneurs to implement insurance programs that will protect not only crop yields, but also their products from falling market prices. In this regard, the *Crop Revenue Coverage (CRC)*, an income insurance program in the United States, has been developed and is being successfully implemented. This program allows entrepreneurs to protect their income from the decline of production, as well as the reduction of prices for their products in the market. However, not all plants in the agribusiness system can be insured under this program. In addition, a separate list of plants has been compiled for each state in the agribusiness system to be insured with CRC. In order to participate in this program, agricultural enterprises pay an administrative fee of \$ 30 per plant to be insured. According to the program, the insured event occurs when the income after the harvest (actual productivity \times the market selling price at the time of harvest) is less than the minimum guarantee amount, and the insurance company pays the difference. It should be noted that this program is also implemented with the close financial participation of the state. Thus, as can be seen from Table 1, in 2014, the state subsidizes more than 50 percent of the insurance premiums of agricultural enterprises in the United States.

Table 1: Measures of insurance premiums and payments on insurance programs in the USA [23]

Insurance programs	Insured areas		Insurance fee, USD		Total insurance payment, USD	
	Ha	%	Total	Including subsidized by the state	total	%
MPCI	89429804	41,1	1110551792	718763038	990931249	31,03
CRC	53073006	24,4	1023127299	586374453	1085692291	34
Under the general programs	217438938	100	3429971939	2041231913	3193340126	100

Thus, insurance activity in the United States has recently developed rapidly and become an important area. The scientific and efficient organization of the insurance business in this country has to some extent contributed to the sustainable development of economic entities with different categories of ownership in the agribusiness system. The development and regulation of insurance activities with the support and regulation of the state, taking into account foreign practice and adapting to local conditions, should be an effective means of overcoming certain difficulties in the agribusiness system in the Republic of Azerbaijan.

4. STATE PROGRAMS ON PRICE AND INCOME SUPPORT FOR ENTREPRENEURS IN THE AGRIBUSINESS SYSTEM

Another group of popular government programs in the United States is federal programs to support the price and income of entrepreneurs in the agribusiness system. Thus, the agribusiness system has an extensive system of government programs that regulate prices. These are Direct payments (DP), Counter-Cyclical Payments (CCP), Marketing Assistance Loans (MAL), Loan Deficiency Payments (LDPs) programs [24]. Let's take a closer look at each program below. The Direct Payments Program (DP) is aimed at entrepreneurs who traditionally grow oilseeds such as wheat, corn, barley, oats, cotton, rice, soybeans, peanuts, and sunflowers. The amount of direct state payments is determined through a certain mechanism. Thus, the number of plots of land where crops were grown in the past (Farm Number) determines the basic area and

productivity of plants on the farm. In order not to encourage the increase of arable land, the base area is determined based on the data of the previous, usually 5-7 years, and the basic productivity is determined based on the average yield, for example, 1991-1995 or 1998-2002. The New US Farm Bill (2002), adopted in the United States in 2002, sets the amount of payments per plant. For example, payments for wheat are \$ 0.52 / bushel (or \$ 1.91 per quintal), for barley \$ 0.24 / bushel (or \$ 0.59 per quintal), and for soybeans 0.44 (or \$ 1 per quintal). \$ 0.59). Direct payments to entrepreneurs (DP) are paid as follows:

$DP = \text{degree} \times \text{base productivity} \times \text{base area} \times 85\%$.

It should be noted that these payments are made on farms regardless of whether these plants are currently cultivated or not. If the total income from one agricultural enterprise for the last 3 years has not exceeded \$ 2.5 million, a limit of \$ 40,000 is set. The total annual amount of payments is up to \$ 5.4 billion. Under the Counter-Cyclical Payments (CCP) program, the government provides direct payments to entrepreneurs when products become cheaper. This program includes plants covered by the DP program. The reverse periodic payment program (CCP) is paid as follows:

$CCP = \text{target price} - \text{rates of direct payments} - (\text{more than two: average annual market price or collateral rates})$.

The New Agrarian Act of the United States, adopted in 2002, sets target prices and collateral rates for 2004-2007. The difference between this program and the DP program is that monetary compensation is paid to entrepreneurs only when market prices fall below a certain level. In this case, as in the DP program, payments are made regardless of the actual production of the relevant plants. In addition, the CCP program sets a limit of \$ 65,000 for an agricultural enterprise if the total income has not exceeded \$ 2.5 million over the past three years. The total annual volume of payments is \$ 5.7 billion. Let's look at the mechanism of the Market Assistance Loans (MAL) program. The new U.S. Agrarian Law, passed in 2002, sets fixed collateral rates for a number of crops. Based on these rates, local fixed collateral rates are applied in each circle based on the specific characteristics of production. If the price of products produced after the harvest is lower than the collateral rates, agricultural enterprises can pledge their products to the state and receive money at local rates. After that, the entrepreneur has 9 months to find a profitable market for his product. If market prices rise, an agricultural enterprise can sell its produce at a higher price and return the money to the Commodity Credit Corporation (CCC) with interest. If it cannot find a more profitable market, the agricultural enterprise can choose one of the following options at the end of the 9-month period:

- 1) The collateral agrees to the transfer of the product to the ownership of the Commodity Credit Corporation. Usually, the goods transferred to the ownership of the Commodity Credit Corporation are sold after 2-3 months. In this case, the agricultural enterprise may incur certain costs for the storage of that product.
- 2) An agricultural enterprise shall sell its products at the current market price within its jurisdiction and transfer the profits to the Commodity Credit Corporation.

Finally, the essence of the popular Loan Deficiency Payments (LDPs) program is that the government compensates agricultural enterprises in the amount of the difference between the collateral rate (including interest on the loan) and the market price. In order to receive this compensation, it is not necessary for an agricultural enterprise to sell its products, it is enough to have the necessary quantity and quality of products. Compensation can be received during the calendar period of the program.

This calendar period varies for individual crops: from the beginning of the wheat harvest to March 31 of the following year, and for sunflowers until May 31. The agricultural participant of the program may decide to receive compensation within the specified period. The agricultural enterprise receiving the compensation may at any time sell its produce at the market price at its own expense. According to this program, if the total income of an agricultural enterprise for the last 3 years does not exceed \$ 2.5 million, the limit is set at \$ 75,000. The total annual amount of payments is about \$ 6 billion. *The Conservation Reserve Program (CRP)* has been successfully implemented in the United States since 1986 to increase environmental security, soil fertility, and other natural resources. In order to participate in this program, agricultural landowners sign a long-term, average 10-year contract. During this period, the participant loses the right to cultivate crops in his field and in return receives financial assistance from the state. The average amount of this assistance in the country is about \$ 120 per hectare, which varies considerably by region. For example, in Kansas it is \$ 94, in Maryland it is \$ 295. More than 34 million acres of land in the United States have been taken out of the agribusiness system under the program, and the total amount of payments is \$ 1.8 billion.

5. THE MAIN REGULATORY DIRECTIONS OF THE STATE POLICY TO SUPPORT ENTREPRENEURS

In addition to the government programs listed above, there are many smaller programs, most of which are short-term. These programs are implemented by the state for 1-2 years in the agribusiness system in connection with crop productivity, the current market situation, natural disasters and so on. In this sense, it is of great interest to study the practice of regulating sugar beet production in the United States. Support for sugar beet growers in the United States has been integrated into long-standing sugar industry protection and support programs. According to the laws of 1934, 1937, 1948, the Ministry of Agriculture had to determine the necessary consumption of sugar in the domestic market and distribute it among domestic and foreign producers, as well as set the relevant norms. According to these laws, in order to prevent the growth of production, payments were made to entrepreneurs, and tax excises on sugar produced and processed in the country were applied. These programs expired in 1974, and for the next seven years the US market was opened to import sugar at compulsory guaranteed prices paid in 1977-1978. With the Food and Agriculture Act of 1981, as well as the Food Safety Act of 1985, Congress restored mandatory guaranteed sugar prices. Subsequently, the 1990 law, the 1993 budget reconciliation bill, and the 1996 and 2002 laws extended the programs until 2007. The law adopted in 2002 provides for the application of the sugar program on the basis of the principle of "no cost" (in all cases, the state should not suffer). The state policy to support sugar producers includes three main areas of regulation:

- Price Support Loans;
- Marketing allotments;
- Tariff-rates quotas.

The current strategy of the US government is to protect local entrepreneurs by keeping most prices in the domestic market above foreign prices.

5.1. Price Support Loans

Sugar producers who comply with the terms of the bond program can borrow from the state through the Commodity Credit Corporation (CCC) based on the collateral rates in the relevant area, pledging their products. These debts are the main means for the Commodity Credit Corporation to keep domestic sugar prices high. Collateral rates are set per pound of goods. The classification of these rates into separate circles allows taking into account the local characteristics of different regions.

Over the next 9 months, the entrepreneur can find a more profitable market for the product. If market prices rise, a sugar producer can sell his product at a higher price and return the money he received earlier to the Commodity Credit Corporation together with the interest rate (collateral interest rates are 1 percent higher than the Commodity Credit Corporation's interest rates, depending on US refinancing rates. The interest rates of the Commodity Credit Corporation were 2.25% and the interest rates on collateral operations were 3.25%). Unable to find a more profitable market, the entrepreneur agrees to transfer the pledged product to the Commodity Credit Corporation after 9 months. Usually, the goods transferred to the ownership of the Commodity Credit Corporation are sold after 2-3 months. Even so, an agricultural enterprise may incur certain costs for the storage of that product. Prior to borrowing, processing enterprises must agree to pay entrepreneurs the minimum support price set by the Ministry of Agriculture, which depends on the collateral rates for sugar cane and sugar beet. Typically, 60 percent of debt, or 40 percent of sales revenue, goes to entrepreneurs, and the exact amount depends on the quality of the product under the contract. If the processing plant does not use the debt system, the entrepreneurs who supply it with the product are deprived of price support through the debt system. The borrower decides whether to repay the loan and return the pledged product within the specified period, or whether the payment will be made. In case of non-payment, the collateral is transferred to the Commodity Credit Corporation in full without additional penalties. Debts obtained through the Commodity Credit Corporation system are non-current debts, as processing enterprises cannot own the pledged products until the debt obligations are met. If the price of sugar in the domestic market is lower than the statutory collateral rate, the Commodity Credit Corporation must accept the collateral product as a repayment of the debt, taking into account the rates. This mechanism protects sugar producers from harm when selling their products. Sugar transferred to the Commodity Credit Corporation is not immediately sold in order to keep prices high in the market. If the market price exceeds the amount of confiscation (total collateral rates and certain transportation costs), producers return to the market. In this way, the state tries to establish a minimum level of prices in the domestic market. After a while, if there is no increase in production or imports, market prices stabilize themselves. However, this program only provides minimum prices for collateral sugar. Another point is that the collateral must be stored in the warehouses of sugar processing enterprises. However, due to the limited capacity of these warehouses, enterprises are not able to attract large amounts of sugar to the program. Unlike other commodity programs, this system of loans is not addressed to entrepreneurs, but to processing enterprises. Thus, the shelf life of sugar beet and sugar cane is much shorter than the shelf life of sugar, so the need for processing is acute. The law, adopted in 2002, sets federal rates of 18 quintals / pound for raw sugar and 22.9 quintals / pound for sugar from sugar beet for the period up to 2021. These rates have remained unchanged since 1995. The high collateral rates for beet sugar are due to the fact that additional processing is required to obtain refined sugar, which requires less labor than raw sugar. Sugar programs are very different from grain, rice, peanut, and cotton programs. The US Department of Agriculture does not make any direct payments to sugar cane and sugar beet producers and processors. This is suggested by the proponents of the sugar program as a positive aspect of the sugar field. It should be noted that collateral rates cannot determine domestic sugar prices without the implementation of other programs. The Ministry of Agriculture also aims to keep the price of refined sugar below 25.2 quintals / pound. In order to ensure that prices do not fall below the previously indicated level, the state also uses tools such as import norms and market distribution.

5.2. Marketing Allotments

Under this program, which prevents overproduction of sugar, the Ministry of Agriculture can limit sales in the domestic market through a flexible distribution system at a level that meets

the planned domestic demand for entrepreneurs. This program does not restrict the cultivation of sugar beet or sugar cane, but simply restricts the production of sugar for sale. If processing plants produce more than they can sell under another program, they pay for the maintenance of that surplus. Through the distribution, the Ministry of Agriculture has the opportunity to curb the sale of domestically produced sugar until it reaches an acceptable level in order to cover the cost of prices and the amount of collateral, including interest rates. Market distribution for national entrepreneurs is carried out annually by a separate formula. Thus, in fiscal year 2014, the distribution was as follows. The Ministry of Agriculture determines the amount of sugar demand by the end of the period, taking into account the sugar reserves. This figure is subtracted from the existing sugar reserves, as well as the volume of sugar imports (1.5 million metric tons) determined in accordance with the terms of the agreements of the World Trade Organization and NAFTA. The obtained price is also distributed among enterprises producing sugar from sugar beet (54.35 percent) and sugar cane (46.35 percent). Redistribution can also occur during the year due to the influence of various factors. Through market sharing and the debt system, it is possible to prevent the overproduction of sugar by national entrepreneurs, thereby reducing the economic pressure on the sale of sugar at a higher price than the world market. These programs are in stark contrast to programs that support the production of some agricultural crops, such as grain, soybeans, wheat, and cotton. Thus, these products are sold on the world market at a very low price (below cost) under the relevant programs, and under the support programs, the difference between the low price and the cost is paid through direct payments from the state.

5.3. Import tariff quotas (TRQ)

Tariff norms are a historically established system of sugar import management. Thanks to this two-tier system, 41 countries around the world export sugar to the United States at lower rates than usual, thus ensuring a stable volume of sugar consumed in the United States. Countries are allowed to export more sugar than the existing norm, but in this case higher tariffs are applied. These tariffs, which are applied for the purpose of over-import, are so high that the domestic market is reliably protected from excessive sugar imports. As the debt system and market share control production in the United States, the rate of return will be measured by preventing the import of sugar into the domestic market at a rate that would lower domestic prices below collateral rates. Tariffs are an important means of restricting imports in order not to disrupt the internal instruments of inventory management, and hence prices. According to the WTO's commitments, at least 1.256 million tons of sugar a year should enter the US domestic market. Also, under the terms of NAFTA, the United States must import sugar from Mexico. Thus, despite price support programs for entrepreneurs, the United States has never been able to meet its domestic needs through its own production and remains an importer of sugar. However, the existing price regulation system of the domestic market is very effective. Until the early 1980s, national entrepreneurs accounted for 55 percent of US domestic demand, but over the next 25 years, that figure continued to rise thanks to programs guaranteeing sugar prices, reaching 86 percent in fiscal 2011 and 14 percent imports, respectively [24]. According to the analysis, domestic sugar prices in the United States remain stable, mainly as a result of comprehensive government regulation. Thus, given that the system of the Commodity Credit Corporation attracts a large number of agricultural products, it can be compared to a kind of state monopoly system [10, 29, 30, 31, 32, 33]. When the volume of imported sugar produced in the country is estimated below the specified level, the amount that can be sold by administrative distribution of the market is limited. Import norms limit the amount of sugar that can be imported to the US market. Support and protection programs for sugar and sugar beet producers in the United States are so effective due to the tight shackles of improved competition in the agricultural market.

The amount of direct government payments to support the prices and incomes of entrepreneurs in the country's agribusiness system is very large. Thus, from 1995 to 2011, the annual amount of direct government payments for these purposes amounted to \$ 15 billion. During this period, the highest figure was recorded in 2006 at \$ 32.2 billion. In our opinion, another important sign of the level of state support for the production of various agricultural crops in the agribusiness system is the share of state support in the cost of production. During this period, most state support - 60 percent - was provided to paddy producers. The average amount of payments is \$ 12,517, which is equal to 7.4 percent of the average gross income of farms participating in government programs, and 26 percent of net income. One-third of the total payments fell to direct payments, and most agricultural enterprises received such payments. Thus, in developed countries, there are diversified systems that support agribusiness. The agrarian policy of most countries is aimed at ensuring maximum food and food security of the state, maintaining a stable economic situation in the agribusiness system, ensuring a minimum level of profitability that will attract the sector in terms of investment, prevent overproduction, protect the domestic market, competitiveness of local entrepreneurs. to provide and so on.

6. CONCLUSION

The experience of countries with mature market relations shows that with economic growth, the share of public spending in GDP also increases significantly. Thus, the share of GDP distributed through the state budget in the most important European countries (France, Germany) has not fallen below the high figures of 10-15 percent over the past hundred years. Even after the Great Recession, as well as during the Second World War, the decline in public spending did not change the growing role of the state in the economy. In general, the 2.5-3.5-fold increase in the share of public expenditures in GDP over the past hundred years in the developed countries of the world should be considered a clear manifestation of the growing trend of the role of the state in regulating the market economy. The study of the experience of foreign countries showed that in developed countries, especially in the European Union, four areas of budget support for agriculture have been established. These include direct payments to entrepreneurs, support for rural development, structural support for agriculture (investment projects), and financing of general services in rural areas. As for the experience of foreign countries in this field, according to the US Department of Agriculture, 1/3 of the various types of business entities operating in the country's agribusiness system have benefited from state support in various ways.

safarov_rashad@mail.ru*

ABSTRACT

Achievement of economic development through the use of innovative management practices to meet the growing needs of the population with the ecologically clean products in connection with the transition to market relations in Azerbaijan is one of the key challenges facing innovaton management. "Azerbaijan 2020: Vision of the Future" reflects the directions and composition of innovative development in Azerbaijan. Creating an innovative economy in Azerbaijan in the context of new economic relations, enhancing innovation activity and ensuring the development of innovation activities are an integral part of the economic policy pursued by the state. Innovative use of advanced technologies in production and management techniques plays an important role is in the management practices of developed countries in the modernization of the economy. In this context, modern directions of application and management of innovations in organizational and legal forms of management should form to modernize the Azerbaijan economy.

Keywords: *innovation, management, product innovation, process innovation, technological innovation*

1. INTRODUCTION

The application of innovative governance to economic entities for the achievement of economic development is one of the areas facing innovation management. The concept of innovation is widely used in the practice of developed countries because it represents advanced innovation in business organizations. A French expert in sociological research M.Krose notes that "Modern competition requires economic entities to be more innovative than access to resources and reserves" (8, 99-100). In the economic literature, the concept of "innovation" was first introduced to scientific studies in the nineteenth century by cultural scientists and it is said that European traditions apapt to the traditional organizational methods of Asian and African societies. At the beginning of the twentieth century, the study of the application of technical innovations to business entities was started. In 1909, for the first time, Zombart in his great article "Capitalist Entrepreneur" bases the concept of entrepreneurship as an innovator, noting that the main function of the entrepreneur is not to save technical innovations in the market for profit, but to make these innovations more widely available. (2, 13). In 1911, Y.Schumpeter brought the role of the innovation process in the economy through the theory of economic development. In this theory, it is talking about "new combination" in the development process. According to Chumpeter, "new combination" appears in a "closed circle" as a part of the production modernization process. This upgrade is a high level of simple production. He considers innovation as an economic effect of technical change, and shows that the production function reflects the change in the quantity of the product, due to changes in the factors affecting the harvest. If we change the function of a whole set of factors, then we receive innovation (3, 185).

2. RESEARCH METHOD CONTENT AND THEORETICAL FOUNDATIONS OF INNOVATION

The development of technological markets has increased the focus on innovation in many countries. In 1920s, the Soviet researcher N.D.Kondratyev investigated the so-called the "big

cycle" or "long wave" changes abroad. According to the author, the cycle and the wave come from each fundamentally new application, and it brings the impression of many new and updated applications. The researchers Utkin have called the innovation a concrete object, Nixin's outcome, Voldaysev's mastering new products, Molchanov's and Gorkberg's the use of results and Zavlina's the use of results. Authors Chumpeter, Valenta, and Voldachek considered innovation as a change. Authors Lain, Brian and Medinsky viewed innovation as a process (8). Since the 1970s of XX century, the role of innovation in the economic growth of developed industrial countries has increased and has reached a decisive position (4, 270). In Russia during the transitional economy, the term "innovation" was also used as "innovation creativity", "innovation process", "innovation decision". At the same time, Russian researchers V.Q.Medinsky and L.Q.Skamay studied the concept of innovative entrepreneurship in their research and divided it into three forms (5, 11):

- 1) Product innovation
- 2) Technological innovation
- 3) Social innovation

The basic classification of innovation processes has also been the subject of scientists' research. According to this classification, three major types of traditional innovation were distinguished.

- 1) Administrative and technological innovation;
- 2) Product and process innovation;
- 3) Radical or incremental (accused) innovation (6, 9).

It should be noted that the study of innovations began in the Western countries in the 60-70s of the 20th century, and in Azerbaijan the attention was increased in the 90s of the XX century. Different aspects of innovative activity in Azerbaijan have been studied by Shahbazov K.A., Isgandarov R.K., Tagiyev A.H., Gasimov F.H., Aliyev T.N., Najafov Z.M., Huseynova A.D. and other scientists. Authors Gasimov F.H., Aliyev T.N., Najafov Z.M studied the organization and management of the national innovation system in Azerbaijan, outlined the theoretical and practical directions of formation of regional innovation system and worked out its structure to form the concept of regional development of Azerbaijan (2, 470-475). Researcher Huseynova A.D. studied the improvement of the mechanism for managing the innovation potential in Azerbaijan. He concluded that the potential for innovation is realized through innovation activity and productivity. Innovation-based competitiveness is a complex characteristic. Generation of knowledge is an essential condition, but not enough. The national innovation potential is the operational model that enables the use of the potential for competitiveness and growth at the country level to reveal the complex nature of innovation and its relation to politics (9, 9). Azerbaijan scientist Tagiyev A.H. summarized the theoretical and methodological issues of innovation in his research, made generalizations and his own statements.

2.1. Implementation of innovation in the Azerbaijan industry by economic activities

The research approaches show that the innovation process is an activity aimed at modernizing the means of production and creativity in the development of more advanced technologies for the creation of new types of technical and management tools for the comprehensive application of science and technology in management. Statistical data show that innovation products produced in Azerbaijan industry by the level of innovation and economic activity are mainly those that have undergone significant changes or are newly introduced and improved. Significant changes, or newly introduced innovative products, have been seen in the industry growth and decline in 2014, 2015, 2016 and 2017. If you look at the statistics for these years, the mining industry produced 129.6 million manats in 2016, the most significant changes and the newly introduced innovation productions accounted for the processing industry.

Azerbaijan has undergone significant changes in the processing industry, or the newly introduced innovative products are in the textile industry, the chemical industry, the metallurgical industry, the food industry, the manufacture of liquor, clothing, the manufacture of construction materials, finished metal products, except machinery and equipment, the manufacture of computer and other electronic equipment, the production of machinery and equipment. In 2018 according to the level of innovation and economic activity in Azerbaijan industry, the volume of innovation products in the volume of improved products amounted to 383.8 thousand manats, which produced 200.0 thousand manats in the processing industry and 183.8 thousand manats in the mining industry. As the analysis of statistical data shows, due to the level of innovation, the manufacturing industry is dominated mainly the production of chemicals, machinery and equipment, installation and repair materials. While focusing on the dynamics of innovation in the industry by years of innovation, it is 1117,600 manats in 2014, 589,700 manats in 2015, 540,900 manats in 2016 and 383,800 manats in 2017 has been a decline in production of innovation products. (table 1).

Factors	A product that has undergone significant changes and has been recently introduced				Improved products			
	2014	2015	2016	2017	2014	2015	2016	2017
Industry – Total	12318,5	929,7	35746,9	14676,7	1117,6	589,7	540,9	383,8
Mining industry	-	-	129,6	-	-	-	-	183,8
Manufacturing industry including	12318,5	929,7	35617,3	14676,7	1117,6	589,7	540,9	200,0
manufacture of food products			402,5	589,5				
beverage production	3973,0	758,0	41,5					
textile industry	3098,8		12845,1					
clothing manufacture			5212,8					
manufacture of leather and leather products footwear			48,0					
chemical industry	0,3	13,4	522,4	1705,1	565,7	127,5		
manufacture of rubber and plastic products			171,3					
production of construction materials			6586,0					
metallurgical industry			500,0	2176,0				
manufacture of finished metal products, except machinery and equipment			9112,8					
production of computers and other electronic equipment	5100,6			9990,3				
production of machines and equipment	145,8	158,3	174,9	215,8	462,9	430,0	524,8	167,1
installation and repair of machines and equipment					89,0	32,2	16,1	32,9

Table 1: Volume of innovation products by innovation level and economic activity, thousand manats (Azerbaijan State Statistical Committee, 2018, p.90)

It is worth noting that the relevance of innovation processes is explained not only by their economic content, but also by their nationwide significance. However, in a competitive environment in the classical market economy, the innovative potential of modern science and technology cannot be fully utilized without government intervention.

2.2. Directions for stimulation of innovative development in Azerbaijan industry

It should be noted that in the practice of developed countries the state intervened in various directions to apply advanced production technologies to enterprises and to finance innovation. From developed countries, Switzerland, Japan and Germany have shown that there is a great deal of funding for technology policy programs. The US Federal Government and Japan have spent more than 450 million dollars on programs to create state of the art practice and counseling centers for small and medium-sized enterprises in the manufacturing industry. All of the costs were spent on providing technical and financial assistance to enterprises that comprise a whole spectrum program, to apply new technology. In 1990, 58 million dollars were spent to help drive innovation in industrial enterprises in 30 US states. In Germany and Scandinavia, joint research was used to help businesses apply advanced technology in enterprises. Over the last decade, these countries have focused on the expansion of technology in the United Kingdom, Denmark, and France, in particular the interest in microelectronics (7, 533-534). Assessment of factors that impede innovation in Azerbaijan industry showed that the thematic situation of cooperation between enterprises and scientific organizations, as well as the elimination of many obstacles caused by economic and production factors, stimulated the application of industrial innovation and achieved technological advancement. This growth rate is also reflected in the costs of technological innovation in the industry in 2013-2017 according to the types of innovation. According to the types of innovations, the cost of technological innovation in the industry in 2013-2017 amounted to 69,888.5 thousand manats, and innovation process - 44,806,600 manats (table 2).

Years	Total expenditures	Including	
		Innovation of products	Innovation process
2013	13877,2	11899,5	1977,7
2014	21534,1	13510,4	8023,7
2015	35179,1	13685,2	21493,9
2016	27929,0	20313,8	7615,2
2017	16135,7	10439,6	5696,1
2013-2017 total in these years	114655,1	69848,5	44806,6

Table 2: Technology Innovation Expenditures by Industry, thousand manats according to the types of innovation (Information of Azerbaijan State Statistical Committee, 2018, p.91-92)

Let us focus on the types of activities and financial resources in the cost of technological innovation in Azerbaijan. Expenses on the enterprises' own funds in the amount of 114655,1 thousand manats, spent on industrial innovations in enterprises in 2013-2017 by technological innovations by activity and financial sources, 98652,1 thousand manats, expenses from the state budget 551,2 thousand manats, foreign investments 11844,2 thousand manats and other expenses amounted to 3607,6 thousand manats. The analysis envisages that during these years the financing was mainly at the expense of the enterprises' own funds (table 3).

Table following on the next page

Years	Total expenditure	Including			
		At the expense of enterprises	State budget	Foreign investment	Other
2013	13877,2	12376,9	551,2	-	949,1
2014	21534,1	21133,5	-	-	400,6
2015	35179,1	34779,2	-	-	399,9
2016	27929,0	14286,5	-	11808,2	1834,3
2017	16135,7	16076,0	-	36,0	23,7
2013-2017 total in these years	114655,1	98652,1	551,2	11844,2	3607,6

Table 3: Technological innovation in industry by activity types and sources of financing, thousand manats (Azerbaijan State Statistical Committee, 2018, p.93-94)

It is important to note that in order to achieve innovative development in foreign practice, enterprises are primarily focused on the sources of financial resources in financing the innovations used. In a market economy, the financial resources of enterprises are mainly generated from the following sources:

- a) founders' funds
- b) incomes from realization of product (work, service)
- c) bank loans
- d) cash generated from the sale of securities
- e) dividends earned on money held in banks
- f) donations from legal entities and individuals, etc.

As it is seen from the analysis of financing of technological innovations in Azerbaijan industry, the costs of technological innovation in the country were mainly due to the following sources:

- 1) At the expense of enterprises
- 2) State budget
- 3) Foreign investments
- 4) Other

3. CONCLUSION AND DISCUSSION

In modern times, innovation management is one of the main directions of national economy modernization in Azerbaijan. In this context, the formation of innovative development is characterized by a number of areas. The most important of these is the acceleration of the formation of the institutional and legal framework to eliminate the obstacles for innovation in Azerbaijan industry. On the other hand, increase the share of state budget funds in the costs of technological innovation to create and enhance product and process innovation in existing enterprises. Another direction is to create a conciliatory environment in the country's innovation policy and, for this purpose, stimulating government support in fiscal, tax and customs policies. The mentioned trends will stimulate economic development by stimulating the development of legislative and regulatory frameworks, infrastructure and technology markets that regulate and encourage innovation activities in Azerbaijan.

ABSTRACT

Increasing the productivity of the textile factories and improving the quality of the products requires their extensive mechanization and automation. For the production of automated knitting factories, the technological processes should be analyzed at the weaving department and the textile shop. The article outlines the main directions of the textile industry, including the mechanization and automation of weaving factories. The processes of weaving and preparation of textile fabrics were analyzed, as well as the technological and auxiliary processes necessary for mechanization and automation were determined. Here is the level of automation of technological processes and machines and equipment that performs them.

Keywords: *automation, mechanization, technological process*

1. INTRODUCTION

One of the ways to increase labor productivity in the textile industry, improve production conditions and product quality is the automation of textile factories. As a result of automation, the problem of complete elimination of manual labor at knitting factories is also solved. The textile industry is developing at a higher pace each year. Provision of such development was carried out on the basis of achievements of science and technology, with the introduction of new technologies for enterprises, improvement of technological processes and increase of labor productivity. This tradition continues today. [1]As a result of research, the main directions of the textile industry development are modernization of existing equipment, combining technological processes, creating new machines and technological flow lines, mechanization and automation of basic and auxiliary production processes. [1,3,6]. Modernization of the existing equipment implies an increase in the reliability and durability of their employees, easier adjustment and maintenance of the machines, as well as improved working conditions [1]. The simultaneous execution of several processes in a machine, such as openings, pulling the arachocan handle and the start of the fabric, are carried out simultaneously, which has resulted in the creation of multi-threaded weaving machines, which produce fabric in a continuous fashion [1,3]. The development in such areas is only in the automation of individual machines. However, the creation of automatic weaving factories requires technological lines [7]. Processes on machines and apparatus of technological lines are essentially a big process-stream line. Despite the fact that technology is very diverse, the generality of the machinery and apparatus for different lines is that the production of primary raw material is organized and operated as an uninterrupted technological flow. For textile factories, raw materials of different types and sizes of yarn come from crushing cutters. All technological processes, from the opening of the yarn in the process line to the production and storage, should be mechanized and automated [7].

Thus, for the creation of automated knitting factories, all technological processes must be automated and mechanized until the yarn is manufactured from raw material and stored in warehouses. For this purpose, a complex system of technological machines should be used to carry out technological processes in knitting and knitting shops [figure 1]. The purpose of the research is to define the level of automation of technological processes and equipment required for complex mechanization and automation at the stages of production of fabric from the potters to the weaving factories at different sizes and shapes from the potters for the production of automated knitting factories. To this end, we will analyze the technological processes of weaving preparation of various sizes and yarns, which are included in the preparatory department of textile factories, and then the modernization of complex mechanization, automation level of weaving process and equipment.

2. ANALYSIS OF TECHNOLOGICAL PROCESSES PERFORMED IN THE WEAVING PREPARATION DEPARTMENT

In many cases, twine yarns made from different fibers enter weaving mills in spinning washes. Dyed twisted yarns made of natural and artificial silk, linen and various fibers enter the textile factories in special shaped washes. Twisted washes of various sizes and shapes are not suitable for the rewinding process in textile mills. Thus, the lengths of the threads in different washes are different, and this requires the machines to be loaded at different times during the subsequent rewinding process. This increases the idle time of the rewinding machine. Defects in the bent threads are eliminated during re-winding to ensure that the loops are not broken during the weaving process. Thus, the main purpose of re-wrapping is to create a threaded wash so that the subsequent re-wrapping process is more efficient. The following requirements [2] must be met when re-threading:

- 1) The physical properties (elastic elongation and strength must be maintained) during re-winding of the threads must not deteriorate;
- 2) The structure of the winding threads in the rewinding washes should allow the threads to be easily opened during the rewinding process and this process to be carried out at high speed;
- 3) The thread should be wrapped as long as possible in repeated wraps;
- 4) The ends of the threads should be firmly connected with a properly knotted knot. Thus, during subsequent technological processes, these nodes can easily pass through the required glasses of the compared parts in the technological loading scheme;
- 5) The threads should be wound at a constant speed, and the tension of the threads should be constant;
- 6) There should be less thread crumbs (ugar) during re-wrapping;

The re-wrapping process is performed as follows. The bent threads are fixed in the drop wash table. The threads hanging from the washer cover the guide rod and enter the tension regulator. From there, the test is passed through a cleaning device, a thread carrier and washed. The tensioning device provides the required tension to the threads. The inspection cleaning device controls the thickness of the threads and cleans the threads from debris and debris. The threader moves back and forth in reverse, allowing the threads to be wound along the axis of the thread. The washing action takes the shaft. He wraps the threads around himself. If the twisted threads are re-wrapped after a special wash, they are placed in a special holder. During repeated wrapping, the wash rotates with a special holder. The threads that are unwrapped from the wash are wrapped around the guide device and passed through the control device to the washer. To create the required tension, a strap or rope is passed over the ball of the special holder and the load is hung from it. The rewinding machine has a body, transmission, rewinding mechanism, tensioning device, cleaning-control device, rewinding washer holders.

During re-winding, the threads are wound on the washer like a screw line, and the angle of rise of the screw is found from the ratio of the velocities α as follows:

$$\operatorname{tg} \alpha = \frac{\vartheta_h}{\vartheta_0}$$

where ϑ_h is the velocity of the deflector at the point of curvature, ϑ_0 is the rotational speed of the washer.

If the angle of inclination of the screw is small, then the winding is conventionally called parallel winding, and if it is large, it is called cross-winding. The tension of the weft threads during re-winding is of great importance for the subsequent processes of weaving production. The tension of the threads must ensure the correct structure and uniform density of the wash. The tension must be within a certain range, when the tension is high the threads are stretched and as a result the breakage of the threads, which is very important for weaving, increases and the number of related knots increases, which makes it difficult for the threads to pass through the glasses. When the threads are opened at high speed from stationary washes, they are affected by centrifugal forces, as a result of which the threads separate from the washers and form a special shaped surface in space, which is also called a balloon. The handle is in the form of a curve with a double curvature in the balloon. When the threads are unwrapped, each of its elements moves intricately in the balloon, that is, the threads move along the length and rotate around the axis of the ball. The total tension of the threads when opened from the gargle is determined by the following factors:

- forces of inertia of the opening threads with the threads of the previous layers;
- the threads of the screw-wrapped threads are connected to each other and the frictional forces on the surface of the ball;
- air resistance;
- force due to the voltage device of the rewinding machine;
- frictional forces on the threads when covering the guides.

Thus, the value of the thread tension depends on many parameters, which have not yet been fully studied. Therefore, the value of the voltage calculated by the formulas obtained on the basis of existing theories is very different from the value of the actual voltage. For example, when using the formula of the central design bureau of textile engineering, the voltage at any point X of the balloon is found as follows.

$$K_x = \frac{2T}{108} \left(l + k \sin^2 \beta \frac{H^2}{r^2} \right) \vartheta^2$$

where T - is the thickness of the thread, k is the coefficient depending on the opening conditions of the thread, β is the angle formed by the screw line of the thread with the axis of the thread, H is the height of the balloon, r is the radius of the thread opening point, ϑ is the opening speed of the thread.

The following requirements apply to these devices used in rewinding machines to obtain and regulate the voltage required during rewinding.

- the handle must provide equal clamping and bending forces;
- must be easy to adjust to get the required voltage;
- garbage should not accumulate on it;
- the device must be reliable and stable when energized;

In all constructions of existing tensioning devices, additional tension in the threads is generated by frictional forces acting directly on the threads and in some devices on the moving blocks surrounded by the threads. In order to check the thickness of the twisted threads in the rewinding and to remove debris, the threads are passed through a control-cleaning device. The head remaining between the boards is used as a control-cleaning device. When the threads pass through the hood, the debris on the threads sticks to the wall of the board and separates from the threads. When there are thickened areas in the threads, the threads are riveted and broken in the space. Studies have shown that the width of the gap should be 2-2.5 times the diameter of the handle. The control-cleaning device has different constructions. In rewinding machines, control-cleaning devices are placed after the devices that supply voltage to the threads, and debris is collected in these devices. If this debris is not cleaned in time, the wheel will go to the winding wash and reduce the quality of the wash. In addition to mechanical control and regulation devices, modern rewinding machines use devices based on photoelectric phenomena and volume changes. In photoelectric devices, when the thickness of the passing thread changes, a signal enters the electrical relay of the devices, and special scissors are activated and cut the handle. Knotting is an operation performed by various skilled workers in the textile industry. Therefore, the quality of the rice is of great importance. A weakly untied knot is loosened as a result of subsequent operations, a knot whose ends are neatly tied does not pass on subsequent machines and causes the adjacent threads on the weaving machines to break. In all cases, the breakage increases, the quality of the product produced and labor productivity decreases. The quality of the rice plays a key role in the preparation of the access. In addition to the quality of the knot, it is important to choose the correct structure of the knot, depending on the physical properties of the yarn, especially its elasticity and stiffness in bending. A special tool - a knoter - is used to make the combined knots strong and the ends of the threads small.

3. THE CURRENT STATE AND PROBLEMS OF MECHANIZATION AND AUTOMATION OF TECHNOLOGICAL PROCESSES AND EQUIPMENT IN THE TEXTILE PREPARATION DEPARTMENT

Analysis of foreign materials and equipments at international exhibitions shows that currently there is no favorable conditions for the world of weaving and textile equipment development. Manufacturers of these equipments are mainly focusing on improving and improving the internationally-respected principles. The next improvement and development of equipments is aimed at obtaining the optimal quality product, as well as at the most advantageous ratio between the cost of equipment and its productivity. At present, any improvement requires long-term research. Therefore, present-day constructions consist of inventions based on expensive theoretical and experimental studies used in the evolutionary process. The main directions of technical development of the equipments in the world can be considered as automation of services and control, which can completely eliminate manual operations, improve productivity, improve the quality of the products produced, and provide energy savings. For weaving machines, yarns for fabric production must be of a certain shape and size. In the preparatory department of weaving, the initial process is the utilization of different sized and shaped washers of the same size and shape. Recycling is completely automated. Recycling machines have been set up in Japan, USA, Germany, Italy, Russia, the Czech Republic and other countries. In some of these machines, manual labor has been completely eliminated, for example, in Japan machine named Murata, in German AutoConverter. In other machines, operations such as finishing, loading full splits, removal of blank spaces are automated. The technological process after the recycling process is wrapping. In this process, a single number of bobbins and single-threaded yarns are wound around the wheelchair or drum. The share of this process in the textile industry is only 3%. However, the subsequent technological process is a very responsible technological process.

Figure 1: Structural scheme of technological machines for weaving cotton fabrics

At present, all technological processes performed in the process of wrapping are almost completely manually carried out. These operations include: carriage of bobbins to spools, placing them in bobbins holders, holding yarn control, spinning from distributor comb, bonding of yarn ends to the roller, removal of breaks, removal of full valve and loading of empty valve to machine. Mechanization of most of these operations will allow full automation of wind turbines. The next step in the preparation of yarns is coating them. It is the most responsible technological process that incorporates physical and mechanical operations. In this process, the yarns are opened from the valves under the tension and passed through the rear and passed to the steering wheel. Here, the yarns are squeezed into the adhesive slide product, squeezed between the rollers and transferred to the drying zone. The cleaned yarns are dried in the drying zone, and then the separating cubes are wrapped around the teeth and wrapped around the towel guides. Yarn rollers are brought into the molding machine and the joining of the ends of the staplers is performed manually. Mechanization and automation of the mentioned technological processes and machines should be carried out. Coating is cooked or cooked in a special cooking room. Its cooking is performed in round or oval shaped vats or autoclaves. Prepared sludge is supplied directly to pumping machines through pipe transporters. Processes of preparation, cooking and slicing machines are automated. Modern drum-locking machines are equipped with devices that automatically adjust the tension of the handle stems to the squeezing valves on the machine's areas, the yarn stretching, sticking to adjust the level, moisture, temperature of the drum's surface. In these machines, coupling, placement of thread rollers, transferring the yarn to the specified devices and removal of the finished navigating machine, and combining the ends of the machine in any work area are performed manually. Mechanization and automation of the processes for the establishment of automatic weaving factories are required. In the weaving machine, we must pass the last preparatory operations and finish spinning operations before going to the fabric production. It is understood that the ends of the wicker sticks are used in the knitting machine and the ends of the new stems of the handlebars are understood as knotting.

The dropping can be done directly on the weaving machines or in the welding unit of the weaving factories. Instead of knotting, a sieve operation is performed in the production of new varieties. Finishing of the ends of the stems is carried out on the spinning machines. For this purpose it is desirable to use knitting machines such as US-100 and US-125, UP-125 produced in Russia. It is understood that the stacking operation means that the stacking members of the weft machine can be arranged in succession from the lamella, the clamps of the clamps and the teeth. Stroke surgery is performed manually, in some cases semi-mechanical and mechanical. For this purpose, sealing machines are used. In some major factories, automatic slinging machines are used to perform all operations automatically. But because of the high cost of the machine, many factories do not accept it. It is recommended that Barler-Kolman (USA) machines be used to handle the stems. The nesting and stacking operations of the yarns are very labor-intensive. Navoy should be mechanized and mechanized and brought to the area and machines where the knotting or handle operations are carried out, installation, installation and finishing of the ends of stems. During the preparation process of the wefts, these wefts are added to the moisture and the emulsification process is carried out to prevent the formation of the wires in the handle. If the machine has mesh knitting machines, the wire bracing process is carried out to bring the spindle shaft from the spinning mill into a suitable shape. Weft wrappers can be seen as highly automated machines. So practically all operations are automated on these machines. Currently, the machine is manufactured in weft UA-300-3M weft wrappers for automatic weaving machines. If the weft thread is derived from the spinning ring machines, there is no need for welding process and weave it to the weaving without preliminary preparation. Preparation of the weaving thread for weaving knitting machines is to put them in the form of cross-cylindrical and conical bobbins.

4. CONCLUSION

- 1) As a result of the research, it was determined that, in order to establish automated textile factories, a complex system of technological equipment should be created for the production of concrete products(material).
- 2) Starting from the weaving department for the creation of automated knitting factories, all technological processes of handling machine parts on warehouses or dyeing plants should be mechanized and automated.
- 3) We have analyzed the level of mechanization and automation of all technological processes and equipment used in weaving and knitting weaving. Here are determined all the technological processes required for mechanization and automation.

ABSTRACT

The article examines the problem of measuring and analyzing endogenous factors of economic growth in a knowledge-based economy. The authors discuss the key characteristics of knowledge – non-competitiveness, non-exclusivity, the ability to set a common framework for the incorporation of new experience and the development of technologies. The review of works with theoretical models of knowledge and technology influence on economic growth is being performed. The authors highlight the need to take spatial relationships in the analysis of endogenous factors of economic growth into account. The purpose of the article is to study the spatial aspect of the knowledge dissemination in the production sector of Russian regions based on the use of the cost indicator for technological innovations. Based on the spatial correlation between 2009 and 2019, it is shown that there is a technological imbalance between regions as a result of an unbalanced distribution of knowledge in the industrial sector, the regional competition in terms of costs for technological innovations, discovered the local spatial clusters of regions with high and low costs of technological innovation.

Keywords: *Economic growth, Endogenous factors, Knowledge, Technological innovation costs, Spatial correlation, Moran Index*

1. INTRODUCTION

Currently, the issue of endogenous growth mechanisms is one of the key issues in the growth theories development. In the modern economic literature, according to the neoclassical production function $F(K, L, T)$, there are three main groups of economic growth resources: physical resources, labor, knowledge and technology [Barro, Sala-i-Martin, 2014]. In the 1980s, P. Romer [Romer, 1986], F. Aghion, and P. Howitt [Aghion, Howitt, 1992] presented an endogenous theory of economic growth based on the dissemination of knowledge among producers as a result of deliberate research and development. Therefore, technological progress is both an expression of the accumulation of human capital and an improvement in the quality of invested capital. The internal quality of the invested capital increases with the growth of the level of technologies created through the use of human capital. In addition to the accumulation of human capital, the deepening of capital specialization can also contribute to the deepening of the division of labor and the formation of a monopoly competitive advantage, which makes economic growth more stable and sustainable and leads to an increase in the marginal return on invested capital. Another option for improving the Solow-Swann model is the macrodynamic model of endogenous economic growth, taking into account the processes of saturation, technology change, and transfer of economic potential [Silverberg, Lehnert, 1994]. The difference between this model is the the assumption of a constant level of technology

elimination, the study of the technological aspect growth through the inclusion of nonlinear functions of scientific and technological progress in the model of economic growth. Kenneth J. Arrow (1962) suggested that technological progress or productivity growth is a by-product of capital accumulation, that is, an effect caused by investment and the accumulation of human capital through training. As a result, Kenneth J. Arrow (1962) showed technological progress as an endogenous variable determined by the economic system. The researchers emphasize that if the first two resources of economic growth (physical resources, labor) are competitive, then an important distinguishing feature of knowledge is that it is a non-competitive product, since two or more producers can use the same technology at the same time. Two key characteristics of knowledge – its non-competitiveness and non-exclusiveness – lead to an important consequence of the link between technology and economic growth – the equalization of factor prices: low salaries and high rates of technological growth in developing economies, with a negative impact on high-wage economies. Another important consequence of this relationship is the convergence of economic growth rates between countries [Barro, Sala y Martin, 2014]. The main idea is that the successor countries are gradually catching up with the technological leaders, since borrowing with the associated cost of copying and further using discoveries is cheaper than innovation with the associated cost of inventing new intermediate and final goods; sometimes the adaptation of technology in the successor country is carried out by attracting foreign capital from the leader country. Examples are Hong Kong, Singapore, China, and Mexico [Young, 1989, Young, 1992, Romer, 1993]. At the point in time when a country that initially has knowledge of the technology of producing only a small amount of goods, then outstrips the leader, there is a change in the technological leader [Romer, 1992, 1993]. Another important characteristic of knowledge is its ability to set a general framework for evaluating and incorporating new experiences and information. Knowledge is the main source of value [Drucker, 1995, Grant, 1993] and sustainable competitive advantages [Nonaka, 1991] not only for a single corporation, but also for a particular type of economic activity, sector of the economy, region and country as a whole. In turn, the region, as a knowledge-creating territory, is an open system that constantly exchanges knowledge with its environment and is able to mobilize the knowledge of its competitors, partners and other participants in the external environment. Therefore, based on a theoretical review of the features of endogenous factors of economic growth, it is interesting to study the spatial aspect of the knowledge dissemination in the production sphere of Russian regions.

2. METOD

In the middle of the last century, using the example of the US economy, the economic aspects of the production and dissemination of knowledge were studied deeply, the costs and the number of employees were measured in five groups of economic activities (research and development, education, mass communication, information technology, information services) called "the sphere of production and dissemination of knowledge" [Makhloop, 1966]. Empirical research on various aspects of knowledge production and dissemination is seriously hampered by the problem of measuring under-resources through available statistical indicators. Currently, official state statistics form the following indicators: the number of employees by type of economic activity; availability of information and communication technologies; investments in fixed assets; funds spent on professional development and retraining of personnel; the share of organizations that implemented technological, organizational, and marketing innovations in the reporting year; the volume of innovative goods, works, and services; the costs of technological innovations of organizations; special costs associated with environmental innovations; the number of organizations that performed research and development; the number of employees engaged in research and development; internal costs for research and development. As a measure of the knowledge dissemination in the production sector in this study, we used the

indicator of the technological innovations costs per capita of the employed population in the Russian regions according to the statistical editions called "Regions of Russia. Socio-economic indicators".

2.1. Spatial dependencies

The mutual influence of regions on each other can be a significant external determinant of the knowledge life cycle, increasing the convergence of the costs for technological innovations growth rates, the mobility of factors and production results. Therefore, it is interesting to measure the spatial correlation in the costs of technological innovations in the Russian regions. To account for spatial relationships in regression models, this study uses a boundary weighting matrix derived from the administrative boundary location database (GADM). To identify the spatial dependence, global Moran indices were determined [Anselin, 1995]:

$$I(X) = \frac{N}{\sum_{i,j} w_{ij}} \cdot \frac{\sum_{i,j} w_{ij} (X_i - \bar{X})(X_j - \bar{X})}{\sum_i (X_i - \bar{X})^2},$$

where N – number of regions, \bar{X} – average value of the indicator X – the cost of technological innovation per capita of the employed population, w_{ij} – elements of the boundary matrix of weights.

The Geary's spatial correlation indices are also calculated [LeSage, Pace, 2009]:

$$C = \frac{(n-1) \sum_{i=1}^n \sum_{j=1}^n w_{ij} (X_i - X_j)^2}{2W \sum_{i=1}^n (X_i - \bar{X})^2},$$

where W means the sum of all w_{ij} , the other notation corresponds to the notation of the Moran index.

The Moran index takes values in the range of $[-1; 1]$. The Geary index takes values in the range of $[0; 2]$, where values from 0 to 1 indicate the positive spatial correlation, and values from 1 to 2 indicate a negative spatial correlation. The positive spatial correlation coefficient means that a growing region contributes to the growth of its neighbors, while a negative value indicates that a growing region "pulls" the resources of its neighbors. The insignificance of the coefficient indicates that there is no link between the processes in different regions.

To identify the spatial clustering of regions, local Moran indices (LISA – Local Index Spatial Autocorrelation) were determined [Anselin, 1995]:

$$I_{Li} = N \cdot \frac{(X_i - \bar{X}) \sum_j w_{ij} (X_j - \bar{X})}{\sum_i (X_i - \bar{X})^2}$$

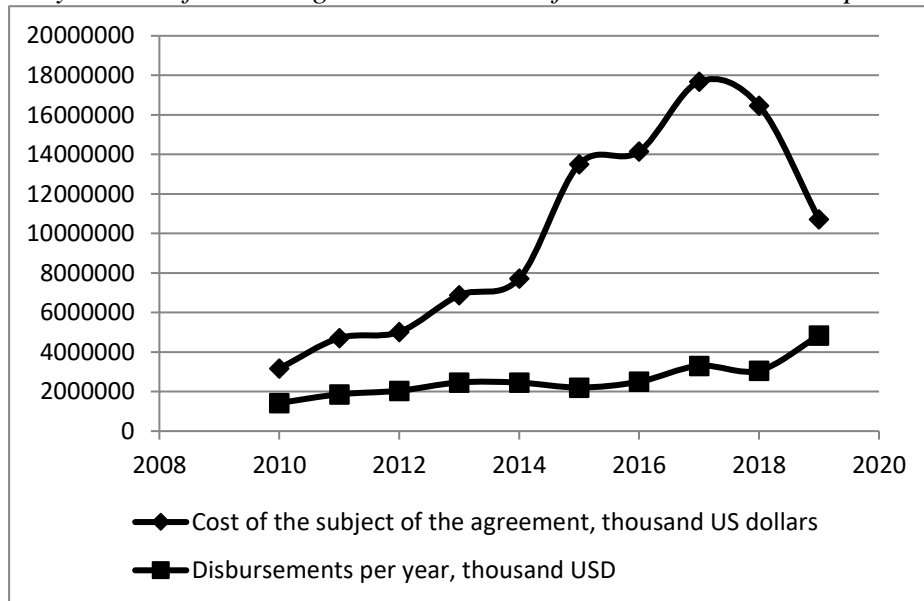

If a given region is significantly different from its neighbors (outlier), then it has a negative value of the local Moran index.

A positive correlation indicates that this region is similar to neighboring territories (cluster). The greater the LISA value modulo, the greater the similarity/difference between the region and its neighbors.

3. RESULTS

As we see on Figure 1, restrictive measures in recent years have led to a decrease in the import of technologies and services. Also, in recent years, there has been a decline in another indicator of the technologies spread within the country - the share of expenditures on technological innovations in the gross regional product in basic prices (Figure 2).

Figure 1: Dynamics of technologies and services of a technical nature import in Russia

Source: obtained by the author based on the materials of the "Regions of Russia. Socio-economic indicators. 2020" edition

Figure 2: Dynamics of the expenditures on technological innovations share in the gross regional product of Russia in basic prices

Source: obtained by the author based on the materials of the "Regions of Russia. Socio-economic indicators"

It is expected that in general, the costs of technological innovations and their growth rates in neighboring territories differ, which indicates the technological inequality of the Russian regions. Local Moran indices confirmed the local spatial clusters of regions with a higher level of spending on technological innovations in Moscow, the Ural Federal District (Yamalo-Nenets Autonomous District, Khanty-Mansi Autonomous District, Tyumen Region), the Siberian Federal District (Omsk Region, Tomsk Region), and the North-Western Federal District (Nenets Autonomous District). Most of these clusters are characterized by the economy direction to the extraction of raw materials and the presence of federal financial support for the technologies development [(Fig. 3).

Figure 3: Cartogram of technological innovations expenditures per capita of the employed population in the regions of Russia in 2019.

Source: obtained by the author based on the materials of the "Regions of Russia. Socio-economic indicators" edition

The global statistically significant Moran spatial correlation index (Table 1) indicated the negative spatial correlation (with the exception of 2009, 2015, 2016, 2019), when the costs of technological innovation in the neighboring territories are different, and strong regions-leaders pulling on resources with weak neighbors. In 2018, there was a positive spatial correlation, which indicates the cooperation of regions, when a growing region contributes to the growth of its neighbors.

Table 1: Global Moran Spatial Correlation Index for Technological Innovation Costs per capita of the Employed Population

2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
0.013	-0.271*	-0.291*	-0.264*	-0.232*	-0.118*	0.034	0.043	-0.115*	0.068*	0.046

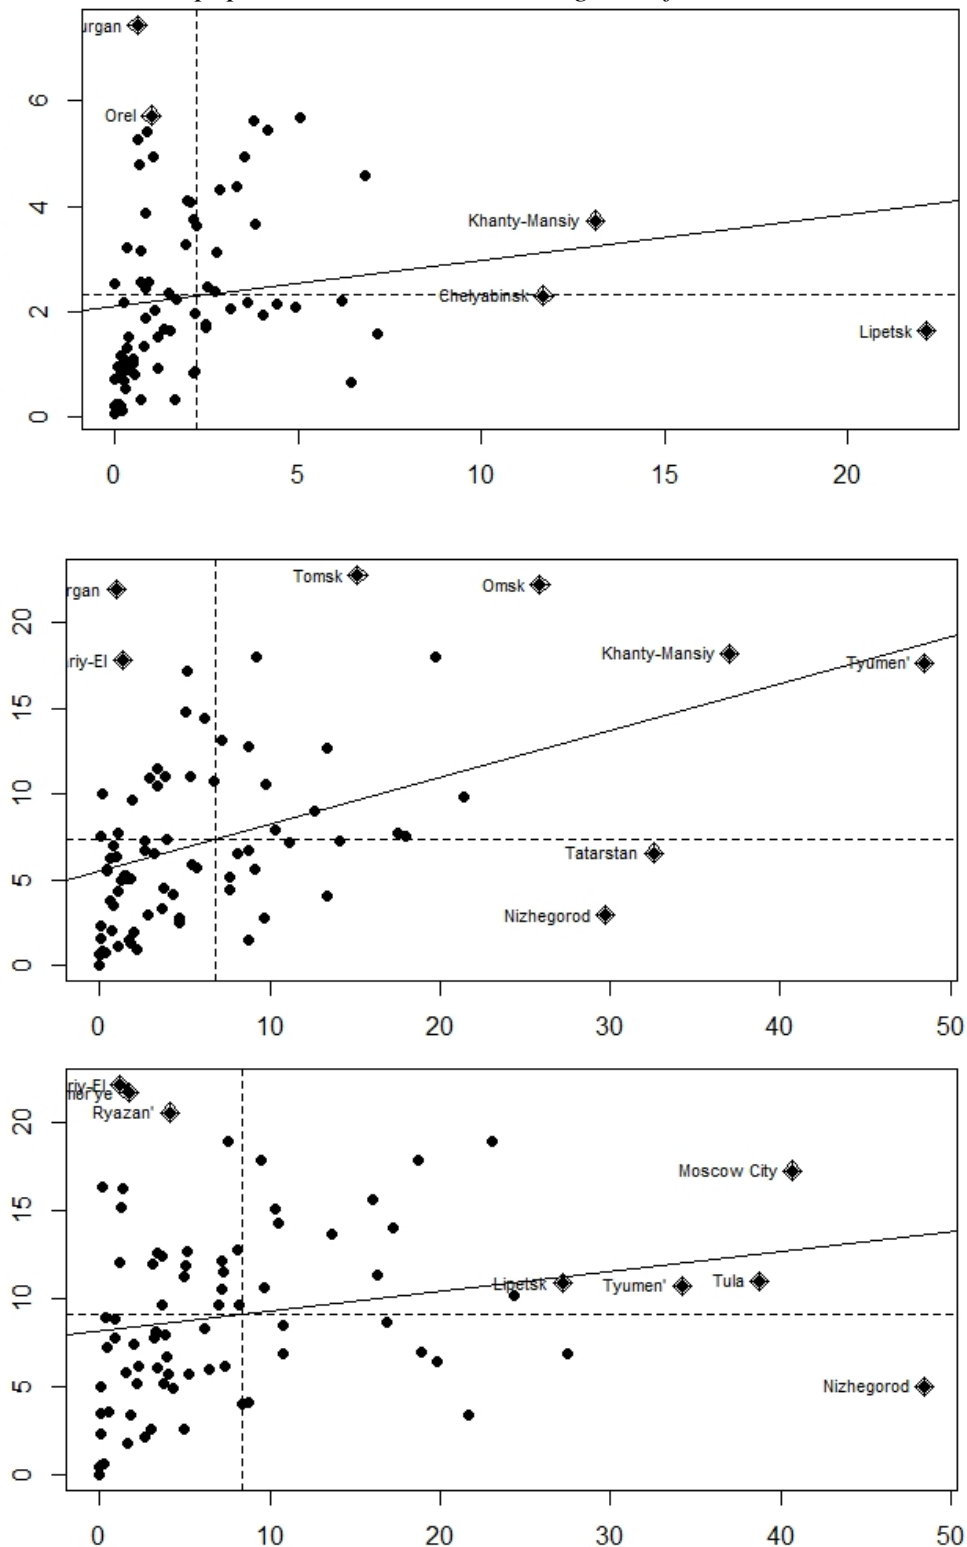

*Note: ***, **, * – significance at 1%, 5%, and 10%, respectively*

Source: obtained by the author based on the materials of the "Regions of Russia. Socio-economic indicators" edition

In the spatial Moran diagrams, most of the Russian regions are concentrated in the LH and LL quadrants (Fig. 4). This means that peripheral atypical regions with low costs of technological innovation are dominated by successful leading regions (LH quadrant with negative autocorrelation) and regions with low costs of technological innovation surrounded by the same neighbors (LL quadrant with positive autocorrelation). In the HL quadrant, there are several atypical, supporting successful lead regions with an increased concentration of technology innovation costs, surrounded by neighbors with low technology innovation costs.

These are the "cores" of technological innovations with superiority and negative autocorrelation over their neighbors. Among such regions there is the Republic of Tatarstan.

Figure 4: Spatial diagram of the technological innovations costs per capita of the employed population, mln rub, in the regions of Russia

Source: obtained by the author based on the materials of the "Regions of Russia. Socio-economic indicators" edition

Previously obtained results in the short term revealed the process of β -divergence of the technological innovations characteristic growth rates of the digital economy development initial stage [Bagautdinova, Kadochnikova, 2020]. That is, if in the short term the technological inequality of the regions increases, and in the long term the levels of technology in the regions converge to an equilibrium state, then this does not contradict the theoretical judgments about the decline in the growth rate of a successful economy due to the decreasing return on factors of production [Krugman, 1979].

4. CONCLUSION

On the basis of the presented results, it is possible to formulate several general theses regarding the knowledge dissemination as an endogenous factor of economic growth. Neoclassical growth theories are limited to the assumption that technological progress is exogenous, depends only on time, and is really weakly related to the processes within the simulated system. The disadvantage of these models is that they do not provide information on growth causes, do not contain recommendations on possible ways to accelerate technological progress, and therefore the economy growth as a whole. Theories of endogenous economic growth overcome this disadvantage of neoclassical theories. The key factor of endogenous growth in the theory of Paul Romer [Romer, 1990, 1994] is a variable called "knowledge" or "information". The main idea of Romer's theory is: "there is an exchange between consumption today and knowledge that can be used to expand consumption tomorrow." He formulates this idea as a "research technology" that produces "knowledge" from past consumption. A significant negative spatial autocorrelation in the costs of technological innovations argued for the technological inequality of the regions as a result of the unbalanced dissemination of knowledge in the production sector. The predominance of costs for technological innovations is observed in the regional clusters of the Urals and Siberia, which have a raw material direction of the economy, as well as in Moscow, in the Nizhny Novgorod and Sakhalin regions. Most of the industrial regions of central Russia belong to clusters with low costs for technological innovations. Note that the calculation of spatial correlation characteristics does not explain the reasons for the formation of territorial clusters or outliers in technological innovations. The assessment of spatial interactions, taking into account explanatory variables and regional differentiation, is the subject of further research on the spatial aspect of knowledge dissemination in the production sphere. This makes it possible to assess the spatial effects of management decisions in the development of territorial production clusters, which are the growth points of the post-industrial economy.

ABSTRACT

The active transition of the world community to an innovative economy, in which the main share of the gross domestic product is provided by the production and sale of high-tech products, leads to the emergence of interest in ensuring the sustainable development of the state and enterprises through the introduction of innovations. In the modern economy, innovations that contribute to the implementation of new ideas in specific technical and commercial achievements are one of the key factors of the competitive advantage of enterprises. This article is devoted to such tools for achieving sustainable economic development as social and environmental innovations. The article defines the essence of social and environmental innovations that ensure the sustainable development of economic systems. Attention is focused on the need to solve the problem of ensuring the sustainable development of economic systems through the implementation of their innovative activities through the introduction of basic and improving innovations. The increase in environmental problems, the economic consequences of natural and man-made disasters, the problems of the social sphere, the rapid decline of natural resources dictate the need for advanced development of certain specific areas of scientific and technological research and development ("clean" energy, biotechnology, genomic medicine, new technologies in agriculture, environmentally friendly materials, "green" innovations, etc.). The sustainable development of the state is influenced by innovative activity, and therefore it is necessary to increase the intensity of the introduction of scientific research, to create conditions conducive to the innovative activity of enterprises.

Keywords: *economic development, environmental innovation, innovation, innovation activity, social innovation*

1. INTRODUCTION

In the history of the development of civilization, innovation is the most important factor in the sustainable and efficient development of the economy. In addition, they form the basis of entrepreneurial activity, the impact of which on modern society is difficult to overestimate. However, in the context of a post-industrial economy and a new paradigm of economic development that is gaining strength, there is a need to revise a number of provisions of the theory and methodology of innovation in order to more fully take into account the new fundamental values. These changes are primarily caused by the transition from a raw material to an innovative economy, the development of energy-efficient, energy-saving and resource-saving technologies, a rethinking of the role of human capital and the need for additional efforts to protect the natural environment, many of whose resources are already close to exhaustion. The concept of sustainable development, which was formed in the twentieth century, is a balanced development in economic, social and environmental aspects (Akimova T. A., 2009, p. 37). According to this concept, all economic entities can be considered as socio-ecological-economic systems, where the priority of goals changes towards the integrity of the natural complex, the environment and improving the quality of life (Alferova T. V., 2013, p.9-10). Favorable economic development, which is expressed in rapid economic growth, does not ensure sustainable development, balanced in economic, social and environmental aspects.

It is the complex interaction of the three aspects that leads to harmonious development in the long term (Tretyakova E. A., 2012, p. 195-201). The ever-increasing number of problems in the social and environmental spheres make adjustments to the traditional models of economic functioning, increasing the importance of social and environmental aspects in making managerial decisions. The concept of sustainable development is based on a combination of social, environmental and economic components, which has been widely adopted both at the micro level and at the international level over the past decades, with a particular focus on social and environmental innovations as tools for achieving sustainable economic growth. Today, a large number of business entities have switched to a sustainable development strategy and are successfully using social and environmental innovations as elements of a business strategy. This is confirmed by the example of such large companies as "Adidas Group", "Henkel", "Procter & Gamble", "HP", "Unilever", "Clorox2", "Dell", "DyeCoo ""Nike", etc. The need for the development and mass implementation of new ideas in business processes, which, on the one hand, create value for the company and its owners, and on the other hand, benefit society, is becoming more and more obvious. One way to achieve this goal is to apply social and environmental innovations.

2. FEATURES OF SOCIAL AND ENVIRONMENTAL INNOVATIONS

There is a close connection between the social, environmental and economic spheres, so it makes sense to consider not only the optimization of one sphere in an isolated form, but also the subsequent impact on other spheres. It should be noted that the existing imbalances in the distribution of opportunities, wealth and power, gender inequality, unemployment, threats to human health, depletion of natural resources, land degradation, lack of drinking water and loss of biodiversity are only small problems in the social and environmental sphere, the solution of which is currently becoming a priority for the international community. The solution of the identified problems is possible only with the introduction of social and environmental innovations at the micro, macro, and global levels. In foreign practice, it is customary to combine these types of innovations and call them "sustainable innovation" (sustainable innovation) and consider them as separate types of this type of innovation. The idea of social innovation was officially recognized in 2010. Specific proposals were included in the Europe 2020 strategy. The developed strategy provides an answer to questions about how to overcome the crisis and create conditions for sustainable and comprehensive growth and development (Arabey E., 2019, p.23). Social innovation refers to new projects, ideas and initiatives aimed at improving the life of society. At the heart of social innovation is a concept that meets all the needs of society: from working conditions and education to the development of society, and health, in order to achieve a sustainable society (Sazanov B. V., 2008, p. 14). Social innovation is associated with such concepts as public-private partnership, corporate social responsibility, social entrepreneurship, and charity. To date, the state, through funding, actively encourages and supports the partnership of entrepreneurship and educational institutions engaged in the development and implementation of social innovations. Investing in social innovation is one of the tools for achieving sustainable economic growth. Human capital, a healthy and educated nation represented by a working-age population are extremely important for economic growth. Meeting social needs is not just an investment that will pay off later, but an integral part of a successful economy, the goal of which is the well-being of the population. The allocation of public funds and charity from large corporations to the social sphere is not enough, and long-term targeted efforts of all interested parties are required. A broad view of social innovation as a way to meet the important needs of society and its systemic change for the purpose of long-term planning becomes necessary. Social innovation is a convenient way to solve the most important social problems. In practice, there is a lot of evidence that social innovations can solve the problems of vulnerable groups, improve the quality of life and contribute to important

systemic changes in society to increase its well-being. According to the OECD (Organization of Economic Cooperation and Development) terminology, "green innovation" refers to any technology that reduces the negative impact on the environment" (Green innovation, website). The emergence of the term "environmental innovation" is due to the need to solve the problems associated with the occurrence of environmental disasters in new ways and with the help of new technologies. In a more specific interpretation, eco-innovation is the creation of new products, processes and methods that meet the needs of people with the rational use of natural resources and minimal emissions of harmful substances (Reid A, 2008, p. 24). Environmental innovations contribute to improving environmental safety and include:

- technologies aimed at protecting the environment;
- organizational innovations for the environment;
- innovative products and services that benefit the environment;
- ecosystem innovations (Egorova N., 2015, p. 300).

The areas of economic activity that most actively use eco-innovations belong to the sector of so-called "clean technologies" (cleantech). Currently, the clean technology sector includes the following areas:

- renewable energy and energy-efficient technologies;
- resource and waste management, material recycling;
- nature-saving construction methods and building materials;
- alternative transport, logistics, etc.

According to Clean Edge, the total size of the "clean" energy industries (biofuels, wind and solar energy) in 2011 was 246.1 billion US dollars, in 2021 they are expected to grow to 385.8 billion US dollars. Clean technology as a whole is currently the fastest-growing venture capital investment sector in the United States. In 2011, their volume increased by 30% and reached \$ 6.6 billion (almost a quarter of all venture capital investments in the United States) (Clean Energy Trends, 2012). Optimizing the consumption of resources - both non - renewable (coal, oil, natural gas) and renewable (water, wood) - will lead to the fact that over time, increasing efficiency will become the goal not only of the company implementing "green" innovations, but also of its partners-suppliers of resources and consumers of products. Companies together with their suppliers will identify and solve problems in the supply chain related to the environmental cleanliness of raw materials and components, and develop measures with consumers to reduce waste and losses. Taking into account the fact that a significant number of consumers prefer environmentally friendly products, which is why companies will be interested in developing eco-products and services. Eco-friendly products themselves become advertising, and environmental cleanliness-an indicator of the quality of the product. The result of identifying such demand will be the formation of a market for organic or environmentally friendly products.

2.1. Use of eco-innovations by large companies

As examples of the implementation of eco-innovations, we can mention the company "HP", which has brought its activities to environmental standards and requirements. Back in the 1990s, the leading specialists of "HP" realized that lead is toxic, and when it was added to the list of dangerous substances in 2006, the company already used solders made from a mixture of tin, silver and copper. Another example of resource-saving activities is "Procter&Gamble", which saved US \$ 830,000 in 2015 by recycling waste at its Amiens plant in France. In addition, at its plant in Lima, the company uses waste instead of burning it to produce methane and useful biofuels. This saved more than \$ 250,000 (P&G, 2016). Interesting technological solutions for environmental protection are offered by the company "DyeCoo", which uses carbon dioxide as

a dye carrier for fabrics and textiles. At a certain pressure and temperature, the dyes dissolve very easily, even more easily than in water. This technology is used by “Nike”, “Adidas”, “Levis” and many other light industry companies. “Nike” experts noted that compared to traditional dyeing methods, this technology reduces the dyeing time by 40%, and energy use by 60% (CO2 Dying Technology, 2017). Thus, value chains are formed around each corporation that meet the principles of the concept of sustainable development and bring certain benefits, both social (good image) and commercial (cost savings).

3. THE IMPACT OF ENVIRONMENTAL AND SOCIAL INNOVATIONS ON SUSTAINABLE DEVELOPMENT

The concept of sustainable development suggests that the classic business model based on the use of cheap energy and raw materials can and should be replaced by a new cost-effective "green" business model. This means that social and environmental innovations will become one of the main directions of the development of the modern economy in the near future. The importance of social and environmental innovation for achieving sustainable development has been justified by many scientists. The result of the justifications is that the resulting mechanism of interaction between innovative factors and the country's economy provides a disproportionate effect of innovation in the form of GDP growth in the country in comparison with the costs in the innovation sector. Together, innovation has a different impact on sustainable development. Thus, technological innovations ensure the economic efficiency of the country's economy and most often contribute to the recovery of the economy from crisis situations. Environmental innovations contribute to environmental safety and environmental protection, and social innovations contribute to the elimination of public problems. The ability to innovate is becoming a key component of the competitiveness of modern companies, as well as one of the most important factors for its sustainability. Pursuing the goals of economic efficiency, enterprises should not forget about the greening of activities, the renewal of the resource base and the performance of social functions in relation to the staff and the public. The effects of the introduction of social innovations as a factor in ensuring the sustainable development of socio-economic systems include:

- Improving the quality of life of the population;
- High level of education and development;
- Increasing the life expectancy of the country's population;
- Competitive quality of life;
- Positive image of the state.

Research shows that environmental innovation, driven by sustainable development policies, can bring tangible financial benefits. The transition of companies to the production of "green" products leads to lower costs, because in this case, less raw materials, energy and other resources are used for production, the prices of which are constantly rising. In addition, companies can earn additional income through the production of higher-quality eco-products. Eco-innovations are an integral part of the concept of sustainable development. The available data on the study of the experience of initiatives in the field of sustainable development indicate that this type of development can rightly be considered "the key driver of innovation in the XXI century" (Nidumolu R., 2009). The use of environmental innovations is aimed at preserving the natural resources of the country and has a positive effect on the environment. The presented effects are indicators of the sustainable development of socio-economic systems. The attractiveness of the introduction and use of social and environmental innovations depends on the number of effects obtained. The effect of social and environmental innovations, unlike other types of innovations, is more difficult to predict and calculate, which indicates a high degree of their riskiness.

It should be noted that there are problems that create barriers for enterprises engaged in the development, implementation and use of social and environmental innovations. These problems include:

- Imperfection of the legal framework regulating innovation activities;
- The high cost of energy-saving technologies in the implementation of environmental innovations;
- High cost of implementing innovations due to high operating costs;
- Lack of own financial resources;
- Lack of economic impact from social innovations;
- Long payback period for a number of environmental innovations;
- Lack of qualified personnel (innovative managers);
- High level of innovation risks;
- Lack of information platforms for social innovation;
- Weak innovation infrastructure.

The presented problems are a serious threat to the implementation of innovative activities of enterprises and hinder the development of the economy as a whole. To eliminate the emerging problems, the state should take measures that will lead to an increase in the intensity of the introduction of social and environmental innovations and stimulate the innovative activity of enterprises, which will ensure the sustainable development of the socio-economic system. Such measures include:

- creating a regulatory framework for the functioning of the environmental market;
- provision of tax and other benefits to enterprises in the implementation of the latest technologies aimed at reducing the negative impact on the environment, the use of non-traditional types of energy, the use of secondary resources and waste processing;
- provision of state support in the form of subsidies for innovative activities aimed at protecting the environment;
- creation of information platforms for social innovations;
- providing financial assistance for the implementation of social innovations;
- promoting the development of social entrepreneurship.

Innovations provide a strong competitive advantage for any level of sustainable development and, as a result, a high level of state competitiveness. The increase in environmental problems, the economic consequences of natural disasters, the problems of the social sphere, and the rapid reduction of natural resources dictate the need for advanced development of certain specific areas of scientific and technological research and development ("clean" energy, biotechnology, genomic medicine, new technologies in agriculture, environmentally friendly materials, green innovations, etc.). It is worth noting that at the moment, almost all developed countries are outperforming GDP growth rates over the rate of resource consumption due to the introduction of advanced technologies.

4. CONCLUSION

The need to introduce social and environmental innovations arises from the need to solve problems in the social and environmental spheres, the main of which is the deterioration of the biosphere. The main goal of environmental and social innovation is to achieve sustainable economic development. They are able to reduce costs, improve product quality, increase profits, create an image and increase the competitiveness of the enterprise. Thus, social and environmental innovations become a new criterion for sustainable economic development for enterprises.

To transition enterprises to a sustainable development strategy, it is necessary to go through the following stages:

- 1) bringing the company's activities to environmental standards and requirements based on regulatory legal acts;
- 2) creating a sustainable value chain by reducing resource consumption and reducing waste;
- 3) development of environmentally friendly products that are an indicator of the quality of the product;
- 4) implementation of new business models that prevent negative environmental impacts and provide financial benefits.

Each stage is characterized by its own problems, the solution of which is necessary for the further development of the enterprise, and the opportunities that allow the enterprise to take a leading position in the market. Experts predict that the next decade will be years of rapid growth in global production of products and technologies related to the environment and alternative energy.

ABSTRACT

It is known that in modern times, it is difficult to manage the activities of an advertising agency because of the dynamic variability of some parameters of business processes. Frequent changes in these parameters reduce the likelihood of achieving the set goals. Therefore, there is a need for the application of organizational and production innovations. The article describes the mechanism of operation of the advertising agency and for this purpose uses the concept of "state of the system" in accordance with the term base of the theory system. As is commonly known, 3 types of approaches (process approach, systematic approach, situational approach) are used more in management. The most widely used of these is the process approach. A process approach to the design and implementation of organizational and production innovations requires "engineering" skills. Therefore, the "engineering" ability is of utmost importance in building an application model to increase the efficiency of the advertising agency. At the same time, the design of the process of application of organizational and production innovations means the procedures applied consistently. These procedures allow you to create a system of purposeful actions that increase the quantity, speed and quality of direct advertising services provided to clients. Each of these procedures is a step towards achieving a specific goal. In other words, the main task in planning the process of application of organizational and production innovations is to find an answer to the following question: "What should an advertising agency that produces competitive advertising products and services look like?"..... In order to increase the efficiency of the advertising agency, the article considers the process components of the activity before moving on to the process of building a specific model for the implementation of organizational and production innovations, and then develops recommendations for the formation of an innovative activity management model to maintain the required level of competition, taking into account the positioning conditions. With the aim of enhancing the efficiency of the advertising agency, I proposed a special model for the application of organizational and production innovations. Another important issue is that the advertising company faces the negative effects of the external environment when implementing organizational and production innovations. These issues need to be considered separately. To prevent such side effects, the company should use PR, advertising, lobbying and other methods of sales promotion. For this purpose, the article describes in detail the negative impact of the advertising agency on the parameters of the external environment in the application of organizational and production innovations. In the end, some advantages of the organizational and production innovations application model to be used to increase the efficiency of the advertising agency were noted and analyzed in detail.

Keywords: *advertising agency, organizational and production innovations, model, efficiency, competitive advertising*

1. INTRODUCTION

Referring to the theoretical and practical basis of managing innovative activities in advertising, we can say that each advertising agency is created by groups interested in this work (created by

the owners of the advertising agency to serve customers) and is a tool to achieve economic, social and political goals. . This definition is important and has nothing to do with the legal form of any advertising agency. The purpose of establishing an advertising agency is to obtain material and financial benefits. In other words, it serves to make money from the sale of advertising products and services. To achieve this goal, every advertising agency must work profitably [6]. Therefore, it needs to use innovation. From this viewpoint, the organizational and production innovations has a very important role to play in increasing the efficiency of the advertising agency.

2. MECHANISMS OF ADVERTISING AGENCY

To describe the activities of an advertising agency, we will use the term "state of the system" in accordance with the term base of system theory. Using this concept, it is possible to identify areas of application of organizational and production innovations in order to increase the quantity, speed and quality of direct advertising services provided to customers. The state of the system means a set of parameters (internal and external) that determine the course of processes occurring in the system. So, the indicators of the system parameters for a certain period of time form the "state of the system." The operation of an advertising agency that provides (ie operates) advertising products and services is characterized as a change in the state of the system in a particular space. In other words, the operation of an advertising agency is understood as the transition (change) of the system from one state to another [8]. The state of the system is a very versatile concept. Therefore, using this concept makes it possible to accurately determine the conditions for building a specific model for the application of organizational and production innovations. For example, a competitive strategy can be viewed as an innovation project. Because this strategy involves changing the position of the advertising agency in a particular space. It is common knowledge that a modern advertising agency must interact with a large number of customers in order to maintain a competitive position. From this viewpoint, any advertising agency can be viewed as a complex system. In particular, the theory and practice of innovation management uses the generalized term "business process" to describe these processes. So, the "advertising business process" is a set of different types of activities. Different types of resources are used at the "start" of such business process. As a result of the activity, an advertising product is created at the "end" of the process, which is valuable for the consumer. You can also consider the work of any advertising agency as a process of combining activities at the highest level. The implementation of an advertising business process always leads to the creation of added value [2]. It is known that 3 types of approaches are used in management. The most widely used of these is the process approach. A process approach to the design and implementation of organizational and production innovations requires "engineering" skills. Thus, the "engineering" ability is very important in building an application model to increase the efficiency of the advertising agency [1]. At the same time, the design of the process of application of organizational-production innovations means the procedures applied consistently. These procedures allow you to create a system of purposeful action that increases the number, speed and quality of direct advertising services provided to customers. Each of these procedures is a step towards achieving a specific goal.

3. PLANNING THE APPLICATION OF ORGANIZATIONAL AND PRODUCTION INNOVATIONS

At the heart of the planning process for the application of organizational and production innovation is the development of a formal logical model that will enhance the effectiveness of the advertising agency. In the logistics paradigm (planning) corresponding to advertising business processes, individual operations, corresponding resources and performers are indicated.

The implementation of the advertising business process is characterized by events (situations). The implementation of an advertising business process is understood as a reaction to changes in the parameters of the external or internal environment (for example, changes in tax rates or prices for advertising products, dismissal of employees, introduction of new equipment in a warehouse, conclusion of contracts, etc.). In some cases, the term "service response logistics" (SRL) is used [7]. This concept is perceived as a process of coordination of logistics operations, which is important in the implementation of more effective advertising services in terms of costs and meeting the needs of consumers. Thus, in the process of producing advertising products and services, the advertising agency can be approached as a system that provides a multi-level service. In particular, we can interpret the management of innovation activities in an advertising agency (related to the application of organizational and production innovations) as the regulation of the parameters of logistics operations or advertising business processes. Such an approach forms the basis of accepted modeling standards (eg, IDEF methodology), structural analysis methodology (Structured Analysis and Design Technique, SADT), and functional-value analysis (Activity Based Costing, ABC) and is implemented through a number of sophisticated programs (ARIS, IDEF / Design, Rational Rose, SAP R / 3, "Galaxy", "Parus", "Etalon", etc.) [4]. An advertising agency is an open-ended system that builds its activities in relation to the external environment. Based on this, we can say that one of the main tasks of managing innovation activities (application of organizational and production innovations) in an advertising agency is to take a certain position in the external environment. It is also about finding the optimal option in the network of resource flows to increase the speed, quality and number of direct advertising services provided to customers. This is due to the formation of some parameters of the advertising business process (for example, sales volume of advertising products and services, tax rates, energy tariffs, market prices, exchange rates, etc.) in the external environment of the advertising agency. It is these parameters that often manifest themselves as factors limiting further development. Moreover, it is worth to note that the nature of these factors will not be so important for the agency (only their dynamics should be considered) if all advertising business processes are clearly defined and the correct parametric model has been created for the application of organizational and production innovations to increase the effectiveness of the advertising agency. It must be borne in mind that the division of parameters into "external" and "internal" is conditional and is determined by the goals of modeling. As a result of the dynamic variability of some parameters of the advertising business process, it is difficult to manage the activities of the advertising agency. Frequent changes in these parameters reduce the likelihood of achieving the set goals. Therefore, there is a need for the application of organizational and production innovations. Several positioning tools are currently known: SWOT-matrix, PEST-matrix, SNW-matrix, model BCG, GE / McKinsey, ADL-LC, SPACE, etc. Most of these tools are based on the results of the Delphi approach or qualitative analysis. Therefore, there are challenges with numerous inconsistencies in the formation of specific models. Also, no clear criteria have been established for these tools to classify external and internal environmental factors. Therefore, the practical significance of using these tools for managing innovation in advertising is very limited [9]. In our opinion, it is important to determine the optimal position of the advertising agency in the overall economic system with the aim of developing and implementing organizational and production innovations. This requires a constant search. The position of the advertising agency should be defined in such a way as to increase the speed, quality and quantity of direct advertising services provided to customers. Determining such a position of an advertising agency is more rigid and difficult than existing approaches. Nevertheless, the problem is solved with great mathematical difficulty. Rather, it requires the creation of a classical form of optimal management of an abstract object. That's a very difficult question.

4. APPLICATION PROCESS OF ORGANIZATIONAL AND PRODUCTION INNOVATIONS

The process of application of organizational and production innovations can be approached from two perspectives:

- 1) Application of organizational and production innovations as modeling of the future situation;
- 2) Application of organizational and production innovations as a management process. [7].

Let's focus on the second point. In the classical theory of optimal regulation, the concept of "situation" is defined as a certain characteristic of the system. This concept not only reflects the current position of the organization, but also affects its future. Despite the ambiguity of this definition, an important point is made here. This point is that in order to increase the efficiency of the advertising agency, the process of implementing organizational and production innovations is often perceived as a means of managing the "future" situation. In view of all the above, we would recommend that the application process of organizational and production innovations be considered as a tool that affects the actual state of the agency's innovation environment. In other words, the process of applying organizational and industrial innovations should be aimed at achieving a given situation envisaged to enhance the speed, quality and quantity of advertising services provided by the agency. Another important point is that the advertising company encounters the negative effects of the external environment when implementing organizational and production innovations. These points need to be considered separately. To prevent such side effects, the company should use PR, advertising, lobbying and other methods of sales promotion (Figure 1).

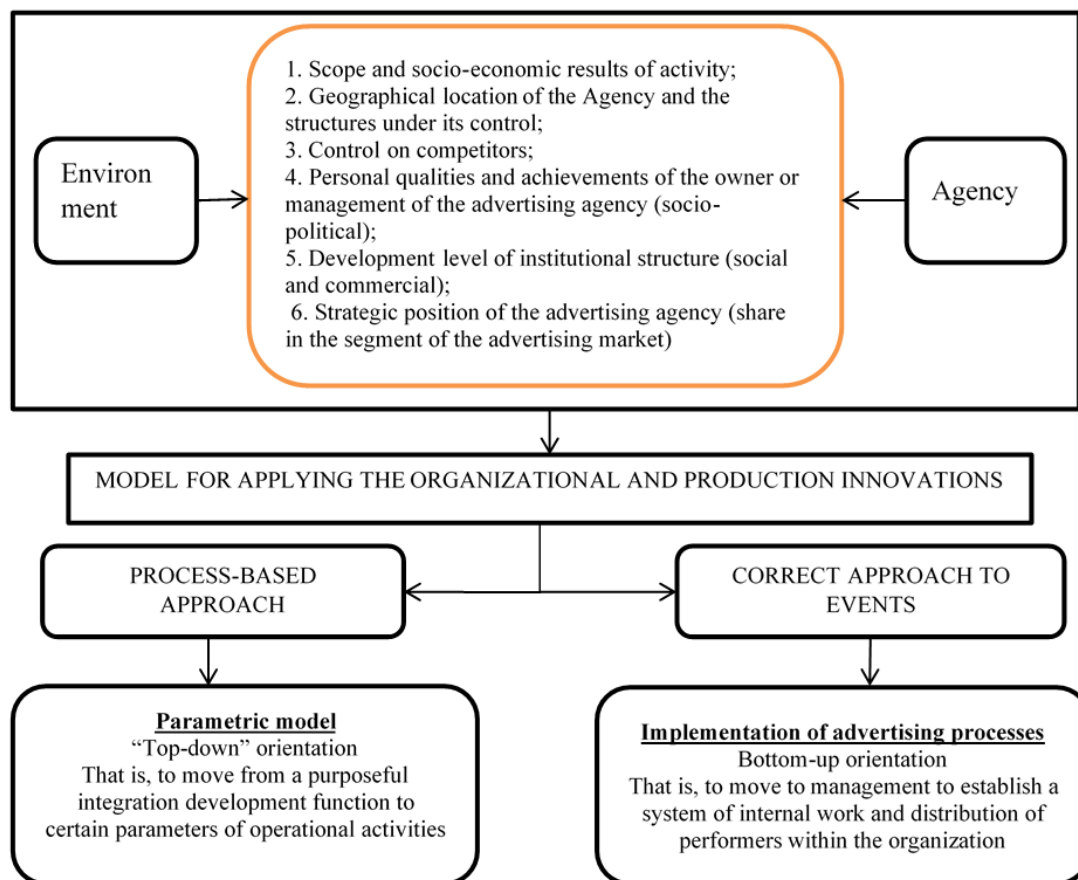

Figure 1: Adverse effects of advertising agency on the parameters of the external environment in the application of organizational and production innovations

5. MODEL FOR APPLYING THE ORGANIZATIONAL AND PRODUCTION INNOVATIONS

Due to the diversity and practical importance of cybernetic algorithms, we can say that the model of application of organizational and production innovations is superior to other models that reflect different aspects of the activities of the advertising agency (financial, industrial, organizational). Through this model, the application of organizational and production innovations regulates existing resource flows. Therefore, as an activity breakdown of the management system, it is necessary to form a serious accounting policy, collect marketing information, control the external and internal environment. Summarizing all of the above on the formation of a model for the application of organizational and production innovations to increase the effectiveness of an advertising agency, we can conclude that the operation of an advertising agency in modern economic conditions is a unique, unpredictable (stochastic) and purposeful process. During this activity, the advertising agency moves from one situation to another ("changing the situation in space"). The main problem of innovation management in an advertising agency is to study the impact of various internal and external events on the parameters of advertising business processes and to correctly regulate these parameters to achieve an efficient production system. Regulation (management) is carried out through the adoption and implementation of management decisions [10]. In addition to all the above, when formulating a specific model for the application of organizational and production innovations, it should be borne in mind that statistics on innovation in Azerbaijan began in 1994 in connection with the transition to a market economy. The main reason why most advertising agencies are not ready for the realities of the current economic situation in the early stages of the transition to a market economy is related to the planned distribution system of economic relations (administrative command system). Thus, the conditions of the external environment were not decisive in this system. There were no advertising agencies in the administrative command system at all. The first advertising agencies began to appear in the first period of transition to a market economy. Therefore, agencies were required to adapt to a new dynamic environment in which all conditions were dictated by the market. In other words, advertising agencies had to react to the external environment, predict future changes, that is, develop mechanisms for managing innovative activities. The development of a model for the application of organizational and production innovations was also included in this mechanism. In a view to increase the efficiency of the advertising agency, I proposed a special model for the implementation of organizational and production innovations (Figure 2).

Figure following on the next page

Figure 2: Model of application of organizational and production innovations to increase the efficiency of the advertising agency

This model requires consideration of the following aspects in accordance with the theory and practice of organizing innovative activities:

- 1) The process of introducing innovations at different stages of the life cycle of an advertising agency should be divided into stages taking into account the limited resources;
- 2) A criteria mechanism should be developed that includes evaluation criteria for scales. This mechanism should be based on a unified approach to the assessment of qualitative and quantitative parameters of innovation;
- 3) The future development of the advertising market must be forecasted. In this case, the future market share should be determined by modeling the specific competitive advantages of the agency in comparison with competitors in the existing market segment.

The way to implement the organizational and production innovation model developed by us is as follows:

- Before innovations are implemented, their suitability is determined by the level of production technology, the degree of complexity and the state of design. In other words, innovations are subject to preliminary examination in accordance with the forecasts of the future economic activity of the advertising agency.

- The importance of evaluation criteria in the criteria mechanism is determined based on the priority areas of the advertising agency's innovative activities (therefore, this section is variable). That is, the assessment of organizational and production innovations is carried out on a scale in accordance with the priorities of the competitive strategy of the advertising agency. The market distribution of new advertising products and services is assessed by determining the competitiveness of these products and services. In this case, it is important to predict the possible share of the advertising market segment and sales revenue.
- Afterwards, investment indicators are determined with respect to the application of organizational and production innovations. It is specified by the production and sales budget of advertising products and services.
- So, the application of innovations goes through several stages of "filtering". The methods of innovation management presented here act as a filter. The ranking of innovations in the introduction is carried out taking into account the investment indicators of their financing, the competitiveness of new advertising products and services in the market, the degree of compliance of innovations with the competitive strategy of the advertising agency and other indicators.
- Subject to the hierarchical sequence, innovation actions are identified at the next stage in accordance with the existing production resources (production capacity, people, capital, the budget of the advertising agency).

6. CONCLUSION

Today, the process of implementing organizational and production innovations in an advertising agency has become an important element in the value chain of the advertising business. From this point of view, the main priority of the innovative activity of each advertising agency in a market economy is to focus on the customer and production and to purchase high quality and competitive equipment. In this context, there is a need to revise guidelines for the evaluation of research and development, as well as to develop new approaches, tools and mechanisms for the management and evaluation of innovative activities in the advertising agency. There are some advantages of the organizational and production innovation model developed by us in order to increase the efficiency of the advertising agency. These advantages include:

- 1) Permanent monitoring of the advertising market is possible in order to assess the competitiveness of new advertising products and services.
- 2) It is possible to determine the compliance of the applied innovations with the development strategy of the advertising agency.
- 3) A unified approach is used to assess the economic and quality parameters of innovative activities.

Summarizing all of the above, we can conclude that any advertising agency using the model we have developed can always assess the competitive advantages of the equipment purchased and the advertising products and services produced in modern market conditions.

ABSTRACT

It is known that investing in the acquisition and creation of long-term tangible and intangible assets is risky because the value of such assets is recovered over a long period and their liquidity is not very high. Therefore, when making investment decisions in this area, different information is always used, generated from different sources, among which the financial statements play an important role. However, to the question - whether the financial statements contain useful information for making effective investment decisions - there is no unequivocal and comprehensive answer. The paper proves that the quantity and quality of such information largely depends on what principles, criteria and rules are the basis of the methodology for accounting of its formation. The analysis and evaluation of current formal and informal prescriptions, judgements and methods of capitalising the costs of creating certain types of long-term tangible and intangible assets are given. This paper drives the conclusion that the information developed on the basis of the currently applied normative does not allow the formation and application of a unified system of indicators for the objective assessment and analysis of the economic and social consequences of investments in the considered assets.

Keywords: *assets, costs, investment, capitalisation*

1. INTRODUCTION

The COVID-19 pandemic has led to a multi-component crisis in the world. The most difficult situation has developed in the economic sphere: there has been a decline in production, the volume of goods and services produced has significantly decreased, and unemployment has risen. The close economic interconnections and high economic interdependence between the countries that existed before the pandemic were noticeably weakened or completely interrupted, which also led to large losses. It is obvious that the restoration of the previous volume and pace of economic development will require a lot of investments, the bulk of which will have to be directed to industries and spheres producing goods and services that can significantly reduce unemployment, significantly reduce the burden of governments to pay unemployment benefits, improve the provision of medical and other vital important services to the population. Meanwhile, as observations show, companies are more inclined to expand investment activities in the financial sphere than in the material one. The need for more accelerated development of the material sphere was once insisted by J.M. Keynes, who warned that “Society as a whole

cannot create conditions for future consumption with the help of financial transactions alone, it can only do this by expanding the physical volume of current production "(1, p. 167). But society is called upon to create conditions that would allow companies to more profitably invest in production activities. In the presented work, accounting for investments in long-term tangible and intangible assets is chosen as the object of research, and the issues of determining the essence, function and classification of investments as well as recognition, assessment and accounting of investment costs are selected as the subject of research. The approaches of scientists-economists regarding the essence and functions of investments are critically generalized, the applied criteria for capitalization and recognition, the current methodology for accounting for investment costs in long-term tangible and intangible assets are considered. This research also presents individual vision of the essence and functions of investments, which were substantiated and formulated, criteria that could be used as the basis for the recognition and accounting of capitalization of investment costs were proposed, an accounting scheme for reflecting information on capitalized and not capitalized investment costs in the financial statements of organizations was proposed.

2. ESSENCE AND FUNCTIONS OF INVESTMENTS

All economists - scientists acknowledge that the concept of "investment" is considered one of the most widely used categories in the economic sciences. However, as proved by the study, the theory of these sciences has not yet developed a unified definition that would contribute to an unambiguous understanding of the essence and functions of investments, and would make it possible to form the most accessible and useful information about investment operations and processes. A truthful definition of the essence and economic content of the concept of "investment" is of particular importance for the development of theory and methodology for accounting for investment costs for the acquisition and creation of assets. We can say that the usefulness of accounting information used to analyze and evaluate investment situations and decisions in companies is based precisely on the semantics and pragmatics of the studied concept. However, with regret we have to admit that in the theory of accounting, the concept of "investment" remains almost unexplored. But in economic theory, financial management and some other sciences there are numerous and diverse interpretations of the essence and functions of investments. The word "investment" comes from lat. *Investire*, and literally means to dress. In the Cambridge Explanatory Dictionary, the concept of "investment" means an investment or act of investing money, effort, time to buy new stocks, cars and other property, as well as the act of buying stocks, bonds, in order to make a profit (2). The Oxford Explanatory Dictionary gives a slightly different interpretation of investment. It characterizes "investment" in two ways: **first**, it is defined as the acquisition of means of production, such as machinery and equipment for an enterprise in order to produce goods for future consumption. Such an acquisition is called *capital investment*; **secondly**, as the acquisition of assets, for example, securities, works of art, deposits in banks or building societies, etc., primarily in order to obtain financial returns in the form of profit or capital increase. This type of investment is called *financial investment* (3). A. Smith interpreted *investment* as investing capital to improve land, to purchase useful machinery, tools and stocks that generate income or profit. In his opinion, fixed capital can bring income or profit only in the process of use, and working capital - in the process of circulation (4, p. 100). Unlike A. Smith, J.M. Keynes construed investment as investing the capital not only to generate income or profits, but also to create effective aggregate demand, contributing to the development of production and reducing unemployment (1, p. 102, 167). Thus, JM Keynes, as it were, "legalized" two functions for investments. In modern economic literature, as Paul A. Samuelson and William D. Nordhaus emphasize, most macroeconomists use the term "investment" to denote an increase in the stock of productive assets - capital goods: machinery and equipment, buildings and structures, inventories.

They accept such investments as capital investments. They also refer to investments as the cost of purchasing securities and call them financial or portfolio investments. According to Paul A. Samuelson and V. D. Nordhaus, investments at the macro level, on the one hand, affect output through aggregate demand, and on the other, lead to an increase in output through capital accumulation. They also note that the main goal of an enterprise making an investment is to make a profit (5, p. 472-473). J. Friedman and N. Ordway define investment as - investing funds to generate income or profit (6, p. 441). According to other economists, investment is an asset or item that is acquired for the purpose of generating income or increasing value (7, 8). There are other formulations of the essence of investment (9,10,11). In the post-Soviet space, most authors also understand investment or capital investment as investing in real or financial objects in order to generate income, profit, interest, etc. (12, p. 53, 13, p. 319, p. 322, 14, p. 26, 15, p. 17-18). According to many representatives of economic theory, investments mainly perform the following functions: regulatory, distributive and stimulating (16). In another source (12), three investment functions are also distinguished: regulatory, distributive and indicative. In our opinion, the regulation function and the distribution function can hardly reveal the essence of investment, since investments, or funds allocated for investment at all levels, are themselves objects of regulation and distribution, as for the stimulating function, it can be argued that the stimulus are not investments, but their final results, that is, economic and social benefits from investments. By the indicative function of investment, the authors mean a regulation or control mechanism to ensure an equilibrium state of the economic system. The processes of social development cannot be regulated with the help of investment activity alone, they are largely regulated by accumulation, demand, supply and other factors. Igor A. Blank in his book entitled "Investment Management" before defining investment, gives ten characteristics: 1. Investment as an object of economic management; 2. Investments as the most active form of involving accumulated capital in the economic process; 3. Investments as an opportunity to use accumulated capital in all its alternative forms; 4. Investments as an alternative opportunity to invest capital in any objects of economic activity; 5. Investments as a source of generating the effect of entrepreneurial activity; 6. Investments as an object of market relations; 7. Investments as an object of ownership and disposal; 8. Investments as an object of temporary preference; 9. Investments as a carrier of a risk factor; 10. Capital as a carrier of the liquidity factor (15, p. 10-16). I. A. Blank describes in detail the content of each of these characteristics. In his opinion, the essence of investment is determined by these characteristics. It is possible to formulate some general objections to the characteristics given by I. A. Blank. So, investments as such cannot act in the form of real property, investment - is the process of investing funds in the form of cash and other resources for the acquisition or creation of assets. Therefore, direct objects of management, and therefore, objects of accounting are cash and other assets. As F. Fabozzi correctly emphasizes, investment management is a process of money management (17, p. 1). It is not investments that generate the effect, but specific tangible, intangible and financial assets. The carrier of the risk factor is not investments as such, but assets created or acquired through investments. Finally, the very definition that I. A. Blank formulated regarding the essence of investment also confirms the correctness of our general conclusion that the characteristics he listed cannot reveal the essence of the category of "investment". Let us give his definition in full: "Investments of an enterprise represent the investment of capital in all its forms in various objects (instruments) of its economic activity with the aim of making a profit, as well as achieving other economic or non-economic effect, the implementation of which is based on market principles and is associated with factors of time, risk and liquidity"(18, pp. 17-18). We believe that it is not the characteristics consisting of ten points that explain the essence of the concept of "investment", but the content of the very definition of "investment", where I. A. Blank reveals the essence and functions of investments quite well. The acceptability of I.A. Blank's definition is explained by the fact that he considers investments as an investment not

only for making a profit, but also as an investment for achieving a different economic or non-economic effect, while not revealing the essence of a different economic and non-economic effect. But still he is one of the few authors who takes the definition of "investment" out of a narrow semantic framework. The essence of investments, like all other economic categories, is determined by the functions that they perform or are called upon to perform. As many representatives of economic theory rightly emphasize, the ultimate goal of all production is the satisfaction of needs, which inevitably involves investment. Without investment, no society can coexist, even if these investments do not bring profit to the entrepreneur or company for some time. Therefore, the production of goods and services is the first natural function of any investment, and therefore of the resources allocated to achieve this goal. At the same time, making an investment in the production process, an entrepreneur (both a manufacturer and an investor) cannot function without the assumption of obtaining a certain income from the sale of goods and services. The revenue or the price of products that the consumer or society must pay for should just contain the income or profits of the entrepreneur or company. Providing income or profits is the second natural function of investment. These functions inherent in investments have always been and will be present regardless of space and time, socio-political structure and ideology of society. They express public and private / corporate interests, are interrelated and complementary. It is possible to change the volume, types, forms, directions, composition, sources of investment financing, elements of its regulation, distribution and stimulus, but these changes will not in any way affect its functions. Based on the abovementioned, the essence of investment has been formulated by us as follows: *investment stands by investing monetary and other resources in order to meet the needs of society in goods and services, as well as in order to generate income and profit for individual and institutional investors.*

3. PROBLEMS OF CAPITALIZATION AND RECOGNITION OF INVESTMENT COSTS IN THE COST ACCOUNTING AND REPORTING SYSTEM

In general economic and accounting literature, investments are classified according to numerous features, most of which are purely theoretical, or completely abstract in nature, and therefore they do not find application in the financial accounting and reporting system, information is not generated on them. Accounting and reporting of investment costs is carried out in three classification groups: a) for tangible assets; c) for intangible assets; c) for financial assets. The definition and classification by themselves do not form a specific value or information on investments, the main methodological element that generates information is the assessment of investment costs. Valuation methods and rules are usually prescribed by the relevant national and international accounting standards. However, not all assessed costs are recognized, that is, capitalized and recognized as part of the initial cost of the created and acquired long-term assets. The problem of capitalization and the recognition of certain investment costs is widely discussed in the accounting literature of Western countries. As the study shows, these discussions are mainly about borrowing costs and overheads. However, specific requirements and criteria for the recognition and capitalization of these and other costs are always set in a regulatory manner. Companies maintaining accounting and reporting in accordance with IFRS (International Financial Reporting Standards) assess and recognize the capitalization of investment costs associated with the creation and acquisition of long-term tangible and intangible assets in accordance with the requirements of the Conceptual Framework for the Presentation of Financial Statements, IAS 16, IAS 38, IAS 40, IAS 41, IAS 23, IFRS 3, etc. Conceptual frameworks define general rules and criteria for recognition, and standards establish a specific list of cost items subject to and not subject to capitalization, that is, recognition. In this case, capitalization or recognition is a reflection of the investment costs incurred as the initial or historical cost of a long-term asset. The main criterion for recognition is the compliance of such costs with the definition of an asset.

In other words, costs are allowed to be capitalized and, therefore, recognized as a specific asset only if: (a) it is probable that the future economic benefits associated with them will flow to the entity; (c) such costs can be reliably measured. This shows that the main purpose of capitalization of costs is to obtain economic benefits in the future. This is a purely microeconomic approach to the essence of investment, which means that when investing, acquiring and creating long-term assets in companies, preference is given to only the second investment function. With all this, in our opinion, the probability of obtaining economic benefits cannot be used as the basis for capitalization and cost recognition, because, firstly, the recognized value always reflects a specific amount, while in the recognition process, “probability” is not expressed by any value, that is, it is an abstract concept, and secondly, the creation of economic benefits is one of the two natural functions of assets, therefore it is unnecessary and inappropriate to put the obvious thing in the basis of recognition. Since capitalization or recognition occurs on the basis of actual investment costs, it is sufficient that the recognition criterion is only the value of these costs. This implies another circumstance, that the recognition cannot be directly conditioned by the quality or usefulness of information, for the reason that the quality or usefulness of accounting information is also not amenable to value measurement. Despite this, the Conceptual Framework explicitly emphasizes that assets and other elements of financial statements should be recognized only if their recognition provides users with information that is useful, that is, relevant and truthful (18, p. 49). Neither relevance nor truthfulness has a specific value or limited cost boundaries. If the information was not used or did not have a significant impact on the investment and other decisions taken, this does not mean that it should not be recognized in the reporting. Moreover, if the recognized information is formed exclusively according to the prescriptions of specific standards, then how it may turn out to be inappropriate and untruthfully presented. The degree of relevance and truthfulness of the information, except for cases when it is intentionally or unintentionally distorted by the preparers of the statements, entirely depends on the very information-generating requirements of a particular standard. Thus, when capitalizing and recognizing investment costs as the initial cost of an asset, it is advisable to use a single general criterion - the reliability of cost estimates. However, the capitalized and recognized value depends not so much on the reliability of the estimate, but on the choice of the composition of cost items subject to and not subject to capitalization. This issue has been and is the subject of extensive discussion in the accounting literature. Given the limited scope of this work, as well as the fact that the composition of such articles is determined not as a result of discussions, but in a formalized manner, we will try to state our position in comparison with the prescriptions of certain standards. Almost all standards divide investment costs: (a) directly attributable to initial cost; c) not included in the initial cost, that is, respectively, for capitalized and non-capitalized costs. At the same time, in relation to certain costs, different approaches are used. So, for example, in accordance with IAS 16, the initial cost of fixed assets can be recognized or capitalized only for the amount of direct costs, which include: costs of employee benefits arising directly from the construction or acquisition of an item of fixed assets; site preparation costs; initial costs for delivery and handling; installation and assembly costs; the cost of verifying the proper functioning of the asset, after deducting the net proceeds from the sale of items produced by bringing the asset to its intended location and bringing it to the desired condition; and the remuneration for professional services rendered [(IAS) 16 paragraph 17]. The standard recognizes these costs as the cost of an asset when the asset is brought to a location and condition suitable for use in accordance with the intentions of management. This requirement of the standard is conventionally referred to as the degree of readiness of an asset for use. If we proceed from this requirement, then it turns out that all those costs that do not directly meet this requirement should not be capitalized. The standard includes a fairly large number of articles [(IAS) 16, paragraphs 19, 20 and 23] to such costs.

Of course, most of the costs provided in these points, not only directly, but also indirectly, are not related to the creation of the asset and therefore it is legitimate that they should not be capitalized. However, in relation to some costs, it is advisable to revise the current approaches. These costs primarily include borrowing costs that arise in connection with the acquisition, construction or production of long-term assets. Considering that, for the overwhelming majority of companies, borrowed funds are an important and sometimes the main source of investment financing, the issue of capitalizing borrowing costs becomes especially relevant. As you know, the procedure for capitalization, suspension and termination of capitalization of such costs is governed by International Standard (IAS) 23. According to paragraph 20 of this standard, an entity is required to suspend capitalization of borrowing costs if the active development of a qualifying asset is interrupted for extended periods, and paragraph 21 requires the termination of capitalization borrowing costs, if practically all work required to prepare the qualifying asset for its intended use has been completed. It follows that all borrowing costs outside the scope of these items are not capitalized, and are not recognized as an initial part of the assets created or acquired, and therefore should be written off to the profit or loss of the organization. These requirements of the standard also apply to intangible assets, investment property. In accordance with the requirements of IAS 16, IAS 38, IAS 40 such costs as administrative and general overhead costs, interest amounts arising as the difference between the price equivalent on the condition of immediate payment in cash and the total amount of the payment, as well as excess material losses, payment costs labor and other resources incurred to build the asset by personal means are also not capitalized and are not recognized as part of the cost of the assets. IAS 38 also does not permit the capitalization and recognition of costs arising from the research phase of creating an intangible asset under an internal project. In order to assess which costs of self-generated intangible assets can be capitalized and recognized, and which cannot, IAS 38 requires an organization to subdivide the process of creating an asset into two stages, that is, the research stage and the development stage. Further, the standard clearly and unambiguously states that no object, which is the result of research or the implementation of the research stage in the framework of an internal project, shall not be recognized as an intangible asset. All costs of this stage are to be recognized as an expense when incurred [(IAS) 38, paragraph 54]. In accordance with IAS 38, an entity may recognize an item as an intangible asset if: (a) the item is the result of the development stage; (c) the entity can demonstrate a willingness to meet the conditions prescribed in paragraph 57 of the standard; (c) in some cases, an entity may demonstrate at the development stage that the asset will generate probable future economic benefits. We have already discussed why the probability of generating future economic benefits cannot be taken as a criterion for capitalization and asset recognition. The conditions written in paragraph 57 of the standard that an entity must fulfill when it recognizes an item as an intangible asset are reasonable and unobjectionable. As for the requirement that an object can be recognized as an intangible asset, if it is the result of the development stage, then the following question arises: *is it possible to create an intangible asset within the framework of an internal project without costs at the research stage?* There can be two answers: 1. No, an intangible asset cannot be created; 2. Yes, an intangible asset can be created. There is no doubt that the probability of the first answer being correct is one hundred percent, while the probability of the second being correct is zero percent. Based on these considerations, we can say the following: if the costs at the research stage did not allow the transition to the development stage of an intangible asset, then writing off all costs associated with the research stage to expenses is indisputable and inevitable; if the costs at the research stage made it possible to move to the development stage and the development stage costs give the organization the basis to demonstrate the possibility of creating an intangible object, then the research costs should be capitalized and recognized as part of the initial cost of this asset. In our opinion, borrowing costs, whether the asset is qualifying or not, regardless the degree of

its readiness for use, administrative and general overhead costs, interest amounts arising as the difference between the price equivalent subject to immediate payment in cash and the total amount of the payment, as well as excess losses of materials, labor costs and other resources incurred when creating an asset by own efforts (if these losses were not caused and directly related to the activities or inactivity of the organization itself) should also be capitalized. For the validity of such a conclusion, it is enough to answer such a question - if the assets were not acquired and / or created, would such costs arise? There is only one answer to this question - no. Therefore, any such costs, in our opinion, should be capitalized and recognized as part of the initial cost of the acquired or created through investment asset. In favor of this idea, it is possible to give an argument that the current accounting methodology, according to which all these costs are attributed to the expenses of the period, according to the authors, distorts the real content of investment situations, investment activities of companies, negatively affects the current financial position and current results of activities. So, non-capitalization and non-recognition of the costs in question, and as a consequence of this, writing them off to the expenses of the period, firstly, leads to the fact that the value of long-term assets created or acquired through investments becomes underreported, and secondly, it increases losses or reduces the amount of gross profit from general activities and reduces the amount of income tax, thirdly - reduces the responsibility of the personnel directly involved in managing the investment activities of the company; fourthly, leading to a decrease in the amount of total capital, it worsens the ratio between the capital and the liability of the company, etc. Currently, no financial report contains absolutely complete information on the amount and movement of investment costs, including capitalized and non-capitalized costs. IAS 7 establishes the procedure according to which only those costs that entail the recognition of an asset in the statement of financial position can be classified as an investing activity. The same standard only requires disclosure of cash payments associated with capitalized costs of acquiring fixed assets, intangible assets and other long-term assets, and cash receipts from the sale of such assets. In our opinion, these indicators cannot give a complete picture of the investment activities of organizations. In our opinion, there should be a separate line item in the statement of financial position that reflects the amount of capitalized costs in progress, and in the statement of profit or loss and other comprehensive income - an item showing the amount of uncapitalized costs that are to be written off to the profit or loss of the organization. To generate such information, it is necessary for organizations to use an appropriate synthetic account for each type of long-term assets, for example, under the name "Investment costs for intangible assets". On such accounts, it is advisable to keep separate records of capitalized and non-capitalized costs. At the end of each reporting period, information on costs capitalized and recognized as part of the initial cost of the related non-current asset, as well as information on unfinished capitalized costs, should be transferred from such accounts to the statement of financial position; to the statement of profit or loss and other comprehensive income - information about not capitalized costs. The information generated under this accounting scheme will make it possible to separately analyze and evaluate the investment activities of companies.

4. CONCLUSION

The overwhelming majority of authors disclose the essence of investment from a micro-level position, they define investment as an investment of capital or funds in order to generate income, profit. Other authors also consider investments at the macro level and note that investments at this level provide the current output of goods and services, and their growth through capital accumulation. There are economists who characterize investments both at the micro and at the macro level. In their opinion, investments are made in order to generate income and profits through the production of goods and services. However, the economists who adhere to this position are not many.

Some economists interpret investment as an asset or income-generating item. For a more complete disclosure of the essence and functions, investments are associated with numerous characteristics that are incompatible with the actual semantics and practical function of the reviewed concept. We believe that the concept of "Investment" should be understood as the process of investing money and other resources in order to meet the needs of society in goods and services, as well as to generate income and profit for investors. Investment creates potential opportunities for combining public and corporate interests. Specific information about the amount of investment is formed not by defining and classifying investments, but by the main methodological element, that is, the assessment of investment costs. Valuation methods and rules are prescribed by the relevant national and international accounting standards. Not all estimated costs are capitalized and recognized as part of the initial cost of the non-current assets created and acquired. International standards divide investment costs into capitalized, that is, directly recognized at initial cost, and not capitalized, that is, not recognized at initial cost. In general, for such a division of costs, the following general and particular criteria are established:

- the probability of receiving economic benefits in the future from the investment object;
- the reliability of the assessment of the value of the asset;
- the degree of readiness of the asset for use;
- the stage of implementation of costs, etc.

The probability of obtaining economic benefits cannot serve as a criterion for capitalization and recognition of investment costs. Since in the process of recognition, the "probable economic benefit" is not expressed in any quantity, that is, it is an abstract concept. Capitalization or recognition is always expressed in actual costs, therefore it is sufficient that the recognition criterion is only the value of such costs. The study and logical judgment allows us to talk about the need and feasibility of capitalization and recognition of the initial cost, along with directly related costs and the following costs: borrowing costs, whether the asset is qualifying or not, regardless the degree of its readiness for use, administrative and general overhead costs, interest amounts arising as the difference between the price equivalent subject to immediate payment in cash and the total amount of the payment, as well as excess losses of materials, labor costs and other resources incurred when creating an asset by own efforts (if these losses were not caused and directly related to the activities or inactivity of the organization itself); costs at the research stage, provided that the costs of this stage allow you to move to the development stage, and the costs of the development stage give the organization a reason to demonstrate the possibility of creating an intangible object.

ABSTRACT

Covid-19 (Coronavirus), founded in China in 2019 and continues to challenge the world, soon became the world's principal enemy. The epidemic has caused the worst global recession since the "Great Depression" of the 1930s. The closure of trade routes, economic shutdown, reduction of production, closure of many jobs has contributed to a remarkable slowdown in the economy. Economists do not rule out that the process of self-recovery may take a long time. However, in our opinion, economic recovery will happen quickly. We believe that after the pandemic subsides, the European economy will recover and soon return to the pre-pandemic economic situation. The recession did not go unnoticed by Europe. What areas did the European life slow down, what did it do to prevent the economic downturn, and when did the vaccination process begin? We will report on such topics.

Keywords: *covid-19, economic influence, European Union, economic predictions, SME, vaccination*

1. INTRODUCTION

The Covid-19 pandemic, a significant economic problem in recent years, continues to spread around the world. Mutated forms are also common in the world. European leaders are troubled to succeed in an agreement on a way to manage the coronavirus pandemic. The latest disagreements have weakened European Union-level responses and made regional solutions challenging to implement. We must not forget that member states are accountable to an outsized extent for their public health policies. There are solely a few EU-level structures that play a significant role during this pandemic. These include medical and foreign standards, shared medical and disease agencies. However whereas every member state has naturally chosen its COVID-19 reactions, there remains a wide range of opportunities to develop cross-border cooperation. Unfortunately, leaders are controversy over financial mechanisms that are being shared at the worst of times. Until Italy frighteningly became the center of Europe by the coronavirus, EU countries were virtually exclusively national. As the situation became tense, Germany and France began cooperating on the main border and sent protective masks to Italy. Later Germany expanded regional ties by buying patients from Italy and France as a sign of EU cooperation. European Union studied the pandemic's impact on the economy, as in many areas, on all aspects of the economy.

According to these researches, various economic forecasts have been made. Economic recovery is expected to begin in 2021-2022, and it is assumed that it will return to its pre-pandemic.

Europe: There are 30,000,000+ infections, and after November, increases observed in the number of cases.

2. SMALL AND MEDIUM-SIZE ENTERPRISES

According to the survey, 70% said their incomes had been reduced and had severe effects due to the pandemic. One in five felt they would not pay their debts and were forced to cut their workforce; 28% had to cancel their growth projects. Overall, more than half thought their businesses could not live for more than 12 months, although 20% of those who participated in the survey were helped by a government (various tax discounts, employee payments.) The results of the query can show:

- *Lower revenue and a bleak outlook* - We can take Spain and Italy from the most affected countries, whose incomes have fallen by 33% and 30%. In Germany, it was 23%.

Figure 1: Revenues have fallen for the vast majority small and medium- enterprises in Europe since the onset of COVID-19 crises (Source: McKinsey&Company)

Totally 80% of the economy went through a period of pandemics, somewhat weak and extremely weak. But here we also see financial changes between countries. In Germany, for example, 39% of SMEs were intense and relatively firm, but in Italy, the figure is 10 percent. There were different ideas among countries about the extent of the pandemic impact on SMEs' financial situation and challenged employees' ability to pay loans or leases.

Figure following on the next page

*Figure 2: Savings jobs: many countries expanded short-time work programs to prevent an unemployment surge. (percent, year-over-year, 2020Q2)
(Sources: Euorstat and IMF staff calculations)*

For example, when Spanish SMEs were having trouble repaying 30% of loans, 14% of their SMEs in Germany faced the trend. Similarly, Spanish SMEs could not retain 38% of their workforce, compared with only 16% in Germany and France. Overall, 14% of SMEs in Europe said they were struggling to maintain their staff because many people were on sick leave or stayed in quarantine.

Figure following on the next page

*Figure 3: Approximately 1 in 5 small and medium-size enterprises in Europe are concerned about meeting payment obligations and retaining employees
(Source: McKinsey&Company)*

Growth projects are also at risk. Altogether, 28% of respondents thought they had to postpone them, while the indicator increased by 37% of Spanish and 30% of English SMEs. It was observed that the worst hit would be on the residential, food services, entertainment, arts, and recreation sectors. The chart above shows SME's concerns about survival because of countries, sectors, and companies. In total, 11% said they would apply for bankruptcy within six months. The situation was highest among Italy and France's most prominent companies (with 50 to 249 employees), where 21% are expected to declare bankruptcy in the near six months. By comparison, single merchants in Spain were most concerned, 19% were expecting default in a period, and only 6% of companies with 50 to 249 employees were expecting bankruptcy. Logistics among industrial sectors are expected to have the highest level of bankruptcy: 22%. Agriculture, housing, food services, retail sales, and sales are very low, but 13 to 15 percent follow this. As a result, the number of SMEs that cannot live will depend on a large extent, the uncertain future course of the pandemic, and the damage to the company's revenues.

For this reason, we asked survey participants to think about how their jobs were going under three different scenarios: where their incomes were stable, declining, or rising. They reported the following:

- 1) If revenues remain stable, 55% of SMEs are worried that they could be closed by September 2021.
- 2) If the situation worsens and revenues decrease by 10-30%, then 77% of SMEs said they could resign by September 2021.
- 3) If the situation improved and revenues increased between 10-30%, then 39% of SMEs said they could nonetheless resign by September 2021.

These scenarios may be affected by the duration of receiving government support for SMEs. Governments within the EU had previously introduced measures to give SMEs immediate anti-crisis liquidity, but now the Organization for Economic Co-operation and Development (OECD) said policies started to shift from policies to helping SMEs survive. But survey data shows that a large proportion of SMEs plans to apply for liquidity support measures still on offer. The addition shows that nearly 20% of SMEs already used state aid; 30% also plan to do so.

*Figure 4: At current trajectory, about 1 in 10 small and medium enterprises in Europe could be expected to file for bankruptcy within six months
(Source: McKinsey&Company)*

Again, there are financial differences between the big EU economies: More than 35% in France and Italy were still planning to apply, while in the UK and Germany the figures were 20- 25% in line.

Figure 5: One-fifth of small and medium-size enterprises in Europe have already applied for government support, with another one-third intending to apply.
(Source: McKinsey&Company)

Coronavirus also temporarily modified the geography of the ECB. The outer borders of the Schengen zone are currently closed. Priority entrance barriers at internal borders make it easier for heavy trucks carrying medical supplies, food imports, and general exports to pass.

2.1. Financial responses

However more is required outside the squad and borders, and the first fiscal move may be the toughest: simply agreeing to share the debt the continent has accumulated in the fight against COVID-19. Here emerged some positive signals. The EU, beside the G20, works along as a collective investor by allocating large amounts of money to vaccine research. Various EU-level financial structures have also been modified to cause this. State aid rules were made easier so member states could subsidize institutions hit by the crisis. Eurozone rules on the total size of government debt have been quickly suspended, and costs have been allowed to exceed the usual allowable threshold. But the EU has moved to take the next step towards transforming the European Stability Mechanism (a post-eurozone crisis tool) into a new "coronavirus crisis emergency bank" funded by "corona bonds" temporarily.

A fierce debate has emerged about both the size of the fund and the terms of its debt. It was met with ridicule given the "whatever is necessary" approach adopted to protect the euro. Italian Prime Minister Giuseppe Conte accused EU partners of a delayed and reluctant response. In addition to France, Spain, and the seven other euro area currencies, Conte's preferred method is to raise funds by dishing out "common European debt." It will write EU member states against the expected slowdown while allowing healthcare and public finances to increase spending further. EU leaders working with a video conference on a large scale cannot argue and postpone. Rescue packages need to be agreed upon swiftly and collectively. Finance ministers are due to report two weeks after the last session with new ideas on backing an emergency coronation – it's a disappointing delay. For struggling countries such as Spain and Italy (and many others to come), the outcome is particularly bitter and likely to help the EU's mood. French President Emmanuel Macron publicly indicated that failure to agree on a single response "could spell the end of the EU." European Commission President Ursula von der Leyen defended the need of the EU for an "intelligent strategy" that at the same time "protects the health of our citizens, keeps our economy on its feet, moves our goods and border workers." While there was little chance that he would get worker movement until the quarantines were removed, Von der Leyen reached an agreement in several key areas. There is finance for protection against a wide range of foreign investment proposals for Europe's "strategic beings" and vaccine researchers. The latter responds to Germany's rejection of an offer by US President Donald Trump to purchase wholesale a German pharmaceutical company investigating a possible COVID-19 vaccine. The ECB problem is how to support member states in their chosen national responses while ensuring that the shared financial package is distributed equally and rapidly. This is for preventing regular debate on 'debt allocation.' The issue is with the prosperous northern EU countries rescuing their impoverished southern neighbors and obtaining both institutional leadership from the Commission and financial advances from the European Central Bank to work together and fast. Failure to do so would threaten the macroeconomic and micro-social connections that form the core of the Union. Schism is also a ready invitation at one price to other provinces and regions that want to offer assistance. Several European nations have already started to move beyond EU borders to fight the crisis. Italy saw the arrival of Chinese medical teams and equipment in mid-March. This newly formed "Health Silk Road" is now delivering a large portion of Chinese medical supplies to trucks loaded with the slogan "The Road to Friendship Does Not Recognize Borders." The question is, how much confidence does this assistance in the future have in Italy's support for China's ambitious Belt and Road initiative? If Italy has anything to go by, the EU could be backed by many new international allies, including Russia and the US, to counter COVID-19. At home, the EU still needs to agree with the response that its members share. And quickly.

3. EUROPEAN UNION ACTION

3.1. Support for EU recovery

To help the EU escape the pandemic's economic and social effects, EU leaders agreed on an emergency 750 billion euro recovery fund called the New Generation EU. The recovery package will prioritize investing in digital and green switches. Besides, the July European Council adopted a long-term EU budget for 2021-2027 to boost growth and support citizens, jobs, and our economy in the years to come. The total multi-year budget and recovery fund are no less than 1,824 billion euros. Simultaneously, the fund also proposed a 540 billion euro support package for the EU, workers, institutions, and member states. The European Central Bank provides an additional 1,350 billion euros under a bond procurement program to help governments during the crisis.

3.2. Linking travel arrangements

EU countries formed a common framework for travel arrangements to protect freedom of movement in the EU during the COVID-19 pandemic. When the measures and general definition of risk zones were reviewed, they agreed on the standard criteria to be considered. A color-coded map of the EU based on member countries' data is released every Thursday by the European Centre for Disease Prevention and Control. The map helps EU countries decide on travel arrangements based on the epidemiological situation for regions. EU countries agreed to release information on new travel arrangements 24 hours before they were to be implemented. The EU launched a Re-EU website available in all 24 languages to help travelers plan their journeys by staying safe and finding the reliable and latest information on travel arrangements.

3.3. Slowing the spread of the virus

EU countries temporarily restricted non-essential travel to the EU to curb the spread of the virus in Europe and abroad. The travel list is reviewed regularly and can be updated when necessary. The criteria for determining third countries where travel restrictions can be removed involves economic and social reasoning, including epidemiological conditions and physical distances.

3.4. Push for COVID-19 vaccination

Three COVID-19 vaccines have already been allowed in the EU, and the vaccination began on December 27, 2020, within the Union. The EU has coordinated joint efforts with vaccine manufacturers to ensure adequate safe, and effective COVID-19 vaccine production in the EU through pre-purchase agreements. Six agreements were signed with the vaccine producers to provide a strong vaccination portfolio for EU countries. Altogether, 2.3 billion doses of vaccines were supplied.

3.5. Support for EU health systems

The EU established a continuing link between member states and EU institutions to ensure crisis management and coordination throughout the COVID-19 pandemic. At the same time, the EU brought medical equipment to a ready state by developing a standard individual protective equipment and ventilation facility under the rescue unit's auspices. It also regulated joint government purchases and key equipment exports to ensure sustainable supply within the EU. The EU proposed a new, strengthened EU4Health program that would improve support for member states' health systems. The EU's main aim of suggesting this program is to help Europe cope with future public health threats because EU4Health has been developed to make a significant contribution to the post-COVID-19 recovery by focusing on making health systems more flexible and promoting innovation in the health sector.

3.6. Protecting jobs

The EU has created a temporary support tool to reduce unemployment risks in an emergency (SURE) to help workers continue their jobs during the crisis. The scheme provides up to €100bn in loans on favorable terms to help member states meet national short-term employment schemes' costs. In the fall of 2020, the first taxis were given to EU countries. Since February 2021, 15 member states have received 53.5 billion euros with the support of SURE.

3.7. Help of EU countries to fund COVID-19 response

The EU is backing its funding against crises through the Coronavirus Response Investment Initiative by diverting roughly 37 billion euros to member states from EU structural funds to EU countries. It also applies the complete flexibility of EU financial rules to help EU countries support their health systems and institutions to keep people in jobs during times of crisis.

EU government aid rules have also been softened to ensure governments save jobs and support citizens and companies by providing liquidity to the economy.

3.8. Increasing European cooperation

The EU makes deploying doctors' teams through the EU Medical Corps easier for ensuring the coming of teams from various member countries to support health systems most affected by the crisis. In a spirit of solidarity, EU countries helped each other. For instance: The rehabilitation departments of Austria, Germany, and Luxembourg were presented to patients in Belgium, Holland, France, and Italy in critical condition. Poland, Romania, and Germany sent teams of doctors to help treatment of patients in Italian hospitals. Hungary and the Netherlands sent ventilators to the Czech Republic. The EU also approved new rules allowing member countries to seek financial assistance from the EU Co-operative Fund to cover emergencies in their health situation. With the recent expansion of the fund, member countries will use up to €800million this year to combat the coronavirus pandemic.

3.9. Support for the most damaged economic sectors

The EU approved emergency measures to protect our food supply chain, prevent food shortages, and support the pandemic's agricultural and fishing sector. The measures include direct backing for farmers and fishers, growing comfort in EU funding. The EU set up 'green stripes' to allow food flow in Europe and recognized seasonal workers as 'critical workers.' The EU also introduced exclusive market measures to support wine, fruit, and vegetable producers.

3.10. Collaboration to support our partners in the world

The COVID-19 crisis is a global problem that requires global solutions. The EU and member states help fight the virus by providing financial support to eliminate the emergency health crisis and humanitarian needs. Team Europe's total effort is 38.5 billion euros. The EU also activated the EU Humanitarian Air Bridge to deliver humanitarian aid to countries in need.

4. EUROPEAN ECONOMY EXPECTATIONS FOR 2021-2022

The forecasts are made based on assumptions. To predict in which direction Europe's economy will grow in the coming years, what risks it faces, you need to speculate where the pace of the current pandemic will increase and when it will weaken. The recovery and growth of Europe's economy in the following years depends on steps to prevent the pandemic and trade relations between countries, especially between the European Union and Britain. On November 5, 2020, the European Commission presented the "Economic Prediction Projects Fall 2020". Here are some of the most critical issues that arise from the forecasts:

- 1) The pandemic caused the most profound decline in AI history, which overwhelmed the Great Recession. Economic activity in Europe was severely shocked in the first half of the year, and there was a strong recovery after restrictive measures were gradually eliminated in the third round.
- 2) The revival of the Covid-19 pandemic has led to a tightening of restrictive measures. The economic self-determination (rebound) stopped. Economic growth would stop in round 4, but it is expected to grow again in 2021. Altogether, EU countries' GDP is expected to increase by 4.1 percent in 2021 and 3 percent in 2022. However, for the eurozone, these figures are expected to increase by 4.2% for 2021 and 3% for 2022.
- 3) Policy measures within the European Union framework and at the national level continue to soften the impact of the Covid-19 crisis on households and firms. Therefore a mutual use of fiscal and monetary policy is required.
- 4) Considering the existing uncertain situation, two assumptions can be made. Firstly, it is evident that tightening measures will still be kept for some time.

This is a clear indication that economic recovery will go at a slow pace. Simultaneously, significant tightening measures in the final round of 2020 are projected to be partially and gradually eliminated in 2021. Second, the EU-Britain's new relationship, which began on January 1, 2021, is thought to be moving forward in the desired direction.

- 5) Negative risks are enormous, but it doesn't mean there are no positive risks. Adverse risks: The pandemic can become more pronounced and last for a long time. This will not only keep economic growth stable but can also accelerate its growth towards negativity, increase unemployment, and deteriorate restriction rules dramatically from now on.

Figure 6: Average growth rate of gross domestic product (GDP) in the European Union (EU) from 2013 to 2022

(Sources: European Commission Statista 2020)

As for the positive risks, medical advances are predicted to accelerate in specific ways, and the economy will also accelerate the recovery process as certain countries begin the vaccination process. As one of the critical issues, the EU-UK trade agreement is that serious steps will be taken to establish expected ties between both sides, which predicts that the region's economy will lead to significant growth in 2021, which has already begun. Thanks to ambitious policy measures across all member states, Job losses were more restrained in the first half of this year than economic activity declines, but it was unprecedented. It also piled up a significant labor market gap that reflects the decline in workers and workers leaving the workforce since March. The eurozone's unemployment rate is forecast to rise from 7.5% in 2019 to 8.3% in 2020 and 9.4% in 2021, down from 8.9% in 2022. In the European Union, the unemployment rate is forecast to rise from 6.7 percent in 2019 to 7.7 percent in 2020 and 8.6 percent in 2021, down from 8.0 percent in 2022. The recent negative of inflation mainly drove the significant drop in energy prices due to a decline in service prices for tourism. The stabilization of the oil price is forecast to have a positive impact on overall inflation in 2021. Prices will grow because of low pressures, weak demand, labor market slack, and a strong euro. Overall, inflation in the European Union was expected to reach 0.6 percent, and by 2021, it was forecast to be 1.3 percent. After a slowdown in 2020, EU economies are expected to grow in 2021 and 2022.

Figure 7: The 2020 GDP Forecast for Europe are Bleak(%/y)
(Sources: FactSet Economic Estimates, Various country statistical agencies)

Looking at these forecasts in certain countries, *the* revival in manufacturing, industry, and exports in Germany during 2021-2022 will lead to economic growth. But the second wave of the pandemic has extended the timing of the process a little slightly. In France, economic growth declined by 9.4 percent in 2020. In 2021, it is expected to increase by 5.8%. *Italy's* real GDP is forecasted to decline by 9.9% this year, grow by 4.1% and 2.8% respectively in 2021 and 2022, similar to the eurozone average. *Spain* is one of the most influenced countries in the pandemic. By 2020, GDP was forecast to decrease by 12.4%. By 2021, it was forecast to grow by 5.4% and 4.8% in 2022. The short-term employment schemes have limited job losses, but unemployment is still predicted to rise this year, only fall in 2022.

Figure 8: Forecasts about european countries and Euro-area
(Sources: European Commission)

The European Union had predicted recently that economic growth in the form of "V" was not expected. But the emergence of a new wave of pandemics has left one forecast every day under uncertainty. Altogether, Europe deals with several significant problems from 2021 to 2022. There is a high probability that most countries will return to the pre-pandemic situation (2019) starting in late 2022.

5. VACCINATION

On December 8, 2020, the United Kingdom became the first country to begin implementing tested and tested vaccines for citizens. The European Union started the vaccination process on December 27, the leaders within the bloc call that day "V-Day." The EU targeted the vaccination of 450 million people among 27 member states during 2021. Contracts were signed with pharmaceutical manufacturers Moderna and AstraZeneca. Tobias Kurth (epidemiologist and director of the Institute of Public Health at Berlin's Charite Hospital) said that mass vaccination would start in March and possibly even April. He hopes that after the mass vaccination process in humans, immunity will be developed to protect against the virus, and life will return to its former state after long-term limitations. Kurth had said it was vital that vaccination be safe and very effective. For the interaction of people with each other as they did before the pandemic, approximately 70% of the population has to go through the vaccination process. Europe and the world need to return to their former way of life; therefore, mass vaccination, revive the economy, and vaccinate at least 70% of the population, are essential as we mentioned before.

6. CONCLUSION

We still see the comprehensive impact of the pandemic on the world. The economic decline also continues in Europe and all over the world. Covid-19 has profoundly affected the international trade, tourism, SMEs, agriculture, job closures, and other areas since it began to spread rapidly and worldwide. The economic shutdown has led to an increase in the unemployment rate. Although the pandemic covers virtually every country globally, the economic impact on each country is not the same. It changes depending on the policies these countries are applying to get out of the influence of the pandemic and the country's economic power. But separately, it is not an easy issue for European countries to overcome the virus. Therefore, governments began to work together and to search for ways to rebuild themselves. European countries have started to support each other and create aid funds to combat pandemics. Various economic forecasts have been made that, over time, the pandemic has caused most of these predictions to go wrong. The vaccination process, which first began in Britain on December 8, 2020, is now on its way to mass worldwide. It is important to remember that at least 3/4 of the population needs to be vaccinated to restore the economy and return to its pre-pandemic. The rapid growth of the economy is a key objective when the pandemic is over. If the long-standing European economy can weaken the pandemic's impact, the economy will recover rapidly and even can pass through the pre-pandemic economic situation. We think that the European economy will grow by 10-15% if the vaccination process is realized in the expected form. Products produced during 2018-2019 have already been sold and used. Production volumes of new products have been significantly weakened as many jobs and factories have closed because of the pandemic's impact. The aggregate supply on the market has declined. Increased demand has led to rising prices and increased inflation. But when the pandemic loses its impact, all jobs will be reopened, and factories will completely restore production power. Domestic and international markets will accelerate the production process to provide the demands of consumers. As we noted, this is one factor that will play an essential role in the economy's growth by 10 to 15%.

TRANSFORMATION AND MODERNIZATION PROCESSES IN AZERBAIJAN IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT

Afag Sultan Mammadova

*Professor at Azerbaijan State University of Economics (UNEC),
Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan
mamedov.afaq@yandex.ru*

ABSTRACT

The article studies the main directions of the processes of transformation and modernization in Azerbaijan in the context of basic principles of the concept of sustainable development. It is noted that, one of the most relevant issues today is the integration of the planetary process of consciousness widespread in XXI century into the dialogue of local national cultures, exploring the new foundations of globalization based on national self-awareness and moral values, the objective, impartial study of the mutual benefit of the social and spiritual heritage of peoples. The establishment of the information society at the beginning of the new millennium, the deepening of globalization and integration increase the importance of building sustainable development on the principles of economic growth, social progress and environmental protection. The contradictions that arise in modern times as a result of aggravation of global problems and the complication of transformation processes require the creation of new models of interaction between civilizations based on dialogue and cooperation. The need for full-fledged and more comprehensive participation in the diversified global market conditions the intensive intellectualization of production, the transition to a “knowledge economy”, the modern norms of integrative development of politics, morality and economy; forms a new culture of thinking that embraces the political and economic processes, lifestyles and the system of values. In the line with the goals of the concept of sustainable development, it is changing in the direction of creating values beyond the narrow pragmatic economic goals, utilitarian markets and the economy. In order to ensure the sustainable socio-economic development, it is high-priority task to minimize the damage to social ecology and natural ecosystems, and to rationalize the moral and political goals in order to overcome planetary threats. From this point of view, the study of social, political and ideological influences on universal progress, determining the role and place of philosophical and social approaches in this direction, which allow us to overcome the challenges and threats of modern times, is one of the factors that actualizes our research.

Keywords: *information society, sustainable development, globalization, universal progress, economic growth, social progress*

1. INTRODUCTION

At the beginning of the XXI century, in the context of the integration and transformation of cultures, the unity of different regions, the East and the West, on the same issues and challenges must be valued as universal humanism and positive democratization in the context of modern principles of sustainable development. The ideas and challenges of the concept of sustainable development of particular importance contribute to the emergence of a new historical stage and the world order, characterized by significant changes in the global space and socio-cultural life. Understanding the realities of modern life and creating a constructive theoretical model of socio-economic processes in the world is a difficult task. The complexity of this in the context of Azerbaijan was also related to the existence of the Karabakh conflict in the region, which began with the groundless land claim of the Republic of Armenia.

This conflict poses an economic and environmental threat not only to Azerbaijan, but also to the entire Caucasus region, impeding the development of political, economic, cultural and social processes and undermining economic growth, social progress and environmental protection, which are the fundamental principles of sustainable development and have slowed down the process of modernization.

2. CHARACTERISTICS OF TRANSFORMATION PROCESSES IN AZERBAIJAN

The integration of Azerbaijan into the world political, economic and cultural processes is important, but in this case, it is necessary to identify parallels between global processes and the national and regional aspects, as well as the features of the transformation of values of the new world order in the local environment and conditions should be identified. Because, despite the processes of globalization, the presence of socio-cultural differences in a single information space is an undeniable fact. This approach shows that the processes of transformation and modernization and sustainable development are no less important in terms of values and axiology. Transformation processes in Azerbaijan took place gradually and step by step in the context of national identity. Getting rid of the deep-rooted traditions of the Soviet empire in the public consciousness, the deviation from outdated stereotypes and misconceptions in public life and mental consciousness, the transition from the administrative-command system to a market economy is a long and complex process of evolution. In a country that lived for many years under a centralized economy and where market relations do not dominate, market relations and democratization present a complex and contradictory path through the periods of crisis, economic reform and stability, overcoming moral, psychological and the ideological barriers. At the same time, in the post-Soviet period, the transition from a closed society to an open civil society was accompanied by the strengthening of independent statehood and integration into interstate relations on an equal basis. The transformation processes require the modernization of social psychology, moral attitudes, and the formation of new social ideals and goals. Because the transition from one socio-political system to another, the confrontation of old, traditional stereotypes with new ideas leads to ideological-collective chaos, which leads to a loss of balance in the social behavior. The processes of modernization and transformation of society are deepening against the background of a variety of social stratification, socio-economic, ethical and moral, spiritual, socio-psychological changes and the construction of civil society. One of the important features of the transformation process of Azerbaijani society is associated with a complex and gradual change and modernization of forms of social consciousness (science, education, religion, morality, law, politics, economics, ecology, etc.).

3. MODERNIZATION AS A VALUE OPTION

Sustainable development and modernization are not an option for humanity, but a global generated by the necessity. As a result of globalization of global integration processes, social consciousness and social way of life are becoming more and more planetary, and the modern standards and the etiquettes of life are emerging. The new systems and stipulations of international relations exclude the conservative tendencies. The universalization of ethnic communities while preserving the freedom and identity of existing world civilization makes the modernization a necessary factor in our existence and life. Any modernization project involves explaining the contours of the modern way of life, determining the necessary ways to modernize the state and society. Modernization also accelerates the integration of national cultures into the new world order. The role of ethical issues and values in international law, and the choice of values and interpretations, norms and rights based on them, is high when the whole world participates in the establishment of a new order. T. Montbrial rightly believes that the formation of a world order will involve an empirical search for a fair model of governance, an expansion

of global civil society, etc.¹ It is clear that modernization is not an easy process, unambiguously accepted by national cultures. The success of modernization depends on the readiness of society to change, the ability of the population to realize the national idea, which will create spiritual unity through the right choice and use of moral, economic resources and assets in the process of transformation. The problems of modernization depend, above all, on the approach to the individual as the greatest capital of the state and the value relationships of the people themselves, their conscious participation in the social processes. The President of the Republic of Azerbaijan has repeatedly stated in his official speeches that we must turn the oil capital into the human capital. This thesis is completely consistent with the transition from a resource-based economy to a "knowledge economy" and modernization efforts to turn the "black gold" of oil revenues into the "gold of human capital". The road to modernity also involves reforms in the educational system. The implementation of modernization in society is determined by the potential and capabilities of citizens as carriers of intellectual, professional "capital". The education helps a person to realize his or her contribution to society. The transformation and modernization are also conditioned by improvements in scientific knowledge, education, and culture, as well as the important role of intellectuals in the social structure of society. The transformation and modernization in Azerbaijan also depend on the rate of social and economic reforms and the construction of civil society. Currently, the development of Azerbaijan as a secular and democratic republic creates a favorable environment for implementing reforms in all spheres of public life, restoring our territorial integrity, and implementing the principles of sustainable development.

4. ON NATIONAL PRIORITIES OF SOCIO-ECONOMIC DEVELOPMENT

In the context of the concept of sustainable development, this requires the integration of Azerbaijan into the new world order as a sovereign state with a new national agenda in global and regional politics. The geopolitical potential of Azerbaijan to become a regional leader is broad. Its rich natural resources, cultural and intellectual development, and its location at the intersection of Russia, Iran, Turkey, and Central Asia coordinates its geopolitical balancing function. The President of the Republic of Azerbaijan Ilham Aliyev signed a document defining "Azerbaijan 2030 : national priorities of socio-economic development" by his decree of February 2, 2021. The document provides for the implementation of the following five National Priorities for the socio-economic development of the country over the next decade, which are of particular importance for the fulfillment of the obligations deriving from the United Nations "Transforming Our World: An Agenda for Sustainable Development. Development to 2030":

- 1) A steadily growing competitive economy;
- 2) A society based on dynamic, inclusive and social justice;
- 3) A competitive human capital and space for modern innovation;
- 4) A great return to liberated territories;
- 5) A clean environment and green growth country.

The document emphasizes that the country has chosen to develop a society with a high level of social welfare, based on the modern standards of living and a socially oriented market economy, as well as the strengthening of successful relations between society, business and the state for the long-term sustainable and rapid development of the country. The national priorities justify the effective and efficient management of the state's role in the economy through market reforms, strengthening the private property institutions, business-friendly governance, and further liberalization of trade regimes to increase access to the local products in foreign markets as key drivers of economic growth. At the same time, the development of private initiatives on a creative and innovative basis, focusing economic resources on the areas that create higher

¹ Monberial Thierry De Le monde au tournent du siecle. Ramses 2000. Lentree dans le XXI –e siecle. p. 2000. p. 13-17.

added value, is one of the key factors that ensure sustainable development in the country. The document states that in order to realize the above-mentioned goals, it is necessary to form an effective macroeconomic policy framework that serves sustainable macroeconomic stability, reinforcing the medium- and long-term "drivers" of the economic development - the modernization of human capital, the expansion of the digital economy and full economic sovereignty. The national priorities are a new development paradigm, which includes the goals of the modern world order, as well as the ability to meet the needs and prospects of future generations, reflecting the ideals of universal - rational economic, ecological and social development.

5. CONCLUSION

In the context of contemporary multiculturalism and the globalization of cultures, the deepening of the processes of transformation and modernization, reflecting the unity of nationality and humanity, diversity and homogeneity, is a logical requirement and objective legitimacy of the process of spiritual and cultural development. The global community of sustainable development issues in the context of inadequate appreciation of national and local cultures and approaching different regional cultures with different standards at a time when cross-cutting trends intersect. Because in order to achieve a rationally balanced social and economic development of mankind, we must minimize unequal opportunities, national, religious, sexual, racial discrimination, double standards, and put an end to such outdated and negative thinking.

WAYS OF EXPANDING THE LOGISTICS SYSTEM OF PRODUCTION DIVERSIFICATION

ABSTRACT

It was noted that the strategic road map on logistics and trade development in the Republic of Azerbaijan would allow the creation of a refining center for petroleum products and the creation of a supply base for general use in the new port of Baku for oil and gas processing and other purposes in the region. At the same time if we look at world experience, the creation of the “Alat chemical and petrochemical” logistics center with high potential and strong infrastructure at the Baku port could have been a great success to our Republic, including chemical and petrochemical enterprises. Thus, the logistics center has the potential to supply a wide range of chemical and petrochemical products, especially major chemical products from Iran and other gulf countries, as well as South-East Asia. In other words, this logistics center could provide a strong stimulus for the formation of processing networks, the creation of chemical and petrochemical enterprises by bringing large volumes of chemical and petrochemical products to our country. On other hand, the processing or re-packing of chemical and petrochemical semi-finished products would increase the export potential and so on. It should be noted that there is serious state support for the development of the logistics system in our Republic, and attention to the development of this area is growing. Thus, in December 6, 2016 by the decree of the president of the Republic of Azerbaijan, the strategic road map on the development of logistics and trade in the Republic of Azerbaijan was approved. In this important document, short, medium and long-term directions of economic development in the field of logistics for the period to 2020, to 2025 and after 2025 for the subsequent period have been determined. In the near future, taking into account the development trends of the logistics system, its strategic targets, the maximum optimal and efficient solutions of the economic and organizational problems of the logistics system in enterprises will be further actualized in our country and in the world. Based on the real challenges of modern era and trends in the development of this sector, enterprises in the creation and operation of an improved logistics system will have a significant role etc.

Keywords: *Enterprise, Logistics System Organization and management, non-oil sector, innovation, material flows*

1. INTRODUCTION

In order to increase the export potential of the non-oil sector, the article explains first of all, the processes of diversification and modernization of the national economy itself must be completed and the issues of acceleration of innovation. In addition, the issues of ways and directions of expansion and logistics system of production diversification in enterprises in modern conditions are also investigated.

2. THE PROCESS OF INCREASING THE EXPORT POTENTIAL OF THE NON-OIL SECTOR

Over the past 15 years, the Azerbaijani economy has developed at a record rates worldwide, the gross domestic product has increased 3,3 times. I want to say again that this is a record indicator on a global scale. The non-oil sector grew 2,8 times, industrial production 2,6 times, agriculture

1,7 times. Our exports increased 4,7 times and our currency reserves rose 24 times and today it is 43 billion dollars. In other words, this means that despite the great contribution in the development of Baku in the regions of Azerbaijan and at the same time to the oil and gas sector, our currency reserves have increased 24 times. The strategic road map envisages improving the competitiveness of the economy and social welfare of the population on the basis of sustainable economic development in Azerbaijan (1). In response to global challenges, as a result of attracting investments, a free competitive environment, market access and Human Development, Azerbaijan's position in the world economy will be strengthened and our republic will join the group of high-income countries. Many of such events are currently undergoing implementation. A number of state support mechanisms for the development of the non-oil sector has been developed and implemented. In particular, large infrastructure projects were implemented in order to develop regions and support agricultural producers, technical support was organized through leasing, fertilizer supply system was created, warehouses were put into use, roads were built, modern enterprises were put into operation, preferential loans were allocated for business projects and stimulating measures have been taken. Despite all this, the non-oil sector has not yet managed to achieve a steady and high growth rate, has not provided a significant reduction in the country's oil dependence and has not been able to solve the existing problems in terms of competitiveness. One of the most important and strategic tasks of Azerbaijan on the international scale is the diversification of foreign trade turnover. The limited range of competitive export products remains a serious problem in the structure of the country's economy. From the export potential of many traditional industries (chemical, oil and petrochemical machinery, metallurgy, etc.) poorly use is continued. A small part of the number of agricultural export potential and agro-processing products with strong export potential and international comparative advantage components in this area is in circulation (fresh vegetables and fruits, grape wine, vegetable oils, etc.). There is a significant difference between the general position of the export potential of the country's non-oil sector and its current potential. Despite the acceleration of the development of this sphere, export regulation, stimulation measures and state support mechanisms, the effectiveness of this work is low etc. First of all, to increase the export potential of the non-oil sector, the processes of diversification and modernization of the national economy itself should be completed, innovation should be accelerated. In addition, it is very important that the non-oil sector is deeply researched and assessed objectively its potential, taking into account the country's natural resources and economic factors. The correct organization of the logistics system in the country plays an important role in this work. The economic essence of the logistics system is to provide uninterrupted operation of farms and commercial enterprises, to organize efficient flow of goods and products in the period from the production process to the consumer cycle, to plan the production, to forecast the demand for goods and products, to ensure the efficiency of their movement, to provide maximum continuous and productive organization of processes. Enough resources are in motion in these processes, a large number of main processes of balancing and distribution of raw materials are carried out, the demand for raw materials and various goods is met for efficient production and commercial activity in the whole economy, at the same time uninterrupted access of finished products and goods to consumers is ensured. Prominent representatives of classical economic theories attached great importance to the maximum efficient use of national resources, development of multiplicative productive spheres, productive use of resource potential in the modeling of entrepreneurship-business development. A. Smith wrote that the roads, canals and river vessels are among the strongest factors for business development (2). M. Porter emphasized the development of assistive areas as one of the four important conditions in achieving international success in terms of the nation's development, technology and productivity and the importance of logistics (3). Thus, the scientific approaches, ideas and judgments about the logistics system are directly related to the formation and development of

the term “logistics”, the development of logistics itself as an area of activity and, finally, the formation of logistics as a science with certain principles, methods and characteristics. Logistics from an economic point of view, it analyzes, studies, determines the principles and methods of the flow of raw materials to the production facilities, the transfer of raw materials to processing pallets in the production processes, the management of the flow of finished products and the delivery to consumers, as well as the flow of raw materials. All this allows the management of processes related to the planning, control, transportation and warehousing of goods and materials, raw materials flows (4).

3. WAYS TO EXPAND THE LOGISTICS SYSTEM TO DIVERSIFY PRODUCTION

Logistics is an area of activity consisting of approaches and systems that provide the rhythmic movement, control of production systems and the required flow of raw materials in relation to the organization of production. Elements of logistics include logistics operations, logistics chains, logistics system, logistics functions, material flows, logistics costs. Logistics areas include military logistics, business logistics, supply and distribution logistics, sales and warehouse logistics, transport and customs logistics, and logistics of stocks. It is necessary to show that the problems related to logistics, approaches to the organization of logistics activities, the essence of the logistics system, its efficiency, the importance in the economic development processes, the role of logistics in the effective functioning of enterprises, in this regard, the contributions to the successful operation of the enterprise remain the focus of attention of world economist scientists and researchers. In the last 50-70 years, the processes taking place in the world economy have been active, mainly due to the trend of transformation, improvement or completely modernize the traditional economic and business mechanisms. In an intensified implementation of strategic road maps in Azerbaijan, the study and identification of ways of expanding the logistics system of enterprises and diversification of production has become an important issue (5). In this direction, there is a concrete strategic roadmap, targets are set, strategic objectives for the nearest and long-term scope of activities in this area and practical mechanisms of action are mainly defined. The correct organization of logistics system in chemical enterprise is one of the main priorities of the non – oil sector. It is important to address the logistics of material resources provision of chemical enterprises in Azerbaijan should be based on objective reality, practical opportunities and existing potentials. The areas and entities proposed to form, create and develop logistics centers or terminals in our republic are in fact centers of traditional development processes of chemical and petrochemical industry and currently the potentials in this area are collected in these areas. In addition, if we look at the context of the creation of a large port in the Alat settlement, it is not difficult to justify the reasons for the establishment of a logistics center in petrochemical enterprises, and it is necessary to benefit from world experience in the field of efficient operation of such logistics centers or terminals in the world experience. The following can be explained the essence and content of each of the proposed logistics center models and the justification of factors, which stipulate their organization. The transport complex of “Azerkimya” PU, which is a large state-owned enterprise and subordinated to the State Oil Company of the Republic of Azerbaijan, is based on certain mechanisms, and this service area actually performs the function of supply and transportation, as well as customs documentation, its maneuverability and dimensions are limited, its activity on defined functions and tasks is built. Speaking of great potential in this area, it is absolutely necessary to create a strong and autonomous logistics center within “Azerkimya” PU. Although this union is a structural unit of the State Oil Company and the company is the only oil and gas producer-monopolist in the country, it cannot fully supply its own chemical and petrochemical complex with the necessary raw materials. Of course, such an approach may be controversial, but the reality is that the EP-300, which is the strongest and most productive not only in Azerkimya PU, but also in the region, has been installed at the level

of 30-40 % of the project capacity. This indicator was 25-30 % from 1990 to 2015. Only in recent years, the attention has been paid to the provision of this unique device with basic materials, which is not related to the development of the logistics system or the expansion of logistics operations in this enterprise, but simply the administration of the company considers necessary to allocate additional resources to its plant, and the problem has been solved. Thus, existing problems should be considered within the market economy approaches and more effective decisions should be made. In other words, with the organization and world experience of the autonomous logistics center within Azerkimya PU, the creation of the logistics operations, infrastructure, provision of machinery and equipment, vehicles, warehousing adequacy for the expansion of logistics operations could create strong conditions for the provision of the Union's main chemical and petrochemical facilities with continuous flow of raw materials. This would raise the current production level at least 40-50%. This, in turn, would mean that chemical products were mainly exported, the additional foreign currency would be included in the country and would improve access to raw resources for small and medium-sized businesses in the chemical and petrochemical industries. In addition, a network of processing enterprises would be created in the country, the number of jobs would be increased, and in general, the additional contributions would be made to the development of our national economy (6). It is no coincidence that the next large logistics center is offered in Sumgayit industrial center again, as this industrial center is considered not only in Azerbaijan, but also as one of the major industrial centers in the region, as well as strong chemical and petrochemical centers. At present, the development of chemical and petrochemical industry in our republic has passed into an intensive phase, and large chemical giants have been put into use soon. An example of this can be the urea plant and the "Socar Polymer" plant in Sumgayit. There is a great interest in the development of private chemical and petrochemical enterprises, there is a lot of demand and real potential, including raw materials and personnel potential in Sumgayit and surrounding areas of Baku. It should be taken into account that in the recent past, many chemical enterprises were operating in Baku (tire plant, rubber and technical products plant, iodine plant, etc.). It should be noted that in the recent past, Sumgayit produced a wide range of chemical and petrochemical products (synthetic rubbers, household chemicals, polyesters, resins, caustic soda, etc.) and the demand for these products remains constantly high in the country and the region, as well as in the world markets. Currently, the monopoly factor in chemistry and oil chemistry complex, a wide network of private companies and manufacturing enterprises has not yet been fully formed. International experience shows that the number of such enterprises in our republic is limited despite the fact that some chemical and petrochemical enterprises in the foreign countries are tens of thousands. From this point of view, the establishment of competitive and export-oriented chemical and petrochemical enterprises is of great importance in our Republic. It is planned to create a logistics center under the "Sumgayit chemical industry park" and this process is continuing. However, it should be noted that taking into account the profile and destination of the park, measures should be taken and an adequate technical base and infrastructure should be created. Among the residents registered until the present time, this chemical industrial park also includes non-chemical-profile enterprises and companies. Thus, a strong base of raw materials and resources, i.e. a chemical logistics center, should be created here, which can form a serious potential for solving the problems of providing investors with raw materials and resources who want to come to this park. One of the important factors contributing to the creation of the "Mingachevir chemical and petrochemical products" logistics center is the demand for various chemical and petrochemical products of this region, as well as the activity of chemical and petrochemical enterprises in the city of Mingachevir. There is a serious need to create a network of processing enterprises in the Industrial City of Mingachevir, as well as in the nearby Ganja and other districts of these regions, which is directly related to the increase in the need to create industrial

enterprises in the regions, the importance of creating new jobs and value, the priority of enterprises to put into operation. Thus, thanks to the creation and development of a network of chemical and petrochemical processing enterprises producing the consumer goods in Mingachevir, Ganja and other areas, it is possible to export chemical and petrochemical products to Georgia, to other foreign countries via the ports of this country, to realize the export of these products Turkey via the Baku-Tbilisi-Kars railway, and to ensure receipt of foreign currency in the non – oil sector. It was noted that the strategic road map on logistics and trade development in the Republic of Azerbaijan would allow the creation of a refining center for petroleum products and the creation of a supply base for general use in the new port of Baku for oil and gas processing and other purposes in the region. At the same time if we look at world experience, the creation of the “Alat chemical and petrochemical” logistics center with high potential and strong infrastructure at the Baku port could have been a great success to our Republic, including chemical and petrochemical enterprises. Thus, the logistics center has the potential to supply a wide range of chemical and petrochemical products, especially major chemical products from Iran and other gulf countries, as well as South-East Asia. In other words, this logistics center could provide a strong stimulus for the formation of processing networks, the creation of chemical and petrochemical enterprises by bringing large volumes of chemical and petrochemical products to our country. On other hand, the processing or re-packing of chemical and petrochemical semi-finished products would increase the export potential and so on. It should be noted that there is serious state support for the development of the logistics system in our Republic, and attention to the development of this area is growing. Thus, in December 6, 2016 by the decree of the president of the Republic of Azerbaijan, the strategic road map on the development of logistics and trade in the Republic of Azerbaijan was approved. In this important document, short, medium and long-term directions of economic development in the field of logistics for the period to 2020, to 2025 and after 2025 for the subsequent period have been determined. In the near future, taking into account the development trends of the logistics system, its strategic targets, the maximum optimal and efficient solutions of the economic and organizational problems of the logistics system in enterprises will be further actualized in our country and in the world. Based on the real challenges of modern era and trends in the development of this sector, enterprises in the creation and operation of an improved logistics system will have a significant role etc. Efficiency evaluation of the organization of logistics system in enterprises and solution modeling of provision problems of enterprises with basic materials are directly related to each other. Thus, enterprises should establish and strengthen close farm-cooperation and cooperation with their main producers-enterprises. However, this is also not enough, so that the main activities of logistics systems and subsystems logistics mechanisms in enterprises should be optimally defined and efficiently organized (7). Realization of basic functions of the logistics system in enterprises should be considered complex and systematic. To achieve all this, the assessment of the economic efficiency of the logistics system in enterprises the developed criteria by the author in the work are reviewed as the important measures.

4. CONCLUSION

Taking these into account, the problems of application of more advanced logistics systems in the uninterrupted provision of enterprises with raw materials and resources should be solved in our Republic. It is important to identify and solve the existing problems on effective organization of the logistic support system of enterprises with raw materials and resources in Azerbaijan. To this end, it is very important to consider a number of tasks and implement measures related to the creation of logistics centers.

- 1) The legislative framework for the regulation of logistics activities in the Republic must necessarily be strengthened. To this end, it is important to develop and adopt the law of the country “on logistic activity” proceeding from modern realities and circumstances in Azerbaijan.
- 2) The possibilities of using different models of progressive logistics system, which allows uninterrupted provision of raw materials and resources of enterprises, should be assessed realistically and their application is desirable.
- 3) It is important to solve the problems of consistent and efficient implementation of the proposed measures to expand the logistics system of diversification of production in enterprises during the implementation of strategic road maps in Azerbaijan.
- 4) In the context of modeling the logistics of chemical enterprises in Azerbaijan, the issues of establishment of five important logistics centers (terminals) on the basis of modern technologies and progressive logistics systems should be considered at the strategic level and it is desirable to be solved them in the near future.

Baku, 6, Istiglaliyyat str., AZ1001, Azerbaijan

elbrus.akberov@mail.ru

ABSTRACT

The sustainability of the socio-economic development of Azerbaijan is determined to a large extent by the establishment of effective foreign economic relations which serve to its integration into the international economic system, the expansion of favorable trade and economic relations with foreign states and international economic organizations in accordance with the national interests of the country. At present, our country establishes mutual economic relations with about two hundred states of the world. But, the majority of these relations, especially export relations are related to oil and gas products. Therefore, today the necessity for profound study, objective assessment and adequate measures of export potential of Azerbaijan's non-oil sector seems very actual. The fact that Azerbaijan is on the list of low-soil countries in the world indicates that the country produces less product in terms of production capacity. Moreover, remaining of about 20 percent of the territory of the republic under occupation for about thirty years decreased sowing and pasture areas considerably, as a result, the volume of agrarian food production did not pass unnoticed. Also, it is impossible to use enough of innovated technologies in agrarian field, therefore the import capacity of foodstuffs still remains high. The point is that, there is enough wide potential in Azerbaijan for production and processing of the majority of the imported products. It is also due to the characteristics of agriculture. So, agricultural products can be put up for sale both naturally and by processing. It also should be noted that, the processed products obtained naturally from exported products return to internal market at high prices. The commodity structure of agricultural export shall be considered periodically for elimination of these contradictions. The exports of products that do not require large investments in processing should be reduced in the near future. The measures shall be taken in the direction of promotion of export of competitive products made of their processing on the basis of high technologies. It can be resulted in increase of employment, improvement of the people's welfare and decrease of currency expenses for food import on the account of processing sector. Therefore, the opportunities for transition from natural raw materials to the finished products shall be investigated in agricultural export of the country and the existing opportunities shall be used maximally.

Keywords: *product, export, import, investment, competition*

1. INTRODUCTION

The development of agriculture depends directly on correct organization of its regulation mechanisms. Various impact levers of the state regulation mechanism are used widely in the process of achieving strategic goals made in this direction. Successively, the successful results of strengthening export potential are related to these impact levers. The results obtained in this field indicate the position of the country in international market and competition ability of domestic manufactured products. But, besides the value of export in any field, its commodity structure is also one of the important indicators. It should not be denied that, the countries, where the export of commodities is preferred as raw material, can't remove the group of developing countries. It should be noted too that, the economic safety of the country, as a whole, food safety which is one of the important components of national security depends on the level of development of the market of agricultural products.

From this point of view, the learning and analysis of conceptual issues of strengthening of export potential of the market of agricultural products has great scientific and practical importance.

2. THE NECESSITY FOR DEVELOPMENT OF THE MARKET OF AGRICULTURAL PRODUCTS AND STRENGTHENING OF EXPORT POTENTIAL

Possessing of the final result of agricultural production to risky nature by depending on the influence of natural and climatic factors much more, non-coincidence of the working period with the production period, exclusion of agriculture from investments and loans due to several natural factors and its being less attractive, as a rule, being the level of profitability and profitableness in agriculture lower than the average indicator of the economy makes it necessary to eliminate the existence of disparity between prices of agricultural products and prices of industrial products. One of the important factors making necessary the development of agriculture is that it is not only a material production sector that provides food for the population and industry with raw materials, but also an area where a large part of the economically active population works and provides employment. In accordance with official statistic information, 39 percent of economically active population in Azerbaijan works in agriculture, hunting and forestry. Hereby, we can conclude that, the special attention and care of the state to agriculture, where a large part of the country's population works has very important significance for development of the market of agricultural products. Today, the minority of social infrastructure objects (education, health, catering) in rural areas and sometimes their absence in general causes to migration of rural population (especially, skilled workers) from village to city and from village to the capital. We must recall that, they took part directly in solution of social problems of the village in the years of existence of public economies. The enterprises which engaged in construction of residential buildings for rural population, provision of people with fuel and water, the services of kindergartens, public caterings, transportation and conveyance, took part closely in solution of social problems by the help of collective-farms and state farms at that period. The solution of the said issues require funds in a large sum, therefore there is a serious need for government intervention. It is very important to prepare and implement large state programs in the Republic of Azerbaijan for solution of existing problems in regard to social infrastructure objects of the village. We think that, the sustainable development of the agricultural sector, improvement of the life level of rural population and increase of employment level in the village will be possible with execution of this program. Basing on thoughts said in regard to the necessity for development of the market of agricultural products and strengthening of export potential, we would like to notify that, the priority fields of agriculture shall be determined prior to starting to the measures in this direction and the significant measures shall be executed just in those fields.

The followings can be attributed to the key priorities of this field in regard to the purposes for development of the market of agricultural products and strengthening of export potential:

- development of the market of agricultural products;
- achieving the transition to the stage of strengthening of export potential;
- provision of food safety;
- support of agricultural production and implementation of effective protectionist policy;
- development of infrastructure in rural territories;
- approximation of the income level of workers working in agriculture to the average indicator on the republic;
- acceleration of scientific-research works in agriculture and strengthening of state care in this field;
- environmental protection;

- raising the level of knowledge of workers working in agriculture;
- environmentally pure food policy, etc.

3. THE MAIN PURPOSES AND DUTIES OF THE STATE IN THE FIELD OF INCREASE OF EXPORT POTENTIAL OF AGRICULTURE

As it seems from key priorities mentioned before, the development of the market of agricultural products and provision of increase of export potential considers the achieving to national goals and therefore, the support of state is especially important in this work. This importance is reflected in the goals set. The main goals of the state can be grouped, first of all, as economic, social and ecological goals in the field of development of the market of agricultural products and increase of export potential. In this regard, the followings can be attributed to economic goals:

- creation of condition for economic development and economic increase;
- preservation of high and stable level of economic increase and employment;
- formation of the market of agricultural products and provision of its stable activity;
- provision of the transition to efficient use of resources;
- prevention of unfair competition and monopolies;
- provision of production of competitive product;
- protection of foreign economic activity of local manufacturers from negative impacts;
- stimulation of professional activity in real sector;
- solution of financing, also crediting and insurance problem of agro-industrial production sphere.

Successively, the followings can be attributed to the social purposes of the state in the field of development of agriculture and increase of its export potential:

- raising of living standards of the population and reducing of poverty;
- obtaining of social progress considering the better meeting everyone's needs;
- decrease or minimization of social inequality (differentiation) among people;
- ensuring the access of the population to social services and development of social infrastructure.

The role of commercial and investment banks is irreplaceable in crediting of the projects of development of agriculture and increase of export potential. Especially, implementation of large-scale agro-investment projects such as financing of establishment of agroholdings and reestablishment of infrastructure is possible only with activity of investment banks. But, considering the agriculture as one of the priority areas of the country's development makes necessary the crediting with special procedures. This difference is reflected in the fact that, the production process is mostly seasonal and the relative length of the production cycle. It is possible to finance the next production cycle on the account of incomes obtained in previous production cycle. But, "long-term farmer problem", i.e. return of farmers' incomes out of incomes obtained from other fields of economy doesn't allow it" [1]. The practice of developed countries shows that, the role of agrarian development banks has been increasing in recent times among financial organization taking part in the process of financing of agricultural area. These banks engage in fulfillment of functions oriented to development of agricultural area and almost, are establishing by state in all cases or on the account of its active financial assistance. The provision of sustainable development considers directly the state support and active government assistances, therefore the establishment of agrarian development banks shall be directly under patronage of the state [2]. The role of credit unions and microcredit organizations can also be noted especially in financing of production subjects engaging in agriculture in the

direction of development of the market of agricultural products and increase of export potential. They are distinguished by the participation of members in the management, the orientation of the obtained incomes for entrepreneurial activity, the existence of mutual trust and common interests. One of the factors of economic security of the development of agriculture and increase of export potential is fiscal policy. Here, more subsidies, other purposeful state funds and allowances are used widely within state budget. The state benefits to the field of agriculture are conducting on different criterions. The practice shows that, the decrease or complete cancellation of government subsidies stems from the fact that subsidies ultimately run counter to the goals of a sustainable economy. So, subsidies strengthen the excessive use of resources and decrease the social welfare of people. The price subsidies for the final product are considered particularly harmful. Thus, in addition to creating corruption, subsidies create a contradiction between the sectors receiving subsidy and those who do not [3]. The mechanism of state regulation of prices in this field should also be working for increase of export potential of agriculture. These prices usually are applied within the terms determined by the state and define different discounts for manufacturers. The purposeful prices provide the keeping of price parity of industrial and agricultural products, payment of taxes and making of other payments, payment of service costs for credits and increase of incomes of agrarian subjects. In general, the price mechanism is the unified system in agriculture, target prices must act as its basic element and other elements of price system shall be formed on their basis [5]. In order to prevent the decrease of production in field of agriculture and to increase the export potential, it is necessary to protect the level of prices of agricultural products from inflation and increase of prices of industrial products. In other words, prices shall be regulated by state in such manner that, it will create stimulus for manufacturers and finally it will increase the export potential of agriculture. One of the important economic provisions in the field of measures conducted in the direction of increase of export potential of agriculture is state financing and subsidies. While preparation of programs and other documents which consider state financing, the regulatory role of the state must be brought to the fore. But, in this case, the principles of sustainable economic development, that is to say, economic effectiveness and social solidarity and ecological responsibility shall be taken into consideration. One of the important economic terms of the development of agriculture and increase of export potential is existence of developed infrastructure. Though infrastructure doesn't take part directly in production process, it has a great influence in the last product, its efficiency and profitability. The insurance of agricultural production is also one of the objects of economic influence of the state in the direction of development of agriculture and increase of export potential. The agriculture includes in the category of comparatively risky fields, therefore the state is obliged to undertake the function of compensation and insurance of risk level of production units with different means. The foreign economic relations take large place in the rank of security factors in the direction of increase of export potential of agriculture. The protection of food market from external interference is considered one of the important terms of establishment and development of sustainable agriculture. The food market shall be protected from negative influences, the use of economic potential of the country as widely and effectively as possible, the creation of abundance of national products and services in the domestic market shall be achieved [6]. Because of this, optimal balance shall be found among import structures providing domestic market with qualitative food products and production areas which export potential is great. In a word, provision of sustainable development stipulates not only the increase of export, but also the import of products, which nominal value is higher than average accepted production norms, and which requires large capital investment and technological innovations. The protection of internal market is the duty of the state and because the struggle for the market has become more intense in modern times, there is a need for well thought systems and economic mechanisms.

The determination of principal directions of stimulation of national economy is necessary under the rule of legislation [7]. We must note that, the government intervention of foreign economic relations in the field of agriculture creates a stimulus for export of products of domestic manufacturers, soft bank credits are giving to the persons who engage in export, the import control is strengthening for protection of interests of domestic manufacturers and other measures are taking on the other hand. One of the important means for provision of the development of agriculture and increase of export potential is application of achievements of scientific and technical progress to production in a short time. The function of delivery of innovations to agricultural subjects shall be fulfilled by information and consultation centres. For this purpose, the establishment of the unified information infrastructure is considered necessary.

4. CURRENT STATE AND CHANGING TRENDS OF AGRICULTURAL EXPORTS IN AZERBAIJAN

The increase of Azerbaijan's export potential from year to year and especially the role of agricultural products in exports play an important role in the economically sustainable development of the country, along with the development of exporting farms. In recent years, the country's agricultural production has increased and is exported to various countries around the world. Wheat, barley, tomato, cucumber and other vegetables, pomegranate, hazelnut and other fruits and berries, along with traditional vine-growing, cotton-growing, silkworm breeding, tobacco and fruit-growing fields are also included in the country's agriculture. The statistical information shows that the production of the main types of agricultural products between 2001 and 2018 has increased. This has also affected their exports.

Table 1: Changes in the export value of agricultural products and their processed products, mln. USD

Products / Years	2001	2018	Increase for 18 years, time
Fresh fruit	11 884.6	325 571.8	27,0
Fresh vegetable	829.4	202 794.4	244,0
Potato	21.2	29 627.5	1397,0
Cotton fibre	14 890.9	79 529.9	5,0
Cotton yarn	212.3	23 667.8	111,0
Fruit and vegetable juices	1046.5	9672.8	9,0
Fruit and vegetable preserves	1076.2	7753.6	7,0

Source: "Export Review" of the Center for Analysis of Economic Reforms and Communication

As can be seen from the table, the export of agricultural products has increased rapidly during 18 years. The reasons for this increase mainly include the expansion of state support for agriculture and the increase of exports of other products, along with traditional exports. Greenhouse tomatoes, apples, strawberries, cherries, hazelnuts, pomegranates, and dates may be cited as an example to them. In modern times, previously seemingly remote export markets have also become accessible. Thus, in addition to the CIS countries, which are traditional export markets, Azerbaijani agricultural products are already exported to European countries, China, Japan, East Asia and the Gulf countries. Despite the fact that products exported from Azerbaijan are weak in terms of marketing and packaging, buyers prefer them more because of their taste. Also, due to climatic conditions, when the export of products in many countries ends, Azerbaijan's agricultural products grow and are ready for export.

However, along with logistical difficulties, poor marketing and lack of packaging also negatively affect the commodity appearance of our products and reduce their competitiveness in foreign markets. Elimination of the existing shortcomings in the near future can help increase the competitiveness of Azerbaijan's agricultural products in export markets. Therefore, measures are being taken to expand the geography of export markets and strengthen their position in traditional export markets, promote the "Made in Azerbaijan" brand and ensure international standards. If we look at the ranking of non-state and state exporting subjects related to the export compiled for the non-sector and realized by the "Export Review" of the Center for Analysis of Economic Reforms and Communication in 2019, we can see that "Nine Climate" LLC, "Global Export Fruits" LLC, "Sun Food" LLC, "Natural Fruit" LLC, "Azerbaijan Sugar Production Association" LLC, "P-Agro" LLC are among the non-state exporting subjects, and the companies of agricultural and food products such as "Azerpambig Agrarian Industrial Complex" LLC, "CTS-Agro" LLC, "Azertutun Agrarian Industrial Complex" LLC are among the companies belonging to the state participating in export operations for the non-oil sector. "Azersun Holding", "Gilan Holding", "Aznar", "Az-Granata" LLC and "Agro procurement and supply" OJSC are among the companies that can withstand competition in the export markets of crop products. The products processed by these companies are distinguished by their competitiveness. For example, it is important that the annual production capacity of wine, strong drinks, cognac, juice and nectar, compote, whiskey and others produced by "Az-Granata" LLC is 100 million packages. This company's products are exported to 20 countries, including the United States of America and Germany. Along with increasing the number of modern processing enterprises in the near future, the processing of potatoes, tomatoes and other products in the country should be kept in the spotlight. Given the expected abundance of products in the conditions of free competition environment formed in Azerbaijan, the increase of sales volume was observed in the Russian markets being from the traditional markets. This sometimes allows the other side to abuse the situation. The fact that large quantities of tomatoes and apples were stored at Russia's customs borders for weeks in the autumn of 2020 has caused serious losses to local entrepreneurs. In the current situation, the government has, as an alternative, held talks with the Kazakh government. In this regard, the main goal now is to minimize dependence on the Russian market and achieve greater advantage in alternative markets. The results obtained in a short period of time are a clear example of this. For example, cherries and pomegranates were exported to Nigeria, and pears, cherries and eggs were exported to Dubai city. In the current situation, relations are being established with the Gulf countries, Africa, Central and Eastern Europe, Singapore, China, India and other states. For example, jams, rice, peas, dried fruits and jam were sent to countries such as South Korea and Pakistan. As a result of negotiations, the first steps have been taken and export operations are expected to take place in the near future. The issue is that the work to be done does not end with the expansion of the geography of agricultural products' export. The correct answers to the questions such as What to export here? and When to export? should also be sought.

Table 2: Changes in the commodity structure of agricultural exports in Azerbaijan, mln. USD

	Product groups	2017	2018	2019
	Total	15 319 977,1	19 489 068,2	19 635 580,4
1	Live animals and products of animal origin	12 606,8	12 090,0	23 231,3
2	Products of plant origin	518 273,9	584 702,4	625 904,0
3	Finished food products, alcoholic and non-alcoholic beverages, tobacco	110 982,8	90 707,7	104 616,8

Source: www.stat.gov.az

If we refer to the data in the previous table, we can say that the export value of fresh fruits and vegetables was 6.0 times higher than the export value of fruit and vegetable juices and preserves in 2001, and 30.3 times higher in 2018. It is also clear from the data of the last table that in the last three years, the value and specific weight of finished food products in the commodity structure of export have decreased with some hesitation. In 2018, the minimum amount of this indicator was recorded. It can be concluded that the commodity structure of agricultural products' export is still dominated by natural products. The efficiency of production and foreign relations is achieved through the export of processed products. Because this process is accompanied by the creation of value added, increase of employment and rising living standards of population. As a result of works done to meet the needs of the republican population mainly through domestic production and ensure food security, as well as measures taken to promote the export of non-oil products, enterprises based on the high technologies in the agrarian sector and produced the competitive products were opened and the export potential has begun to strengthen in a number of areas along with meeting the local demand. It is clear from the conducted analysis and research that the main purchasing country of Azerbaijani agricultural products was Russia in 2020 and Turkey and Switzerland follows it. Last year, the main part of the country's non-oil export was tomato (201,4 million USD) and cotton (131,9 million USD). In general, in 2020, the country's fruit and vegetable export was 607,7 mln.USD, cotton yarn export was 19 mln.USD, alcoholic and non-alcoholic beverages export was 12 mln.USD, sugar export was 26,9 mln.USD and tea export was 9,5 mln.USD. Thus, the non-oil export of Azerbaijan in 2020 was 1,9 billion USD and compared to 2019, it was 5,2% (102 mln.USD) less. This can be mainly connected with the distrust of close import partners, the risk of losses from their unpredictable actions and the weakening of mutual relations due to the pandemic.

5. CONCLUSION

It is necessary for the country to have diversified foreign trade relations in order to be recognized in the world community and take a worthy place in the international market. In order to maximally benefit from these relations, each country tries to make efficient use of its natural and economic resources. If the country is observed a technological backwardness and a shortage of qualified personnel, then it leads to losses in foreign economic relations. Thus, the natural export of a product without processing means a significant loss of added value and income. This is a characteristic situation for developing countries, including Azerbaijan. This is more clearly reflected in the example of agricultural products. It is a real fact that the specific weight of fresh fruit and vegetable in Azerbaijan's agricultural export has increased, while the share of their processed products has decreased year by year. Despite the increase of cotton, tobacco, cocoon, hazelnut and date export in recent years, the production and export of processed products from them and other products (grape, tomato, apple, etc.) is decreasing. This can be connected with the small number of processing enterprises, their low production capacity, the investment capacity for the establishment of new enterprises, as well as the lack of marketing experience of existing enterprises. For this reason, subjects that avoid from the strong pressure of competitors in foreign market satisfy with the export of natural agricultural products. For the purpose of preventing from it, consistent measures should be taken to invest in the establishment of large agro-processing enterprises in the country, to provide them with tax and credit benefits, as well as to promote and stimulate the export of agro-processed products in the near future. At present, Azerbaijan is the most successful country in the region in terms of favorable natural conditions, geographical location, developed infrastructure and financial opportunities for taking of these measures. Moreover, the quality (ingredients, taste) of the agricultural products in Azerbaijan prefers from foreign analogues.

In this regard, it can be thought that there will be a great demand for processed products obtained from them in foreign markets. Therefore, using the existing opportunities, it is possible to change the structure of Azerbaijan's agricultural exports in favor of agro-processing products, and its implementation is a requirement of the present time.

ABSTRACT

Digital entrepreneurship is an essential field for future innovation. The Azerbaijani government has taken a number of important steps in this direction, however, the weakness of the country's innovation ecosystem, as well as the lack of a historically formed open innovation culture that constantly supports entrepreneurs and encourages them to take risks, has led to relative stagnation. In the last years, there has been a relative slowdown in venture investment, and there has been a gradual decline in the number of successful companies entering the market. Therefore, there is a need to improve coordination between the different policy instruments used by the state, accelerate digital transformation and stimulate state-owned enterprises to create the need for innovation, and ensure a predictable business environment and internationalization of the national startup ecosystem. All this characterize the urgency of the research topic. The purpose of the research is to identify the existing problems in the policy of the state in the field of digitalization of entrepreneurship and to develop specific proposals and recommendations to address them. The research used a number of general methods of economics, including a systematic and logical approach, comparative analysis, as well as methods of analysis and synthesis. The article analyzes the theoretical and practical approaches to defining the goals and directions of the state policy in the field of digitalization of entrepreneurship, as well as to identify and eliminate the main problems. The authors advice on the impact of the policy of digitalization of entrepreneurship on the socio-economic processes in the country, substantiate the role and importance of measures taken by the state in solving the problems of socio-economic development of the country. The scientific novelty of the research is a comparative analysis of the policy of Azerbaijan and a number of developed countries in the field of digitalization of entrepreneurship, the development of priorities for improving socio-economic policy based on the interaction between the digitalization of entrepreneurship and socio-economic development.

Keywords: *digital entrepreneurship, innovation ecosystem, government innovation policy, government support tools*

1. INTRODUCTION

The problem of effective of small and medium-sized enterprises development is becoming increasingly important for the Republic of Azerbaijan. Today, small and medium-sized enterprises development is the most important element of a market economy. The experience of foreign countries shows that sustainable development of the state and sustainable economic development is impossible without the institution of entrepreneurship, because it determines the rate of economic growth, the structure and quality of the country's gross domestic product. A small enterprise responds quickly to changes in the external environment, effectively replenishes unused market space, restricts market monopolies, and creates additional jobs, which are especially important in crisis. Entrepreneur provides most of the goods and services to the population and it is an important taxpayer for the state.

Business advantages (independence, risk-taking, organizational mobility, sensitivity to innovation, management and technological agility) allow the entrepreneur to successfully respond to changing market conditions, sell the necessary goods and services, primarily with its own capital and favorable welfare. In the mode of digital transformation, the existing institutional system changes, other coordinates of the institutional balance appear, a more complex and contradictory institutional environment emerges, and institutional changes occur [1, p. 37]. The transition to the digital economy could not touch upon the business sector. From this point of view, the issue of digital enterprise formation is especially relevant today in Azerbaijan. The urgency of digital economy development and the application of technology is actively discussed, because a single theoretical and methodological base for research in this area is still being formed and not fully developed and it stimulates its deeper analysis and search.

2. DIGITALIZATION OF THE ECONOMY - AS A FACTOR OF ENTREPRENEURSHIP DEVELOPMENT

Changes in the economy related to the development and application of digital technologies have a significant impact on already established business models. New materials, expanded reality, admixture technologies, UAV, advanced robotics, cloud computing and data storage, biometric and implantable technologies, large-scale technologies, big data and machine learning, a huge layer of financial technology, etc. events use from information technology efficiently. In general, the digital economy can be defined as a set of social, economic and cultural connections realized within the digital space, involving the widespread use of information and communication technologies and big data. “State Program on Expansion of Digital Payments in the Republic of Azerbaijan in 2018-2020” markets and economy sectors in which the digital economy interacts with competing entities; platforms and technologies for the development of markets and industries; defines as a set of institutional environment (normative regulation, information infrastructure, personnel, information security) [2]. As noted by the Rector of UNEC, Professor A.Muradov, “... a large number of digital platforms have emerged worldwide through the use of information-based business models and the digitization of existing sectors. Today, 7 of the world's 8 largest companies by market capitalization (Amazon, Alibaba, Facebook, eBay, Uber, Didi Chuxing, Airbnb) use digital platform-based business models. The presence of firms can be considered a key indicator of the strength of these platforms” [3, p. 8]. The digital economy has already passed through several stages of development:

- 1) 1990-2005. Introduction stage. E-business and e-commerce development;
- 2) 2005 - 2010. Growth stage. Explosive growth of new products and e-services;
- 3) 2010 - 2019. Maturity stage. Mass placement of online channels and digital influence to traditional enterprises;
- 4) From 2020, systemic transformation and fundamental digitalization are forecasted based on a systematic approach.

According to the European Commission, in general, it can be observed strengthening digitalization, widespread use of information technology and intellectual capital around the world [4, 5]. The evolution of EU member states in the field of digital competition can be tracked by the International Digital Economy and Society Index (DESI), which is a summary indicator and covers five indicators characterized by more than 30 indicators. This includes the following indicators:

- Connectivity measures the location of broadband infrastructure and its quality, access to fast and ultra-fast broadband services, it is a necessary condition for competitiveness;
- Human Capital and Digital Skills measure the skills required to use ICT effectively;

- Use of Internet Services takes into account various online activities such as online content consumption, video calls, as well as online purchase and banking operations;
- Integration of Digital Technology evaluates the activity of enterprises from the point of view of ICT application, i.e., whether the company uses electronic invoices, cloud services, whether they carry out electronic sales, etc.;
- Digital Public Services assess the level of e-government and e-health services development.

Business is the area where digitalization processes are most active. The use of information resources to increase the level of competitiveness of business structures is associated with the optimization of business processes and their transfer to digital platforms. Digital platforms are hybrid structures aimed at creating value by providing direct interactions and transactions between large groups of third side users [6, p. 22-36]. The undoubted advantages of business digitalization are the automation of business processes, new ways of attracting customers, reducing decision-making time and reducing costs. The difficulties in the transition to the digital economy are the lack of skilled personnel who understand business transformation, the limited time frame for transformation and conservatism. Possible aspects of business growth through the use of digital technologies are the development of customer service and the use of communication channels (analytical tools, assessment, variability, adaptation, forecasting) to attract and retain customers, to form a positive image; strengthening partnerships in business using non-standard solutions; data enrichment and application of innovative technologies, modeling of consumer behavior and processes, search for new fields of business development by making forecasts based on Big Data [7, p. 78-84]. Information technology is included in all spheres of socio-economic life of society, it has a significant impact on the development of individual sectors of the economy. According to the information on the dissemination of information technology in the business sector and science-technology field, in general, the business sector is far ahead of the scientific-technical sector in terms of the use of the Internet in shopping, the use of CRM, ERP, SCM for sale. This lead in the use of RFID technology is almost 58% (14 times). Modern technologies are firmly integrated in the economic processes of economic entities and define their business processes. The share of digitalization of financial settlements in electronic form and the solution of organizational, economic and management tasks is particularly high (52-56%). Thus, the application of modern digital technologies for SMEs is not only a factor, but also a tool for development. According to experts, the digital revolution has already begun in small and medium enterprises in the country. Many small business owners are already using online technology to grow their business. The readiness of SMEs in Baku and other regions of Azerbaijan (Business Digitalization Index (BDI)) for the digital business model is assessed by the Business Digitalization Index (BRI).

This index is calculated primarily on the basis of the following special indicators:

- data transmission and storage channels: this indicator indicate whether the company uses various digital channels (cloud technology, corporate mail, instant messaging, automation systems, etc.) for data transmission and storage;
- integration of digital technologies: the parameter measures the level of technologies application at work - artificial intelligence, Internet of Things, 3B printing, use of online documents, etc .;
- Internet use in sales: the indicator takes into account the various activities used by enterprises on Internet channels (availability of a website, pages on social networks, use of promotional channels, etc.);
- information security: it measures the readiness of entrepreneurs to face potential digital threats;

- digital training: the indicator demonstrates the level of training of the company's management in the field of digital technology training and the experience of conducting such course and trainings.

3. TARGETS AND PRIORITIES OF THE PUBLIC POLICY OF AZERBAIJAN IN THE FIELD OF ENTREPRENEURSHIP DIGITALIZATION

The use of ICT by businesses in the Republic of Azerbaijan is low, especially among SMEs. In 2015, only 30-50 percent of SMEs used the Internet, due to their limited skills and awareness, as well as their preference for traditional practices. According to the State Statistics Committee, in 2019, only 9.8 percent of companies had a website [8]. The territory of the High Technology Park, established in 2012 by the President Order, covers 50 hectares areas on Pirallahi Island, a district of Baku. Its mission is to strengthen the high-tech economy by providing a business-friendly environment with modern facilities, economic incentives and business services. Today, however, it is accepted more than an industrial park and the number of computer service companies located here is small. However, there is a using incubator for various startups. In 2015, a resident company in Mingachevir High Technology Park began production of computers, tablets and other electronic devices too. Another indicator of the limited software sector in the country is reflected in trade statistics. Azerbaijan faces a significant balance of payments deficit in the field of computer and information services, which suggests that there are shortcomings in the realization of the country's potential in the development of IT applications. Some universities in Azerbaijan, which have incubators for social entrepreneurs, provide aid to the field of technology startups. Some telecom operators also have startups that aim to develop mobile applications for entrepreneurs [9]. Besides, there are a number of startup events organized by international organizers (Seedstars) [10] and universities that provide mentorship (Massachusetts Institute of Technology) [11]. In addition, Azerbaijan's Annual International Exhibition and Conference on Telecommunications, Innovation and High Technologies, known as Bakutel, provides an opportunity for startups to present their ideas to an international audience [12]. In November 2018, the “Innoland” Incubation and Innovation Center was started, which includes a fabrication laboratory, collaboration work area, incubator, research, development center and technology academy. Although there are a number of government initiatives to assist SMEs in mastering ICT, none of them have yet had a significant impact on the development of SMEs in the ICT sector. The Easy Support for Family Business (ABAD) initiative is implemented by “ASAN” Service and helps to be SMEs more productive in agriculture and handicrafts fields through an incubation mechanism. Similarly, the new Small and Medium Business Development Agency (SMBDA), launched in June 2018, aims to facilitate SME business procedures through some digital initiatives, including ICT training and the creation of a G2B (state-business) electronic registry portal. The government also aims to support startups that engage in innovative activities through tax stimulus [13]. One of the other serious challenges facing SMEs and startups in Azerbaijan are access to credit; according to World Bank surveys in 2013, access to finance was noted as the biggest hurdle facing Azerbaijani enterprises. [14] Banks in Azerbaijan are reluctant to credit to high-risk enterprises. Through the State Fund for Information Technology Development, startups are provided with capital (mainly for seed financing). Besides, SME Funds under SMBD leadership will provide guarantees for SMEs in order to support their financial accessibility. SMEs usually need more flexible financing options in terms of volume and type of funding, depending on the stage of development. Financing of high-growth startups in the world is usually achieved through angel investment and venture capital, but this type of financing is almost non-existent in Azerbaijan. E-commerce is not developed enough in the country. In recent years, only 5-6 percent of the population has made online shopping, the figure is very low compared to the corresponding world average of 24 percent.

Despite the fact that retail e-commerce almost doubled between 2016- 2017 and increased from 25.6 million manat (\$ 15 million) to 46 million manat (\$ 27 million) in 2017, this is only 04 percent of GDP, which is lower than the corresponding average for the world and neighboring countries [15]. Azerbaijan is ranked 68th among 144 countries in the UNCTAD B2C E-Commerce Index due to poor penetration of electronic payments, including credit and debit cards, lack of local online stores, underdeveloped logistics, lack of trust between buyers and sellers, poor digital literacy among people in general [16]. Another problem is the high transaction fees associated with foreign credit card payment networks. In order to solve the problem, the government envisages the development of e-commerce as one of the priorities of the State Program on Expansion of Digital Payments in 2018-2020 [17].

4. CONCLUSION

We can say with fully confidence that entrepreneurship has already begun to digitalize in Azerbaijan. However, most enterprises remain largely traditional in their activities, use only a few digital technologies in their businesses and they do not reuse the entire business structure. It is very expensive for some people, some persons are afraid of cybercrime and others do not find the right technology for their work. In order to stimulate companies, we believe that the government needs targeted measures for information security, investment in scientific research and digital entrepreneurship. Thus, the importance of digital technologies for the modern economy is undeniable. All over the world, in every field and in every company, people are digitizing what they are doing. Every day new digital assets are created: new applications, functions, ideas are developed - all this makes us faster and more efficient, our lives are safer, new innovations are opened for society. Together, these small digital steps have a profound effect on the economy as a whole. To avoid uncertainty in the future, it is necessary to actively cooperate with international organizations in theoretical and practical areas. It is important to explore the potential of technology to contribute to economic development and innovation, both at the industry level and at the national level. We believe that for the digital economy growth and digital entrepreneurship development, it is necessary to develop the national IT sector, stimulate the creation of innovative technologies and cooperate for their development at the international level. It is necessary to create a solid fundamental knowledge and skills base that provides highly qualified training of young professionals. It is important to further streamline the conditions for the development and improvement of young talented specialists within the Republic of Azerbaijan. It is necessary to stimulate investment and entrepreneurship in this field, to apply new technologies for business development. It is important to provide support for beginners, contribute to the development of new innovative enterprises that will be focused on international markets and viable in the face of global digital competition, mobilize knowledge through key production and economic relations, as well as exchange and create new jobs in high technology field. Business leaders need to develop good business strategies based on the use of IT, rely on digital technologies to interact with customers, business operations must consist of digital connections between themselves and process participants and business structures must respond to change. IT is a business environment and can be used to increase competitiveness. The transition to new technologies in modern times is the key to successful entrepreneurship. Modern information and communication technologies are a much-needed product for the organization and promotion of a well-functioning business, effective entrepreneurship gives it a competitive advantage in the business environment. It is important to integrate modern technologies into daily work and business processes, change its format, start a business in the same way as new digital services and systematically train staff to work with new technologies. The development of digital public services and the integration of digital technologies into entrepreneurship is particularly important.

In order to move on the trajectory of recovery and development in the liberated lands, our country needs the interaction of society, business and the state, that is, the penetration of digital relations at all levels of interaction. Digitalization is a tool that can make the economy of our country and its different regions modern and competitive.

ABSTRACT

Since the second half of the twentieth century, migration processes have acquired truly global proportions, covering all continents of the planet, social strata, and groups of society, various spheres of public life. Quite rightly, the past century is called the "era of migration". International migration in modern society is a fairly significant phenomenon in terms of its scale, as well as its socio-economic and political consequences for countries and regions. The process of internationalization of production, which is actively taking place all over the world, is accompanied by the internationalization of the labor force. Labor migration has become a part of international economic relations. Despite giving rise to certain problems, labor migration provides undoubted advantages to countries that receive and supply labor. The intensification of migration processes observed in recent decades is expressed both in quantitative and qualitative indicators: the forms and directions of movement of labor flows are changing. Cross-country migration of the population and labor resources occurs when there is a significant contrast in the levels of economic and social development and the rate of natural demographic growth of countries receiving and giving away labor force. The world community, which until recently did not directly feel the size, characteristics, and consequences of migration processes at the international level, faced the need to coordinate the efforts of many countries to resolve acute situations and collectively regulate migration flows. The purpose of this work is to consider the concept of migration, to identify the main causes and consequences of migration and emigration of labor resources, and ways to regulate them. To achieve this goal, the following issues will be addressed in this paper:

- *revealing the concept and types of international labor migration;*
- *showing the scale and direction of international labor migration;*
- *considering the socio-economic impact of labor migration;*
- *considering the state regulation of external labor migration;*

Keywords: *international labor migration, labor resources, migration processes, migration regulation policies*

1. INTRODUCTION

An important part of world economic relations is international labor migration - the movement of workers looking for work to other countries. International labor migration is the interstate movement of labor resources with a change of permanent residence. It includes two counter phenomena: emigration and immigration. Emigration is the departure of the population of a country abroad, immigration is the entry of the population of other countries into the territory of a given country. These multidirectional flows of labor resources form the international labor market, which brings together similar markets at the level of states and regions. Labor migration is a form of existence of the international labor market.

Illegal migrants could enter another country both illegally and legally (by private invitations, as tourists) with the subsequent transition to an illegal position or illegal employment. A special type of population migration is forced migration, i.e., this type of migration happens under the influence of forced circumstances or stressful conditions in the form of wars. The urgency of the problem of labor migration is that labor resources have always been of a great value and a strategic reserve of a country. Even though “import” of labor from abroad in the form of labor migration has many benefits associated with it, this process is also viewed by some as a threat to the welfare state as well as the cultural identity of the receiving nation. Therefore, states employ immigration policies to regulate the number and composition of immigrants entering the country during a particular period. This work aims to study and identify modern problems and consequences associated with the migration of human resources, as well as to analyze the causes of migration and the mechanism of its regulation.

2. THE HISTORY OF THE EMERGENCE OF MIGRATION PROCESSES

Historically, migration processes originated many centuries ago. The first massive movement of workers was the import of slaves from Africa to America. In the 40s of XIX century there was an explosion of emigration from Ireland to the United States due to the "potato famine". Large-scale migration in the early 80s of XIX century from Italy and Eastern Europe to the United States was associated with falling prices for European wheat. The flow of migration slowed sharply due to the deteriorating economic situation in the United States and gained strength again during the economic recovery. A new wave of migration from Europe to the United States was noted in the 1920s. To the reasons already mentioned, we must add here the difficulties of post-war life in Europe. After World War II, three new flows of labor migration to the United States were noted. First, it is a "brain drain" - a steady flow of highly qualified professionals and their family members to North America. Second, the flows of refugees from Hungary (1956) after the suppression of the anti-communist uprising and from Vietnam (1974-1975) after the end of the Vietnam War, as well as from Cuba (1980). Third, the largest influx of this period is the influx of labor from Mexico, the Caribbean, and Asia to the United States. At the beginning of the new century, 84% of all immigrants came from these regions. Mass migration to the United States has always been great. The wealth of this country has attracted and continues to attract the population of many countries of the world. The size of the annual influx of migrants depended on the economic conditions in the United States, stimulating migration from Europe and other regions. Today more than 700 thousand people a year legally immigrate to the country. A special role in the processes of labor migration of the XIX-XX centuries is the migration of the population from China to the countries of Southeast Asia and North America. It was mainly of a resettlement nature and it is estimated that 70 to 100 million people migrated during this flow. In Europe after the Second World War, especially since the early 1960s, quite intensive processes of labor migration were also noted. Labor from Spain, Portugal, Greece, Yugoslavia, Turkey was actively used in the economies of the industrially developed countries of Europe. In the mid-1990s, the influx of immigrants to Western Europe was at the level of 180 thousand people a year. Countries receiving the bulk of immigrants are Germany, France, Great Britain, Switzerland. Australia is the classic country of immigration in the Asia-Pacific region. In the XIX-XX centuries, this country received a large number of emigrants from different countries. In the early 1990s, Australia pursued a migration policy that stimulated business development, therefore, first of all, foreigners were urged to invest in the country's economy. It is from this decade that the immigration wave to Australia has noticeably decreased. According to official figures, there were more than 35 million migrant workers in the world by the beginning of 2005, compared to only 3.2 million in 1960. If migrant workforce with accompanying dependents are also taken into consideration, then the number of migrant workers with their families can currently exceed 100 million.

3. REASONS BEHIND LABOR MIGRATION

The reasons for labor migration can be different, both economic and non-economic in nature. Non-economic reasons might include political, national, religious, racial, family, etc. issues. In recent years, economic reasons have begun to play an increasing role: job search, increased income, living standards, etc. Economic reasons lie in the different economic levels of development of individual countries. The labor force moves from countries with low living standards to countries with higher living standards. Chronic unemployment, which exists in some countries (especially underdeveloped ones), has become an important factor in the increase in migration. Therefore, the possibility of migration appears due to national differences in wage conditions. In industrialized countries, thanks to the ability to solve a complex of socio-economic problems, a fairly high standard of living has been made possible for the population, which has, basically, a certain level of education and culture. Therefore, in production and infrastructure there is a whole list of non-prestigious low-paid jobs and specialties for which it is difficult to find an employee. At the same time, in developing and former socialist countries, where unemployment is high and wages are low, there are many who are eager to take such jobs in order to provide financial stability to their families. It is essential to distinguish between internal labor migration, occurring between regions of one state, and external migration, which could also be called international migration, affecting several countries. International labor migration between developed countries occurs primarily for non-economic reasons. In this case, the prestige of the job or firm, the possibility of professional growth, career, and cultural needs play a significant role. Non-economic reasons include political and religious reasons, unification and disintegration of states, natural disasters, wars, environmental problems, and personal reasons. Each of these and many other non-economic reasons can and do lead to large interstate movements of labor, which will have the same economic consequences as international labor migration. For developed countries, a big problem is the so-called "brain drain", for example, from Europe to the United States. Israel has become a kind of center of attraction for immigrants. Its population has increased by 60% due to migration flows and to a large extent (by 30%) due to immigrants from the USSR. Another direction in labor migration is the departure of qualified specialists and scientists to developing countries, which is often caused by economic factors, new job opportunities and, finally, simply the desire to get a job in a new place, to test their capabilities in new working conditions. This flow of migrants is relatively small.

4. CONSEQUENCES OF LABOR MIGRATION

Practice shows that labor migration can be beneficial both for countries exporting labor and for countries receiving it. For an individual country, the export of labor is an important source of currency to the country. It is received regularly in the form of transfers to families and when an employee returns from abroad. The departure of labor force abroad means an improvement in the situation on the domestic labor market, a reduction in unemployment in the country. Temporarily idle funds of immigrants held in bank accounts can be used to finance the host country's economy. At the same time, remittances sent to the country allow families to increase the level of consumption, increase aggregate demand, stimulate the development of production, i.e., enable the country as a whole to solve a complex of internal socio-economic problems more successfully. Part of the money received through the purchase of shares, land, real estate is directly invested in the development of the national economy. Furthermore, working abroad allows people to acquire new professional skills, experience, knowledge, which they will use when returning to their homeland, increasing the productivity of work. They also expand the capacity of the domestic market, present additional demand for goods and services, stimulate production growth and additional employment in the host country. Countries that import labor are primarily concerned with reducing production costs.

Host countries save on costs that have been invested in education and training of workers and professionals in donor countries. Immigrant workers receive significantly lower wages than local workers, which helps to reduce production costs and increase the competitiveness of national goods in the world market. The influx of highly mobile foreign workers facilitates structural, sectoral and other changes in the national economy. Immigrants contribute to the rejuvenation of the nation, since mainly young people emigrate - the most mobile part of the population in the best working age, thereby improving the demographic situation, especially in the industrialized countries of Western Europe, which are characterized by an aging indigenous population. Foreign workers often play the role of a shock absorber in the event of crises and unemployment, as they can be the first to be fired from their jobs. They are not provided with pensions, health insurance and are not taken into account in the implementation of social programs. At the same time, labor migration can have negative consequences. The negative consequences for recipient countries are as follows. Entire sectors of the economy (services, trade, construction), with the long-term use of foreign workers, become dependent on their labor. This leads to a reduction in the number of jobs among the indigenous population, increases unemployment, and generally worsens the situation on the national labor market. There is expected to be a significant decrease in the wages of the national labor force, with the supply of foreign workers on the labor market growing, who fill vacancies for low-paid and unskilled jobs. Conflicts are likely to occur between the indigenous population and immigrants, as a result, social tension as well as hostility within the society will grow. More often than not, migration is presented as a threat to the cultural identity of the receiving nation, which turns migration into a security matter, enabling governments to implement strict immigration policies (Huysmans, 2000). It is no coincidence that in recent years, in the interests of neutralizing the negative consequences and enhancing the positive effect obtained by the country as a result of labor migration, the means of both state policy and interstate policy have been used quite widely. An increase in its volumes is becoming a feature of modern international labor migration. Although there were only 3.2 million migrant workers in 1960 in the world, this number increased to 35 million in 1995. The socio-economic aspects of international labor migration can be viewed from three points of view: the migrant, the country of departure and the country of arrival. It is well known that the economic interest of migrants is to improve their living standards in the country of destination. Countries, depending on various factors, may be interested in both immigration and emigration. Emigration interest, as a rule, is of developing countries, where the demographic situation is very difficult, and the standard of living is relatively low. The interests of all three subjects may coincide or contradict with each other. In addition to the economic and social aspects of international migration, there are also demographic and political aspects. An increase in population density complicates the relationship in the human-nature system. The concentration of the population in cities causes an increase in social tension, leads to incitement of ethnic conflicts, an increase in crime, etc. When forming the concept of migration policy, all these aspects should be taken into account.

5. REGULATION OF LABOR MIGRATION THROUGH GOVERNMENT POLICIES AND INTERNATIONAL INSTITUTIONS

To eliminate the negative consequences and enhance the positive effects received by the country as a result of labor migration, it is necessary to use a set of means of state and interstate regulation of migration processes. State interference in the movement of labor across state borders dates back to the regulation of international markets for goods and services. Already at the end of the 19th century, the legislation appeared that prohibited the departure of workers and the entry of unwanted foreign citizens. On the contrary, it encouraged the immigration of specialists for promising sectors of the economy, representatives of rare professions, people with a worldwide reputation in the field of science, culture, art and sports, business

representatives investing their capital in the economy of the host country, and, finally, workers willing to perform harmful and difficult work for the minimum wage. Today, the states of the world community have developed a whole system of measures to regulate intercountry labor migration, including legislation on the legal, political, and professional status of migrants. Migration policy is carried out directly through national migration services, usually created under the ministries of labor, justice, or foreign affairs. Immigration services carry out the functions of control over the entry into the country. Their responsibilities include issuing entry visas, permits, coordinating them with entrepreneurs' applications for employment, as well as monitoring the time spent by foreign workers in the country. Non-migration policies related to labor-market and education can also have indirect effects on the number of immigrants entering the country, which explains why immigration policies sometimes fail to have a desired effect on the migration process (Czaika & De Haas, 2013). Countries importing labor resources, constantly experiencing the need to attract labor, base their immigration policy primarily on measures to regulate the number and quality of arriving migrant workers, and the immigration quota indicator is used as a regulatory tool, which is annually calculated and approved in importing country. When determining the quota, the country's needs for foreign labor and for certain categories of the population involved (gender and age groups, education, etc.) are taken into account, as well as the state of national labor and housing markets, the political and social situation in the importing country. An example of high requirements for the quality of the arriving labor force is evidenced by the need to go through the procedure for recognizing the documents of education or vocational training held by the migrant, as well as the existing work experience in the specialty. The age limit is one of the most common criteria for selecting immigrants and is in favor of younger applicants. The following issues are also considered to ensure the quality of workforce: good health of an arriving migrant (typical for a number of Scandinavian countries and the United States); additional professional requirements related to a number of specialties or professions (in the United States, a foreign programmer must own the software accepted in the country, be familiar with the corresponding computer systems); limitations based on personal and psychological background (For instance, an applicant for South African citizenship must have a "pleasant character", and representatives of any of the parties of the totalitarian type are prohibited from entering the United States). There is also an argument that immigration policies are hardly effective since the primary causes of migration, such as labor market imbalances remain unaffected by those policies (Czaika & De Haas, 2013). Thus, the implementation of such policies, that do not address the core of the problem, is unlikely to solve the migration issue, but rather it is going to force migrants to seek other ways and routes of immigration (Hampshire, 2015). At the same time, it should be borne in mind that the value of any qualitative feature in the selection of immigrants is not constant and may change in favor of other priorities. But for a number of characteristics, such as the age qualification, the availability of a labor certificate, the possession of a profession and professional training, the requirements are quite stable over time. The world community and international organizations play a certain role in regulating labor migration. The world community has recognized it as an expedient and necessary condition to adhere to certain legal norms and standards enshrined in the documents of international organizations. By ratifying international conventions, countries regulating the process of labor migration recognize the priority of international law over national legislation, which is important both for the country and for migrants. If a labor-importing country is mainly responsible for the arrival and use of migrants, then the functions of a labor-exporting country primarily include regulating the outflow and protecting the interests of its migrant citizens abroad. Therefore, in many respects, the interests of the countries-exporters and importers of labor are closely intertwined. Nowadays, a considerable number of global institutions and organizations (primarily within the UN), as well as regional groupings, continue to deal with the problems associated with the

migration of the population and labor resources. Thus, the UN Commission on Population has a fund, part of which is used to subsidize national programs in the field of population migration. The activities of the International Labor Organization (ILO) also include the regulation of intercountry migration of the population. A number of international treaties adopted by the World Health Organization (WHO) contain special rules that relate to the physical condition of migrant workers. UNESCO documents contain provisions aimed at improving the education of migrant workers and their families. The role of the International Organization for Migration (IOM) is growing, its purpose is to ensure orderly and planned intercountry migration, its organization, exchange of experience and information on these issues. In addition, in the Western Europe region, the Intergovernmental Committee on Migration works to promote and protect the rights of migrant workers. The mechanism of national and international regulation of labor migration includes a set of the following instruments:

- creation of appropriate state institutions;
- international agreements (bilateral and multilateral agreements);
- quality requirements for foreign labor (certificate of education, work experience in the specialty);
- direct quotas and indirect regulation of labor imports;
- regulation based on economic criteria;
- administrative measures to ensure the import of labor;
- economic aid to regions of mass emigration; the formation of an emigration climate;
- foreign exchange and banking policy (privileges on foreign exchange deposits, opening foreign branches of domestic banks, using foreign banks);
- financial policy; investment and tax policy; customs policy, etc.

At the international level, several organizations have been created whose work is aimed at streamlining migration processes. The International Labor Organization (ILO) was founded in 1919, and in 1946 it became a specialized agency of the United Nations. Within the framework of the ILO, conventions and recommendations are adopted that establish labor standards in the field of wages, hours of work, holidays, and labor protection. 172 conventions and 181 recommendations have been adopted until today. International Organization for Migration (IOM) was founded in 1949. The main functions of the IOM are implementation of orderly and planned migration of citizens, organization of movement of refugees, prevention of brain drain, consultation on migration issues. IOM is not part of the UN agencies, but works closely with the UN. The SOPEMI Migration Monitoring System coordinates the activities of national immigration offices (established by the OECD member countries). Intergovernmental agreements on the recruitment of foreign labor stipulate the conditions of stay of migrants in the host country, the observance of which intends to protect the interests of migrants. The legal basis for the implementation of the activities of state bodies of the Republic of Belarus in the field of migration, first of all, are the Constitution of the Republic of Belarus, as well as the laws "On the legal status of foreign citizens and stateless persons in the Republic of Belarus" (1993), "On citizenship of the Republic of Belarus" (1991), "On Refugees" (1995), "On External Labor Migration" (1998), etc. These legal acts regulate the procedure for exercising control by the state, mainly over the legal movement of the population, the entry of citizens and stateless persons into the territory of the Republic of Belarus and exit from it. The functions of regulation and control are entrusted to the Committee on Migration under the Ministry of Labor. In order to coordinate the efforts of government bodies involved in solving migration problems, a national migration program for 2001-2005 has been developed. To create a base for regulated migration, agreed strategies are applied at the bilateral level through the conclusion of intergovernmental agreements on labor activity and social protection of citizens.

Belarus has concluded intergovernmental agreements on temporary work and social protection of citizens working outside their states with the Russian Federation, the Republic of Moldova, Ukraine, the Republic of Poland, the Republic of Lithuania, the Republic of Kazakhstan. The agreements ensure the observance of the rights and legitimate interests of migrant workers, equality of remuneration for their work with citizens of the state of employment, payment of benefits and compensations in case of early termination of an employment contract, as well as in case of injury, occupational disease or other damage to health associated with the performance of job responsibilities.

6. CONCLUSION

Labor migration is the relocation of the working-age population from one state to another for a period of more than a year, caused by economic and other reasons, and can take the form of emigration, departure, and immigration. Labor migration leads to equalization of wage levels in different countries. As a result of migration, the total volume of world production increases with the more efficient use of labor resources. Quantitative indicators related to labor migration are part of the current account balance and are classified by income, payments to non-residents and private unpaid transfers, which represent the estimated cash equivalent of property moved by migrants at the time of their departure abroad and subsequent shipments of goods and money to their homeland. The economic benefits of international labor migration include an increase in the income of migrants, transfers of funds from abroad to their homeland, and a decrease in production costs in countries receiving remittances. Developed countries are the main destination for immigration, while developing countries are a source of emigration. State regulation of the international labor market is carried out on the basis of the national legislation of the host countries and countries exporting labor, as well as on the basis of interstate and interdepartmental agreements between them. Regulation is carried out through the adoption of budget-funded programs aimed at limiting the influx of foreign immigration labor or at stimulating immigrants to return to their homeland or re-emigration. Most host countries take a selective approach in regulating immigration. The screening of immigrants is carried out on the basis of their qualifications, education, age, health status, as well as based on quantitative and geographical quotas, direct and indirect bans on entry, and other restrictions.

ABSTRACT

Today, as never before, the use of modern technologies to solve existing problems has become urgent. The use of digital technology acquired new practical value during the Covid-19 pandemic when society faced new challenges. The fact is that the pandemic has had the strongest negative impact on the tourism sector. Therefore, in Georgia, Azerbaijan, as well as in other countries, tourism trends and key statistical characteristics have changed significantly. The revival of tourism, along with the epidemiological situation, will depend on many factors. Clearly, digital transformation, as a synthesis of advanced digital technologies combining physical and digital systems, will be crucial to shaping and realizing demand for a country's diverse tourism product. This put on the agenda the identification and analysis of the factors affecting the recovery of tourism and the expectations that we should expect after the end of the Covid-19 pandemic. We can boldly say that, today, digital technologies can be considered as a catalyst for the revival of the tourism industry and consequently the growth of Georgia's and Azerbaijan's economy. The aim of my research is to determine the impact on the expectations and prospects of the revival of the modern digital technology tourism industry in Georgia and Azerbaijan for the post-pandemic period. It will be of great importance how the popularity of Georgia and Azerbaijan will increase and their attractiveness coefficient in the digital world will increase. And, in general, what will be the response to the activities of travel companies in the post-pandemic period in terms of digital transformation. The methods of induction, deduction, observation, grouping and analysis were used in the research process. Digital technologies can be considered as a catalyst for the revival of the tourism industry and consequently the growth of the country's economy;

- Digital technologies are transforming the tourism industry and introducing new tourism products and services;*
- Leading the way for companies to interact with customers through online marketing, social media and various applications and so on.*

Keywords: *tourism, analysis, digital technologies, statistics*

1. INTRODUCTION

Today, Georgia and Azerbaijan, like the rest of the world, are facing great challenges. The Covid-19 pandemic has caused serious problems that have had a negative impact on almost all economic activities. Economic growth rates have declined, the social background of the population has deteriorated, relationships based on active communications have collapsed, they have been replaced by virtual, online platforms in the real world, and so on. However, until 2020, in the conditions of globalization, the quantitative parameters of the development of

Georgia and Azerbaijan were growing intensively. For Georgia and Azerbaijan, globalization has become a crucial issue in everyday political, economic, social, and cultural life. From the strategic point of view, it is very important for Georgia to enhance the world trade-economic, financial and other kinds of relations, especially when it is in the foreign interests of the country to share the advanced European values and experiences and join the European Union (Quliyev A., Abesadze, Abesadze, O., Amanova, L.,2019). The Covid-19 pandemic posed new challenges to the world. It is difficult to determine how much Georgia will remain an attractive country for international visitors in the post-pandemic conditions. (Abesadze, N. Statistics of tourism expectations in the post-pandemic period in Georgia.2020) Of course, Azerbaijan is facing the same problem. In order to form the right economic policy of Georgia and Azerbaijan it is necessary to conduct a theoretical and practical research in the area of the integration of Georgia into the world economic area, to study the foreign economic contacts quantitatively, to reveal the main tendencies of the development, to calculate their forecasting indexes, to estimate the results correctly and to work out appropriate political-economic proposals and preventive measures.(Abesadze.,N.2015). Today, as never before, the use of modern technologies to solve existing problems has become urgent. The use of digital technology acquired new practical value during the Covid-19 pandemic when society faced new challenges. The fact is that the pandemic has had the strongest negative impact on the tourism sector. Tourism in the active phase of development, especially international, has moved to the stage of uncertainty and all related activities have actually reached the stage of dormancy. Therefore, in Georgia and in Azerbaijan, as well as in other countries, tourism trends and key statistical characteristics have changed significantly. The revival of tourism, along with the epidemiological situation, will depend on many factors. Clearly, digital transformation, as a synthesis of advanced digital technologies that combine physical and digital systems, will be crucial to shaping and realizing the demand for a diverse tourism product across the country. This put on the agenda the identification and analysis of the factors affecting the recovery of tourism and the expectations that we should expect after the end of the Covid-19 pandemic. We can boldly say that, today, digital technologies can be considered as a catalyst for the revival of the tourism industry and consequently the growth of Georgia's and Azerbaijan's economy.

The purpose and objectives of the study:

The aim of research is to determine the impact on the expectations and prospects of the revival of the modern digital technology tourism industry in Georgia and Azerbaijan for the post-pandemic period.

Research methods:

The methods of induction, deduction, observation, grouping and analysis were used in the research process.

2. RESULTS

Georgia and Azerbaijan are striving to boost tourism numbers with new projects and activities that are planned for increasing tourists' flow into the region, improving touristic infrastructure and services.Both countries have huge potential for implementing joint projects to further develop and support tourism in the region. As for tourism ties between Georgia and Azerbaijan, the statistics show that Georgia is one of the most favorable destinations for Azerbaijani tourists (Abesadze,N.,Abesadze, O., Amanova,L.,2020). What will happen in the future? How will develop tourism? It will be of great importance how Georgia's and Azerbaijan's popularity increases and its attractiveness coefficient in the digital world increases. And, in general, what will be the response to the activities of travel companies in the post-pandemic period in terms of digital transformation.

Prior to the pandemic, Georgia and Azerbaijan had a very good and successful experience in how to "sell" Georgian and Azerbaijan tour products through digital marketing or the Internet in different parts of the world. The country was popularized with various videos. But in a thirty-second clip it is difficult to make all the messages, and also, in terms of outdoor advertising, it is unthinkable to show all corners and all directions of Georgia on the billboard. Digital technologies allow potential visitors to receive different types of messages about Georgia and Azerbaijan that may be of interest to them. Georgia and Azerbaijan have a lot in common to offer foreign visitors, namely: picturesque nature, Black Sea subtropical zone and Caspian continental climate, winter resorts, historical monuments, rivers and waterfalls, rocky towns, traditional cuisine and, of course, Georgian-Azerbaijani hospitality. As can be seen from the table below, international travel visits were increasing until the pandemic. In 2019 alone, the number of visits to Georgia increased by 7.8% compared to the previous year, including 6.2% of tourist visits. One day at 8.3%. The number of visits to Azerbaijan increased by 11,3% compared to the previous year, including 10.4% of tourist visits. One day at 13.6%.

Table 1: Classification of International Travel

	2018		2019		Change		Change %	
	Georgia	Azerbaijan	Georgia	Azerbaijan	Georgia	Azerbaijan	Georgia	Azerbaijan
International traveler Visits	8679, 5	2849,6	9357, 9	3 170,4	678, 4	320,8	7,8%	11,3%
Other visits (non-tourist)	1476,2 1	2605,3	1632 190	2863,5	155, 9	258,2	10,6%	9,9%
international visitors Visits.	7203,4	244,3	7725,8	306,9	522,4	62,6	7,3%	25,5%
Tourist vizits	4800,0	651,6	5100,0	719,9	300,0	68,3	6,2%	10,4%
Same-day Visits (Excursion)	2400,0	1024,4	2600,0	1164,0	200,0	139,6	8,3%	13,6%

Source: National Statistics Office of Georgia , The State Statistical Committee of the Republic of Azerbaijan

Georgia and Azerbaijan have significant potential for the development of various types of tourism. For example, both countries have the potential to become an attractive country for medical tourism. Based on proper assessments of the survey results, it is possible to offer additional services in tourist packages for tourist flows in Georgia, for example, aesthetic medicine, plastic surgery, dental medicine, balneological and other services. It should be noted that there are about 2400 species of natural water sources in Georgia. Their level of awareness in terms of tourism is still low. Sulfur waters, Sairme, Tskaltubo, Akhtala etc. Healing water procedures, Borjomi, Nabeghlavi, Likani, Sno, Mukhuri, Lugela ”(which is unique in its natural calcium), etc. The diversity of high-quality tourism packages based on the use of natural resources, as a result of the right approach and assessments, can become one of the preconditions for the growth of medical tourism between Georgia and Azerbaijan. Azerbaijan has considerable experience in the development of medical tourism. They have a niche that ensures a systematic increase in international patient flows: healing mud volcanoes, mineral years, naphthalene oil, and so on. Sh. The latter is used to cure more than 70 diseases, including skin, tendon and neurological disorders. Obviously, the process of tourism revival in Georgia and Azerbaijan will not be easy. It is important that in order to stimulate both international and domestic demand, in parallel with the creation of high quality tourism products, convenient, safe tourist flows in the tourism market are ensured in full compliance with the necessary regulations for the post-pandemic.

In general, the buying process in the world is changing rapidly. Digital technology has completely changed the traditional, established business model of selling tour packages. In the past, one approach was quite enough to give a boost to sales. However, today, sellers of tourism products need to do much more to succeed, in particular, to create a different and individual experience that encompasses the real and digital "life" of the country. The sales approach must be complex and modern. Today, people are increasingly actively communicating with travel companies through electronic devices. When they start searching for any type of information, it adds spontaneity, which is reflected in mobile devices. It will be of great importance to popularize the use of mobile apps that will offer customers different tours and through modern virtual reality, users will be able to see what different parts of the city looked like during the past era. The special effect will be created by the feature of the voice guide built into the application, which informs the user about the unique, customized tour of the rarely told stories. With the help of a virtual guide, tourists are given the opportunity to visit often unnoticed and unknown places. Digital technologies are transforming the tourism industry and introducing new tourism products and services. This circumstance has created new perspectives for tourism businesses. The company has moved forward with communicating with customers through online marketing, social media and various applications. There is no alternative to using digital technologies to promote and raise awareness and attractiveness of Georgia and Azerbaijan as tourist countries. Because digital transformation requires systemic changes in tourism business processes, business models, and economic relationships in and around the tourism industry, a wide range of specialized technology and business consulting is required, which can be obtained from different countries, competent services, centers, private and public sectors.

3. CONCLUSION

- The use of digital technology has acquired new practical value during the Covid-19 pandemic;
- There is no alternative to using digital technologies to promote and raise awareness and attractiveness of Georgia and Azerbaijan as tourist countries;
- Digital technologies can be considered as a catalyst for the revival of the tourism industry and consequently the growth of the country's economy;
- Digital technologies are transforming the tourism industry and introducing new tourism products and services;
- Leading the way for companies to interact with customers through online marketing, social media and various applications;
- It will be very important to promote the use of mobile applications;
- It will be very important how the popularity of Georgia and Azerbaijan will increase and its attractiveness coefficient in the digital world will increase;
- The main thing is how the digital companies will react to the activities of travel companies in the post-pandemic period.

ABSTRACT

The actuality of the research. One of the main problems of inventory companies that order different types of products is to find the EOQ by keeping total costs to a minimum. Having the feature of substitution for more than 2 products is the way to find the best reorder point and demand level for the product that reaches 0 in stock. In the process of substituting inventory types, the firm determines the upper and lower levels of the cash flow and the return point by using the Miller-Orr model, one of the optimum cash method models. Establishing an EOQ model for substitutable products by determining the cash level positively affects the balance of the total costs and expenditures of the firm. The aim of the research is to ensure the calculation of the EOQ model for substitutable products by choosing the most appropriate of the optimum cash management models to the financial processes of companies working with large-scale inventory orders. Correlation analysis was used for the data collected through quantitative research. In order to conduct research and reveal the relationships between variables, the data obtained from the enterprise "Özst Azerbaijan" were used. Necessary data at the time of the research were collected through an interview. These data cover issues related to the finance and product ordering of the enterprise. In our country, researching the subject or using it in practice has not been given much place. By doing this research, it is to ensure that the economic order quantity, substitutable products and the Miller - Orr model are used in the same process and that the company is kept in a balance in the total costs and expenses.

Keywords: *EOQ, Miller-Orr model, Cost, Company, Optimum cash*

1. INTRODUCTION

The EOQ model is not used frequently in our country. But it does not mean that this issue is not seen as a problem. Avoiding the expenses of the problem has been avoided. Costs that we perceive as minimums that we do not expect may turn into excessive numbers. By improving the web level to achieve the minimum level of our high-figure costs, we will ensure a fixed amount of cash at the cash register without exceeding the maximum rate of money flow (staying between the minimum and maximum levels). In order to determine a reasonable order amount by reducing the total costs, transfer costs and order costs in the economic order quantity, the calculation of the optimum cash amount within the lower and upper cash limits of the cash flows (it should be determined with the Miller-Orr model beforehand) is considered as a preliminary add. High-level factors such as transportation costs, re-ordering process, stocking, demand, cost per unit of product affect both the creation of EOQ and the movement of fiscal functions. The application of Miller - Orr model to the financial process of the company before the orders are placed will determine the economic order amount more clearly. Let's look at the questions raised by considering the general financial problems of the firm when calculating the economic order amount: "Will it be possible to make the payment instantly when the large volume of product orders are delivered?", "How can we find the economic quantity according to the total costs during the monthly or annual ordering periods?", "How can we minimize the total costs and apply it to the EOQ model?". The importance of questions in this way is due to the availability of a cash attitude. Having cash amount in the cash or assets with liquidity ratio, the fixed or incremental cycle of the monthly cash flow facilitates the calculation of the long-

term fixed economic order quantity formula for the business. Of course, the formula needs to be recalculated when the demand decreases or increases. The purpose of writing the article is to ensure that the most appropriate of the optimum cash attitude management models is integrated into the EOQ model. The models used in cash attitude management time stand on the basis of our research. After these models are investigated one by one, it has been revealed how positively they have effects on financial processes and functions. Formulas on each model are generally explored for businesses with large orders. The probabilities that the research carried out in practice can be used for each client company have been taken into consideration. Annual total costs ($TM_{(annual)}$) based on annual ordering costs ($SM_{(annual)}$) and annual stocking ($STM_{(annual)}$) costs are applied to the order model after minimizing. When the EOQ model is calculated for the customer firm, the monthly cash in and out of the company will be determined. A Miller - Orr model is faced with problems such as having to maintain a minimum cash balance, and the amount of cash flowing in and out on a daily basis is stochastic, that is, it is not fixed. The optimum cash holding model determines the lower and upper level of the cash flow and the return point for the ordering firm by considering this or similar problems. Return point represents the targeted cash balance. As a result of integrating the Miller - Orr model into the EOQ model, the economic order model will be calculated by reducing the annual total costs according to the targeted cash balance.

2. ESTABLISHMENT AND EVALUATION OF THE ECONOMIC ORDER QUANTITY MODEL FOR SUBSTITUTABLE PRODUCTS

The correlation technique will be used to reveal that there is no difference in the demand rate if the substitutable products change, i.e. if they replace one or another. The result of the correlational analysis will determine whether the relationship between these two variables is positive or negative. With the incarnation of the positive and negative relationship, its appeal will also reveal that this relationship is strong and weak.

Substitutable products	Product price (y)	Demand level (x)
Mozzarella cheese	9.95 AZN	13 kg
Cheddar cheese	6.86 AZN	15 kg
Parmesan cheese	10.42 AZN	9 kg
Total	27.23 AZN	37 kg

Table 1: Product price and order quantity (monthly)

(Source: Data obtained from the accounting department of the company "Özsüt Azərbaycan" for 2019)

In Table 1, data on product price and demand ratio are noted. Demand rate (x) is accepted as independent variable, product price as work-dependent variable.

$$n = 3; \sum x = 37; \sum y = 27.23; (\sum x)^2 = 1369; (\sum y)^2 = 741.4729; \sum x^2 = 475; \sum y^2 = 254.6385; r = -0.82.$$

There is a negative and weak relationship between the change of substitutable products and the demand rate. This means that there is an independent relationship between the replacement of substitute products and demand. The result from the correlation analysis is that the increase or decrease in demand is not necessarily related to the change of substitute products. Demand can vary according to different factors. Now it is necessary to determine the accuracy of the hypotheses.

- H1a: There is a difference in the rate of demand based on the change of substitutable products.
- H2b: There is no difference in the rate of demand based on the change of substitutable products.

Assuming the H1a hypothesis as H1 and the H1b hypothesis as H0, it can be summarized as follows:

H1; $p > 0$ H0; $p = 0$

T test will be used to find the significance level of the correlation coefficient of the hypotheses. For this, the number after $T_H = r/\sqrt{(1-r^2)/(n-2)}$ test statistics is required. When $T_H > T_t$, the H1 hypothesis will be accepted, while the H0 hypothesis will be rejected. The correlation coefficient is tested at the level of $p > 0.05$. H0; If $p = 0$, the correlation coefficient is insignificant, H1; The fact that p etmektedir 0 means that is is significant.

$$|T_H| = -0.82/\sqrt{(1-0.6724/(3-2))} = |-2.503| = 2.503$$

$$T_t = t_{\alpha; n-2} = t_{0.05; 1} = 2.0013$$

Since $|T_H| > T_t$, the H1a hypothesis was accepted as correct, while the H1b hypothesis was rejected. In short, there is a difference in the rate of demand based on the change of substitutable products.

Substitutable products	Product price (y)	Order quantity (x)
Mozzarella cheese (A)	9.95 AZN	16.25 kg
Cheddar cheese (B)	6.86 AZN	18.75 kg
Parmesan cheese (C)	10.42 AZN	11.25 kg
Total	27.23 AZN	46.25 kg

Table 2: Product price and order quantity (monthly)

(Source: Data obtained from the accounting department of the company "Özsüt Azərbaycan" for 2019)

The order quantity (x) is considered as the independent variable and the product price (y) as the dependent variable.

$$n = 3; \sum x = 46.25; \sum y = 27.23; (\sum x)^2 = 2139.06; (\sum y)^2 = 741.4729; \sum x^2 = 742.1875;$$

$$\sum y^2 = 254.6385; r = -0.83.$$

There is a negative and weak relationship between the change of substitutable products and the order quantity.

- H2a: There is a difference in the amount of the order based on the change of substitutable products.
- H2b: There is no difference in the order quantity based on the change of substitutable products.

Assuming the H2a hypothesis as H1 and the H2b hypothesis as H0, it can be summarized as follows:

H1; $p > 0$ H0; $p = 0$

T test will be used to find the significance level of the correlation coefficient of the hypotheses. For this, the number after $TH = r/\sqrt{(1-r^2)/(n-2)}$ test statistics is required. When $TH > T_t$, the H1 hypothesis will be accepted, while the H0 hypothesis will be rejected. The correlation coefficient is tested at the level of $p > 0.05$. H0; If $p = 0$, the correlation coefficient is insignificant, H1; The fact that p etmektedir 0 means that is significant. Based on H1a, H2a hypotheses, Table 3 shows the correlation between products A and B, B and A, B and C, C and B, A and C, C and A:

	A	B	C
A	0	1	0
B	1	0	1
C	0	0	0

Table 3: Correlation between substitute products (A, B, C)

(Source: Author's calculations based on interview questions made at research time)

Dependence between products essentially expresses itself more heavily in A and B products. According to the result obtained from the Pearson correlation analysis, the dependency factor between each 3 product pairs is indicated as in Table 4 below:

	A	B	C
A	0	1	0.4
B	0.8	0	0.1
C	0.6	0.2	0

Table 4: Dependency factor analysis based on business data

(Source: Author's calculations based on interview questions made at research time)

As it can be seen from the table, the dependency factor between B and A - 0.8, B and C - 0.1, A and B - 1, A and C - 0.4, C and B - 0.3 C and B are 0.2. The dependency factor between A and B is higher, which means that when product A is out of stock, it is easy to use from product B. Secondly, it is the dependency factor between product B and A, at which time it is possible to use product A when product B is out of stock. The adherence between other product pairs is known to be weaker. The parameters required to apply the substitute products to the model are optimum order quantity (SM), delivery time (TS), order cost (SM) and demand rate (TO). These variables are given in Table 5:

	SM	SM	TO	TS
A	119.4 AZN	83.076 gr.	13 kg	8 gün
B	96.04 AZN	98.076 gr.	15 kg	8 gün
C	83.36 AZN	32.140 gr.	9 kg	8 gün

Table 5: Variables on substitute products (in numbers)

(Source: Author's calculations based on interview questions made at research time)

In Table 5, monthly values for the substitute products are expressed in figures. When the optimum order quantity is calculated, transfer costs are not taken into account. Because the company whose data is being used directs the transfer costs to the supplier business.

General transfer cost is calculated on a monthly basis, but it is not possible to calculate this separately for cheese products. Based on the data, it is necessary to find the reorder point (YSN) for A, B, C products. The tables below indicate the 12-week demand rate and product inventory levels. Here;

- Z - time;
- CTR - demand rate;
- TS - delivery time;
- EO - inventory ratio.

The sections painted with age colors represent product renewal.

Z	H ₁	H ₂	H ₃	H ₄	H ₅	H ₆	H ₇	H ₈	H ₉	H ₁₀	H ₁₁	H ₁₂
T ₀	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25
EO	13	9.75	6.5	3.25	16.25	13	9.75	6.25	3.25	16.25	13	9.75

Table 6: 3-month demand rate and inventory level for a product A

(Source: Author's calculations based on interview questions made at research time)

$$\text{YSN (A)} = \text{TS} * \text{TO} = 8 * 13 = 103$$

Z	H ₁	H ₂	H ₃	H ₄	H ₅	H ₆	H ₇	H ₈	H ₉	H ₁₀	H ₁₁	H ₁₂
T ₀	3.75	3.75	3.75	3.75	3.75	3.75	3.75	3.75	3.75	3.75	3.75	3.75
EO	15	11.25	7.5	3.75	18.75	15	11.25	7.5	3.75	18.75	15	11.25

Table 7: 3-month demand rate and inventory level for a product B

(Source: Author's calculations based on interview questions made at research time)

$$\text{YSN (B)} = \text{TS} * \text{TO} = 8 * 15 = 120$$

Z	H ₁	H ₂	H ₃	H ₄	H ₅	H ₆	H ₇	H ₈	H ₉	H ₁₀	H ₁₁	H ₁₂
T ₀	2.25	2.25	2.25	2.25	2.25	2.25	2.25	2.25	2.25	2.25	2.25	2.25
EO	9	6.75	4.5	2.25	11.25	9	6.75	4.25	2.25	11.25	9	6.75

Table 8: 3-month demand rate and inventory level for a product C

(Source: Author's calculations based on interview questions made at research time)

$$\text{YSN (C)} = \text{TS} * \text{TO} = 8 * 9 = 72$$

Reorder points on each product trigger a reorder if the products are less than the demand rate in stock. The delivery time for the products on a 3-month basis is expressed in the same figures.

Z	H ₁	H ₂	H ₃	H ₄	H ₅	H ₆	H ₇	H ₈	H ₉	H ₁₀	H ₁₁	H ₁₂
T ₀	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25	3.25
EO	13	9.75	6.5	3.25	0	-3.25	-6.5	-9.75	16.25	13	9.75	6.5

Table 9: Week intervals when product A is out of stock

(Source: Author's calculations based on interview questions made at research time)

In Table 9, the delivery delay on product A is indicated. The purpose of showing this delay on the 3-month (12 weeks) demand rate and the inventory level is to solve the problem of the stock when it is replaced with product B. The parts painted in red, mean the exhausted product that is not in stock.

Since the factor dependency between product A and product B is equal to 1, it is possible to substitute product A with product B within this 3-week period. And with this, the demand rate for product A will be transferred to product B. Product B is transferred according to the demand rate of product A (the more the weekly demand rate is, the more transfers are made), which is accumulated in stock for the product that can be replaced by product A. It is possible to see this clearly in Table 10:

Z	H ₁	H ₂	H ₃	H ₄	H ₅	H ₆	H ₇	H ₈	H ₉	H ₁₀	H ₁₁	H ₁₂
T ₀	3.75	3.75	3.75	3.75	3.75	7	7	7	3.75	3.75	3.75	3.75
EO	15	11.25	7.5	3.75	18.75	11.75	4.75	-2.25	18.75	15	11.25	7.5

Table 10: Replacing out-of-stock product A with product B

(Source: Author's calculations based on interview questions made at research time)

As it can be seen from Table 10, product B will be consumed rapidly from the 6th week. Since there is a rapid depletion, the B product in the 8-th week will be found less than the demand rate in the stock. In practice, cash is kept for the delay of the product supply or for the commission, ie the penalty, so that it is not in stock. No commission is charged for the delay in the company we research. It is necessary to calculate a new demand rate for a B product to avoid product delays and cash payment for penalties, to ensure you have items in stock:

$$T_{Oy} = A_{TO} + K_G * B_{TO}$$

In calculating the new demand rate for product B, A will be used from the demand rate of the product, the correlation power between products A and B, and the demand rate of product B.

Here;

- T_{Oy} - the new demand rate for product B;
- A_{TO} - A product demand rate;
- B_{TO} - B product demand rate;
- K_G - Correlation power between product A and B
- $T_{Oy} = 3.25 + 1 * 3.75 = 7$

The new demand rate for product B is 7. After calculating the new demand rate, the new reorder point (YSN) needs to be calculated:

$$YSN_y = T_{Oy} * T_{S_y}$$

Here;

- YSN_y - newly designated reorder point;
- T_{S_y} - the newly determined delivery time.
- $YSN_y = 7 * 8 = 56$

At the new reorder point, the new demand rate reached 7. This rate will be valid for the 6th, 7th and 8th weeks. From 9th week onwards, it will proceed at the previous demand rate of product B (ie 3.75). The new reorder point is calculated as 56. Delivery time is accepted as 8 days unchanged.

Table following on the next page

Z	H ₁	H ₂	H ₃	H ₄	H ₅	H ₆	H ₇	H ₈	H ₉	H ₁₀	H ₁₁	H ₁₂
T ₀	3.75	3.75	3.75	3.75	3.75	7	7	7	3.75	3.75	3.75	3.75
EO	15	11.25	7.5	3.75	18.75	11.75	4.75	18.75	15	11.25	7.5	3.75

Table 11: Repairing deficiency of product B

(Source: Author's calculations based on interview questions made at research time)

Since the value obtained for the reorder point is 56, the reorder point will move to the 6th week and the repair of the product in the stock will have passed from the 9th to the 8th week. And in this case, there will be no product deficiency or punishment.

3. DEVELOPMENT AND EVALUATION OF THE EOQ MODEL IN INVENTORY MANAGEMENT FOR MORE THAN TWO SUBSTITUTABLE PRODUCTS

External factors were considered for the development of the model. External factors include the financial processes of the company. Due to the use of substitution products for the development of the model, optimum cash management models should be applied simultaneously when the EOQ model is used. Is it possible to use the Miller-Orr model in the financial process when the EOQ model is calculated? If we pay attention to the assumptions and limitations of the Miller - Orr model, we first reach the upper level of the cash balance by finding the minimum cash balance and return point of the company. It seems possible to do this procedure for any business. It is possible to apply the Miller-Orr model at the same time when the EOQ model is established in the restaurant sector. In order to develop the model, Miller-Orr model will be used to ensure that the cash flow in the financial processes of the enterprise positively affects the order costs. The data obtained for the establishment of this cash management model are based on the calculation and indicated in Table 12:

Fixed cost of cash transfer	Minimum cash balance	Alternative cost of holding cash	Alternative cost of maintaining cash.
1.000 AZN	100.000 AZN	220.605 AZN	0.55%

Table 12: Cash transactions (in numbers)

(Source: Data obtained from the accounting department of the company "Özsüt Azərbaycan" for 2019)

What we need to learn is to find the difference between the lower and upper levels and calculate the return point. For this;

$$\text{Spread} = 3 * (\frac{3}{4} * (t * n) / v)^{1/3}$$

$$\text{Spread} = 3 * (\frac{3}{4} * (1000 * 220605) / 0.55)^{1/3} = 52,032$$

The difference between lower and upper cash levels were 52,032. This refers to the area where the cash will move.

$$\text{Return point} = \text{Lower cash level (M)} + 1/3 * \text{Spread}$$

$$\text{Return point} = 100000 + 1/3 * 52,032 = 100017,3$$

In order to maintain the balance between the lower and upper levels, the cash balance of the company was 100017.3.

$$\text{Upper cash level} = \text{Lower cash level} + \text{Spread}$$

$$\text{Upper cash level} = 100017,3 + 52,032 = 100069,332$$

And from here, we found the top cash ratio. The company should try to reach the return point in order to maintain the current stability when the cash transaction exceeds the upper cash level or falls below the lower cash level. For the Miller-Orr model, after determining the upper and lower cash levels and return point of the company we are researching, it is necessary to review the order amount in general.

Graph 1: Upper and lower cash levels in the monthly cash amount of the Özsüt company
(Source: Author's calculations based on interview questions made at research time)

Since we do not have data on the annual cash cycle (essentially daily / monthly income and expenditures) from the "Özsüt Azerbaijan" company, it will not be possible to show in the graph in which months the company is up or down from the top level. Due to the fact that sales increase in the spring and summer months, the rate of demand for products in March-July and, depending on this, the amount of orders increases. Order amount and demand increase will cause increase in order costs and income of the business. What we need to take into account is that the cash cycle of the company we are researching does not only include the costs of the order quantity of substitutable products and the income from sales. And therefore, adding the Miller-Orr model to all financial processes of the company in the establishment of the model will help to keep the total order costs in the EOQ model in balance and prevent the cash amount from exceeding the upper cash level or on the contrary, the cash amount from falling below the lower cash level. The EOQ model helps the company to determine the most economical order quantity by revising the substitute products in its possession over the model. Considering the dependency factor between products, we can find the most substitutable product and order quantity for the company by recalculating more than 2 products based on the demand ratio, order quantity, inventory level and reorder point on the EOQ model. The fact that the level of demand is variable is related to the change in sales rates with the season. As the demand rate changes with the season, it automatically affects the order quantity and order costs. In some companies, the annual demand rate may be constant. This stability causes the order quantity to be fixed. It is impossible to see this constancy in sectors such as restaurant business. Here, it is necessary to take into account external factors. External factors and the variability of demand create difficulties in using the EOQ model frequently.

4. EVALUATION OF THE PROS AND CONS OF THE EOQ MODEL IN INVENTORY MANAGEMENT FOR SUBSTITUTABLE PRODUCTS

The most positive aspect of the EOQ model for substitutable products in stock management is taking the inventory under control. Here, the raw material to be considered as inventory, production time or the company inventory used for sales is very useful for products that are out of stock. With the application of the EOQ model, the company can manage the product management correctly. It is possible to see the use of products on demand equally distributed. It is possible to stock the delivered product units and to keep track of the rate of product depletion in stock. This will actually enable the product cycle to be kept under control by making small calculations comfortably by the business. The figures related to the product being calculated give the company a table of the product consumption in stock, delivery intervals, monthly / annual order amount. It prevents over-ordering or consumption of extra products that are in stock. The downsides of the EOQ model for substitutable products in stock management arise in relation to the model assumptions. The company expresses the demand rate by regions (daily / weekly) in the same figures. And the annual demand is considered to be predetermined, which is seen as impractical for all businesses. Since we investigated the restaurant business as an example, if we take into account the internal / external factors, we can estimate the annual demand. However, estimated figures may confuse the direction of our order quantity. Since the demand is flexible, it affects the order quantity. Since the annual demand of the business is different from each other, the EOQ model is not used frequently. The time of the calculation of the EOQ model, transfer costs are covered by the ordering company. The transfer costs of the units (products) ordered in the company we have researched are paid by the supplier companies. In the EOQ model, when the number of product units increases, no discount is made by the supplier company. The model focuses directly on the order quantity and its ordering costs. It does not take into account the discounts. Making discounts can positively affect the reduction of costs. The time intervals between the products being out of stock and their ordering and receiving orders are the same. This is practically impossible. Because there may be problems caused by us or the other side, or the demand of the product may say. This means that the product remains in stock due to the decrease in demand, and the product is quickly exhausted in the stock due to the increase in demand. With the rapid completion of the product, the substitute products with the evaluation of the company should be put into the circuit for demand. When the EOQ model of the Miller - Orr model, which is the most suitable one of the optimum cash management models, is added to the financial process, it turns out that this model should be established for all products to be ordered here. Because it is possible to prevent the cash outflows (costs and expenses) from exceeding the level of cash level by applying the Miller - Orr model. It was not possible to take into account order costs and all cash inflows / outflows, as we could not get reports on all expenditures and cash outflows from the Özsüt company, which I took as a sample for the research. When we have all cash inflows / outflows, it will be possible to see the fluctuations between upper and lower cash levels clearly.

5. CONCLUSION

We can list the results as follows:

- 1) Since the focus is on substitutable products, the possibility of changing the demand level and the reorder point in the establishment of the EOQ model and imposing a penalty on the supplier at 0 stock level and not being able to meet the demand will be eliminated;
- 2) Using the EOQ model is not suitable for every sector. It is not very suitable to apply to the inventory order of the restaurant enterprise "Özsüt Azerbaijan", whose data is used as an example for research. It is more desirable for companies dealing with larger order quantities. Making calculations in small businesses such as restaurants may not give accurate results.

Because here, variables that are important for the calculation of the economic order model (such as transportation costs, penalty costs) are not included;

- 3) The purpose of the research paper was to calculate the EOQ model for substitutable products in optimum cash management. Since all of the data required for the financial segment is not provided by the company, there is no table on general costs / expenses and other product orders. It has been found that it is possible to use the Miller-Orr model, which is one of the optimum cash management models, in real business processes. By calculating the Miller-Orr model for the business, the lower and upper cash levels of the company and the return point were determined. And in general, product ordering, ordering costs, overhead costs and expenses, sales and so on. Cash flow generating fluctuations should cycle through specified levels. This process ensures that the costs of the company are manageable and the optimum ratio of order costs can be calculated according to the order quantity and demand level.

ABSTRACT

The article covers education, science and poverty levels indicators, the exchange rate of the manat, per capita income and other indicators. The indicators were examined and correlation analysis was conducted to identify the factors that significantly affect the poverty rate. The poverty rate was econometrically assessed in the Azerbaijani example. It was found that the share of secondary special education institutions graduates and university graduates per 10,000 people, the number of articles per 1 million people in basic science and engineering indexed in Web of Science, per capita income reduces the country's poverty rate, while the increase in the manat against the dollar increases poverty rate. It was determined that the share of secondary school and vocational school graduates per 10,000 people did not have a statistically significant impact on the country's poverty rate. The dataset is based on data from national and international official statistics and covers the years 2001-2019.

Keywords: *graduate, poverty, science*

1. INTRODUCTION

There is extensive research in the economic literature on the level of poverty, education coverage, level and quality of education, as well as the level of science and its impact on the country's economic growth (Caire & Becker, 1967), (Popov Ed. et al., 2013), (Datzberger, 2018), (Gauthier, 2018), (Carter, 2014), (Foster E. J. ; Greer J. & Thorbecke, 2010), (Foster, Greer, & Thorbecke, 1984), (Hajiyev, Shabanov, & Hasanli, 2021). The impact of innovations on the quality of education (Hasanli & Shabanov, 2018), the level and quality of education in the country (Shabanov & Quliyev, 2017), (Isakhanli & Pashayeva, 2018)), the prospects for the establishment of educational clusters in the regions of Azerbaijan were considered (Shabanov, 2019). The impact of the level of education on various socio-economic indicators was considered (Zubrytska, 2018). (Balamurali, Janflone, & Zhu, 2015) showed that a 1-fold increase in the level of education in the United States increases the ratio of income to the poverty line by 6.26%. The general conclusion of these articles is that education and science are important factors in increasing employment, GDP growth and poverty reduction in the country. In addition, the establishment of an effective innovation system in the country, the high share of high-tech and technological products in exports are factors that increase the welfare of citizens (Cornell University, INSEAD, and WIPO, 2020), (OECD, 2016), (Baneliene, Melnikas, Strazdas, & Toločka, 2018), (Zhou & Luo, 2018), (Nabieva et al., 2021), (Si, Ahlstrom, Wei, & Cullen, 2020). It is believed that the high level and quality of education, the transformation of science and entrepreneurship into a productive force, the establishment and development of an effective innovation system in the country increase the welfare of its citizens, make the country's economy competitive.

This article examines the impact of the education level and science on the country's poverty rate from the econometric point of view. It is essential to consider these factors, as the choice of explanatory variables is crucial in the dataset formation in econometric modeling.

2. DATASET FORMATION AND MODEL SPECIFICATION.

The country's poverty rate is one of the main indicators of the country's socio-economic situation. Detailed information on this indicator is given in a number of sources (Foster et al., 1984), (Foster E. J.; Greer J. & Thorbecke, 2010b). Poverty levels are calculated by using the following formula:

$$P = \frac{1}{H} \sum_{h=1}^q \frac{Z_h - Y_h}{Z_h} \quad (1)$$

Here, H is the number of households, q is the number of poor households, Z_h is the poverty line, taking into account the family composition of household h, and Y_h is the real income of household h. The poverty line is the minimum income (in real terms) necessary to meet the living needs of a particular country. Thus, the P indicator calculated using formula (1) shows what percentage of the country's population lives below the poverty line. Poverty threshold and rate in Azerbaijan for 2001-2018 are given in the source (Yashar, 2019).

	2001	2005	2010	2013	2016	2017	2018
<i>Poverty threshold, AZN</i>	24.0	42.6	98.7	125.2	148.5	165.7	175.2
<i>Poverty rate, %</i>	49.0	29.3	9.1	5.3	5.9	5.4	5.1

Table 1: Poverty threshold and poverty rate in Azerbaijan

(Source: (Yashar, 2019))

The table shows that the poverty rate in Azerbaijan dropped from 49% to 5.1% in 2001-2018, which can be considered a very successful trend. One of the most important factors affecting the country's poverty level is education. Numerous indicators are used to describe the education field. When examining the level of education and the impact of science on country's poverty rate, we initially should consider the choice of explanatory factors. It is known that in developed countries, secondary education consists of 3 stages. These include primary, secondary and high school. The grades corresponding to the listed levels of education in Azerbaijan are grades 1-4, 5-9 and 10-11. We a priori assume that the higher the share of graduates of these educational institutions in the country's population, their ability to find work and adapt to the requirements of the labor market would be higher. In this regard, it is desirable to select indicators for each of the three levels to study their impact on poverty. Due to the fact that the share of primary school graduates in Azerbaijan from 2008 to 2016 was 100%, we considered it inappropriate to include this indicator in our study.

<i>Year</i>	2001	2002	2003	2004	2005	2006	2007	2008
<i>Primary school completion rate, %</i>	93.9	94.6	95.8	96.5	97.7	98.2	99.8	100.0
<i>Year</i>	2009	2010	2011	2012	2013	2014	2015	2016
<i>Primary school completion rate, %</i>	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Table 2: Primary school completion rate

(Source: https://www.stat.gov.az/source/millennium/source/MDG_en-05.01.2017.pdf)

Instead of the share of graduates of grades 10-11, we have included in our study the share of graduates of vocational and secondary special education. In addition, the share of university graduates was chosen as an explanatory factor. As an indicator of the level of science at the international level, we have selected the number of articles in the field of fundamental science and technology, indexed in the country in the international scientific and bibliographic database Web of Science. The article calculated the share of this indicator per 1 million population and selected it as an explanatory indicator. It is known from the scientific literature that in terms of the impact on economic growth, the number of articles published in the field of fundamental science and technology is more important than the number of articles devoted to economics and business (Jin & Jin, 2013). The number of indicators measuring the level of education were examined to form a database. The number of secondary school graduates per 10,000 population, the share of vocational school graduates, the volume of GDP, state budget expenditures, monetary incomes of the population, expenditures of the population, nominal wages in the country were studied, relevant correlation analysis was conducted and these indicators were reported but not included in the dataset. This allowed the explanatory factors included in the database to be independent of each other, i.e. to eliminate multicollinearity in the econometric models to be built. In addition, since the number of documents (articles, reports and reviews) indexed by country in the SCOPUS database (<https://www.scimagojr.com>) and the number of articles indexed in the Web of Science database have a strong positive correlation, it is sufficient to choose one of these two indicators. In this sense, we have preferred the article on natural and technical fields indexed in the Web of Science database per 1 million population as an indicator that characterizes the level of science in the country. Thus, the dataset of selected indicators for 2001 to 2019 is formed as shown in Table 3.

<i>Il</i>	<i>Poor population, %</i>	<i>Number of specialists graduating from secondary special education institutions per 10000 persons (people)</i>	<i>Number of specialists graduating from higher education institutions per 10000 persons (people)</i>	<i>Number of articles in science and technology per 1 million people Indexed in the Web Of Science (pieces)</i>	<i>Exchange rate 1 US\$= man</i>	<i>Per capita income, at current prices (manat)</i>
2001	49.0	14.08	29.46	19.61	0.96	535.5
2002	46.7	15.74	33.93	29.92	0.98	618.8
2003	44.7	18.26	34.42	33.04	0.99	700.7
2004	40.2	17.26	37.41	41.94	0.98	796.7
2005	29.3	18.70	38.48	41.26	0.95	962.2
2006	20.8	19.16	32.90	32.63	0.89	1 201.3
2007	15.8	19.62	36.09	47.87	0.86	1 692.3
2008	13.2	19.68	37.11	54.37	0.82	2 378.3
2009	10.9	17.78	38.77	70.04	0.80	2 560.4
2010	9.1	16.18	34.53	66.15	0.80	2 866.1
2011	7.6	16.10	33.82	70.04	0.79	3 371.7
2012	6.0	17.20	38.04	73.55	0.79	3 789.3
2013	5.3	13.46	36.08	50.30	0.78	4 040.3
2014	5.0	15.58	34.64	41.70	0.78	4 192.4

2016	5.9	17.61	38.07	61.16	1.60	4 710.1
2017	5.4	16.61	38.23	75.10	1.72	5 053.2
2018	5.1	12.49	37.50	76.93	1.70	5 407.8
2019	4.8	12.45	37.63	n/a	1.70	5 758.6

Table 3: Dataset

(Source: The State Statistical Committee of the Republic of Azerbaijan and formed by the authors on the basis of official data of the portal <https://www.worldbank.org>)

The model specification was selected as following:

$$\begin{aligned} \text{POVERTY_RATE_IN_PERCENT} = & C(1) + C(2)*\text{SPECIALIZED_IN_10000PRS} \\ & + C(3)*\text{TERTIARY_IN_10000PRS}(-2) \\ & + C(4)*\text{JAST_PER_MILLION_PUPIL} + C(5)*\text{EXCHANGE_RATE} \\ & + C(6)*\text{INCOME_PER_CAPITA_MANAT} + C(7)*\text{DUMMY_2013} \end{aligned} \quad (2)$$

Here, POVERTY_RATE_IN_PERCENT variable is a poor population, as a percentage, SPECIALIZED_IN_10000PRS variable is a number of graduates of secondary special education institutions per 10 thousand population, TERTIARY_IN_10000PRS variable is a number of university graduates per 10 thousand population, JAST_PER_MILLION_PUPIL variable is number of articles indexed in Web of Science, EXCHANGE_RATE variable is an exchange rate of manat to dollar, INCOME_PER_CAPITA_MANAT variable is a per capita income (in manats), Dummy 2013 is a dummy variable and has a value of 1 for 2013 and zero for other years. This factor was included in the model because the number of articles in 2013 dropped sharply by 46% compared to 2012. By including this dummy variable, the negative impact was neutralized.

3. BASIC RESULTS

The regression equation is constructed as following:

$$\begin{aligned} \text{POVERTY_RATE_IN_PERCENT} = & 143.954298305 \\ & - 2.7085700272*\text{SPECIALIZED_IN_10000PRS} \\ & - 1.67867325813*\text{TERTIARY_IN_10000PRS}(-2) \\ & - 0.149699209936*\text{JAST_PER_MILLION_PUPIL} \\ & + 9.86627066171*\text{EXCHANGE_RATE} \\ & - 0.00823614565702*\text{INCOME_PER_CAPITA_MANAT} \\ & - 12.324862579*\text{DUMMY_2013} \end{aligned} \quad (3)$$

The economic meaning of the equation is as following:

- If the number of graduates of secondary special institutions (per 10,000 population) increases by 1 person in the current year, the poverty rate in the country will decrease by 2.71%;
- If the number of university graduates (per 10,000 population) increases by 1 person in the current year, then the poverty rate in the country will decrease by 1.68% with a 2-year delay;
- If the number of articles indexed by researchers in the Web of Science database (per 1 million people) increases by 1 unit in the current year, the poverty rate in the country will decrease by 0.15%;
- If the per capita income of the population in the country increases by 100 manat in the current year, then the poverty rate in the country will decrease by 0.82%;
- If the exchange rate of manat depreciates by 0.10 manat against the dollar in the current year, then the poverty rate in the country will increase by 0.99%;
- Changes in selected explanatory factors cause a change in the explained indicator by 96.3%.

During analysis of the econometric model results, it was shown that the ratio of the number of graduates of secondary special education institutions per 10,000 population to the level of poverty in the country was higher than the ratio of other explanatory factors. However, it does not mean that the number of secondary special education institutions graduates per 10,000 population outweighs other factors (the number of university graduates per 10,000 population, the number of articles indexed in the Web of Science per million people).

Thus, some university graduates and the authors of articles indexed in the Web of Science also graduated from special education institutions. From this point of view, these factors have a share in the ratio of the number of graduates from special education institutions. It should also be noted that the share of university graduates is affected not by the current year, but by a 2-year delay. We can explain this point by saying that a university graduate (we can also call him a young specialist) gains experience during those 2 years and manages to realize certain chances to increase his income. The number of articles published in the basic science and technology (per 1 million people) is slightly lower than the level of poverty in the country compared to the level of education. We explain this by the fact that the country still has the higher share of mineral resources in exports and shortcomings in the national innovation system.

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Mineral fuels, lubricants, the share of similar materials in exports, as a percentage	85,1	91,3	88,9	86,0	82,2	76,8	84,6	81,4	97,1	92,8
Year	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
Mineral fuels, lubricants, the share of similar materials in exports, as a percentage	94,1	94,4	93,1	92,7	92,4	87,9	91,2	90,5	91,7	90,7

Table 4: The share of mineral resources in exports in Azerbaijan
(Source: https://www.stat.gov.az/source/trade/az/f_trade/xt007_3-4.xls)

Table 4 shows that in 2016-2019, the share of mineral fuels, lubricants and similar materials in total exports in Azerbaijan were slightly more than 90%. It is known that in countries not rich in mineral resources, such as Singapore, Israel, South Korea, Austria, etc. the innovative development strategies are applied to increase the well-being of the country's citizens (WIPO GII, 2019a). In countries with the higher share of natural resources in exports, the innovative development is relatively slow. Examples of such countries are Russia, Iran, Kazakhstan, Turkmenistan, and oil-exporting Middle Eastern countries (Cornell University, INSEAD, and WIPO, 2020), (OECD, 2016). Thus, the econometric statistics of the model are described in the table below:

Dependent Variable: POVERTY_RATE_IN_PERCENT				
Method: Least Squares				
Date: 04/07/21 Time: 17:26				
Sample (adjusted): 2003 2018				
Included observations: 16 after adjustments				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	143.9543	17.32639	8.308381	0.0000
SPECIALIZED_IN_10000PRS	-2.708570	0.511679	-5.293490	0.0005
TERTIARY_IN_10000PRS(-2)	-1.678673	0.315293	-5.324171	0.0005
JAST_PER_MILLION_PUPIL	-0.149699	0.058849	-2.543795	0.0315
EXCHANGE_RATE	9.866271	2.594998	3.802034	0.0042
INCOME_PER_CAPITA_MANAT	-0.008236	0.000743	-11.09206	0.0000
DUMMY_2013	-12.32486	3.654411	-3.372599	0.0082
R-squared	0.978029	Mean dependent var	14.32500	
Adjusted R-squared	0.963382	S.D. dependent var	12.93138	
S.E. of regression	2.474516	Akaike info criterion	4.949603	
Sum squared resid	55.10907	Schwarz criterion	5.287610	
Log likelihood	-32.59682	Hannan-Quinn criter.	4.966911	
F-statistic	66.77306	Durbin-Watson stat	2.469465	
Prob(F-statistic)	0.000001			

Table 5: Econometric statistics of the model

The coefficients of the established regression equation are statistically significant by 95%. All necessary tests have been performed and the established model is adequate. The model is implemented using the Eviews software package.

4. CONCLUSION

The article uses various specifications to assess the poverty rate in Azerbaijan, constructs regression equations and concludes: while the share of secondary special education institutions and university graduates per 10,000 population, the number of articles in the Web of Science on basic science and technology per 1 million people and per capita income reduces the country's poverty rate, the depreciation of the manat against the US dollar increases the poverty rate. It should be noted that the number of university graduates, in contrast to other indicators, affects the poverty rate in the country with the delay of 2 years. It was found that the share of secondary school and vocational school graduates per 10,000 people do not have a statistically significant impact on the country's poverty rate. The obtained results are consistent with the results found in the scientific literature on economics (Balamurali et al., 2015). We believe that in our future research, it may be of interest to look at the impact of the country's innovation level on poverty.

ABSTRACT

Cultural and creative industries are one of the fastest growing sectors in the world economy. CCI is an industry that combines economy, culture and creative technology. According to the 2002-2015 review to Creative Economy of the United Nations Conference on Trade and Development (UNCTAD), CCI showed an average annual growth rate of 7,3%. At the same time, the world exports of CCI products and services increased by more than twice over the years, from \$ 208 billion in 2002 to \$ 509 billion in 2015. Recent international research shows that CCI generates 6.1% of global GDP (4.3 trillion USD) and 3% of global annual income (2.25 trillion USD). About one percentage of world's labor force are working in CCI, which means 29.5 million jobs. The measurement, monitoring and evaluation of development processes in this sector are not fully available due to lack of comprehensive statistics on CCI in Azerbaijan. According to the UNESCO report in 2018, CCI's share of GDP was mentioned 1%. The research of authors aims to examine the current situation in Azerbaijan, determine the share of CCI in the economy and assess the impact of the development of this sector on tourism. The development aspects of the CCI, the realization of the potential for development of the CCI in the liberated lands, contribution of the proclamation of Shusha city as the cultural capital on development of this sphere has been examined and made relevant proposals in the period of Post-Pandemic.

Keywords: *Azerbaijan, culture and creative industries, tourism, creative sectors, GDP, Strategic Road Map*

1. INTRODUCTION

Cultural and creative industries are one of the fastest growing sectors in the world economy. In 2019, the 74th session of the UN General Assembly adopted 2021 as the “Year of Creative Industries for Sustainable Development” (UNGA, 2019). The role of this sector, which has a 3% share in global GDP (UNESCO, 2021), is also growing. CCI is a type of industry that combines economics, culture, and creative technology. In the coming years, the increase in the level of education in the world, the increase in income and leisure time will lead to an increase in demand for culture. Thus, as societies become richer and people's basic needs are met, so does their need for the consumption of intangible products. Creativity is a complex process of innovation that combines some or all of the following dimensions: ideas, skills, technology, management, production processes, and culture at the same time. Therefore, culture should be analyzed both as an intermediate product in the production process and as a final consumer product (films, books, music, cultural tourism, etc.). In general, creativity develops economic competitiveness, helping to protect local jobs alongside skills and talents. Creative industries can stimulate the development of tourism by providing creative content for tourism and supporting innovative approaches to tourism and marketing.

Relationship of tourism with the creative industry:

- development of tourism products;
- revitalize existing tourism products;
- experience in using creative technology to develop tourism;
- exceeding the limitations of traditional cultural tourism models (OECD, 2014).

Azerbaijan's National Priorities for 2030 determine the development of both CCI-s and tourism sector. It was emphasized in this document that in the future, the digital society, which supports the most modern technological areas and innovations, will become a leading force in development. An ecosystem that stimulates creativity and innovation in society must be established to keep the country competitive (NP, 2021). This article examines the impact of the CCI-s on the development of the tourism sector, assesses the current state of tourism and creative industry in our country, explores the development potential of CCI-s in the liberated areas and formulates relevant proposals.

2. A REVIEW OF CCI DEVELOPMENT ON A GLOBAL SCALE

The UN's declaration of 2021 as the “International Year of Creative Economy for Sustainable Development” can be seen as a manifestation of the growing attention to this area on a global scale. Consider that, this sector generates \$2.250 billion in value worldwide each year and provides more jobs for people between the ages of 18 and 25 than in any other field. The cultural sector alone employs 30 million people worldwide. As for the tourism sector the direct contribution of the travel and tourism industry accounted for 3.3 percent of the total global GDP in 2019. Comparatively, the total contribution of the travel and tourism industry in 2019 accounted for 10.4 percent of the total GDP worldwide (Statista, 2021). Research shows that Travel & Tourism will be the key sector in driving the recovery of the global economy post-COVID-19 by generating new jobs and driving visitors back to destinations. Importantly, the sector will also have a positive economic domino effect on suppliers across the entire supply chain (WTTC, 2020). The development of these two sectors has a positive effect on each other. There are several areas to consider when analyzing the creative and cultural industries:

- Visual arts (crafts, painting, sculpture, photography), performing arts (theater, dance, circus) and heritage (museums, art and antiques market, libraries, archeological activities, archives);
- Cultural industry, including film and video, radio and television broadcasting, video games, book and press publishing, music;
- Creative sectors, (fashion design, interior design, graphic design), including design architecture and advertising (T. Emilia et al., 2008).

According to the Creative Economy Outlook for 2002-2015 of the United Nations Conference on Trade and Development (UNCTAD, 2018), CCI-s grew at an average annual rate of 7.3%. At the same time, world exports of CCI products and services have more than doubled over the years, from \$ 208 billion in 2002 to \$ 509 billion in 2015. International research of the recent years (CISAC, 2015) shows that CCI-s accounts for 6.1% (\$ 4.3 trillion) of global GDP and 3% (\$ 2.25 trillion) of worldwide annual revenues. For comparison, this is more than India's GDP. CCI-s employs about 1% of the world's working-age population, which means 29.5 million jobs: the fine arts (6.73 million workers), the book industry (3.67 million workers) and the music industry (3.98 million workers). The number of employees in CCI-s exceeds the total number of employees in the automotive industry of the United States, European countries and Japan. Innovative and advanced activities of small businesses and individuals are attracting more attention, with more young and middle-aged people working in these fields.

According to the information of the European Commission for 2018, CCI-s produce goods and services worth about € 509 billion annually and this number accounts for 5.3% of EU GDP. This is three times more than the share of agriculture in the EU GDP. These sectors employ 12 million full-time workers (for comparison, the number of agricultural workers in the EU is 10 million) and they make up 7.5% of the employed population in the EU. According to the figures, CCI-s are the third largest employment sector in the EU (MCCI, 2019). According to the economic figures of the Department of Digital Development, Culture, Media and Sport of the United Kingdom for 2018, employment in the creative industries increased by 30.6% between 2011 and 2018. However, the similar figure for the country during these years was only 10.1%. Almost half a million jobs have been created in the UK's creative industries, an increase of 2.8% annually since 2011 (DDDCMS, 2021). Regarding to the information of the department, with these growth rates, the creative industries were the fastest growing sector compared to other sectors of the economy. It is expected to be opened 1 million new jobs by 2030 in the UK. In general, according to the evaluation of the UNESCO, the United Kingdom and other advanced countries, CCI-s are growing twice as fast as traditional sectors of the economy and require less investment. The “Create UK” strategy developed in the UK in 2012, is established based on the principles of the government's core industry strategy program and identifies the creative industries as important as traditional industries in the British economy. According to the strategy, five main priority areas have been identified: access to finance, education and skills, infrastructure, intellectual property, exports and attraction of the investment to the country. As a result of the activities carried out over the years, the share of the British CCI-s in the British economy increased from 87.5 billion pounds in 2010 to 131 billion pounds (DCMS, 2017) in 2017 (an increase of 49.7%) it also had a 7.1% (DCMS, 2017) share in the United Kingdom's Gross Value Added Value (GVA).

Figure 1: Index of GVA growth for Creative industries and for total UK: 2010 to 2017 (2010=100)
(Source: DCMS, 2017)

It is no coincidence that in the former Soviet Republics, as well as among the countries of the region, development processes related to CCI-s have already begun (eg, Ukraine, Georgia). (Creative Georgia, 2016; Cristina Farinha, 2017; Skavronska, 2017). Georgia adopted a Roadmap for the Development of Creative and Cultural Industries in 2016, and a Creative Georgia public legal entity was established under the Ministry of Education, Science, Culture and Sports of Georgia to coordinate the development of CCI-s, the development of social media is one of the priorities of the "Long-term National Cultural Strategy 2025".

CCI-s are essential for inclusive economic development, reducing inequality, and achieving the UN 2030 Sustainable Development Goals. Adoption of the UNESCO Convention on the “Protection and Promotion of the Diversity of Cultural Expressions” (UNESCO, 2005) is the main international document on the development of creative economies in terms of the improvement and implementation of rules and measures to support the production, distribution and use of products and services by CCI-s. International experience shows that the main role of states in the development of CCI is to create a favorable legal and administrative environment and business environment for them, the development of the CCI market, its promotion at the local and international levels, training of skilled labor, etc. to achieve such goals, effective coordination between sectors and ministries, provision of management and joint planning and relevant institutional organizational activities for this purpose should be implemented. There is a mutually beneficial relationship between tourism and culture. Thus, the tourism sector is important for creative industries because it has the following potential:

- evaluate cultural and creative values;
- expand the audience for creative products;
- support innovation;
- improve the image of countries and regions;
- open export markets;
- support professional networks and knowledge development (OECD, 2014).

As highlighted in the OECD's Impact on Culture Tourism (OECD, 2009) report, this link is changing with new forms of tourism based on tangible and intangible heritage. Destinations offer consumers the opportunity to develop creative economic approaches, support innovation, and make destination centers more diverse and attractive because they are looking for attractive and competitive tourism products. Here is an example: Austin, the capital of the US state of Texas, is considered the "capital of live music in the world." In 2010, 60% of tourists said they came to listen to live music as a reason to visit the destination. That year, it generated \$ 1.4 billion in revenue and provided 18,000 permanent jobs. The importance of creativity in the knowledge economy is growing. Knowledge and skills become the center of value creation in the economy, and economic, cultural and social power in the creative industries. They contribute to economic growth and employment; contributes to the development of innovation, initiative and skills; supports urban and rural renewal; stimulates exports; preserves cultural identity and enhances cultural diversity.

3. CURRENT STATUS OF CULTURE AND CREATIVE INDUSTRY AND TOURISM INDUSTRY DEVELOPMENT IN AZERBAIJAN

In the XXI century, there is a dynamic development of both CCI and tourism on a global scale. Of course, Azerbaijan cannot stay out of the trends in this area. Because the development of the non-oil sector in Azerbaijan is a priority, and both of these sectors are of exceptional importance in terms of implementing the country's priorities. Thus, Azerbaijan must find new "driving forces" for sustainable economic growth, deep diversification of the national economy, full realization of export potential for goods and services. Although the oil sector is one of the pillars of socio-economic development, the non-oil economy must become the center of development (NP, 2021). From this point of view, both CCI and the tourism sector stand out. National Priorities also emphasize that only a diversified economy can be sustainable. Namely, the development CCI and the tourism sector that can play an important role in economic diversification. It should be noted that the number of tourists visiting Azerbaijan has increased dynamically since 2016. Thus, in 2019, the number of tourists visiting the country increased by 49 percent compared to 2015 (SSC, 2021).

*Figure 2: Number of tourists coming to Azerbaijan and citizens leaving the country as tourists, thousand people
(Source: SSC, 2021)*

It should be noted that a significant growth in the tourism sector is projected in 2020. Unfortunately, in order to prevent the spread of coronavirus infection, the introduction of a restrictive regime on the state border between the Republic of Azerbaijan and neighboring countries, as well as temporary restrictions on travel in most countries has led to a sharp decline in visitors in April-December 2020 (SSC, 2021). The visits were mainly for non-tourism purposes. As a result, in 2020, 4 times fewer foreigners and stateless persons came to Azerbaijan in compare with 2019. Our research showed that in 2010 only 65% of foreigners and stateless persons came to Azerbaijan for tourism purposes, but in 2019 the situation in this area has changed for the better. It was clear from the analysis of statistical data that in 2019, 90% of visitors to Azerbaijan made trips for tourism purposes. 57% of Azerbaijani citizens traveling abroad in 2010 and 78% in 2019 made trips for tourism purposes. As can be seen, since 2016, there has been an increase in both the number of tourists visiting our country and the mutual tourism turnover. Thus, in 2016, 2044.7 thousand people (SSC, 2016) and in 2019, 2863.5 thousand people (SSC, 2019) came Azerbaijan for tourism purposes. In 2018, Azerbaijani residents provided services worth \$ 4.7 billion to foreign residents . During the period of these services, exports of tourism services amounted to 2.6 billion US dollars, while imports amounted to 2.3 billion US dollars. As a result, there was a surplus of \$ 349.8 million (CBAR, 2020). The positive trend here is that while the balance of tourism services was negative in 2009, a positive balance was achieved in 2018. At the same time, the share of tourism in the structure of services exports was 56.2%. As for CCI-s, the lack of comprehensive statistics at the national level does not fully allow measuring, monitoring and evaluating development processes in this sector. The 2018 UNESCO Cultural Development Indicators Report on Azerbaijan was a reference point for determining the share of CCI-s in the Azerbaijani economy(UNESCO, 2018). The report puts the share of CCI-s in GDP at 1% (\$ 374 million for 2016). The data of the Ministry of Taxes was used for the calculations, which also took into account only the data of individuals and legal entities registered as taxpayers. In general, the existence of problems such as concealment of income or low turnover, non-registration as a taxpayer suggests that the share of CCIs in the economy is higher than the above figure. As an example, before the pandemic, an average of 60,000 marriages were made in Azerbaijan each year (63869 marriages in 2019) (SSC, 2020).

Most marriages are accompanied by weddings. Assuming that an average of \$ 2,000 is spent on music, entertainment, photography and video services for each wedding party, then one figure (\$ 120 million) appears to be one-third of the figure calculated by UNESCO above. we see. This is a figure calculated only for wedding ceremonies and some services provided at the wedding. By the way, weddings for the development of domestic tourism can be held in the liberated city of Shusha, the cultural capital of Azerbaijan. As for international tourism, since 2016, there has been a practice of holding wedding ceremonies in Baku. During 2018 and 2019, 200-400 guests from India, the United Arab Emirates, the United States and Germany and from other countries attended the Indian wedding at the Bilgah Beach Hotel and Fairmont Baku, Flame Towers, which are among the most popular hotels in Baku. Let's take another example. Baku is included in the UNESCO Network of Creative Cities. Baku, one of the most beautiful cities in the Caucasus, always attracts the attention of musicians and cinematographers for its music videos with its modernity and richness of historical and architectural samples. World celebrities, especially Russian and Turkish show business celebrities, shoot their music videos in Baku, Gabala and other cities. This situation makes a positive contribution to the development of both the creative and industrial industries in our country, as well as the tourism industry. According to the UNCTAD Creative Economy Outlook for 2002-2015, Azerbaijan's trade turnover on CCIs for 2005-2014 was compared (UNCTAD, 2018). Thus, while the volume of exports and imports in 2005 amounted to 4.94 million US dollars and 51.77 million US dollars, respectively (trade balance - 46.83 million US dollars), in 2014, a similar trend was observed in exports and imports. The volume of imports amounted to 3.95 million US dollars and 138.04 million US dollars, respectively (trade balance - 134.09 million US dollars). This gives reason to say that the negative balance observed in the trade turnover of Azerbaijan for CCIs has increased almost threefold during the period. Since it is important for Azerbaijan, which is in the early stages of development of primary schools, to study the current situation in these areas, the Ministry of Culture of the Republic of Azerbaijan has been implementing a number of research projects with the support of a number of international organizations (Creative Azerbaijan, 2019). The latest research report by the Ministry of Culture clarifies the current situation with CCI-s, highlights the important potential role of these areas in the country's socio-economic and cultural life, and identifies the development of a long-term and multilateral integrative program as an important measure for Azerbaijan (Creative Azerbaijan, 2021). Also, the strategic roadmap stresses that cultural and historical heritage of the Republic of Azerbaijan is very rich. At present historicalcultural sites interesting for tourists are being restored and relevant tourism development plans are being prepared for such sites to use them as tourism attractions (SRM, 2016).

4. CONTRIBUTION OF THE LIBERATED TERRITORIES TO THE DEVELOPMENT OF CREATIVE INDUSTRY

One of the five priorities announced in the document "Azerbaijan 2030: National Priorities for Socio-Economic Development" is related to the great return to the liberated territories. It is emphasized in the document that we can bring the share of the liberated region in economic activity to the pre-occupation situation and increase it steadily. It is the CCI-s and the tourism sector that can play an exceptional role in restoring economic activity in the liberated territories. It should be noted that as a result of the occupation of Shusha by the Armenian armed forces in 1992, about 600 historical and architectural monuments were destroyed and looted. After the liberation of Shusha in 2020, the announcement by the President of Azerbaijan of the country's cultural capital (PA, 2021) opens up great opportunities for the development of CCI in this city. Work is already underway in Shusha to restore the Vagif Poetry Days and the "Xari Bulbul" Festival.

On the other hand, the construction of a new road to Shusha and the construction of an international airport in Fizuli create great opportunities for the development of tourism in these areas. It should be noted that in the 70s and 80s of the XX century, the development of tourism in Karabakh reached a high level, there were a large number of resorts, cultural institutions, leisure centers, and there were many beds in the accommodation facility. Thus, in 1987, a significant part of 50,000 foreign tourists to Azerbaijan, 250,000 tourists from different regions of the USSR and 2.5 million domestic tourists who took part in tours organized by local tourism and excursion bureaus visited Karabakh. In general, on the eve of the occupation of Shusha, the number of buildings of the Sanatorium-Resort Association reached 18. There were 316-bed Shusha rest house and 6-bed buildings of 1000-seat sanatorium of all-Union importance, medical building, 400-seat canteen and others. There is a need to develop a comprehensive program of measures to transform Shusha into a climatological and balneological resort, as well as to operate as a tourist center. It should be noted that international competitions have been held in Shusha before. At present, the city is planning to hold the International Nightingale Festival. At the same time, according to the Azerbaijan National Culinary Center, the International Culinary Festival will be held in Shusha in August 2021, and applications are already being received from 15 countries to participate in the festival. Our research shows that there is a great potential for the development of CCI-s and the tourism sector in the liberated areas. Reconstruction of these areas, especially the restoration of the city of Shusha, will make a significant contribution to the development of CCI-s and the tourism sector in Azerbaijan.

5. CONCLUSION

In conclusion, we can note that the attention to CCI-s is growing globally, and the UN declaration of 2021 as the "Year of Creative Industries for Sustainable Development" is a manifestation of this. Since 2019, increased attention to the development of CCI-s in Azerbaijan. However, at present, the creative industry in Azerbaijan is not yet fully accepted by society as a unified management and supply. It is important to bring new thinking and impetus to this area. There is a need to establish intensive partnerships with private sector participants on CCIs, and to establish more flexible and effective mutually beneficial relationships with creative unions and associations that bring together creative people in specific areas of culture. The application of optimal Public-Private Partnership models for the private sector should be stimulated in the more effective management of state-owned cultural institutions by sectors. In view of the above, it would be expedient to develop a "Strategic Roadmap for the Development of Culture and Creative Industries in Azerbaijan for 2021-2030." in order to ensure effective coordination of long-term strategic planning and development processes for the development of CCI-s in the country. This document can be an integral part of broader national goals, including the diversification of the economy, including exports, support for the development of small and medium enterprises, education reform, regional development, reducing youth unemployment. It should also be noted that these jobs are more open to digitalization than other industries. The development of CCI, in turn, can contribute to achieving the goals set for the tourism sector. Because Azerbaijan has hundreds of cultural tourism destinations. It can also attract cultural tourists, especially in the liberated territories. The organization of international music festivals and other creative events in Shusha and other liberated regions will also give impetus to the development of alternative tourism. We also propose to pay special attention to the development of CCI-s and tourism in the project "State Program for the Restoration and Sustainable Development of the Liberated Territories of the Republic of Azerbaijan for 2021-2025".

DEVELOPMENT TENDENCIES AND DIVERSIFICATION PROBLEMS OF AZERBAIJAN'S ECONOMY

Shahla M. Rzayeva

*Associate Professor at Azerbaijan State University of Economics (UNEC), Azerbaijan
rzayeva.shahla@mail.ru*

ABSTRACT

The study finds that, despite various indicators of economic growth for the world and countries provided by credible international financial institutions, the outlook for economic growth in 2021 is negative due to the global pandemic in 2020. The developing countries are projected to expand at a faster rate. The negative dynamics that have been observed in most countries around the world are the product of a strict quarantine regime enforced in response to the pandemic and its repercussions, and it is unavoidable that the results of such steps will be passed on to the Azerbaijani economy. According to the study, non-oil GDP, which has been a positive contributor to GDP growth over the last three years, will decline by 2.3 percent in annual projections in the timeframe under consideration in 2020. However, in terms of its effect on shifts in overall value added output, it has long since lost its dominant role. To avoid the spread of new coronavirus infections, decreases in value added from non-oil industries, which account for around 70% of GDP, resulted in a 1.4 percentage point reduction in GDP decline. This was due to the April implementation of a strict quarantine regime. The pandemic's continued weakening of aggregate demand has stopped inflation from accelerating, whereas the quarantine regime has sped up disinflationary patterns. Of course, the new strategic plan, which is marked by the restoration of the country's territorial integrity, necessitates deep structural-institutional changes, the formation of export capacity, and long-term economic development through non-oil sector expansion, national economy competitiveness, improving, innovating as well as diversifying the economy. They will ensure the country's economic growth in Azerbaijan if the country's citizens' well-being is strong.

Keywords: *non-oil industry, alternative energy sources, non-oil exports, global pandemic, economic growth*

1. INTRODUCTION

As part of a new level of socioeconomic growth, one of Azerbaijan's top goals is to enter the ranks of developed countries by modernizing all aspects of public life. Our country's reforms are also based on global challenges of the moment, necessitating the need to identify the main contours of the country's future stages of development. The country's and the region's complex political, economic, and humanitarian processes necessitate the introduction of complex, systemic, and dynamic economic reforms to shape a post-oil economy on a global scale. Accelerating economic growth focused on high, sustainable, inclusive, and private initiatives, and ensuring the return of the population to the liberated territories, are two of the most pressing challenges ahead. As the formation of a fiscal framework must adapt to new realities, including the preservation of stable foreign exchange reserves and the gradual reduction of transfers from the State Oil Fund to the state budget, macroeconomic stability in terms of resistance to internal and external shocks will be needed in the future.

2. NEGATIVE EFFECTS OF GLOBAL QUARANTINE CONDITIONS ON THE DYNAMICS OF IMPORTANT ECONOMIC INDICATORS

The COVID-19 pandemic had more negative effects than anticipated in the first half of last year, according to the June issue of the *International Monetary Fund's* World Economic Outlook. Due to the national lockdowns, the estimates on significant economic parameters for

2020 and 2021 have been decreased. However, trade has grown at a time when disease treatment has been effective, vaccine testing has increased, and global quarantine conditions have improved as a result. The forecast scenarios for 2020 have been improved to reflect the gradual growth of economies and the relative recovery in demand, and the economy is projected to decline at a slower rate (Table 1).

Countries/regions	Data	Forecasts					
	2019	Indicators on 2020			Indicators on 2021		
		Issue in April	Issue in June	Issue in October	Issue in April	Issue in June	Issue in October
Economic growth							
World	2,8	-3,0	-4,9	-4,4	5,8	5,4	5,2
Developed countries	1,7	-6,1	-8,0	-5,8	4,5	4,8	3,9
USA	2,2	-5,9	-8,0	-4,3	4,7	4,5	3,1
Euro zone	1,3	-7,5	-10,2	-8,3	4,7	6,0	5,2
Japan	0,7	-5,2	-5,8	-5,3	3,0	2,4	2,3
United Kingdom	1,5	-6,5	-10,2	-9,8	4,0	6,3	5,9
Canada	1,7	-6,2	-8,4	-7,1	4,2	4,9	5,2

Developing countries	5,1	4,6	4,4	5,0	4,5	4,5	4,7

Table 1: The oil price line reflects the change in the average price for Brent, Dubai and WTI. The average oil price per barrel in the October issue is projected at \$ 61.39 in 2019, \$ 41.69 in 2020 and \$ 46.70 in 2021.

(Source: IMF - "World Economic Outlook: The Great Lockdown" April 2020)

As shown in the table, the estimated figures for most countries or regions for both years have improved as compared to the previous scenario. Positive dynamics are expected to replace the negative dynamics forecasted for 2020 and observed during the assessment period the following year. As a result, while the global economy is forecast to contract by 4.4 percent in 2020, it is forecast to grow by 5.2 percent in 2021. This trend, which can be seen in other countries or regions, is largely explained by the relative improvement of aggregate demand determinants such as consumption and investment, which had dramatically deteriorated the previous year. The uncertainty surrounding the COVID-19 pandemic, the disease's re-expansion towards the end of the year, and knowledge of the idea of improving the quarantine regime in some countries make the October issue unlikely to be positive. However, it has weakened. According to the Republic of Azerbaijan's State Statistical Committee, the country's GDP was 58469.5 million manats in January-October 2020, down 3.8 percent in real terms from the same period the previous year.

Despite a major weakening of global demand for oil, the sharp drop in oil prices and the agreement to reduce oil supply to prevent a sharp drop in prices had a significant impact on the amount of value added in the country's oil sector. 64.0 percent of the 3.8 percent decline was attributed to the oil sector. Oil production dropped 7.6% from January to October, outpacing the positive effect of a 7.3 percent increase in gas production, resulting in a 6.3 percent decrease in oil GDP. Oil production has dropped since the OPEC+ agreement was agreed to be extended at a meeting in May 2020, with a resumption expected in 2020. According to OPEC monthly statistics, Azerbaijan is one of the largest non-OPEC countries expected to reduce oil production in 2020, with a decrease of around 0.06 million barrels per day (Figure 1). Our country's daily production will average 0.71 million tons in 2020 and 2021, according to the organization's estimates.

Figure 1: Annual change in production for non-OPEC countries, mln. Barrel / day
(Source: The picture is based on OPEC's monthly bulletins)

3. EXPANDING THE DIVERSIFICATION OF ECONOMIC DEVELOPMENT

Some of the most important developments in the country's economic growth are increased regional economic activity, the organization of their integration into global economic systems, and the formation of export potential. The creation of Azerbaijan's regions is an important part of Azerbaijan's successful and long-term socioeconomic development strategy. Completion of tasks envisioned in adopted and effectively implemented state programs for regional growth, as well as decrees on additional measures for regional socio-economic development. Long-term growth in the non-oil market, as well as the quality of services and social infrastructure in the regions, as well as the business environment, are all top priorities. More jobs have been created and poverty has been reduced as a result of improving the business environment, increasing investment, and launching new companies. Between 2004 and 2018, the gross domestic product increased by 3.3 times, with the non-oil sector rising by 2.8 times, manufacturing by 2.6 times, and agriculture by 1.7 times. Targeted policies resulted in the development of more than 2 million new jobs in the country, 1.5 million of which were permanent, more than 100,000 new enterprises, a 5% unemployment rate, and a 5.1 percent reduction in poverty during this period. The large-scale work done as part of state initiatives has laid a solid foundation for future regional development.

The work done in the coming years to promote socioeconomic development in the country's regions, including rural areas, will be driven by paragraph 3 of Article 109 of the Republic of Azerbaijan's Constitution. The State Program on Socio-Economic Development of Azerbaijan's Regions for 2019-2023 was adopted and is being implemented successfully in order to continue the work, improve infrastructure and social services, and increase employment and material well-being for the population living in the regions. The share of a number of budget revenue parameters in GDP is projected to grow in the non-oil sector, while remaining stable in the face of the global pandemic. Revenues to the state budget, including non-oil sector revenues, are expected to increase in 2021, while the GDP ratio is expected to stay constant (Figure 2). Budget revenues as a percentage of GDP are expected to remain at 33.6 percent in 2021, unchanged from 2020, whereas non-oil sector revenues as a percentage of GDP are expected to grow. The tourist and hospitality sector experienced the sharpest decline among non-oil sectors, and it had the greatest negative effect on non-oil GDP. Assuring the tourism sector's long-term development and importance as a main economic sector in the Republic of Azerbaijan President of the Republic of Azerbaijan Ilham Aliyev signed the "State Program for the Development of Tourism in 2010-2014" on April 6, 2010. The main goal of the State Program is to develop a modern tourism sector in Azerbaijan that meets high economic, social, and environmental standards while also contributing to the country's main economic development. Establishing conditions for the expansion of tourism operations, as well as ensuring its transformation into one of the key areas, is critical.

Figure 2: Ratio of state budget revenues to GDP, in %

The discovery of the COVID-19 virus inside the country's borders in March, on the other hand, had a significant effect on both foreign and domestic tourism, with both hitting new lows. According to the State Statistical Committee, from January to October 2020, there was a 56.7 percent decrease compared to the same period last year. It was 62.2 percentage points lower than the comparable indicator from the previous year (Table 2).

Indicators	Unit of measurement	2019 10 months	2020 10 months	Differene
Value-added	Mln. Manats	1624,9	711,0	-913,9
Real growth rate	%	5,5	-56,7	-62,2

*Table 2: Placement of tourists and value-added on public catering sector
(Source: Developed based on data of the State Statistical Committee)*

Despite the non-oil sector's decline in 2020, growth in non-oil industry and trade was observed, including agriculture as a key indicator of the country's export potential. It should be noted that, in contrast to 2019, the pace of growth in the relevant areas has slowed. Agriculture, forestry, and fisheries, which account for 7.5 percent of GDP, increased by 1.6 percent in the same period last year, but by 5% more than in the same period this year. Furthermore, the non-oil sector's real growth rate was 11.3 percent in the first ten months of 2020, compared to 15.7 percent in the same period of 2019. However, as in 2019, the non-oil industry had the greatest positive impact on non-oil value added this year, and was able to offset, although partially, the negative impact of the tourism sector (Figure 3).

*Figure 3: Annual change in value added in non-oil sectors, real %
(Source: Picture has been developed based on data provided by the SSC)*

The transportation and warehousing industry, as seen in the graph, is one of the sectors with positive trends in relation to 2019, with value added increasing by 4.8 percentage points and 5.3 percent. The increase in value added in the field of transportation is explained by a high increase in revenue from air freight, despite a drop of 18.9% in freight and 39.0% in passenger transportation in the first ten months of 2019. Following tourism and hospitality industry, the construction sector experienced the next major downturn, with a fall of 6.4 percent of total GDP in 2018, which accelerated to 8.0 percent in 2019. A drop in fixed asset investments may explain the acceleration of the decline. It's worth noting that construction and installation work accounted for 63.1 percent of overall investments. According to the results of the first ten months of 2020, there was a fall in fixed asset investments, with domestic sources taking the lead in overall investments. Fixed asset investments totaled 11,540.2 million from January to October 2020. In real terms, it fell by 2.1 percent from the same time last year.

The decline was triggered by a 9.9% drop in non-oil sector investments during the year, according to the decomposition of oil investments. Despite the fact that oil sector investments increased by 11.7 percent in 2019, overall investment growth was due to the fact that oil sector investments lag behind other sectors. It was impossible to stand there and watch it happen. When looking at the funding sources, it's clear that the decline in fixed capital investment was caused by domestic sources. In contrast to domestic investments, which dropped 8.9% over year, foreign investment increased by 25.8% reversing negative trends in 2019. Domestic investment, which accounts for 64.0 percent of total investment, should be noted. As a result, despite a significant increase in foreign investment, there has been no increase in total investment (Table 3).

Indicators	Unit of measurement	2019 10 months	2020 10 months
Investments in the main capital	Mln. Manats	11407,4	11540,2
Real growth rate	%	-2,6	-2,1
Oil sector	Mln. Manats	4270,9	4781,8
Growth rate	%	-13,4	11,7
Non-oil sector	Mln. Manats	7136,5	6758,4
Growth rate	%	6,8	-9,9
Internal investments	Mln. Manats	8108,6	7390,1
Growth rate	%	13,8	-8,9
Foreign investments	Mln. Manats	3298,8	4150,1
Growth rate	%	-24,2	25,8

*Table 3: Fixed capital investments and their classification
(Source: Table developed based on SSC data)*

Investments in the public sector amounted to 4708.4 million manat in January-October 2020, accounting for 40.8% of total investments in fixed assets manats. It should be noted that this figure is 15.6% less than in the corresponding period of 2019. The imposition of a strict quarantine regime and subsequent extension of its length in response to rising global health threats and deteriorating medical conditions in the country had a negative impact on the population's economy, resulting in a decrease in income. The population's income dropped by 1.4 percent in nominal terms and 4.1 percent in real terms between January and October 2020. The fact that the population's income is lower than the rate of inflation, as well as a decrease, indicates that real purchasing power has been lost. The average monthly wage, which is a critical component of the population's income, continued to increase in double digits in 2019, as a direct result of the social package initiatives implemented in 2019. In this case, the fall in wages may be due to a reduction in other sources of revenue, such as 2020 transfers. With retail trade turnover of 1.5 percent and paying services provided to the population, the consumer economy continued to deteriorate in reaction to the lockout system and the long-term decline in real incomes. Despite a 25.9% drop in the overall value of goods and services sold in the industrial sector, the total value of goods and services sold in the consumer market fell 7.7% due to lower demand from both state and non-state territory. Despite the fact that social package policies were supposed to raise rates by increasing demand next year in late 2019, a sharp change in consumer behavior due to tense medical conditions has kept these expectations to a minimum. Thus, from January to October 2020, the average annual inflation rate was 2.8 percent, with food items being the primary driver of price increases. Food prices rose 5.1 percent in comparison to the same period last year, indicating that demand was not declining. As a result, it ranked first among the industry basket subgroups in terms of growth rate (Table 4).

In contrast to other categories, the primary causes of price rises in the food, beverage, and tobacco subgroups could be linked to a rise in global food prices as well as a decrease in demand for these products during the quarantine period. Food prices started to rise again in June after falling since February 2020, according to October data, rising by 2.3 percent on a monthly basis and 5.6 percent on an annual basis.

Subgroups included in the consumer basket	Jan-march	January-June	January – September	January-october	2019 10 month
Food, beverages and tobacco	5,2	5,5	5,2	5,1	3,7
Non-food products	1,2	1,3	1,3	1,3	1,2
Services	1,4	1,0	1,1	1,0	2,2
Total	3,0	3,0	2,9	2,8	2,6

Table 4: Changes in the price index for subgroups included in the consumer basket, average annual, %

(Source: The table is based on the SSC data)

Despite the declining dollarization trend, the manat's exchange rate dynamics have improved in response to the sharp drop in oil prices since the end of the first quarter of 2020, which has raised inflation expectations and raised the possibility of increased import inflation. As a consequence of the stability that has been achieved, these expectations have been reduced. It's worth remembering that over the last ten months, the average annual inflation rate has been near the middle of this range, which is consistent with the Central Bank's target range. It should be noted that basic inflation, as calculated without taking into account the prices of state-regulated goods and services, as well as seasonal agricultural products, was 2 percent in the average annual assessment from January to October 2020. Currency auctions conducted jointly by the Central Bank and the Republic of Azerbaijan's State Oil Fund were crucial in keeping the manat's exchange rate stable. As a result, the currency supply sold at currency auctions is used to ensure that SOFAZ transfers to the state budget are made on time and to raise the proportion of manat-denominated assets in SOFAZ's investment portfolio. Between January and October of this year, SOFAZ sold 6170.5 million dollars, with 9968.3 million manats used to manage SOFAZ transfers to the state budget. Important changes in consumer behavior in March influenced the high increase in foreign exchange supply for the first half of 2020. For the first ten months of 2019, the currency supply realized in the foreign exchange market was 19.4 percent higher than the amount of currency sold in the same timeframe of 2019. Oil exporters agreed in March to reverse weakening global demand patterns, forcing a steep drop in oil prices that eventually led to instability in the foreign exchange market, reducing Azerbaijan's oil revenues. As a result of these procedures, the selling of dollars reached 549.5 million in March 2020, which is the average monthly figure for 2019. That's roughly four times what it was in 1928.3 \$ million is a large sum of money. Following that, pandemic-induced isolationist regimes changed consumer behavior once more, resulting in a decrease in currency demand and, as in previous months, a moderated supply of foreign exchange. In early 2020, fluctuations in the foreign exchange market affected the amount of deposits, including a fall in household deposits, and developments in the banking sector played a key role in this decline. The current pandemic has had an impact on the banking industry as well. Public deposits decreased by 5.3 percent in March due to the aforementioned reasons. They also dropped by another 5.3 percent in subsequent months due to the revocation of certain banks' licenses. The figures had risen into the double digits. The 2-digit increase in the annual change in total deposits seen at the beginning of the year was followed by a 4.1 percent drop at the end of October (Figure 4). The decline in growth rate as compared to the same time in 2019 can be explained by a drop in foreign currency deposits.

In annual terms, manat deposits rose by 11.6 percent in the first ten months of 2020 (up from 30.7 percent at the start of the year), while foreign currency deposits decreased by 13.2 percent (4.1 percent increase at the beginning of the year). The steps taken by the monetary authority to ease monetary policy are aimed at increasing the role of banks in the process of promoting economic activity, making loans more accessible. During 2020, the Central Bank has repeatedly revised the parameters of the interest rate corridor at various stages and implemented interest rate reductions to ease monetary policy. The discount rate 9.25% applied at the beginning of the year has been reduced from 6% to 6.5% to date. The decision to lower interest rates was influenced by the stability of the manat's dynamics, low inflation, and weakening demand.

Figure 4: Total loans and deposits, at the end of the period, mln. manat.

Source: The picture is based on the CBA's statistical bulletins).

The decline in deposits in manat had an effect on the amount of money supply by the end of October 2020. The general money supply grew at a rate of 13.7 percent in manat, down 14.9 percentage points from the start of the year. Among the constituent elements of this monetary aggregate, there was a decrease in time deposits in manat, as well as a decrease in growth in other components. The drastic change in consumer behavior during the lockdown regime has weakened the growth of the monetary base, resulting in a weakening of demand. The prevailing pandemic conditions have significantly reduced economic operations, the growth of the monetary base, which was around 30% at the beginning of the year, fell to around 6% in April, and the growth rate in April was the same as in February which decreased by about 5 times compared to. In the following months, there was a gradual increase in the monetary base in manat, and the transition to double-digit growth from July onwards resulted in a 17.5% increase in late October. According to the World Bank, the Azerbaijani economy will recover to pre-pandemic levels by the end of 2022. The acceleration of domestic demand in 2021 would boost economic growth, according to the study, but this will be due to improved health and increased government spending. High oil prices are projected to help the current account return to surplus by reducing the financial deficit. Because of the anticipated tightening of fiscal policy and the long-term recovery in oil production, the speed of economic recovery is expected to be moderate without significant structural reforms after 2021 (amid growing financial pressures).

Achieving the growth of the country's information and communication technology industry is one of the country's modern economic development trends. Along with a country's socioeconomic growth, the level of application of information and communication technology is one of the most important indicators of its intellectual and science capacity, transparency and efficiency in government, and societal development. The widespread use of information and communication technology is critical for ensuring national security in the field of information, in addition to serving the country's overall growth. In modern times, the space industry has evolved into a critical tool for resolving global and regional socioeconomic, scientific, and technological issues, as well as a means of advancing in space. Space exploration contributes to scientific and technological advancements, which leads to creativity. Significant steps have been established, and strategic tasks have been set, in order to make this sector of the economy, after the oil and gas sector, the top priority. The world's oil and gas reserves are depleting, necessitating the use of alternative and renewable energy sources. Renewable energy sources include water, wind, solar, biological waste, and, with the aid of some facilities, even sea waves. The benefit of using this energy is that it has no negative effects on the atmosphere and does not pollute it with toxic waste. The development of this sector is already a priority for the Azerbaijani government. Azerbaijan's advantageous geographical position and climatic conditions allow widespread use of environmentally sustainable alternative (renewable) energy sources. The use of alternative energy sources in the production of electricity and heat while using the country's natural resources would allow for progressive changes in electricity's future growth. As a result, in 2004, the Republic of Azerbaijan implemented the "State Program on the Use of Alternative and Renewable Energy Sources." The State Agency for Alternative and Renewable Energy Sources of the Republic of Azerbaijan was created in 2013 to improve the country's management system in the field of alternative and renewable energy. A strategic plan for 2015-2018 has been established by the department. The aim of this plan is to increase the development and productive use of alternative and renewable energy resources, recognize and extend the use of renewable energy capacity, and develop measuring observation stations as an operation. Solar energy, which is Azerbaijan's primary renewable energy source, has become more widely used in recent years. The explanation for this is Azerbaijan's abundance of sunny days. The Absheron Peninsula and the Caspian Sea coast receive 2,500 hours of sunlight each year, while the Nakhchivan Autonomous Republic receives 2,900 hours. One of the successful steps taken in this field is the establishment of the Gobustan Experimental Landfill and Training Center. Azerbaijan's use of wind energy is also a promising field. Powerful winds blow in the Absheron Peninsula and along the Caspian Sea coast for more than 270 days a year. Wind speeds reach 7.2 meters per second on an annual basis. In other parts of the world, the number of windy days ranges from 20 to 70. As opposed to a coal power plant, a wind power plant with a capacity of 500 kW avoids the emission of 750-1250 tons of CO₂ and 3-6 tons of other harmful substances. The widespread use of wind turbines in the Absheron Peninsula, according to experts, will make a significant contribution to the country's economy. In this sector, large-scale wind energy usage could provide 20% of total energy balance while saving the same amount of fossil fuels. It is possible to save about 2.4 million tons of fuel oil and avoid the release of 7.5 million tons of carbon dioxide into the atmosphere by using wind energy over a 20-year period. To ensure the growth of non-oil exports, goals have been set for the near future to improve the country's competitiveness, achieve high growth rates in the non-oil sector, and raise GDP per capita at the expense of this sector. The large-scale work on creating technoparks and industrial districts is commendable in this regard. This work began after the signing of the Law of the Republic of Azerbaijan "On Special Economic Zones" and the Decree "On the establishment and organization of industrial districts." The aim of developing and implementing these important new policies is to establish favorable conditions for the growth of small and medium businesses in the country's manufacturing and service sectors.

The low share of infrastructure spending is a necessary condition for lowering the costs of industrial enterprises. Simultaneously, the growth of small and medium enterprises necessitates the strengthening of cooperative relationships between businesses. Given that industrial districts are designed for the development of competitive products and services by small and medium-sized enterprises with the requisite infrastructure to engage in entrepreneurial activity, their high usage is strategic. One of the benefits for businesses in these areas is that they do not need to build infrastructure for them. As a result, the state provides all infrastructure elements to the businesses before they begin operations.

4. CONCLUSION

Economic growth depends on reducing the natural resources factor and ensuring the non-oil factor's supremacy in the country's gross domestic product and the formation of the state budget. The document "Azerbaijan 2030: National Priorities for Socio-Economic Growth," which was approved by President Ilham Aliyev's decree dated February 2, 2021, opened up new possibilities for identifying the country's long-term sustainable development goals and introducing reforms based on specific programs. The government has assigned the task of introducing reforms, programs, and initiatives in five key areas based on national priorities: 1) a competitive, strengthened economy; 2) a society built on diverse, egalitarian, and social justice; 3) competitive human capital and capacity for new innovations; 4) a significant return to liberated territories; 5) a clean environment and "green development" nation. The resolution of the issues reflected in the national priority would restore the liberated territories' historical role in the country's economic and social system. The area will become one of the most important ties in economic activity, with the same pace of growth as the rest of the world, if innovative methods and new technology are used. The initiatives and projects undertaken by Azerbaijan to restore the international transport and logistics corridor in the region will not only improve the country's access to global markets, but will also provide a major boost to the growth of liberated areas. Using available resources and geographical location, ensuring modern socio-economic growth in all Azerbaijani regions is a national priority driven by rapid development.

ABSTRACT

This paper identifies the factors and earning opportunities that affect investor behavior during the Brexit process. As a result of leaving the single market obstacles to the movement of capital and labor, the difficulty of trade relations, and the implementation of financial services under new rules have led to economic and political uncertainty. This situation was partially resolved on December 24, 2020. A number of indicators influenced investor behavior in 2016-2021. These includes: changes in the legislation; uncertainty after statements; earning opportunities. At the same time, the reputation of the London financial center complicates this issue. For investors, London is the number one financial hub in Europe and the center of their financial operations. While other European financial centers are trying to take advantage of this process. In the course of this process, there has been an increase in investment flows to the UK. This can be considered unexpected in the event of Brexit uncertainty. Because a number of experts predicted a decline in investment flows to the UK in the event of Brexit. However, according to a number of institutions, the UK ranks first in the world in terms of the attractiveness of the investment climate. It is the factors that affect investor behavior that determine this process. With the Brexit effect, investors have a chance to achieve their goals, ie to make a profit. Given that the EU has made great strides in the integration process, it was impossible for the UK to withdraw from the union with the prospect of a no-deal. As a result, the end of this process resulted in an agreement, and the UK does not actually lose connection with single market, with some exceptions. Thus, Brexit will only lead to losses in the short term. In this case, long-term targeting is more optimal.

Keywords: *Brexit, Economic uncertainty, Financial regulation, Investor behavior*

1. INTRODUCTION

The Brexit process has been on the agenda in the European Union since 2016. This event has caused uncertainty in European financial markets. On the agenda of the media No-deal Brexit probabilities was seriously discussed. The factors behind this process were Theresa May's Article 50 statement (Wearden, 2016) and her subsequent failed Brexit approach. Boris Johnson, despite his tough stance, has reached a high-priority agreement with the EU. This raises the question is the probability of a No-deal Brexit high. Uncertainty in the financial markets existed, albeit slightly, after the Canadian-style deal. The reason was that the agreement focused too little on the financial sector. The Memorandum of Understanding, reached in March 2021, resolved many details. This means that in the coming years, the partners will continue their relations through bilateral negotiations (Nardelli, 2021). Brexit has created uncertainty in financial markets (Garibli, 2017). This has ultimately increased volatility in the markets. Volatility also means the opportunity to earn. In this case, the behavior of investors attracts attention. If we look at the statistics and a number of reports, we can see that the UK is still attractive to investors. This shows that investors take into account the influence of other factors in decision-making in such processes.

2. THE MEAN OF UK FOR INVESTORS

The United Kingdom attracts investors on a number of indicators:

- Forbes selected the Kingdom as the best country for business in 2019; (Badenhausen, 2018)
- One of the world leaders in the financial sector; (TheCityUK, 2020)
- The headquarters of most professional financial institutions are located here;
- UK has all the infrastructure and professionals needed for financial markets;
- The main financial operations of the European Union are carried out in London;
- Geographically located in the center of other financial centers around the world (free from time difference)
- Attractiveness of financial regulation rules;
- Availability of a comfortable environment for foreign companies (for example, there are 1,400 financial services companies in about 80 countries) (Sowels, 2017, p.3) (46.8% of companies engaged in financial and insurance activities belong to foreign entrepreneurs) (ONS, 2020)
- Adoption of English as an international language;

London is the number one financial center in Europe: (Table 1)

	UK	USA	Japan	France	Germany	Other
<i>Cross-border bank lending (Q2 2020)</i>	15	10	13	10	7	45
<i>Foreign exchange turnover (Apr 2019)</i>	43	17	5	2	1	33
<i>Interest rate OTC derivatives turnover (Apr 2019)</i>	50	32	2	2	1	14
<i>Conventional fund management (end-2019)</i>	6	46	7	4	-	-
<i>Insurance premium (end-2019)</i>	6	39	7	4	4	39
<i>International debt securities Outstanding (Q1 2020)</i>	13	9	2	6	5	65

*Table 1: The indicators of the financial centers (%)
(Source: TheCityUK, 2020)*

In the list of net exporters of the largest global financial services, the UK is the leader in 2019 (\$ 77.0 billion)(TheCityUK, 2020, p.8). London also ranks second in Europe and fifth in the world in terms of assets in the banking sector (\$10.2 trillion)(TheCityUK, 2020, p.12). Operations of major European banks are implemented from London. After the Brexit, the banking sector may face higher commissions, which will have a significant impact on their revenues. In the 1960s and 1970s, London began to increase its prestige as a financial center around the world, and this accelerated in the 1980s. The free movement of capital in the EU has created the conditions for the development of this financial center (Howarth, 2017). The UK is in the top five in surveys conducted by various organizations. It was inevitable that the Brexit process would affect investor behavior. The delay in the Brexit process, the spread of hard and soft Brexit news, and the situation created by the statements of politicians about Brexit, inflamed uncertainty. Also, Brexit uncertainty depended on the outcome of trade talks. The issue of leaving the single market, the loss of passport rights, the adoption of equivalence rules include a number of uncertain decisions and future obstacles.

According to the trade agreement reached on December 24, 2020 and the current state of the economy, it is possible to predict how investment decisions will change:

- The agreement reached by the partners to the trade agreement also put an end to the uncertainty in EU since 2016.
- Adoption of a zero tariff rate on trade in goods could be good news for the country's economy, especially for the machine and medical industries, which are linked to Europe.
- The pound sterling depreciated against the US dollar. Despite positive Brexit news, the exchange rate has risen, but it did not return the "expensive" pound before the 2016 referendum (Huseynzade, 2020). The "cheap" pound has also helped investors, especially those from the United States.
- The government is providing incentive packages to protect the economy. This creates conditions for investors to be confident in government assistance.
- The Bank of England is trying to protect the economy by lowering interest rates. Although the latter reductions are mainly aimed at Covid-19, they are also valid for Brexit.

3. CHANGES IN REGULATION RULES

The main problem in the financial market related to Brexit is related to free access to the single market. The government had to constantly discuss labor and capital mobility and legal principles within the market with the EU (Garibli, 2017). However, in October 2016, T. May stated in his speech and later in a document called the "White Paper" that the Kingdom would take control of its borders and put an end to the legal procedures of the Union. This clearly meant that the single market would be abandoned. This means that 5,476 companies of British origin and 8,008 companies of Union origin will not be able to take advantage of the single market (EU Withdrawal Impact Assessment, 2018). As a result of the loss of passport rights, financial relations between the Kingdom and the EU will be governed by the principle of equivalence. "Equivalence" refers to the process by which the European Commission assesses that a third country's regulatory, supervisory and enforcement regimes are equivalent to those of the EU. Regime financial and banking services face restrictions on direct contact with the EU market (Deslandes J., 2019, p.5). Equivalence regime is not possible for banking services (credit and deposit), payment services, and UCITS sectors. Only professional services are available for Alternative Investment Funds (AIFMD) and Regulated Markets (MiFiDs). In general, the regime does not fully cover the financial sector. The regime does not yet exist in the banking and insurance sectors. On investment services, regulation of Over-The-Counter derivatives (EMIR), Credit rating agencies, securities financing operations, Financial benchmarks, Trade Repositories (SFTR) rules are fully enforced in equivalence mode (Casper De Vries, 2017, p.23). The kingdom was trying to get the upper form of this regime. Note that equivalence rules are better than no regulation. Let's look at an example to understand the difference between these two regulation regimes. A bank of British origin serves a customer from the Union to issue loans and bonds in the international credit market. The bank provides a derivative to the EU company to protect against currency and interest rate risk. The bank provides these services to the customer with the right of passport on CRD IV and MiFID. CRD IV does not exist in the equivalence rules, thus limiting lending and advisory services. If the EU's MiFID II rules for a third country recognize equivalence for the United Kingdom, it may be possible for a UK bank to provide loans and derivatives services with additional permission from ESMA (BBA.org.uk, 2016, p.6). Equivalence rules provide access to third-country firms to operate in member countries of the European Economic Area (Deslandes J., 2019). In this case, London could remain a place for EU to trade stocks and over-the-counter securities. As a result, companies will have to operate under more complex EU regulations (Sowels, 2017, p.7). It is now clear that future financial relations between the European Union and the United Kingdom will depend on the evolution of the European equivalence rules or the essence of

bilateral agreements. In March 2021, an agreement on financial services was reached. This agreement confirms the rules of equivalence. At the same time, according to the agreement, the parties will meet twice a year to discuss. This can lead to improvements in equivalence rules (Nardelli, 2021). One of London's "challenges" is that it is the main base for transactions with euro-based derivative financial instruments conducted by the clearing house (Sowels, 2017, p.10). It should be noted that the fact that these operations take place outside the Eurozone is somewhat controversial. The European Central Bank declared ECB would not support liquidity in 2011 for such transactions (ECB, 2015). However, the United Kingdom challenged the decision in the European Court of Justice and won. The decision may come into force again as the UK leaves the EU. Because in this case, the ECB can more easily make a decision against the UK, which is outside the EU jurisdiction. In this case, financial centers such as Frankfurt, Paris, and Amsterdam come to the fore to act for the financial center of Europe. However, no financial center in Europe has the infrastructure to do this, such as London, technical and legal problems must be solved (Howarth, 2017) (Williams-Grunt, 2021). This should destabilize the market. The "transfer" process will incur costs. It will not be easy for many companies, investors, and customers to move from the London financial center.

4. BREXIT INFORMATIONS AND FINANCIAL MARKET

Before the Brexit referendum, if we look at the forecasts for the development of major stock indices in Europe and the UK, Brexit effect has been obvious (Figure 1). This effect was mainly remembered by growth. Only in February and the last months of 2018 there were reductions. The first case is related to the slowdown in negative news about Brexit and the rise of the pound, in the second case, there was a decrease due to the No-deal Brexit effect. However, the relationship with the pound sterling is not always justified. As can be seen, the FTSE 100, FTSE 250, CAC, and DAX indices showed an increase during the period of Brexit uncertainty. Growth took place after the negative Brexit condition by repeating this situation many times, it can be concluded that there is a connection between fluctuations and negative news. Negative news consist of:

- News about the increasing probability of No-deal Brexit;
- Hard Brexit information;

In contrast, there is an increase in the stock market with Soft Brexit news. Statistical analysis shows that European stock indices are correlated with the FTSE 100. In this case, other European indices are affected by the processes taking place in the UK indices. Note that UK indices are affected by Brexit events (eg, statements by politicians, the pound's exchange rate) (Table 2 and Figure 2), in which case the same effect applies to the entire European market.

	<i>DAX</i>	<i>CAC</i>	<i>FTSE 100</i>	<i>FTSE 250</i>
<i>DAX</i>	1	0.67	0.87	0.98
<i>CAC</i>	0.67	1	0.74	0.63
<i>FTSE 100</i>	0.87	0.74	1	0.90
<i>FTSE 250</i>	0.98	0.63	0.90	1

Table 2: Correlation matrix for FTSE 100, FTSE 250, DAX, and CAC (2001-2021 April)
(Source: Data were obtained from Investing.com)

In 2016, the FTSE 250 index (*Std.dev* = 3.37%) was more volatile than the FTSE 100 (*Std.dev* = 2.38%). This happened in 2020 under the uncertainty of Covid-19 (*Std.dev* = 8.94%; 6.87%). The main reason for the increasing impact on the FTSE 250 is that it is made up of UK-based companies, which more clearly reflects the UK economy. Contradictory information, often spread during trade negotiations, led to short-term losses in the market.

As a result of observations, it is possible to witness the recovery of losses within a maximum of 3 days. Compared to other indices in European financial markets, UK indices have so far gained less value since the Brexit referendum (Table 3). This proves that the UK is the biggest loser in this process. In second place is the DAX index. If we look at the correlation matrix, it was more related to the UK indices. Graph 3 provides the exchange rate between the pound sterling and the USD and the search popularity of 4 Brexit related news (*Soft and Hard Brexit; No-deal Brexit; Ireland border*) via Google. As a result, Brexit news has a significant impact on the pound sterling. Although the most negative news by investors was Brexit news during the 2016 referendum, the undesirable news for investors in the following years was the increase in the probability of No-deal Brexit.

Figure 1: Brexit effect over the European indexes (2001-2021 April)
(Source: investing.com)

Table following on the next page

INDEX	From 24 Jun. 2016 to 31 Jan. 2020	From 24 Dec. 2020 to 22 Feb 2021
FTSE 100	+18.69%	+1.87%
FTSE 250	+31.42%	+2.38%
CAC	+41.39%	+4.56%
DAX	+35.84%	+2.99%

Table 3: Increase in price for the most important stock indexes for Europe
(Source: investing.com)

According to Table 3, it is possible to avoid uncertainty when focusing on a long period. The same is true in the Forex market. In political and economic uncertainties such as Brexit, markets are affected by the nature of the information disseminated.

Figure 2: Correlation graph for FTSE 100, FTSE 250, CAC and DAX (2001-2021 April)

Figure following on the next page

Figure 3: Analysis of the Brexit effect on the Pound with Google search volume, 2015 May - 2020 May
(Source: Bank of England, Google Trend)

	Average impact	Maximum impact	Minimum impact
Hard Brexit	3.60%	8.60	2.0%
Soft Brexit	2.80%	3.20%	2.40%
Ireland border	2.50%	4.0%	0.8%
No-deal Brexit	7.70%	9.45%	6.04%

Table 4: The effects of various Brexit information on the pound (GBP/USD)

Table 4 demonstrates the effects of various Brexit informations on the Pound Sterling. The highest impact occurs with No-deal Brexit information.

Figure 4: The range of popularity of Brexit information
(Source: Google Trend)

Figure 4 shows the periods when the relevant Brexit information was popular. Based on this, it is possible to identify the causes of uncertainty in the markets.

5. THE GROWTH OF INWARD FDI DURING BREXIT

Despite Brexit uncertainty, FDI inflows to the UK have increased. However, the opposite news can be seen on the media's agenda. The main point is the news that there will be an influx of investments from the UK under the influence of Brexit.

Figure 5: Net FDI into the UK, 2006-2019, (million GBP)
(Source: House of Commons Library, 2020)

The increase in FDI is more pronounced in 2016. According to UNCTAD, UK rank in EU on inward FDI flows, ranked first in 2016, 2017 and 2018 years. The Economist cites the reasons for this: low tax rates and a stable legal system. At the same time, the share of non-EU investments is growing in recent years (Ward, 2020). This could be one of the key issues in achieving the “Global Britain” idea.

6. WHY DOES INVESTMENT FLOW?

To understand the factors that contribute to this situation, let's note the pros and cons for investors in the UK during the Brexit process: (Table 5)

Disadvantages	Advantages
Leaving the single market and losing the right to a passport	Depreciation of the national currency
New regulation rules	Low interest rates
Economic uncertainty	Supporting the business environment
The declining trend in the economic indicators of the United Kingdom	Optimal and stable market infrastructure
	Reputation of the UK

Table 5: Evaluation of the UK by Investors

As can be seen, the indicators on the advantages side were obtained mainly by state regulations. In this case, the UK government was able to minimize part of the impact of the shock and economic crisis caused by Brexit on the economy through interventions. Using Brexit, UK tried to overcome the stagnation in the macroeconomic situation (Huseynzade, 2020). All of these factors ultimately affected investor behavior. Despite all the uncertainty, the UK has been able to attract investors.

7. HOW TO EARN DURING UNCERTAINTY? EXAMPLE OF BREXIT

Until December 24, 2020, there was uncertainty in the United Kingdom and the European Union. The situation created by both Brexit and the Covid-19 pandemic is causing fluctuations in financial markets. In this case, how can investors obtain benefit from this situation? After all, volatility also means the opportunity to earn.

7.1. Aim for the long term

One way out of economic uncertainty is to focus on the long term. Undoubtedly, the indexes that have suffered the most from the Brexit process are the FTSE 100 and 250. In 2020, trade negotiations between the United Kingdom and the European Union were delayed and uncertainty in the markets increased along with Covid-19. This situation was especially complicated by the fall in oil prices. In this case, only technology companies have shown some growth. However, very few technology companies are represented in the FTSE 100. On the other hand, due to the impact of the pandemic, a number of British companies stopped paying dividends (Barclays.co.uk, 2020). However, these types of fluctuations are mainly characterized as short-term effects. After a while, growth occurs, and this creates an opportunity for earn.

7.2. Take advantage of the depreciation of currencies

In some cases, currencies depreciate during economic uncertainties. The pound lost -8.06% (euro -2.39%) after the Brexit referendum. The loss is not limited to this. However, this is thought to be good for the UK economy. For example, the behavior of the Bank of England proves this thesis (Huseynzade, 2020). Multinational companies that make up the FTSE 100 index can return the money they earn to the country's economy. Because in this case, foreign investors can earn more by turning their earnings into pounds. Also, if these companies earn income from foreign economic activity, new investment opportunities arise due to exchange rate, so the pound is currently relatively inexpensive. Prior to Brexit, this opportunity was somewhat limited. During the Brexit process, the pound lost historical value against the USD and creating mentioned opportunity for investors.

7.3. Use diversification opportunities

It is possible to make a profit by staying out of the volatile condition caused by Brexit. Asian financial markets appear to be the most suitable markets to take advantage of diversification opportunities. For example, the share of the assets of the State Oil Fund of the Republic of Azerbaijan in Europe is declining during the Brexit process, and these assets are mainly directed to the Asia-Pacific market (SOFAZ, 2021).

7.4. Assess the effects of other factors

In recent years, the main "voice" in European financial markets is Brexit. However, there is a fact that other factors cause positive or negative fluctuations. This was the case with the discovery of the Covid-19 vaccine. At that time, there was no positive news in trade negotiations, but there was an increase in indices, due to vaccine. As a result, investors can earn benefit in the financial markets, taking into account such indicators.

7.5. Investment opportunities created by Brexit

Prior to the December 24, 2020 trade agreement, there were two possibilities: a deal or a no-deal. In these scenarios, fluctuations in the value of the pound were expected. In this case, it would be beneficial to invest in ETFs used to reduce risks and increase diversification opportunities. At the same time, investors who are confident that the EU and the UK will reach an agreement could invest in companies owned by the UK in indices such as the FTSE 100 and

250. Because the financial market of the United Kingdom is characterized by flexibility. When they lose value under the influence of information, they can recover it quickly. If investors hoped the parties would come to an agreement, they could make a long-term profit by buying real estate in the UK due to low interest rates. During the period of uncertainty, the real estate market does not show good results. However, it will be profitable when everything returns to normal. During periods of growing uncertainty, price increases slowed, and when this was over, there was an increase (ONS, 2020). Investing in gold can be seen as a traditional way in such cases. In the case of Brexit, there was a depreciation of the pound and a rise in the price of gold. Another way seems to be investing in cryptocurrencies. It is possible to make a profit by determining the inverse relationship between the value of Bitcoin and other cryptocurrencies during uncertainties (Huseynzade, 2019, p.78). However, the risk is not small at these points. Earning opportunities in some cases act as a means of protection, not profit.

8. CONCLUSION

Factors influencing investor behavior with the Brexit effect can be identified:

- Changes in regulation;
- Increasing the probability of No-deal Brexit with the prolongation of the negotiation process;
- Investment opportunities created by the macroeconomic situation;
- Statements of politicians and the context of the agreements reached;
- London's reputation as a financial center and its opportunities;

During the Brexit uncertainty, investors had a chance to profit. To do this, investors must target in the long run, take advantage of currency volatility, take advantage of diversification and take into account the impact of other factors on markets. However, in many cases, these opportunities act as protective behavior.

ABSTRACT

The article examines the issues of anti-corruption regulation of the relationship between the civil service and entrepreneurship, as well as measures to improve the efficiency of government bodies in business regulation. Objectives: based on the analysis of legislation, to determine anti-corruption measures in the regulation of entrepreneurship, to reveal the influence of the civil service on business, to determine the boundaries of the participation of civil servants in the regulation of entrepreneurship, to determine the effectiveness of the control functions of the state body in the regulation of entrepreneurship. The article uses the methods of comparative analysis, logical generalization and synthesis. The author used a mutual analysis of business activity, economic indicators and anti-corruption statistics, revealed the impact of eliminating administrative and bureaucratic mechanisms on improving the business climate in the country. Analyzed the legislative framework for anti-corruption management of the activities of civil servants. The analysis of various approaches to ensuring the opportunities and freedoms of civil servants and the expectations of the interests of entrepreneurs in the process of making decisions on the regulation of entrepreneurial activity is carried out. Reforms are outlined in the model of public administration in Azerbaijan. Particular attention was paid to optimizing the work of the civil service and improving anti-corruption mechanisms. As a result of the study, recommendations were made to improve the efficiency of civil servants providing services to entrepreneurs.

Keywords: *Civil Service, Civil Servants, Anti-Corruption, Efficiency of Public Administration, Mechanism*

1. INTRODUCTION

Corruption is not a national phenomenon. This problem is universal, accepted all over the world, which is constantly discussed and tried to solve. This can be seen from various conventions (6), documents of international law. Since the mid-1990s the General Assembly of the United Nations, through multiple resolutions, has expressed serious concern about the problems and threats posed by corruption to the stability and security of societies, undermining the institutions and values of democracy, ethical values and justice, and jeopardizing sustainable development and the rule of law (18). "Corruption is a constant in the society and occurs in all civilizations; however, it has only been in the past 20 years that this phenomenon has begun being seriously explored" (Štefan Šumah, 2018). We are convinced that international cooperation in preventing and combating corruption is a transnational manifestation of paramount importance, and there is a "need for a comprehensive and multifaceted approach to effectively preventing and combating corruption." Preventing corruption is one of the goals, and the promotion and strengthening of measures to improve the efficiency and effectiveness of the fight against corruption "confirms the universality of this problem" (20). The essence of corruption is manifested in the bribery (venality) of officials. In particular, the institutional roots of corruption stem from the relationship between the state and the official. This relationship allows an official to abuse public resources in two ways: either directly in their own interests, for example, by embezzling funds from the state budget, or by taking bribes to act in the

interests of others. Corruption is the replacement of professional ethical values with criminal, antisocial and immoral norms (Golik Yu.V., 2005). Thus, corruption poses a threat to society and the state. However, corruption should not be seen as a symptom of poor or incompetent governance. Because the interests in each society are different. As long as there is a conflict of interest in a society, there will always be corruption. Since the regulation of the interests of individuals, the state and society is carried out through state bodies, the elimination and fight against corruption becomes one of the main goals of the state. In accordance with these conventions and other international legal acts, laws and regulations have been adopted at the national level. Law of the Republic of Azerbaijan "On Combating Corruption" No. 580-IIQ of January 13, 2004, Law of the Republic of Azerbaijan "On approval of the Regulation on the Anti-Corruption Commission of the Republic of Azerbaijan" No. 906-IIQ of May 3, 2005 and amendments thereto December 30, 2008, Law of the Republic of Azerbaijan No. 945-IIQ of June 24, 2005 "On approval of the Rules for submitting financial information by officials" with additions, amendments No. 93-IIIQD of April 7, 2006 and No. 420-IIIQD of October 01, 2007, "National Strategy for Increasing Transparency and Combating Corruption" approved by Presidential Decree No. 2292 of July 28, 2007, "National Action Plan for the Development of Open Government for 2020-2022" reflects the main steps taken in this direction. The strategic course on the application of anti-corruption measures was determined by the Decree of the President of the Republic of Azerbaijan No. 347 of June 8, 2000 "On strengthening the fight against corruption in the Republic of Azerbaijan". The Commission for Combating Corruption of the Republic of Azerbaijan and the Main Directorate for Combating Corruption under the General Prosecutor of the Republic of Azerbaijan act as specialized bodies in the field of combating corruption (21). Despite the adopted laws and the established institutional foundations in recent years, statements about anti-corruption measures in Azerbaijan are often observed in the speeches of President I. Aliyev. Society and entrepreneurs are actively involved in preventing corruption. Therefore, research to improve the mechanisms of anti-corruption regulation of interaction between public service and entrepreneurship is relevant.

2. ANTI-CORRUPTION MEASURES AND BOUNDARIES OF THE PARTICIPATION OF PUBLIC OFFICERS IN THE REGULATION OF ENTREPRENEURSHIP

The existence of corruption and the fight against it stem from its functional nature and can be large-scale in terms of "time-space". The fact that corruption is not eradicated increases the likelihood of its existence in public administration, state and municipal systems (Minakov P.A., 2007). Thus, in accordance with the legislation "Corruption is illegal receipt by officials of material and other benefits, benefits or privileges using their status, the status of the body they represent, official powers or opportunities arising from this status and powers, as well as attraction by physical and legal persons of these officials to their side by illegal offer or promise, or transfer of the marked material and other benefits, benefits or privileges to them" (1; Article 1.). This definition makes it possible to explain the meaning of corruption as an abuse of power and harm to the interests of the state and society for the sake of one's own interests. Corruption offenses include direct corruption offenses and offenses that create conditions for corruption.

Anti-corruption measures in the civil service can be divided into two main groups:

- 1) Measures to combat external manifestations of corruption. This is expressed in specific corruption offenses, that is, official receipt, extortion or bribe-giving.
- 2) Measures to combat institutional conditions that can lead to corruption in the public service, i.e. offenses that create conditions for corruption.

From a legal point of view, corruption in the public service is confirmed by the presence of specific crimes provided for by criminal law.

In the thirty-third chapter of the Criminal Code of the Republic of Azerbaijan, crimes of corruption and crimes against the interests of the service are:

- abuse of power (Article 308);
- the use of state budget funds, targeted budget funds or extra-budgetary state funds for other purposes (Article 308-1)
- illegal conduct of public procurement or spending of public funds without conducting procurement procedures (Article 308-2)
- exceeding official powers (Article 309);
- appropriation of official powers (Article 310);
- bribery (passive bribery) (Article 311);
- bribery (active bribery) (Article 312);
- illegal influence on the decision of an official (trade in power) (Article 312-1.);
- fraud with official position (Article 313);
- negligence (Article 314.);
- illegal decision-making on a land plot in exclusive state ownership (Article 314-1);
- the allocation of land or permission to carry out construction and installation work in violation of the rules established by law (Article 314-2);
- failure to prevent construction work carried out in violation of the rules established by law (Article 314-3).

However, different anti-corruption measures related to the business activities of officials are specified in different laws. Mainly:

- 1) Permission of civil servants to engage in entrepreneurial activities. According to the law, a civil servant cannot engage in any other activity, except for scientific and creative activities (2; Article 20.1.2). Also, in order to obtain material and other benefits, benefits or privileges, to provide individuals and legal entities with the use of their status, the status of the body (institution) represented by them, official powers or opportunities arising from this status and powers, illegal assistance in the implementation of entrepreneurial activities, and also in obtaining subsidies, subventions, grants, loans and other benefits, is an offense that creates conditions for corruption (1; Article 9.3.2). To engage in entrepreneurial activity directly, or through other or fictitious persons, to work part-time (except for scientific, pedagogical and creative activities), as well as members of the executive bodies of economic entities and financial and credit organizations engaged in entrepreneurial activity, is an offense that creates conditions for corruption (1; Article 9.3.3.).
- 2) Receiving illegal financial rewards or benefits from individuals and legal entities as a result of providing them with any assistance using their official powers. In order to avoid such cases, “an official may not demand or accept gifts as a reward or that give the impression of such an award for himself or others, which may affect the impartial performance of official duties or which give the impression of such influence” (1; Article 8.1) For this reason, for example, it is a corruption offense to demand, receive material and other benefits, privileges or concessions directly or indirectly for oneself or third parties in exchange for actions or omissions in connection with the performance of their official duties or powers (1; Article 9.2.1.). Also, the Decree of the President of the Republic of Azerbaijan No. 103 of June 22, 2009 "On strengthening the fight against corruption offenses in the management of state and municipal property" expanded anti-corruption measures in this area.
- 3) Participation of a civil servant in the management of joint stock companies, limited liability companies and other business entities, directly or through a representative. The realization of the interests of joint stock companies, limited liability companies and other similar

organizations by the civil servant himself or through a representative (relative, acquaintance, friend, etc.) leads to corruption. From the experience of recent years, it can be seen that officials own large shares of joint-stock companies and become owners of enterprises and organizations existing in commercial and entrepreneurial structures (Voronin Yu.A., 2006). According to the law, these actions are considered offenses for officials (1; Article 9.3.3).

One of the main problems is the legalization of illegal funds received in the service after dismissal from public service. One of the important anti-corruption mechanisms is the control of internal and external financial accounts of employees, even after leaving the civil service. In self-defense, officials use their relatives and representatives to hide their assets and property. In accordance with Article 3. of the Law of the Republic of Azerbaijan No. 767-IIIQ of February 10, 2009 "On Combating Money Laundering and Financing of Terrorism" measures against money laundering and terrorist financing are:

- monitoring;
- development and implementation of an internal control system by monitoring participants and other persons participating in monitoring;
- prohibition on informing the client or other persons about the measures taken against the legalization of money or other property obtained by criminal means and the financing of terrorism;
- the measures stipulated by the laws of the Republic of Azerbaijan and international agreements to which the Republic of Azerbaijan is a party.

Currently, in accordance with the law, officials must provide the following information (1; Article 5.):

- about their income every year, indicating the source, type and amount;
- on property that is subject to taxation;
- on deposits, securities and other financial resources in credit institutions;
- on participation in the activities of companies, foundations and other economic entities as a shareholder or founder;
- on a debt exceeding five thousand five hundred manats;
- for other financial and property obligations over 1,100 manats;
- Require officials to provide information on their income annually indicating the source, type and amount from officials only in accordance with the procedure established by law.

As you can see, in case of violation, both laws allow investigating the current financial situation of officials and the use of funds that they earned in the past. Failure to provide information about your income for unjustified reasons or deliberately submitting incomplete or distorted information may result in disciplinary action against such persons. Persons against whom special disciplinary measures are applied in accordance with the Constitution and laws of the Republic of Azerbaijan may be brought to disciplinary responsibility in accordance with these rules, and the Commission for Combating Corruption of the Republic of Azerbaijan may publish information in the official state newspaper about persons who do not comply with these requirements. The main problem is that civil servants use contacts and acquaintances obtained as a result of their work in previous state bodies in their own interests, moving into commercial structures. This manifests itself as a form of corruption, that is, a form of corruption using personal contacts after being dismissed from public service. Legislative gaps and personal ties allow this form of corruption to spread across different levels of government. The experience of the People's Republic of China in overcoming this situation is interesting.

In this country, the activities of a civil servant, even after being dismissed from the civil service, are under control. Another problem is the protection of trade secrets. This problem is both state and official. In accordance with the legislation, "State secrets are confidential, professional, commercial, investigative and judicial secrets of a profession (for example, a doctor, lawyer, notary), the use of which is limited in order to protect the legitimate interests of citizens, departments, enterprises and organizations, and other legal entities, regardless of the type of property" (4; Article 34.4.). Personal data by type of access are divided into confidential and open categories. One of the limitations of information considered intended for official use is "facts of violation of the law by state bodies and their officials" (4; Article 37.1.9) According to the law, a civil servant is not entitled to use information obtained in the course of his official activities for personal purposes (3; Article 17.3). The imperfection of the control system leads to an increase in corruption and the transfer of state interests through a civil servant to commercial and other spheres. Thus, the corrupt officials, despite the existence of the necessary laws and all the prohibitions, through the transfer of information, try to put pressure on the civil servants who work properly. For this reason, it is indicated (4; article 41.1) that the owner of the information takes administrative and technical measures to protect the information intended for official use. The law also defines the terms for restricting access to information (4; article 40). In accordance with Article 30 of the Law of the Republic of Azerbaijan "On State Secrets", the procedure for liability and settlement of disputes for violation of this legislation has been established. One of the factors contributing to corruption can be the misinterpretation of personal loyalty. In this case, the very appointment based on personal loyalty can lead to deformation of the civil service system, and when recruiting personnel to eliminate corruption, recruitment for vacant administrative positions is carried out on the basis of interviews and competition, while close relatives are prohibited from working together. The civil servant must inform the head of the state body in cases where the transfer to another position may lead to a conflict of interest (3; Article 15.3). After the termination of the civil service, a civil servant cannot be employed in subdivisions, enterprises, organizations or their subdivisions, which he previously supervised during the period established by law. After being fired, he cannot transfer information that he owns to commercial and other structures. In the practice of foreign countries (for example, Russia), if a civil servant is dismissed from the civil service and accepted for a new position within 2 years, he must report the last public position within the first 10 days of work (5). A civil servant should not allow his interests or the interests of interested persons to influence the performance of his official duties and should not create conditions for this (3; Article 11.3). It should be noted that the subject of the conflict can be not only the civil servant himself, but also other relatives who are directly involved in the process (Kodan S.V., 2007). Conflicts of interest can manifest themselves in various forms, such as evading ethical compliance. The legislation does not provide for separate liability for conflicts of interest and liability for corruption as a result of failure to resolve conflicts of interest. Therefore, it is difficult to determine the relationship between corruption and conflicts of interest. In this case, it is necessary to compare three concepts: "corruption", "conflict of interests" and "personal interests of a civil servant", to clarify the essence of each of them in accordance with the law. A situation resulting from a conflict of interest was considered a form of offense. In many cases, there is no need to prove anything when an official (civil servant) is dismissed due to a conflict of interest. In this case, the presence and concealment of a conflict of interest is already assessed as a propensity for corruption. A conflict of interest can inevitably lead to a change in moral values and, therefore, create conditions for a different application, meaning and interpretation of ethical norms by an official. In some cases, self-interest, lying and withholding information can become the behavior of a government official exposed to a conflict of interest, and can change for the worse, affecting professional behavior.

This reduces responsibility and compliance with the law, which does not allow promoting the model of civil service, called elementary law enforcement (Kabashov S. Yu., 2013). In the event of a conflict of interest, a civil servant either deliberately fails to perform the necessary actions provided for by law, or experiences difficulties in objectively fulfilling his duties. Thus, the purpose of preventive measures against the activities of a civil servant that may lead to corruption is not only to indicate the reasons that have a real negative impact on the work of a civil servant (for example, the influence of personal interests), but also to prevent this impact. In cases where a contradiction may arise between the official duties of a civil servant and his personal interests, the civil servant is obliged to provide information on the nature of these interests (3; Article 15.2). Currently, a draft law “On the prevention of conflicts of interest in the activities of officials” has been prepared. The draft law addresses issues related to the prevention and elimination of conflicts of interest in the activities of civil servants and other officials, as well as restrictions imposed on officials in order to prevent conflicts of interest during their tenure.

3. EFFICIENCY OF PERFORMANCE OF CONTROL FUNCTIONS OF THE PUBLIC SERVICE SYSTEM IN THE REGULATION OF ENTREPRENEURSHIP

In addition to gaps in legislation, the complexity of the application of legal norms in practice leads to corruption (Talapina E.V., 2006). Imperfections in legal norms are divided into 4 groups:

- 1) In procedures for the implementation of legal norms, for example, when paying fines, when a citizen has to spend a very large amount of money, which can lead to giving a bribe to be exempted from paying this amount. In order to prevent this from happening in Azerbaijan, as well as to reduce direct contact between officials and citizens, the procedure for the implementation of legal norms is organized according to the principle of a "single window".
- 2) A large number of checks allows the official to conclude a deal with the person being checked. In order to prevent such a situation in Azerbaijan and eliminate unreasonable checks, the President of the Republic of Azerbaijan adopted Decrees "On prevention of interference that hinder the development of entrepreneurship", "On measures to ensure the organization of activities of business entities on the principle of a single window."
- 3) Legal norms allow an official to choose different options for behavior based on his own opinion, and the fact that the law does not always indicate how an official should behave in certain circumstances allows an official to behave differently, increasing his tendency to corruption.
- 4) Legal norms empower an official or government body to develop and adopt regulations, which does not always mean that these regulations will contain anti-corruption measures. The factors that determine corruption are usually bureaucratic, and an official, having significantly increased the level of application and regulation of legal norms, as well as misinterpreting their application, can create conditions for corruption (Romanov V.L., 2008). In recent years, Azerbaijan has seen an increase in the number of anti-corruption measures and an increase in public and state control in this area. This can be seen from the data in the following Chart 1.

Chart following on the next page

Chart 1: Measures taken by the Main Department for Combating Corruption under the General Prosecutor's Office of the Republic of Azerbaijan

The analysis shows that, compared to 2006, in 2019, the number of criminal cases referred to courts increased by 7.9 times, and the number of cases referred to the Grave Crimes Court of the Republic of Azerbaijan increased by 9.8 times. The number of accused persons increased by 6.3 and 7.2 times, respectively. This directly reflects the increased transparency in this process. In 2019, effective business cooperation was intensified between the Main Directorate and the Ministry of Labor and Social Protection, the Ministry of Economy, the State Customs Committee and the Food Safety Agency. This, in turn, has a preventive value for detecting corruption and other offenses in these areas. In 2019, the General Directorate for Combating Corruption under the General Prosecutor's Office of the Republic of Azerbaijan conducted an investigation based on 32 materials received from the Ministry of Labor and Social Protection, 25 materials from the Food Safety Agency, 21 materials from the Ministry of Economy, 7 materials from the State Customs Committee. Criminal cases have been initiated on a number of these materials. Based on these materials, 59 cases of embezzlement and embezzlement with the use of official positions were initiated against 101 people, 55 cases for fraud with the use of official position against 69 people, 18 cases of abuse of office against 36 people, 20 cases for bribery (passive bribery) against 52 people, 43 cases for bribery (active bribery) and incitement to personal bribery against 68 people, the rest of the cases were related to other corruption crimes (8). The results of the anti-corruption reforms carried out in our country in 2019 are reflected in the annual reports prepared by Transparency International. The report, published at the end of 2019, notes that Azerbaijan has improved its position by 26 points in the Corruption Perceptions Index compared to 2018. As a result of the widespread application of modern world experience and reforms in the management system, including the tax and customs system, they have significantly increased state budget revenues. An increase in the number of ASAN service centers (State Agency of Azerbaijan for the provision of services to citizens and social innovations under the President of the Republic of Azerbaijan) to 17, created to provide public and private services in a single space in accordance with the principles of efficiency, transparency, politeness and responsibility, is an example of anti-corruption measures. Since its inception, "ASAN service" centers, and this is a short period of time, received more than 35 million applications.

Also, the launch of DOST centers (Sustainable and Operational Social Security Agency) as a unique project that allows 132 services in the field of employment, labor, social protection and security through a “one-stop shop” is a clear example of achievements in the fight against corruption in our country (Ilham Aliyev, 2020). Services provided by central and local executive authorities, state and state-controlled legal entities, public legal entities established on behalf of the state, and budgetary organizations are assessed based on the "ASAN service" index. During 2019-2020, the State Agency assessed a total of 554 services, including 270 services from 25 central executive authorities, 229 services from 13 local executive authorities in Baku and 55 services from 4 legal entities providing public services. According to the rating table for 2020, among 554 services "Electronic state registration of a limited liability company with local investments", the service of the Ministry of Economy, which contributes to the development of entrepreneurship, is in 14th place, and the service "Electronic payments and VAT refunds" through a single deposit account " is in 27th place, "Online monitoring of the execution of appeals, inquiries and letters sent to the Ministry of Taxes and Tax Collection by applicants" - in 28th place. Of the 990 services provided on the portal of public services ([# 0](https://www.dxr.az/tesnifatlar)), 62 services are related to entrepreneurship and entrepreneurial activity, 160 services for taxes, 6 services for customs, 31 services for state regulation and control, the rest of electronic services also serve the development of entrepreneurial activity. Analysis of legislation shows that measures are constantly being taken to create a favorable environment for entrepreneurship. “The main part of the reforms carried out in the country is aimed at improving the business environment and developing entrepreneurship. Thus, the suspension of inspections in the field of entrepreneurship for a period of 2 years (extended until January 1, 2022), a reduction in the number of licenses and simplification of the procedure for issuing permits for entrepreneurial activities, the amount of fees paid, continued work on the creation of an electronic portal in this area, the creation of appeal boards on the protection of the rights of entrepreneurs, the application of the principle of a "single window" in the transportation of transit goods through the territory of the country, tax and customs privileges for 7 years to increase investment in the country, further expansion of e-customs services in order to simplify customs procedures in export-import operations, used Green Corridor "to minimize the number of required documents and procedures when crossing the customs border of goods and vehicles, establish other pass systems from international practice, improve public procurement procedures, create call centers in government agencies that respond to requests from entrepreneurs, provide information and consulting services, and other procedures have been implemented” (Ilham Aliyev, 2020). Over the past few years, the government has taken important steps to protect the rights of entrepreneurs and ensure transparency, and prevent unjustified government interference in business activities. Thus, in accordance with the Law of the Republic of Azerbaijan dated October 20, 2015 "On the suspension of inspections in the field of entrepreneurship", inspections in the field of entrepreneurship in the territory of the Republic of Azerbaijan (subject to exceptions) were suspended from November 1, 2015 to January 1, 2022. months after the entry into force of this Law, 640 inspections were carried out in business entities, without tax inspections. For comparison: 38 months before the suspension of inspections, more than 185,000 inspections were carried out, excluding tax inspections” (9). In his closing speech at the meeting following the results of 2019, President Ilham Aliyev said: “Great opportunities have been created for entrepreneurs. Therefore, we demand from entrepreneurs that they be honest, work cleanly, do not go astray, and do not hide taxes. If someone unreasonably demands something from you, immediately report it to the Presidential Administration, the Cabinet of Ministers, central executive bodies” (Ilham Aliyev, 2020). As a result of economic reforms and anti-corruption measures, the number of business entities in Azerbaijan is increasing every year, and this can be seen from the data in Table 1.

Years	GDP, million manats	Share of the private sector in GDP, %	Investment in the economy, million manats	Total value added, million manats	The number of Entrepreneurial entities	The number of created entrepreneurial entities	The number of liquidated entrepreneurial entities	State budget revenues, in fact, million manats	State budget expenditures, in fact, million manats
2005	12522.5	77.8	6 733.4	11,576.0	270266	31172	180	2055.2	2140.7
2010	42465.0	81.7	14118.9	39 588.5	389048	38084	5818	11403.0	11765.9
2015	54380.0	81.2	20057.4	49521.0	661332	76681	16490	17498.0	17784.5
2016	60425.2	83.7	22706.4	55,503.7	777534	145485	33667	17505.7	17751.3
2017	70337.8	83.8	24462.5	65333.4	896641	148499	33809	16516.7	17594.5
2018	80092.0	84.7	25877, 0	73 893.7	955978	84378	30041	22508.9	22731.6
2019	81896.2	85.0	24986.6	74 562.8	1002282	103949	30483	24398.5	24425.9

*Table 1: Mutual analysis of business activity and economic indicators
(Source: <https://www.stat.gov.az/source>; 04/12/202)*

Analysis of the data in the table shows that over 14 years the volume of GDP increased 6.5 times, the volume of investments in the economy increased 3.7 times, the total value added increased 6.4 times, the number of business entities increased 3.7 times, and the number of newly created enterprises 3.3 times, the state budget revenues increased 11.9 times. The number of liquidated enterprises is 3.4 times less than the number of newly opened ones. This once again reflects the positive dynamics of entrepreneurship development and is the result of anti-corruption processes in the country.

4. CONCLUSION

The fight against corruption has intensified in recent years. Basically, measures are aimed at eliminating the causes of corruption, which are of a preventive nature, and help to more radically eliminate the problem. We consider it necessary to take measures to:

- 1) Ensuring clear legal regulation of the activities and powers of the state body and civil servant;
- 2) Restricting the rights of officials and the conditions under which they can make free decisions;
- 3) Improving the requirements for high moral and professional qualities in the public service;
- 4) Increasing the salaries of civil servants and keeping them from corruption. Wages should be higher in areas where there is a risk of corruption, and the loss of a civil servant upon dismissal should be higher than income from bribes;
- 5) Improving the methods of submitting declarations for property and income of all civil servants, without exception, etc.

The main state measures to improve anti-corruption legislation should be:

- Anti-corruption expertise of legal acts and projects, approval of the law on the issue of conflict of interest;
- Increase the intensity of competitions and interviews for all positions to ensure transparency and objectivity in the selection of civil servants;
- Development of institutions for monitoring the implementation of anti-corruption legislation (non-state and state), etc.

Thus, anti-corruption legislation should exist as a single system and measures of financial control, against cases of violation of ethical legislation should be improved.

THE EXPERIENCE OF APPLICATION OF EFFECTIVE MODELS OF SCIENCE-EDUCATION-BUSINESS COOPERATION IN MODERN TIME

Musaev Azer Rejdin

*Azerbaijan State University of Economics
Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan
azer_095@mail.ru*

ABSTRACT

The article is devoted to the study of the experience of applying modern effective models of science-business cooperation. Realization of science-education-business cooperation through different sources leads to weakening of the links between the components of “fundamental research application, research-industry production” cycle. As a result, the speed of development of the research sector lags behind the speed of development of the country’s economy and doesn’t meet the needs of entrepreneurship for new technologies. Integration processes in science, education and business are conditioned by the acceleration of scientific-technological progress under modern conditions, the application of innovative scientific developments in mass production and the informatization of the economy. The development of science-based industries places new demands on the training and re-training of innovative responsive personnel, as well as on science, education and business in a complex that cannot develop independently and adapt to changes in technology and equipment. All these issues have determined the timeliness of this study. Socio-economic analysis, generalization and economic-statistical methods were used in the research process. The article identifies the main priorities of high-tech development, the main directions of state policy in Azerbaijan in this direction and the importance to form a more productive architecture of scientific-education-business cooperation. The article also reveals the modern requirements and shortcomings of integration processes in science, education and business, explores the principles of the national strategy of scientific development and modern international models of scientific and business cooperation, and makes relevant proposals for their application in Azerbaijan.

Keywords: *scientific-business cooperation, education policy, integration processes, model*

1. INTRODUCTION

One of the modern challenge of 21st century is making the scientific potential to become the main sources of the stable economic development, to make industrial knowledge and innovations to become new products and technologies and also strengthen science-business collaboration. In his context, a program document «Strategic Road Map for the national economic prospects of the Republic of Azerbaijan» [1] which directed to renewal of national economy structure, aimed to determine the new vanguard sectors provided the stable development of the country’s economy, processing comparatively to production, sectors based on high technology in comparison to non-technological sectors, development of private entrepreneurship and other essential components in relation to state entrepreneurship. The Strategic Road Map taking the global and regional priority and the available source of the state economy aimed to form an inclusive economy based on high technology covering the short-term - until 2020, medium-term - until 2025 and long-term - after 2025 according to 12 strategic roadmaps of 11 leading sectors. Main priorities of high-tech development should be directed to a new stage of the innovation society - formation of an economy which based on the generation, dissemination and using of knowledge. The basis of the technology development is formed, by transformation of innovation and scientific results, into the new products, unique habits and abilities and application them to the constantly variable activity fields.

Applying Investment resources into the intellectual activity becomes the most efficient way of utilizing them. Intensification of production and using of the results of scientific and technical progress lead to a sharp shortening of the innovation cycle and renewal of the technological innovation rate. State policy implemented in Azerbaijan in recent years, including the State Strategy for the Development of Education, the State Program for Industrial Development for 2015-2020, the creation of innovative structures such as technoparks, industrial parks, industrial districts for the development of small and medium businesses, etc. In order to achieve technological progress, studying the best practices of countries that have already passed this stage it would be advisable to form a more productive architecture of scientific-educational-business cooperation directed to state policy and management.

2. THE MAIN PRIORITY OF THE HIGH TECHNOLOGI ACCORDING TO THE MAIN DIRECTION OF THE STATE POLITICS IN AZERBAIJAN

Implementation of scientific-educational-business cooperation from various sources leads to a weaken of the links between the components of the cycle of «fundamental research-application, research-industrial production». As a result, the development rate of the research sector falls behind from the rate of development of the country's economy and do not meet the requirements of entrepreneurship to new technologies. Integration processes in science, education and business are settled by the acceleration of scientific and technological progress in modern conditions, the application of innovative scientific developments in mass production and the iinformationization of the economy. Development of science-intensive industries made new demands on the field of education and business of the training and retraining of innovative sensitive personnel, as well as the science, education and business in a complex that can't develop independently and adapt changes in the technology and engineering. Insufficient funding of science and education by the state and their weak integration with the production do not satisfy the requirements of innovative development of the economy and the balance graduate's specialists of higher educational institutions are not ensured the balance of specialists demanded in national economy. Thus, according to statistics, about 75% of graduates of Azerbaijani universities can't find a job in their specialty. It's obviously seen that in term of science and practitioners we need the formation of the innovative education which is based on integrated mutual development of education, science and production system. Simultaneously, education is accepted as a main chain of the integration processes at the state level. In this regard, universities must be the central chain of the integration processes of science, education and production. At present, Azerbaijani universities are entering a new stage of development, gaining the status of the National Innovative University or Republic University which is named the second model of academic knowledge. Characteristic features of this model: the aspect of knowledge application, innovation centers, technoparks, business incubator, including small innovative enterprises creating innovation infrastructure, beginning from the coordination of the educational plans mutual cooperation with the trainee, social responsibility for the information produced. Modern universities are cooperating more actively with scientific institutes and centers, creating joint application efforts of scientific laboratories, research institutes to solve new global problems, creating innovative application companies. Within the framework of establishing innovative-applied firms, universities and scientific organizations have the opportunity not only to develop the material and technical base, but also to accelerate the commercialization of scientific developments, to train highly active specialists who are scientifically active and innovative. Significant impetus to the integration of science, education and business efforts is provided by state support. The «State Strategy for the Development of Education in the Republic of Azerbaijan» [4] approved by the Decree of the President of the Republic of Azerbaijan No. 13 dated October 24, 2013 aims to update the structure and content of education, as well as to develop fundamentalism and practical orientation of curricula and

programs, strengthen the durability educational system. This strategy provides the following as a priority: integrated scientific-educational, applying experienced models of enterprises; formation of national universities, which are considered as centers of integration in order to increase the efficiency of the use of intellectual potential, which still has a place in the modern higher education system. The «State Program on Increasing the International Competitiveness of the Higher Education System in the Republic of Azerbaijan for 2019-2023» approved by the Decree of the President of the Republic of Azerbaijan dated November 16, 2018 [5] is a continuation of purposeful steps taken in this direction.

3. THE NECESSITY OF FORMALIZATION MORE PRODUCTIVE ARCHITECTURE OF THE SCIENCE-EDUCATION-BUSINESS COLLABORATION

In the context of the challenges of the modern world, it would be better to utilize the advanced practices of technologically development countries, on preparing a new architecture for focused scientific, educational and business relations. From this view of point, the reforms are implemented in France for last years also typical for Azerbaijan. Thus, there have notable similarities both in the institutional organization and functional forms of science, also in the style of public management. Far from it, there have multipolarity in science policy and management in Azerbaijan. The university science from the Ministry of Education, institutes of the Academy of Sciences from the Presidium of the Academy of Sciences, corporate science from relevant ministries and companies, science under the principals of the project funding from the State Science Fund, and admission to higher and secondary schools are realized by the State Examination Center. Certainly, multipolarity in the management of scientific-higher education relations can be unexpectedly which aims to integrate into the European higher education area. In 2013, a new on higher education and science was adopted in France to increase the efficiency of the conductor system for managing scientific development, which was formed in the 50s and 60s of the last century. Relevant governing bodies and programs for the realization of higher education strategies based on the principles of the law formed - «New National Research Strategy», «France-Europe 2020», «National Strategy for Higher Education», «New Industrial France», «Innovation Tax Incentive System». For the realization of the strategies were prepared the main directions, work plans, monitoring and evaluation methods by these organs. For the first time in the history of France on the law statement named “Higher education and Science” covering both of the development issues both of the two system drew the followings into the front: enlarging and diversifying the collaborations between the science and education communities, increasing the quality of the scientific research, the tasks of the transformation the results of the researches to the workplace. In France, the coordination of science and education policy began to be carried out by the Ministry of National Education, Higher Education and Science. For carrying out driver function between the other ministries and interesting subjects who attended at the development of scientific-innovation was entrusted to the Head office of Science and Innovations of Ministry. Funding of the scientific researches were entrusted to the Inter-Ministerial Mission for Science and Higher Education. The accuration services of the quality and effectiveness of the scientific research and higher education carrying out by the Higher Council for Scientific Research and Higher Education Evaluation created condition for the raising the ability of competitiveness of science and education. Another efficient mean of the funding research in France is the State Investment Bank for projects financing. Industrial development programs and transfer projects of the innovative technology are financed by this bank. The bank has capital of 21 milliard euros and branches in 42 regions of France. The world’s innovative leaders prefer the trend which is focused on the directs results of the fundamental scientific researches in Germany, Great Britain and Japan. In this countries were prepared a new structure of the state support for the science, establishing the mechanism of the diversifying of the financial resources of the scientific

development and also applied constantly system for development of the tax incentives for the institution which invest capital for the science. For this purpose additional benefits are widely utilized on the field such as bank loans and state subsidies together with the tax credit, special taxation regime for the profit which is getting from the innovation grants and intellectual property and so on. European experience shows that the operator function of science-education-business programs can be entrusted to some organization at the same time. For instance, the program operator function on the field of the higher education and scientific researchers can carry out by the Ministry of Education and the Academy of Sciences, the field of ecology and energy by the Ministries of Ecology and Energy, for the industrial clusters Ministry of Economy and other relevant investment bank.

4. THE PRINCIPLES OF THE SCIENTIFIC GROWTH AND ITS INTEGRATION PROCESSES WITH THE BUSINESS

In order to make this kind of reforms efficient in Azerbaijan, it would be advisable to build the scientific development of the national strategy on the following principles:

- to direct scientific research to the global and local challenges which are faced by modern society, , to convert these challenges into specific goals of the state science policy, to determine and support the priority fields of national science and technology development on based of public-business partnership;
- to create proper conditions and incentives for the sustainable development of scientific research
- to strengthen public-business partnership, to support entrepreneurship and high-tech small companies, to stimulate the attraction of foreign direct investment in research;
- to ensure the production of knowledge based on the development and international clearness of the components of the science-business partnership system and to increase the attractiveness of the national education ecosystem.

These principles are influenced one way or another in the State Strategy for the Development of Education. By implementing institutional and structural reforms which can ensure to realize the science-business partnership system from a single center, it is possible to further increase the effectiveness of application mechanisms based on these principles. In other words, it would be beneficial to alter the existing model of multipolar management with more efficient and more flexible methods of influence in order to ensure the self-sufficiency and self-organization of the science-higher education-business ecosystem. State Strategy for the Development of Education in Azerbaijan collectivized with the principles of development of science-education-business relations. This strategy is aimed at integration into the European educational space based on improving the quality of education and recognition of its results. Application of public administration models in different areas of the strategy and the tradition of participation of public institutions serve to ensure the lucidity, simplicity and investment attractiveness of the education system. Most principles of the national education strategy - lucidity of the higher education system to all over the world, distribution of the higher education institutions in terms of territory, participation of all partners who are interested in the development of higher education in the coordination process, sufficient resources for development, and so on are in a line with the principles of the European model.

5. CONTEMPORARY INTERNATIONAL MODELS OF THE COLLOBARATION SCIENCE – BUISNESS AND THE TASKS OF APPLYING THEM IN AZERBAIJAN

Further branching of the multilevel education system for the European educational field is characterized by the training of specialists at the bachelor's, bachelor's, master's and research master's levels.

Horizon 2020, Erasmus Mundus, Erasmus Plus Projects and Tuning methodology are very essential tools on studying and application of the European experience. At present, the Tuning methodology plays an important role on compiling educational programs and plans in the 28th of European countries. In accordance with this, firstly the conjuncture of the labour market is studied, then with the help of survey among the specialists of the proper fields of economy, priority specialties, general and specific competencies relevant with them, determines educational demands which require relevant competencies, establishing correlation connects between the competencies and subject modules and their distribution among the subjects based on the module principles of credits. In connection with the improvement of the scientific-educational relations, the most urgent issues is to simplify the exam and the reducing of the restrictions on admission master degree. Today's master is tomorrow's doctorant, teacher of the university, researcher, production manager. For the last years, some universities use of full-time education without making any relevant changes in curriculum and study programs, thus it leads to a sharp decline in the quality of the master degree. Giving the right to defer military service to students who admitted master degree as a clear example of that how we appreciate the importance of master degree quality in the formation of the country's scientific and educational potential. Main problems of scientific research, as being in the technologically developed countries, must be focused on the challenges which are important for economic growth. Today, the basis of national science formed in the state-funded scientific-research of universities, departments, scientific-research laboratories, institutes of the Academy of Sciences and scientific institutions of line ministries. The research areas of these institutions are mainly aimed at solving problems that are specific to the post-Soviet space, directly departments, institute and scientific schools of private scientists, that are not having in common with the local and global challenges of modern times, not responding of the demand of entrepreneurs. Innovative institutions with special status, such as techno parks, start-ups, and master centers, aimed at accelerating the commercialization of new technologies and research results should be widely used in universities and research institutions. For identification of common interests between science and industry, raising the level of education and improving of the staff of technological enterprises and other relevant issues can be solved in this type of innovative platforms.

6. CONCLUSION

Purposeful policy is being carried out to ensure the political, economic, social independence and territorial integrity of Azerbaijan, as well as its technological independence. The tasks set by the President to ensure the technological development of the country - the transformation of scientific potential into the main resources of sustainable economic development, the transformation of productive knowledge into necessary products and innovations, the pace of development of science and innovation sector and the needs of entrepreneurship in new technologies. The quality and timeliness of the implementation of strategically important tasks, such as coordination, further highlights the importance of the implementation of scientific-educational-business partnership from a single center and with high professionalism. We consider that the leaders of the universities must be more innovative. It's impossible to describe the future of the universities without the educational-scientific-business triangle and the diploma of such universities will be insufficient for the labour market. without There is no future development of the university for us. We think that, there will be formed material and technical basis, co-ordinated with the profile of the universities. Universities had to put all the means which is gaining from the education and budget to the future, but not for the aesthetic view of the universities building. However, it's not too late yet. The experts who are indicated the importance between the higher educational institutions and the business world, also noticed the essential of developing innovation and entrepreneurship in cooperation with industry and

business, also emphasized necesseraies development of the culture of innovation and entrepreneurship. If the reforms are carried out in all directions correctly, the result will be optimistic.

ABSTRACT

Introduction and purpose of the study - Our present world is characterized by the empowering revolution of technology. The dominance of IT in 21st Century is eminent. Humans exposed to external threats like the Covid-19 pandemic are made to rely on technology than ever before. While our developed systems are disturbed in the wake of this crisis, emphasis is made on the reliance of technological power than on human capacity. This research aims to undercover how major sectors like education are hinging their activities on technology. E-learning is fighting the odds in the time of distrust and uncertainty. The research strategies used are: 1) a quantitative analysis of affected students (internationally), 2) studies published on the role of technology in education and crisis management. Data has been collected first-handedly by surveying student responses and supporting secondary sources. The findings support our given stance on technology's savior role in current times. It is evidenced that the majority of higher educational institutions are going by e-learning methods. There are implications on the quality and means to this approach, to be dealt with in futurist stages of advancement. This research work is formulated on the basis of secondary sources. It includes academic literature, scientific published articles covering global aspects of the pandemic and role of technology. Some primary information regarding the international students has been collected at the initial stage of research. Used sources includes materials of scientific-practical conferences and business forums, expert analyses, documents of international organizations, as well as of business associations specialized also in scientific research. Methods include rational reasoning based on the analysis of relevant subject and of statistical data, analysis of COVID-19 reports and data that is publicly available on the websites of different global forums. The concluding discussion and implications can be, principally of interest to readers of education technology. Also, the content gives a direction to the future of e-learning and present state of academic. The paper discusses how educationists and investors are corresponding to crisis management.

Keywords: *Technology, Education, e-learning, Crisis Management, Covid-19, Pandemic*

1. INTRODUCTION

As water is to life, technology has become a vital sign for the 21st century human race. The information technology revolution has changed people's control of life; the way they work, communicate, and progress. Tech is ingrained into our socio-economic and political roots now. Organizations have transitioned to a technological way of doing their routine operations, and seek more investments in IT rather than physical assets. Even in the time of novel risks like the ongoing COVID pandemic they look up to the technology as a crisis management tool. Education is the code of life, and with changing times it needs constant renewal to keep us on the fast track. Necessarily it is demanded of academia to be highly up-to-date with current trends and practices; technology is an irreversible trend of our present century. With the onset of 21st century, academia was already challenged to integrate digital skills in the traditional pedagogies. However, the emergence of COVID-19 has left the academic sector with no option at hand expect adoption of e-learning. This novel pandemic has changed our education process for an indefinite future; across the globe 93 percent institutions remain shut. ICT is the only resort to the crisis management of all educational endeavors.

Despite the implementation hurdles and new-born platforms, e-learning has taken the market with a swamp. This research objectifies how technology is rescuing our timeworn tutoring system.

2. PREVALENCE OF IT IN THE 21ST CENTURY

Throughout the past, advancements have revolutionized the way and means to present living. Over the course of time, we have transitioned from the mechanical to information technology age. 21st Century humans are dominated by the encompassing arch of IT in every sphere of their lives. The interaction between the technology evolution and the economic and societal development has always been an important aspect of human history. Unconditionally, today human functionality is technology centric; from smartphones that make us connect to the jobs that we perform, everything is IT driven. Organization for Economic Co-operation and Development had rightly anticipated in the late 90's an exciting period of technology in the 21st Century. It was not long after, just within the first decade of 2000's there was profound change in political, economic and social structures that created a new paradigm in the world order. Kumar (2008) has noted technology to be an enabler for changing expectations to realities.

The prevalence of IT could be estimated by how technology has enabled:

- 1) Greater knowledge
- 2) Communication
- 3) Economic stability
- 4) Industrial-efficiency
- 5) Globalization
- 6) Life style changes etc.

Most importantly it has enabled greater knowledge i.e. rise of literacy and more means to education. With the availability of vast reading material, literacy rate has amplified from 10 to 80% over the past 50 years. Accessible reading also led to the Reformation in Europe. The most notable break-through in significance to education is the shrinking size of computers (from room size desktop to a palm top) (Pal, 2008). However, the rate of technological impact is determined by the country/society's investment in IT sector.

3. TECHNOLOGY IN THE TIME OF CRISIS

Crisis is an unforeseen risk, like the emergence of a pandemic; we face from situations out of our natural ability to control. Foresight and timely planning could make us ready to embrace challenges if not completely warding it off. Nevertheless, risks can be mitigated by efficient and effective formulation of contingencies. Ironically, 21st Century is a wake to possibilities and unprecedented crisis. Humans of today are living in a fragmented and multi-actor context, where crisis management demands mechanisms for rapid information sharing (Galaz, 2009). History is a witness to the uncontrolled death toll resulting from brutal Pandemics like the outbreak of Plagues, Cholera, Influenza, HIV/AIDS, and now the novel COVID-19. With the advancements in technology, the global crisis management has become more coordinated and monitored with internet-based surveillance systems. Currently, the novel corona virus is the biggest crisis around the globe having been reported in 213 countries. What does technology bring us? 21st century technology has brought *wireless communication* to the forefront. For each and every country exposed to COVID-19, technology is a vital sign; already having a tangible impact on community collectivism, political behavior, and economic sustenance internationally. Nearly all IT enabled sectors are adapting; to minimize the physical proximity, and create a more wireless connectivity. The educational sector is hard-hit worldwide, where distant education has cut all physical ties.

Nonetheless, it is one of the mainstreams that did not get gridlocked in spite of the disaster. All thanks to the timely incorporation of virtual models of education that academia stood its ground in continuation of the teaching-learning activities.

3.1. Academia's Transition to e-Learning

Modern day education is less dependent on paper and more reliant on technology. Digital libraries have taken away the influx of readers to physical libraries. Storage capacity depends on the cloud space than on the stacking shelves. Learning and teaching practices, both have become technology centric. Digital literacy is one of the 21st Century core competencies that developed education systems are based on, while developing economies are geared towards it (Voogt, Erstad, Dede, & Mishra, 2013). In particular, following the rampant spread of COVID pandemic, information technology has impacted on educational practices. Consequently, we have seen an academic shift i.e. e-learning. The following facts and figures endorse the transition to e-learning as a rescue strategy of the academia in response to crisis management:

- Over and above 1.2 billion children are out schools, in 186 countries (WEF)
- Nationwide closure has globally impacted 70% of student population; affecting ~ 2 billion learners (UNESCO)
- Zoom is widely noted to be used by 96% U.S. Universities (US News and World Report)
- EU is coming up with Digital Education Action Plan in mid-2020 for supporting online learning (European Union)

Whether residing in their home countries or being stranded in foreign lands students, e-learning is the one and only identified way out. For instance, Azerbaijan is a hub of multicultural students. It attracts students from more or less 50 countries. Presently, a survey of an international dormitory revealed that the 150-200 students from 35 distinct nationalities were continuing their academic learning activity via e-learning platforms. Clearly the pandemic has disrupted our traditional classroom learning. Owing to a substantial demand, notable online learning platforms are providing an open access to their services/courses (Zoom, Coursera, edX, Moodle etc.). However, education experts maintain that there has already been an increasing trend in adoption of education technology. The global e-learning market is projected to touch \$350 Billion by 2025.

4. SUMMARY AND IMPLICATIONS OF INFORMATION TECHNOLOGY ON FUTURE LEARNING

Globally, individuals are living in a time of crisis. Especially with the impulsive outbreak of a pandemic, we know that if we cannot totally abate it we can at least manage it. Research and development indicates that 21st century technology has made equipped us for automation and communication. Cutting out on the need of physical presence in many ways. However, with the unfortunate impact of COVID-19 we all are by force or by will hooked to IT. The first quarter of year 2020 has seen an unexpected shutdown of businesses, borders, essential services and physical spaces. The routine activities which were once normal have now become strange. Our communities have been transformed by technological forces. Nearly every sector of our socio-economic life is affected, and E-Systems are becoming the new normal. Educational institutes are among the badly shook organizations; with this academic shift from traditional classrooms to virtual study rooms. Higher education sector is using this crisis as an opportunity to integrate more digital tools and to best leverage them. In this time of distress, everyone is wondering whether e-learning will remain in focus post-pandemic. For now, ICT's savior role in academic survival is quite evident. This shift is bound to impact the worldwide education market and investments in education technology remain lucrative, given the surge in its usage.

ABSTRACT

An increase in labor productivity is a significant factor providing ensuring economic growth of the country. The main research question is: “What factors influencing labor productivity determine the positive development dynamics of the Azerbaijani economy?” This article considers the impact of such factors as the average monthly wage, the percentage employed in industry, in agriculture, forestry and fisheries, in construction, and the mean years of schooling to the labor productivity level in Azerbaijan. The aim of this article is to quantify the influence of the above-mentioned factors to the labor productivity level based on the economic and mathematical modeling. To achieve this goal, the following tasks were completed: (a) theoretical justification and identification of significant factors influencing the productivity level in the economy of Azerbaijan; (b) the statistical analysis of labor productivity indicator for the period 2015-2019 and (c) creating the correlation-regression model based on selected factors. The analysis of the labour productivity dynamics for the period of 2015-2019 in the sectoral context is presented. Modeling of factors’ influence is performed by means of regression analysis. The methodology employed are disclosed with the scientific deduction, that allowed to identify the key factors influencing productivity dynamics; the analysis of statistical data for productivity level in Azerbaijan for the period 2015-2019, and economic and mathematical modeling in the form of regression analysis. Results obtained demonstrate the significant influence of such factors as the average monthly wage, the percentage employed in industry, the percentage employed in agriculture, forestry and fisheries, the percentage employed in construction, and the mean years of schooling to the labor productivity level in Azerbaijan. The most influential are the average wage level and employment in the primary sectors. It is proved that the productivity defines the developmental vector for Azerbaijani economy and its economic growth.

Keywords: *educational level, employment, labor productivity, wage level*

1. INTRODUCTION

The economy of Azerbaijan has been gradually developing over the recent years, and can be referred to as the transition period economy. Like other national economies of the post-Soviet era, it is facing challenges related to economic growth. To ensure economic growth, an increase in the productivity of the national economy is required. Therefore, the study of the determinants contributing to the increase productivity in the labor sector, is essential for the development of the economy. Increasing productivity depends on many factors. From experience, it is clear that differences in the dynamics related to increasing productivity, are explained by different socio-economic circumstances. In particular, such factors as the level of education reached [8], to which degree scientific research and innovation are being implemented, [11] and the amount of remuneration as a motivational component at any workplace [4,7] are fundamental in determining the level of productivity, and consequently, the rate at which economic growth takes place in different countries. The study of all the above determinants and their influences, quantitative and qualitative, inspired the topic of this study. The purpose of the article is economic and mathematical modeling of the factor influence on the change in labor productivity in the economy of Azerbaijan.

In order to achieve the goal, a number of tasks have to be completed:

- 1) Theoretical substantiation and identification of significant factors affecting productivity in the economy of Azerbaijan.
- 2) Statistical analysis of labor productivity for 2015-2019 and characteristics of the current trend.
- 3) Construction of a correlation-regression model describing the factorial influence on the dynamics of changes in labor productivity in the economy of Azerbaijan.

2. LITERATURE REVIEW

Labor productivity as a key determinant of economic growth was paid attention to by many famous scientists such as V. Petty [24], D. Ricardo, K. Marx, A. Smith [27], M. Keynes [20]. Theories formulated by them explain the behavior of economy in terms of aggregate performance indicators, which include (aggregate demand and aggregate supply). The contribution of Azerbaijani scientists G. Azizov [5], Sh.T. Aliev [3], N.M. Mustafayeva, R. Jabiev [17], K.Kh. Abdullaev [1], A. Allahverdiev, E. Huseynov [2] and others, is also worth noting. In their works labor productivity is considered as a structural element of Azerbaijan's economy, which focuses on its sectoral structure. Foreign authors, including Gehringer, Agnieszka [13], Gerald Hübner [14], Joachim Krause and Matthias Lücke [18], Griffith, Rachel and Redding, Stephen and John Van Reenen [15], Elvin N. Afandi and Gabor Pellenyi [10], Kevin J. Stiroh [19], Jan Fagerberg [12], Shahabinejad [26] and others did comparative analyses of different economies in their works, while paying special attention to the factor of labor productivity. However, none of the aforementioned scientists, paid attention to modeling those factors that affect labor productivity, in particular in the economy of Azerbaijan, which is what our research focuses on.

3. METODOLOGICAL APPROACH

The key research question is: "What factors affecting labor productivity determine the positive dynamics of the development of the Azerbaijani economy? "

The study used general scientific methods of analysis such as:

- 1) For the theoretical substantiation of the studied literary sources, the method of scientific deduction was used. This allowed the key factors affecting the dynamics of labor productivity to be identified, focusing in particular, on the economy of Azerbaijan).
- 2) Analysis of statistical data in the industry to set out the contributions of different industries to the development of the economy of Azerbaijan.
- 3) Economic and mathematical modeling in the form of constructing a regression, in which the dependent variable (y) is the dynamics of labor productivity in the period 2005-2019, and the independent (influencing) factors are:
 - x1- Average monthly wages in the economy as a whole.
 - x2- Percentage of people employed in industry
 - x3- Percentage of people employed in agriculture, forestry and fisheries
 - x4- Percentage of people employed in construction
 - x5- Mean years of schooling (years)

In addition to the aforementioned specific methods of scientific research, graphical analysis, comparative analysis, and the classification and systems approach, were applied in the analysis of the sectoral component of labor productivity in the economy of Azerbaijan.

4. RESULTS

The level of labor productivity is an important indicator. Where there is increased productivity, it confirms the efficient use of labor resources and capital. One of the qualitative indicators of labor resources is the collective intellectual level, which is developed through primary, secondary, and tertiary education. Education has become one of the deciding factors influencing the country's economic development [4,14]. When education levels rise, individual workers' requirements related to working conditions and wages also become more complex. This is reflected by the indicators of the percentage of employees in the sectoral structure of the economy as a whole. To ensure economic growth as a result of labor productivity, highly qualified human capital is needed. The need for a proper education system is amplified by this. This is emphasized in the works of the scientists Azer Allahveranov, Emin Huseyov, G. Azizov, Griffith, Rachel and Redding, Stephen and John Van Reenen [2,4,15,30]. Taking into account their opinions, and their own views on the educational factor, the influence of the average duration of schooling on the level of labor productivity needs to be considered [4,5]. Based on the opinion of G. Azizova, Kevin J Tiron [4,19] ensuring full employment requires investment in the creation of new jobs and continuous improvement of human capital. The intensification of labor productivity is closely related to the issue of employment of labor resources in the economy. It is thus important to know what the sectoral needs are of the labor market, as its efficient distribution is based on the level of labor productivity [5,6,10]. It follows from the aforementioned that the amount of the average wage, the level of education and the level of sectoral employment will determine the productivity level of the economy of Azerbaijan as a whole. After analyzing the statistical data, it is advisable to choose independent variables, or influencing factors, such as the amount of the average wage, the percentage of those individuals employed in industry, the percentage of individuals employed in agriculture, forestry and fisheries, the percentage of individuals employed in construction, and the mean years of schooling. Based on the opinions of scientists and the listed statistical indicators, the hypothesis tested in this research is as follows:

- Hypothesis H0 (*Null Hypothesis*): The average monthly wage (x1), the percentage employed in industry (x2), the percentage employed in agriculture, forestry and fisheries (x3), the percentage employed in construction (x4), and the mean years of schooling (x5) do not influence to the labor productivity level (y) in the Republic of Azerbaijan
- Ha (*Alternative Hypothesis*) : The average monthly wage (x1), the percentage employed in industry (x2), the percentage employed in agriculture, forestry and fisheries (x3), the percentage employed in construction (x4), and the mean years of schooling (x5) significantly influence to the labor productivity level (y) in the Republic of Azerbaijan.

4.1. Influence of employment to the productivity

To display the real picture of the development of the economy of Azerbaijan, we will analyze the indicators of labor productivity in the sectoral breakdown for the period including, and between, 2015 and 2019.

Figure following on the next page

Figure 1: Labor productivity (thous. manat per person) of employed population (nominal GDP) - Compiled by the author on the basis of statistical data from Azerbaijan
(Source: <https://www.stat.gov.az/>)

As can be seen from the presented dynamics, labor productivity in the economy as a whole for the period 2015 to 2019, had an upwards trend. The growth rate of labor productivity in terms of the nominal GDP for 2019, in relation to that of 2015, amounted to 42.46%. However, in reality, the dynamics of labor productivity is visibly increasing in the oil sector. The main reason is the influx of foreign capital and the high profitability, brought about by high energy tariffs. At the same time, scientists are considering the need to diversify the economy of Azerbaijan, focusing on the development of the non-oil sector. In particular, Gerald Hubner pointed out the need to increase labor productivity through investment in human capital [14]. Joachim, K. and Matthias L [18] focus on reducing informal employment and increasing the efficiency of the agricultural sector through increased labor productivity. Elvin N. Afandi and Gabor Pellenyi note the need to increase the use of the potential of agriculture and labor productivity in it as a result [10]. Based on the opinion of the above scientists and our own vision of the Azerbaijani economy, it is being considered relevant to single out employment in the fundamental sectors of the economy such as oil, agriculture x1 x 2, and other industries). This is to be applied as a determinant of the predetermining determinant of labor productivity.

4.2. Influence of wage level to the productivity

As an important incentive for workers, wages can have a significant impact on the gains of productivity. In the economic literature, and in official government documents, it is often said that wages should increase “in accordance with the growth of labor productivity”. In a balanced economy the growth rates of average wages and specific NPP (net national product equal to the difference between gross national product and the amount of depreciation of fixed capital) should be approximately the same, the correlation between labor productivity and wages is the same [21]. In the works of the representative of the neoclassical school of economic theory, J. Clark, a detailed scientific substantiation of the theory of marginal labor productivity is presented [9].

Based on his theory of marginal productivity of labor and capital, a worker's fair wage should equal his marginal productivity. That is, by increasing wages, the maximum level of labor productivity is gradually achieved. The marginal productivity of the employee must be equal to the optimal level of wages. Since upon reaching the peak, labor productivity begins to decline. It is necessary to ensure equality between the marginal productivity of labor and wages in order to achieve maximum values of output. J. Clark concluded that the size of wages depends on the productivity of labor and the level of employment of workers, that is, the more workers are employed, the lower the productivity of labor and the lower the wages should be. The inconsistency of the thesis put forward is that an increase in the number of workers does not lead to a decrease in labor productivity, but to a more detailed division of labor, which, as a result, leads to an increase in labor productivity. Professor Azizova G. A. emphasizes the importance of labor productivity as one of the fundamental factors, the increase of which, as practice shows, can be achieved by stimulating the labor force. Despite the significant growth rates, the level of labor productivity in Azerbaijan is significantly lower in comparison to developed countries [6]. Taking into account this fact, Azizova G.A. considers how an increase in labor productivity affects the likelihood of an increase in wages, and how wages affect labor productivity. Having carried out a comparative analysis of changes in labor productivity and wages using the regression model, [7] and identifying the existence of a mutual influence between labor productivity and wages, G. Azizova comes to the conclusion that the outstripping growth of wages is an important condition for further growth of labor productivity in Azerbaijan. In our opinion, one should agree with the author's opinion about a differentiated set of determinants of productivity, focusing on the social component of the country's human capital. G. Azizova also emphasizes that the reason for the differences in the level of wages is not only the provision of land and natural resources, but also the level of technologies used, which will increase labor productivity, which will have a positive effect on the level of real wages.

4.3. Influence of educational level to the productivity

The level of education of the population is an important factor determining the development of human capital. According to William Petty [24], human wealth depends to a large extent on the level of knowledge of its inhabitants and is more productive than natural resources or the stock of physical capital. For his part, Adam Smith was also involved in the study of people as a resource of high productivity, welcoming Petty's ideas, confirming that people's abilities are the determining factors of economic progress, suggesting that the wealth of a nation is achieved by improving the productive potential of human labor [27]. Thus, his famous proposal for a division of labor is closely related to the development of specialized skills, which can be compared to improvements in machines that already facilitate and shorten working hours. The neoclassical model of economic growth in the well-known work of R. Lucas [23] emphasizes the importance of the accumulation of human capital, which plays a leading role in terms of improving the qualifications of workers. As a result, the marginal productivity of labor increases both within the firm and outside it. In his model, human capital essentially plays the same role as scientific and technological progress. In our opinion, in order to achieve growth in labor productivity, it is worth focusing on the quality of the institutional environment, available sources of funding, and business specialization. It is worth noting the similarity of neoclassical views with such modern researchers as Kevin J. and Stiroh [19], who point to the importance of technological progress in high-tech industries and the growth of investment, which have a positive impact on changes in the US economy. As neoclassical analysis shows, cumulative growth in labor productivity has accelerated due to technological progress in high-tech industries and increased investment. From the point of view of the productivity theory, the approach described by the authors reflects all the necessary prerequisites for the growth in

productivity, and at the same time, it is based on a list of controllable factors, and does not include many unregulated factors the latter referring to (risks and uncertainty). Therefore, the application of classical and neoclassical theories in today's conditions, unfortunately, is very limited and requires additional verification in special economic and mathematical models. The dominant role of foreign direct investment was also emphasized by modern Azerbaijani researchers Azer Allahveranov and Emin Huseyov [2]. In their research, they also see the need for a radical renewal of the human capital base, which in turn will ensure the long-term and sustainable development of the Azerbaijani economy. However, it should be borne in mind that in addition to attracting foreign direct investment, it is worth paying attention to expanding entrepreneurial opportunities in the private sector, which ultimately will have a positive effect on the development of the economy as a whole. It is necessary to note the significant contribution of T. Schultz to the creation of the theory of human capital, in whose opinion the return on investment in human capital has delayed effect. For instance, the result obtained from the contribution will only become visible after some time [25]. In the research by the scientist, there is a direct correlation between labor productivity and the level of human capital. The higher the level of an employee's human capital, the higher the level of its productivity. The significance of the contribution to human capital and its impact on the growth of labor productivity is reflected in the works of contemporaries. Among modern scientists, it is worth highlighting the study by Griffith, Rachel and Redding, Stephen and John Van Reenen [15], who studied the factors that determine the growth in a group of industries in twelve OECD countries. As a result of their research, they identified the dominant influence of both investment in human capital and R&D. Together with the factors highlighted by the authors, it should be noted that the adaptability of knowledge and human capital has a time lag, and therefore there is a certain gap in time between the emergence of new technologies and their implementation, which hinders productivity growth not because of the lack of innovation, but because of their insensitivity (delays).

5. MODELING OF FACTOR INFLUENCE TO THE PRODUCTIVITY LEVEL IN AZERBAIJAN

The study of the influence of factors was performed using regression in an applied software package in an excel file. Using the regression analysis, the influence of the following factors on the level of labor productivity was.

The following regression equation was obtained:

$$y = -68.2262 + 0.0235 * x_1 + 4.0437 * x_2 + 1.3419 * x_3 + 2.1354 * x_4 - 2.2044 * x_5 + e,$$

where x_1 is the average monthly wage in the economy as a whole.

x_2 - Percentage of employed in industry

x_3 - Percentage of people employed in agriculture, forestry and fisheries

x_4 - Percentage of people employed in construction

x_5 - Mean years of schooling

e- unexplained determinant

Table following on the next page

Definitions of the dependence of labor productivity from selected factors						
	Labor productivity	Average monthly nominal wages and salaries paid by sectors in the economy	The percentage of employment in the industrial sector	The percentage of employment in the agriculture, forestry and fishing	The percentage of employment in the construction	Mean years of schooling (years)
	Y	x1	x2	x3	x4	x5
2005	3,08	123,6	7,2	38,7	5,2	10,7
2006	4,56	149	7,4	38,5	5,3	10,7
2007	6,81	215,8	7,5	38,4	5,3	10,2
2008	9,52	274,4	7,5	38,2	5,4	10,2
2009	8,33	298	7,3	38,1	5,4	10,5
2010	9,81	331,5	7,1	38,2	6,6	10,5
2011	11,90	364,2	7	37,9	7,1	10,5
2012	12,31	398,4	7	37,7	7,2	10,5
2013	12,87	425,1	7,2	37,1	7,2	10,5
2014	12,82	444,5	7	36,8	7,3	10,5
2015	11,64	466,9	6,9	36,4	7,2	10,5
2016	12,69	499,8	7,1	36,3	7,2	10,5
2017	14,59	528,5	7,2	36,4	7,2	10,6
2018	16,41	544,60	7,5	36,3	7,3	10,6
2019	16,58	635,1	7,4	36	7,4	10,6

Table 1: Definitions of the dependence of labor productivity from selected factors - Compiled by the author on the basis of statistical data from Azerbaijan.

(Source: <https://www.stat.gov.az>; <http://hdr.undp.org/en/indicators/103706>)

The regression equation shows that, if the average monthly salary for the economy as a whole increases by 1%, then labor productivity will multiply by 0.0235. If the percentage of employed persons in the industry rises by 1%, then labor productivity will multiply by 4.0437. If the percentage of persons employed in agriculture, forestry and fisheries increases by 1%, then labor productivity will multiply by 1.3419. If the percentage of persons employed in construction increases by 1%, then labor productivity will multiply by 2.1354. If actual mean years of schooling decreases by 1%, then labor productivity will decrease by 2.2044 times. The degree of reliability of the regression model is determined by the coefficient of determination R^2 . In our case, $R^2 = 0.9841$. This means that the explained variation is significant, being 98.41%, due to the selected factors. Only 1.59% is attributable to unexplained variations that could be caused by other factors, or the standard error of this simulation.

6. CONCLUSION

The analysis confirmed that the economy of Azerbaijan, has in general, moved in a positive direction, specifically referring to labor productivity, as from 2015 to 2019. The low level of labor productivity in 2015, however, was due to the dependence on the oil sector to boost the economy. This was a crisis period for Azerbaijan, brought about by low oil prices. The regression analysis depicts the influence of factors on labor productivity in Azerbaijan, of which the main factors are: the amount of the average wage, the percentage of people employed in industry, the percentage of people employed in agriculture, forestry and fisheries, the percentage of people employed in construction and mean years of schooling.

OPPORTUNITIES AND PRIORITIES OF AZERBAIJAN'S TRANSITION TO THE CONCEPT OF INCLUSIVE GROWTH

Gunay M. Panahova

*Associate Professor at Department of “Theoretical and Practical Economics”,
Azerbaijan State University of Economics (UNEC), Azerbaijan
gunaypanahova@gmail.com*

ABSTRACT

At the article, it searches the problems of ensuring the transition to the concept of inclusive growth in Azerbaijan from a theoretical, methodological and practical point of view. SWOT analysis and evaluation of existing concepts related to the concept of inclusive growth leads to the conclusion that inclusive growth is, above all, the optimal use of labor potential, ensuring effective employment, minimizing poverty and its negative consequences, the level of income between different social groups. It is necessary to eliminate the sharp differences, as well as to reduce inequality in living standards between different regions, especially in the provision of social infrastructure, in general, comprehensive human development, as well as access to health and education services. It is also a fact that the transition to inclusive development is not possible without ensuring the transition to sustainable development. Then, the possibilities, main ways, characteristics and mechanisms of transition to the concept of inclusive growth on the basis of concrete materials of Azerbaijan are evaluated on the basis of SWOT analysis, while identifying priority fields, and its implementation, the creation of appropriate social infrastructure to ensure sustainable development in the long run, a sharp increase in the share of human capital in GDP, the creation of the necessary institutional structures for effective social policy and the transition to inclusive development are national priorities. It is also emphasized that the balance of resources of our country, the degree of their use, the achievements in socio-economic development in recent years will allow our country in the near future to move to the concept of inclusive economic growth. At the end of the article, the concrete suggestions and recommendations are put forward to improve the mechanisms of social development, social progress and effective implementation of the social security system in our country to ensure the transition to the concept of inclusive growth.

Keywords: *inclusive growth concept, sustainable development, inclusive development, Strategic Roadmap, development concept, social development, social security system*

1. INTRODUCTION

The gained successful achievements, created economic, socio economic, financial potential, human capital, infrastructure, institutional base, as well as the level of improvement of social welfare allowed our country to present the transition to inclusive development as a practical problem in the field of socio-economic development and allowed it to be implemented step by step in Azerbaijan during last 15 years. At the same time, the economic, social and humanitarian crisis that has surrounded the world as a result of the coronavirus pandemic in recent years, as well as the relatively limited role of the oil factor in the development of the national economy, increased global pressure on the nature of economic development as a whole has deformed the factors, criteria, social orientation, driving forces, principles, and mechanisms of economic growth. This, in turn, is aimed at ensuring the transition to the concept of inclusive development in the near future in accordance with the changing situation and economic realities in our country, the Presidential Decree of February 2, 2021, made it an objective necessity to define "Azerbaijan 2030: national priorities for socio-economic development. Thus, the establishment of a "dynamic", inclusive and socially just society in our country in the next decade has been identified as one of the main priorities.

It should be noted that the nature of socio-economic development in our country, its inclusion is guided by the Constitution of the Republic of Azerbaijan. Article 15 of the “Economic Development and the State” section of the Constitution states: “Economic development in the Republic of Azerbaijan works for increase the welfare of the people based on different types of property. The Azerbaijan State creates conditions for the development of a socially oriented economy on the basis of market relations, guarantees free enterprise, prevents monopolies and unfair competition in economic relations.”

2. THEORETICAL AND METHODOLOGICAL BASES OF THE RESEARCH OF TRANSITION PROBLEM TO THE CONCEPT OF INCLUSIVE GROWTH IN AZERBAIJAN

In the world practice and existing economic literature, there is no single approach to the socially oriented market economy, in other words, the main point, indicators of inclusive development, opportunities, ways and mechanism of their implementation. Thus, at the opinion of the commission preparing the "Europe 2020" strategy shows that inclusive development intends making full use of the country's labor potential, ensuring full employment, reducing poverty and its consequences, minimizing income disparities between different social groups, achieving social development as a whole, elimination of existing disproportions between the country's regions, etc. In our opinion, such an approach to the concept of inclusive development attracts more attention. At the same time, in the first decade of the 21st century, some economists comment the concept of more inclusive growth in the scientific literature in a broader sense, that inclusive development is not only the growth of GDP, but also the overall development of human capital, increase their share in revenues, their active participation in the economic life of the country, access to education and health care for low-income groups, reduction of unit costs of products and services, as well as efficient use of natural resources and environmental protection. The possibility of the transition of individual countries to the concept of inclusive development and the analysis of the real situation show that the level of development of national economies as a whole and the chosen model of economic development have a significant impact on the speed and nature of this process. It should also be noted that in Post-Soviet Republics that have gained independence in recent years, as well as in countries involved in national conflicts, the possibility of inclusive development is more broadly influenced by economic, social and political factors. From this point of view, while assessing the possibility of Azerbaijan's transition to the concept of inclusive development, the new economic and social reality of the liberation of the Karabakh region as a result of the Patriotic War and its restoration, revival, resettlement of refugees and IDPs should not be overlooked. All of the above confirms the idea that the transition of our country to inclusive development should be carried out as a managed, regulated, systematic process. Because without eliminating the existing inequality in welfare, income and consumption in the country as a whole, but also the right to life for all members of society, the right to liberty, the right to decent work, economic, social environment and normative-legal the base must be created. Analysis of inclusive development concept of individual developed countries shows that although the fundamental principles are the same, but depending on the level of economic development of each country, the model of regulation of socio-economic-humanitarian processes, national mentality, as well as priorities for each specific period and there are mechanisms of realization. From this point of view, when preparing inclusive development concept in our country, it is necessary to take a differentiated approach to this problem, taking into account the existing economic and social realities of our country, global challenges, national, regional and local interests. When defining the inclusive development concept in our country and its priorities, the factors determining the level of the inclusive development index in the Republic of Azerbaijan must be taken into account.

Based on the existing economic literature and relevant government documents, we can identify the factors that ensure the inclusive development index in the Republic of Azerbaijan as follows:

- Multiple GDP growth in the last decade;
- multiple increase in GDP per capita;
- Sharp reduction in poverty;
- The country's external debt is less than 20% of GDP;
- Low level of demographic dependence;
- Low Gini coefficient compared to G7 countries;
- multiple reduction of CO₂ emissions per unit of GDP;
- Significant increase in median income, etc.

It is also true that the inclusive development concept should in fact be considered as part of a model of sustainable development. President of the Republic of Azerbaijan Ilham Aliyev said in his historic speech at the 90th anniversary of Baku State University on November 2, 2009 that “the transition period in our country's economy is over...., we must draw conclusions from the results of a process that has already been completed, to ensure the sustainable development of the country's economy, we must deeply analyze our achievements, put forward proposals that are relevant to our society, and think about new paradigms.” In recent years, the necessity to strengthen the social and humanitarian aspects of sustainable development in the international sphere, as well as the practical implementation of these goals has become even more urgent. Thus, the need for a comprehensive institutional and economic approach to the problem should be emphasized in order to ensure the implementation of the sustainable development goals in accordance with the goals of sustainable development adopted at the UN summit in September 2015. In order to ensure the effective implementation of these goals, the National Coordination Council for Sustainable Development was established in Azerbaijan. It should be noted that today Azerbaijan has entered such a stage of economic development that its future inclusive development should be based not on the involvement of natural resources, but on the efficient and optimal use of all the country's resource potential, especially human capital. Today, our national economy has the opportunity to develop itself, increase its competitiveness, ensure security and most importantly, solve social problems. It is also a fact that in the current conditions of Azerbaijan's active integration into the world economy, it is impossible to move to inclusive development concept without the necessary systematic, logical reforms in all fields and directions. Taking into account the above-mentioned, a reform strategy has recently been developed in our country in accordance with the changing economic situation and economic realities and is being successfully implemented in practice. The reforms implemented in our country in recent years in connection with inclusive development can be grouped as follows: investment-innovation; improving the business environment; investment promotion; implementation of structural and institutional reforms; increasing the competitiveness of the national economy; stimulating the development of the non-oil sector and exports; state support for the development of profitable labor-intensive industries and productions; improving the system of salaries, pensions and social benefits; Promotion of "Made in Azerbaijan" brand, etc. It is a logical consequence of all this that in the “Doing Business 2019” report published by the World Bank, Azerbaijan was included in the list of 10 most reformist countries in the world and in 2019 was declared the most reformist country in the world. When assessing the directions and nature of reforms in our country, it is necessary to emphasize such a principled approach that the formation and implementation of all economic reform strategies, measures must be conditional on the security of the national economy, the protection of national interests.

3. OPPORTUNITIES, CHARACTERISTICS AND PRIORITIES OF AZERBAIJAN'S TRANSITION TO THE CONCEPT OF INCLUSIVE GROWTH

For the first time in the "Main Directions of the Strategic Roadmap for the National Economy and Key Sectors of the Economy" in the decree of the President of the Republic of Azerbaijan dated March 16, 2016, based on the fundamental provisions and priorities of the formation and development of the national economic development strategy. It set as a strategic task the harmonious solution of economic and social development, the unification of the interests of current and future generations, as well as increasing the inclusion of the economy. In the document, it takes into account the strengths, weaknesses, opportunities, possible dangers and threats of economic development on the basis of SWOT analysis and 360-degree diagnosis of the Azerbaijani economy, the competitive advantages of our country, the philosophy, paradigm and principles of inclusive economic development as a whole have been determined and the economic development strategy, action plan and main goals and objectives until 2025 and the system of views after 2025 have been reflected. At the same time, in order to ensure the implementation of the main strategic goals and objectives of the country in 12 strategic roadmaps for 11 sectors, approved by another presidential decree dated December 6, 2016, to improve the structure of the national economy in accordance with changing conditions and students. The expectation of an optimal balance between the financial sector, in particular, the effective application of fiscal and monetary mechanisms in the regulation of socio-economic processes, has been set as an important task. In general, over the past 15 years, Azerbaijan's economy has taken high place among the world countries in terms of development. Thus, over the years, Azerbaijan's gross domestic product has increased 3.7 times, the non-oil sector 3.6 times, non-oil exports 5.2 times, industrial potential 2.7 times, agricultural production 2.3 times, wages increased 7.5 times, pensions 9.2 times, unemployment fell to 5% and poverty fell to 5.1%, our foreign exchange reserves increased 24 times to \$ 50 billion, \$ 250 billion was invested in the country's economy, 2 million new jobs were created against the increase of 5 million people. In 2003-2020, more than 3,500 schools and 600 medical institutions were rebuilt or overhauled in our country. 48 olympic centers have been established, 18,000 kilometers of roads have been built. Gas supply to the population has reached 97%, numerous projects have been implemented to improve the supply of drinking water, especially in the regions, as a result, the supply of drinking water to the population is at 75%. In general, the results of the socio-economic development programs of the three regions implemented in 2004-2020 are more heavy. Suffice it to say that over the years, 54 billion manat has been spent on the implementation of these programs at the expense of all financial sources, as well as the state has provided more than 2.5 billion manat in soft loans to entrepreneurs through the National Fund for Entrepreneurship Support. The analysis also shows that due to the results achieved in all fields of socio-economic development in the last decade, macroeconomic stability was further strengthened in 2019, the stability of the national currency was maintained, inflation was reduced by 10% compared to the same period last year, the share of socially oriented expenditures from the state budget increased by 28.4% in 2020 compared to 2018 and reached 32%. Investment promotion programs implemented by the state are of special importance in ensuring inclusive development in Azerbaijan. Suffice it to say that 107 projects are being implemented in our country until January 1, 2019, and 332 projects are planned to be implemented this year. The implementation of all these projects will create 12,000 new jobs in our country. The role of the self-employment program which implemented successfully in our country is also draw attention in ensuring inclusive economic growth. This program will cover 7,000 people in 2019 and improve their employment. It is known that the small and medium business development is important in ensuring inclusive development in the country. For this purpose, the establishment of "Easy Support for Family Business" "ABAD" centers will contribute to raising the level of employment in our country.

The analysis shows that in modern times, the Azerbaijani economy is in the process of transition from quantitative to qualitative changes, to an economy based on efficiency. Thus, the share of intellectual capital in economic growth tends to increase due to the development of intensive factors in economic growth, especially scientific and skilled labor, the share of the non-oil sector in GDP increases, the structure of imports and exports improves, the competitiveness of the national economy rising gradually. A very important aspect of ensuring inclusive development in the context of our country's entry into the post-oil era is related to the development and diversification of the non-oil sector. As a result of systematic measures and government programs implemented in this direction in recent years, the share of the non-oil sector in GDP has reached 65%. The analysis shows that the results achieved by our country in the field of economic development in recent years and the existing potential have significantly increased its competitiveness. According to the World Economic Forum's Global Competitiveness Report 2017-2018, the competitiveness of the Azerbaijani economy has doubled and ranked 35th among the world countries. World experience shows that in modern times, human capital has become a driving force in the development of national economies, increasing competitiveness, labor productivity, most importantly, ensuring the transition to the concept of inclusive development. The results achieved in the socio-economic development of our country in all directions and fields over the past 15 years have allowed the President to implement very serious social programs to increase the inclusion of economic development. Thus, the President issued a decree on February 25, 2019 "On additional measures to strengthen the social protection of the population" to provide social benefits to large groups, another decree on February 26, 2019 to provide "a single monthly allowance for IDPs and persons equated to them" sharply increased the amount of benefits. By another Presidential decree dated February 8, 2019 "On raising the minimum wage", the minimum wage was increased by 38.5% from 130 to 180 manat, thus, the level of the minimum wage was fully adjusted to the level of the subsistence level. On April 19, 2018, a lump sum payment of 11,000 manat, will be provided for the heirs of martyrs died before August 2, 1997, according to the order dated February 14, 2019 "On increasing scholarship for doctoral candidates, students and pupils of higher, secondary special and initial vocational education institutions", as well as master's degree students of the Azerbaijan National Academy of Sciences" to improve their social status, doctoral scholarships are 300 manat, for doctoral students in the amount of 180 manat, as well as with this order to increase the scholarships for masters and students. Access to health care for all groups in the country is important in ensuring inclusive development. Taking this into account, the Presidential Decree dated December 20, 2018 "On some measures to ensure the introduction of compulsory health insurance in the Republic of Azerbaijan" is planned to be completed in 2020, for the completion and application of all activities related to the introduction of compulsory health insurance. Social and labor pensions were developed by another Presidential decree dated 27 February 2019 "On Labour Pensions". In general, in recent years, significant progress has been made in improving the social welfare of our country's population. COVID-19 pandemic as a whole has a strong negative impact on the socio-economic development of developed countries, including Azerbaijan, especially on inclusive development, dynamics, character, implementation mechanism, financial opportunities, employment, especially the social status of low-income families, small and medium business activity. To minimize the negative effects of the coronavirus pandemic, a comprehensive system of measures was established by the order of the President of the Republic of Azerbaijan, initially allocated 2.2 billion manat from the 2020 state budget for these purposes. Due to the nature of inclusive development and the level of people's incomes, appropriate measures have been taken to make education and health services accessible to low-income families. Thus, we would like to note that by the decision of the President No. 138 dated April 13, 2020, for the second semester of the 2019-2020 academic year and the first semester of the 2020-2021 academic year, respectively, tuition fees of 15.2

thousand and of 13,9 thousand students were paid from the state budget. Very serious measures have been taken to strengthen the material and technical base and infrastructure in this area in order to meet people's demand for health services in a pandemic. It should be noted that in order to ensure the realization of inclusive development in the country in the current realities, during the COVID-19 pandemic in our country began to implement strong measures to support employment and social welfare. Thus, 12 measures system was implemented in 4 fields, covering 4.8 million people, in other words, 48.1% of the country's population. These include, first of all, protection of unemployment risks and social protection of public sector employees, protection of unemployment risks of non-public sector employees, social protection, employment and social protection system of the unemployed and dismissed, strengthening social protection of vulnerable groups, including the provision of social services and social protection at home to persons over the age of 65, financial assistance, as well as significant discounts on energy and public utilities. In accordance with the tense social conditions of the post-pandemic period, qualitative changes have taken place in the nature of labor relations and demography in our country as a whole. Thus, on January 1, 2021, the salaries of employees increased by 2.7%. In general, 53.8% of these employees worked in the public sector and 46.2% in the private sector. During the last year, the living minimum for social demographic groups of the population was increased to 190 manat, including 201 manat for able-bodied people, 157 manat for pensioners and 170 manat for children. During this period, as a whole, targeted social assistance in the field of social protection and social security in our country increased by 5.1% compared to 2019, as well as social benefits and pensions increased by 4.1%. In the social policy pursued in our country after the war, strong social support measures are being implemented for the families of martyrs and war veterans. Thus, social support measures were provided to 7,000 people, including pensions and benefits to 3,600 martyrs' family members, and the needs of many people for housing and cars were met. According to the relevant instructions of the President, financial support and benefits will continue until the resettlement of refugees and IDPs in the liberated lands and the restoration of their normal life activities. The necessary institutional structures, including the Agency for Sustainable and Operational Social Security (DOST), was created in our country to ensure inclusive development in the post-pandemic and post-conflict periods. It is known that the development and adoption of an effective economic development strategy is a initial condition for ensuring the inclusive development of the national economy. Because the success of the development concept, which is ultimately to be implemented, depends vitally on how effective and optimal the existing regulatory system in the country is. Thus, taking into account the existing financial and economic potential of the country and the multiplier effect should be considered as one of the most important conditions when developing an economic development strategy. Given the importance of an objective assessment of the legislation impact on the nature and dynamics of socio-economic development, the Azerbaijan state always tries to have a strong enough intellectual burden of all normative legal acts adopted in connection with socio-economic development.

4. CONCLUSION

In general, all the programs, projects, goals and measures adopted by the Azerbaijani government in connection with inclusive economic growth in recent years have been implemented in a timely and quality manner. In general, the assessment of the socio-economic development of the country over the past 15 years on the basis of SWOT analysis and 360-degree diagnostics highlights the main priorities of the inclusive development strategy: first, the formation and implementation of innovation-oriented investment policy to achieve inclusive development; second, the creation of appropriate infrastructure to ensure sustainable inclusive growth in our country, which is applied stable; third, the formation of a national

innovation system in Azerbaijan that meets world standards and criteria; fourth, a sharp increase in the share of intellectual capital in the country's gross domestic product; fifth, it defined the market as the necessary institutional change in response to changing conditions, demand and economic realities. All this gives us every reason to conclude that despite the above-mentioned problems, especially the difficulties caused by the coronavirus pandemic, the inclusive development strategy developed in the near future, taking into account the resources of our country in modern times and their potential for mobilization in the near future and will ensure sustainable development.

ABSTRACT

The existing problems of mortgage crediting in Azerbaijan are tried to be solved at different levels from Bank structures up to government: though the problems which solution is important and stand before mortgage mechanism and mortgage crediting in regard to real estate, housing market and those have many aspects, its mutual relation with other social-economic factors is drawn to the foreground. The mortgage of real estate always has been one of the most reliable methods to provide the fulfillment of obligations in a proper order. Mortgage mechanism is one of the important priorities of market economy system to buy an apartment and gives an opportunity for creation of efficient investment environment. So, there are significant problems in economic aspect of mortgage crediting. Solution of these problems is not so easy. But, it is impossible to increase the efficiency of mortgage crediting without trying their solution and attempting to it. All of these mentioned confirm the urgency of this research. Different types and models of mortgage crediting in Azerbaijan and in the world are considered in the article, they were compared from the standpoint of economic efficiency, profitability and social orientation and estimated. The establishment of organizations and importance of their development giving an opportunity to increase of crediting and financing systems of housing market by basing on analysis of the world practice is emphasized. It was concluded that, the application of different systems of saving in housing construction gave an opportunity to increase the level of guarantee in efficient and available apartments, all of these were accepted as important process, the importance of the use of mortgage model mechanisms basing on balancing was said. The selection of mortgage models in mortgage crediting systems depends on features of national economic development and development history of financial-mortgage system of the state. The comparative functional analysis of national models of mortgage formed during a long period gives opportunity to determine their priorities and negative sides. Also, the necessity of classification of means analyzed and investigated in terms of different priorities was emphasized to finance mortgage assignment apartment market as one of the research results. The use of the main elements of each model considered and their application put forward as suggestion to improve and develop the system of financing of apartment market and mortgage crediting in the article.

Keywords: *mortgage, crediting, mortgage crediting system, apartment market, apartment construction, financing of apartment market*

1. INTRODUCTION

At present, the provision of people with convenient apartment is one of the actual, social and economic problems. There are different mortgage crediting models in the world practice to solve this problem. The European and USA practice is very significant. Mortgage crediting - is an activity on crediting of apartment and other property purchasers. Mortgage systems of modern states have many specific features substantiated with different mortgage models. These models are basing on the process of implementation of certain mutual relations schemes between system participants. The modern world practice is urgent especially for Azerbaijan. The elements of existing mortgage systems may be coordinated by considering their features.

2. WORLD MORTGAGE CREDITING SYSTEM

The social-economic development strategy of the national economy of separate countries (concrete legislation, certain mortgage mechanisms, etc.) is determined especially with many internal features of modern systems of mortgage crediting. In this case, it is necessary to indicate the differences in legislative regulation in the countries where legal systems of Romano-German and Anglo-Saxon are available. The mortgage system almost is the same in all countries of the Continental Western Europe, except Denmark. In these countries, the confirmation of notary acts, cadastre or land cadastre, publication of information about mortgage transactions and other important documents has compulsory character (Aalbers, 2017). It is important to note that, compulsory notary confirmation of all documents is applied in transactions on mortgage crediting in our Republic. The mortgage system is more liberal in the countries where Anglo-Saxon legal system is available and low formalization is required. So, the documentation in Anglo-Saxon mortgage system also may not be confirmed under notary. It is important to note that, there are the circumstances for exact determination of mortgage subject (Black and Kohl, 2017). The Denmark mortgage system may substantiate to the first and second approach. The American mortgage system is one of the important mortgage systems. So, here securities market developed significantly and many debt liabilities are provided with mortgage. From this point of view, the changes occurred in the fund market exert strong influence to mortgage crediting. Because, as it seems from the world financial crisis, while many segments of the market decrease, including mortgage market, the development of mortgage influences to the financial market (Aalbers, 2008). The following models shall be noted especially according to their importance:

- 1) *Little open model* is available in Great Britain, Israel, Spain: bank's own capital, deposits and interbank credits – are the sources of money used for issue of mortgage credits. Its speed is determined with current business environment.
- 2) There is *enlarged open model* in USA: banks grant credit to client depending on income level and credit history (Bricker et al., 2017; Carragher and Webster, 2011).
- 3) There is *balanced autonomous (free) model* in Germany: citizens establish cooperatives and make investments during a certain period. While collecting the half of value of future residential real estate (apartment), the Cooperative's participants got a right to buy real estate (apartment) in consecutive order. They pay the remaining part during the following 10 years (Carragher and Webster, 2011).

The other kind of mortgage crediting systems covers the single-level and two-tiered mortgage models. The selection of this order or other model depends on features of national development and development history of financial and mortgage system of the state. The implementation of refinancing procedure of credit is an important process (Goodman and Woluchem, 2014). In accordance with those mentioned above, two-tiered model is applied in USA, but single-level model in the European countries. The two-level model of mortgage is formed for the reason of increase of need to credit transactions recorded historically in the national level (Smith, 2015). These measures have been applied in order to increase the liquidity of credit and to finance it again in future. Though mortgage has two-stage model, the transmission of the credits of initial mortgage market to open market by the help of State Mortgage Agency is expected (Vojtech et al., 2016). The Mortgage Agencies are obliged to form mortgage "money" (capitalist is one of the forms of monopolies, which income of all participants enters to the total fund and then it is distributed among them in the comparison considered in advance) on the basis of the same credits and to sell them (or their shares) to investors again. The obtained money may be transmitted immediately to the second investors. The funds obtained from such transactions also may be used for issue and placement of mortgage securities. It stipulates the development of fund market and transactions with mortgage securities.

These transactions provide continuous movement of financial flows in the world financial market. The single-level and two-tiered model showed existence of significant differences depending on their historical development. The analysis of processing of two-tiered mortgage crediting model in USA shows that, this mortgage crediting system is formed as effective (as one of the basis) model during a long period. But, its development became slower for the reason of wars and crisis (Leathers et. al., 2015). The analysis of the American mortgage crediting model gave an opportunity to us to select the main six stages of its development. At the first stage (30th years of XX century), the mortgage developed actively till great depression causing to collapse of apartment market. Finally, the percentage of unpaid mortgage credits increased distinctly. USA government took urgent measures for restoration of situation. The next important event was establishment of Federal Housing Administration in 1934. This step solved mortgage debt problems partially (Leathers et al., 2015). Let's analyze single-level model of mortgage crediting used especially in European countries. Its essence is issue of loan securities provided with mortgage credits issued by bank giving a mortgage credit on one hand and provided with real estate mortgaged on the other hand. Mortgage business is regulated under special legislation. The issuer (especially banks) indicated in the legislation may grant mortgage lists (Ross and Tootell, 2004). The state and bank control authorities supervise strictly over activity of mortgage bank. It is expected that, the state will support the participants of mortgage mechanism within this model, will determine game rules and will made mortgage as effective economic development tool (Leathers and 2015). Recently, macroprudential tools affecting to demands of capital for real estate objects are used on the basis of capital in several European countries. So, more strict criterions are determined for application of minimum 25% risk weights (RW) for Swedish mortgage credits and discounted RW for residential real estate of Croatia, Ireland and Great Britain, RW is increased for risks provided with commercial real estate in Ireland and Norway. For example, Romania and Sweden (Ferrari etc., 2017; Luque and Mello, 2017; Davis and Zhu, 2011). The main establishments of mortgage crediting are formed in the centuries of XVIII-XIX. The mortgage and maintenance concept emerged on this kind of credit at this period. At the next stage (50th years of XX century), special institutes have been established for organization of mortgage crediting transactions and repeated mortgage market with securities. The third stage (the end of XX century, the beginning of XXI century) has been in regard to improvement of indicators of mortgage market and existing market tools within the model. The world financial crisis slowed the development of this market: interest rates increased and the list of programs became shorter. For example, some European mortgage products decreased or their demands to potential debtors became strict. But, now we can speak about development of post-crisis model of Europe, restoration of market, expansion of crediting and expansion of opportunities of citizens to give subsidy to purchase of real estate (in some countries, for example, Austria). Interest rates change among 3-8% depending on country and credit terms (Davis and Zhu, 2011). The single-level model of mortgage crediting is applied in Hungary, Germany, Denmark, Poland, Slovakia, France, Czech and other European countries. The analysis of single-level mortgage model gives an opportunity to determine its priorities and negative sides in comparison with two-tiered model (Carr and Anacker, 2014).

Its priorities:

- low entry price.
- simplified legislative regulation.
- At the same time, two-tiered mortgage model has priorities which are considered the shortages of the same level model:
- credit risks not covered with insurance and guarantee are distributed among all credits as a result of formation of mortgage “money”.

- public authorities give guarantee to certain type of mortgage and helps to get discounted mortgage to concrete categories of citizens.
- public authorities pursue concrete policy to stimulate the issue of insurance and guarantees by help of legislative and financial support for citizens and other model participants. At the same time, government develops regulation and control system to stabilize the influence of model.
- model gives an opportunity to enter the Fund market and to use of more transparent price mechanism. It gives an opportunity to market participants to estimate risks and benefits from investments to certain mortgage products.

Savings system for housing construction is more widespread in the single-stage model of mortgage crediting. Its period consists of several stages. In the first stage, money is collected: the depositor concludes with Construction Savings Bank, and the latter attracts the funds. So, the savings system in the housing construction is independent of the securities and Banking markets, change of interest rates and securities rates. Collecting money takes 5-10 years. As a result, the depositor collects 40-50% of the amount specified in the contract. The interest rate on the deposit is much lower than the market deposit. Mortgage is granted in consecutive order. Its interest rates are much lower than market prices. The construction savings system will operate at low interest rates when there is no public demand between citizens for mortgage credits. The German mortgage system has the most advanced state mortgage banks. They are only entitled to issue securities for valuable mortgage. Such banks may act as a mortgage. The Construction Savings System is also well developed in Germany. It is a prototype for similar systems in other countries that apply it. The German system has two additional advantages, other than general guarantees to reliability peculiar to the European model of mortgage banks:

- Bank control system conducts selective inspections from time to time.
- Mortgage bank manager is appointed as a supervisor for this concrete bank.

Giving of the credit in 100% (sometimes 98%) amount of the purchase and sale price of real estate is an important advantage of the German model. However, the credit amount does not exceed 80% of the value of the mortgaged property, and the interest rate is 4-7% per annum. The interest rate on the credit is fixed by the duration of the contract. However, it may be lower than the period intended for full payment of the credit. In this case, the creditor may offer a new rate at the end of the agreed period and the borrower will determine whether there is a need for its acceptance. When the mortgage credit bought, the paid deposit should also be taken into account. The conjuncture of the financial market influences the creation of a balanced autonomous (free) model in connection with the accumulation of debt resources (the principle of mutual aid fund) by attracting the deposits of future borrowers. This model may be interested for Azerbaijan. Because, in most cases, the value of the residential real estate (apartment) in the secondary market is lower than in new buildings. Moreover, the value of the apartment construction in Azerbaijan is much lower than market price of the real estate. Cooperatives were created during the Soviet era. However, this practice is not present at the moment, and it requires a more sophisticated multi-structured system to make structures more efficient.

3. DISCUSSION

Banks may play a decisive role in real estate financing through mortgage financing. They:

- give a credit for land acquisition and existing buildings for housing construction;
- financed the construction projects,
- credited the non-bank credits, credit and non-financial firms on the basis of the deposit of real estate (Davis & Zhu, 2011).

Thus, the housing construction in the USA especially depends on mortgage credits. Almost, all homes are bought for a family through mortgage credits and it had led to significant growth in the real estate sector in the country (Leathers and al., 2015). It should be noted that large companies established in 1935-1981s, such as Fannie Mae and Freddie Mac, was become to the most important financial organizations of the mortgage market for long years (Carr and Anacker, 2014; Shapiro and Kamarck, 2015). In the late 1980s, a new type of securities issued by mediators for mortgage investments emerged. They expanded the mortgage market and strengthened their positions. However, the situation was exacerbated by the 1998 and 2008 crises, especially when the "bubble" burst in the housing market in 2008 and the collapse of the USA mortgage market. However, the USA experience has shown that after serious crises, the mortgage system, which has been actively developing during the Great Depression, has transferred from a serious government regulatory mechanism to a self-regulated economic system. The mortgage system related to the necessity of provision of citizens with the favorable apartment is supported by the government. The American mortgage system is one of the fastest restoring and developing models. Despite a 20% decrease in apartment prices during the global financial crisis, American citizens became poor about USD 5 trillion. Reliable borrowers in the real estate market faced the problems of crediting very quickly. So, the mortgage crisis affected about 40% of the total volume of market credits. However, In the USA, the mortgage model works effectively. In 2016, the minimum interest rate on the credit was 2,81% compared to the previous minimum recorded in May 2013 (2.86% for a 15-year credit) (Bricker et al., 2017). Based on those aforementioned, despite the serious consequences of the crisis, the USA mortgage market has restored rapidly. But, we cannot say the same about the Azerbaijani market where there are still quite high rates of mortgage credits. The Azerbaijan experience is attempted to use savings model for housing construction. But, this system isn't widely used. The construction savings system is carried out through private cooperatives in the world experience. Despite a significant risk reduction and more liberal credit conditions, Azerbaijani citizens don't want to be part of such cooperatives. They consider that the mortgage system is safer and less risky in terms of interaction with constructors and building owners, as well as procedure for giving of the credit. However, the obtained information shows that housing construction savings system may lead to significant progress in providing citizens with the favorable apartment, and banks may be provided with additional resources, credit products, including mortgage credits with long-term money. So, two directions may be successfully implemented: mortgages crediting and housing construction savings system. Housing construction savings system may be offered to citizens who are not urgent the need of purchase of the real estate. Money obtained from depositors may bring them additional income and give additional money to creditors who can use these resources to obtain profit by offering them various credits (for example, consumer credits etc.) in a short period of time. Banks may place remaining moneys in the form of mortgage, but with more liberal credit conditions. Citizens who need urgent money can apply for a mortgage. Accordingly, the rate of urgency will cost them higher interest rates and harsh conditions. So, citizens who need a real estate will be divided into two groups for products that they can use. These measures may allow you to strengthen Azerbaijan's position in the global financial market, settle several social problems and reduce social tension by providing citizens with favorable apartment.

4. CONCLUSION

In order to summarize, almost national mortgage models (shorted open, expanded and balanced autonomous (free) models) have been formed for a long time. Comparative functional analysis allowed you to identify the advantages and disadvantages of each model. We also determined that balanced autonomous (free) models may be carried out in Azerbaijan. Because, prices in the initial housing market (new buildings) are lower than prices in the secondary market.

Moreover, the construction value is much lower from market prices of the real estate. The network of construction cooperatives should be expanded. Because, it will improve the financing system of housing market. We recommend that you use the elements of each model designed to improve the financing system of housing market. There are two main models of mortgage crediting, i.e single-tiered and two-tiered models. The two-tiered model is more widespread in the USA. The essence of this model is that mortgage credits available on the initial mortgage market are provided to government-backed agencies. As for the same-tiered model, the essence of this is that the Bank which gives mortgage credit independently issues loan securities. These models have differences in their evolution. In our opinion, the German housing construction savings system can be effective in Azerbaijan. This system allows you to collect gradually money that is necessary for purchase of the property. This system may serve as a tool of the housing market financing system. If the borrower doesn't need immediate purchase of real estate, it can join the savings system for construction and gradually save money by earning a small percentage from the amount of accumulation deposit. If a citizen needs immediate money, a mortgage application shall fill. However, the urgency will cost him/her a higher interest rate and harsh conditions.

ABSTRACT

COVID-19 aims to ensure the sustainable economic development of the Azerbaijani economy in the financial sector and to make certain changes in the regulation of fiscal and monetary policy in this sector. In the context of the implementation of economic reforms in the country, the implementation of economic policy in accordance with the relevant specific conditions is very important for this period. Stimulation of both national and regional economies through the introduction of fiscal and monetary policies in a country in a pandemic environment, the provision of local markets based on achieving a certain stability in the financial sector, depends largely on financial stability and fiscal and monetary policy. The development model aimed at ensuring sustainable development in the country has negative priorities: expecting optimal ratios of key and progressive factors in economic growth, economic security of the national economy, competitiveness, growth efficiency in terms of reproduction, social efficiency and the level of efficient use of one of these factors. The focus on the impact of fiscal policy should be improved. Even during a pandemic, the regulation of macroeconomic stability depends to a large extent on the optimal coordination of monetary, fiscal and fiscal policies. Coordination between fiscal and monetary policy in connection with the use of oil revenues in solving the problems of national development of the country's economy during the pandemic is of particular importance. Thus, this policy is the basis for a serious economic and social threat in accordance with the current level of inflation in the country. As a result of successful monetary, fiscal policy and other economic measures carried out in the country in 2020, successful responses to external and internal shocks were given and conditions were created for effective management of these shocks, which have a strong impact on all spheres of public life and economy. For 2021 and the medium term, the country faces challenges such as a return to a sustainable economic growth trajectory, a doubling of GDP over the next 10 years, macroeconomic stability in the light of realities, and the restoration of liberated territories.

Keywords: *sustainable economic development, development model, economic stability, fiscal-monetary policy, pandemic*

1. INTRODUCTION

The sharp decline in oil prices since 2014 and the economic crisis in trading partner countries have slowed growth in the country, the balance of payments and non-oil budget deficit, the processes in the financial and banking sector, as well as the global economy COVID-19. The pandemic has necessitated new approaches to economic development in Azerbaijan. This required the development of a new scientifically based economic development strategy. To this end, the country initially developed and adopted a strategic road map for key sectors of the economy. As we have noted, the announcement of a pandemic of a new strain of coronavirus infection that started in China in 2020 and continues to spread rapidly, the negative impact of these global quarantine conditions on the dynamics of important economic indicators, had a

negative impact on most economies in a short time. Uncertainty over the duration of the pandemic required all national economies and international organizations to adopt mechanisms, decisions, regulations, laws, as well as economic projects, programs, and programs that would affect this economic process, and to work together effectively. First of all, the leading countries and international organizations began to make predictions about the pandemic. However, these predictions differed from each other. From an economic point of view, the economic forecasts for the countries of the world can be considered useful for our analysis. International financial institutions have begun to forecast economic growth for the world and countries in the first place. Unfortunately, these figures were forecast with negative trends. Thus, in the "Economic Outlook of the World" prepared by the International Monetary Fund in June 2020, believing that the quarantine conditions will be relaxed, trade will gradually recover, the economy will gradually recover, and demand will recover. Forecasts for the end of 2020 were adjusted to improve, and the rate of economic decline was predicted to gradually decrease [1]. According to these forecasts, the global economic decline was projected at 4.4%. IMF experts attributed the weakening of the pandemic in 2021 to countries and regions of the world to the relative revival of aggregate demand determinants such as consumption and investment. However, due to the uncertainty of the pandemic, in some countries, on the contrary, the increase in the scale of the disease, the tightening of the pandemic regime in many countries, has resulted in a weakening of these positive forecasts. The World Bank said the pandemic would cause the deepest crisis since World War II. However, after the World Bank's analysis of the results of the pandemic, it was said that the forecasts would be possible due to the support from the fiscal and monetary sectors. The Asian Development Bank (ADB) said tensions over the pandemic would cause social unrest and tensions, with escalating trade tensions between the United States and China as an important risk factor, and predicted that they would ease during the pandemic. The impact of the pandemic on the economy of Azerbaijan The introduction of the quarantine regime in the country and the subsequent extension of this period, first of all, led to a decrease in the population and its income. This led to a decline in real purchasing power, as a result of which the consumer market began to shrink, as a result of which trade turnover decreased, services provided to the population decreased, and food prices rose. At the same time, there was a decrease in investments in fixed assets. However, during this period there was an increase in trade, which includes non-oil industry and agriculture, and is a key indicator of the country's export potential. In such circumstances, of course, the fiscal and monetary policy pursued in the economic sphere and its effective regulation were of special importance. It should be noted that during the pandemic, the role and responsibility of the state in the formation, improvement of the financial system in general and the application of its necessary mechanisms is growing. On the one hand, the ongoing global financial crisis, on the other hand, the COVID-19 pandemic, which has negatively affected the economic and social life of all countries, has made ensuring financial stability and security in national economies a major problem and task. From this point of view, the most important economic problem not only for Azerbaijan, but for the whole world economic system is the effective implementation of macroeconomic tax and monetary policy, first of all, the restructuring of the budget sector and the application of the most effective methods of budget planning, budget revenues and the effectiveness of cost control should be increased. In order to ensure the real effectiveness of these problems, there is a need to strengthen the institutional orientation, ie to develop and implement laws that will support the solution of these problems. Although I find it difficult to say how active it is, the country has passed laws that will support economic reforms. For example, the Financial Stability Board of the Republic of Azerbaijan, which is an integral part of structural reforms, should have had a positive impact on governance.

2. INTERACTIVE RELATIONSHIP BETWEEN MONITORIAL AND FISCAL POLICY IN PROVIDING FINANCIAL STABILITY DURING THE PANDEMIC PERIOD

In the context of the COVID-19 pandemic, the transformation of the Azerbaijani economy into sustainable economic development necessitates changes in economic development. In this regard, the main interaction of fiscal and monetary policy with the state's monetary resources depends on the financing of the budget deficit and the effective management of the monetary sphere. The impact of fiscal-budget-tax-deficit on the level of inflation and the growth rate of production also depends to a large extent on how it is financed. As we know, the state budget deficit is mainly financed from 4 alternative sources:

- 1) By transferring funds from the Central Bank of the state;
- 2) By purchasing government debt bonds by the private sector in the domestic market;
- 3) By mandatory placement of government debt bonds;
- 4) Through external debt.

I would like to note that all four of these sources can be used. However, it should not be forgotten that the coordination of monetary and fiscal policies can be carried out in two directions: in the first direction, the Central Bank takes a leading position, regardless of the government's financial needs, the monetary authority can determine the growth of the monetary base. Thus, the government may be forced to determine the budget deficit in accordance with the financial capabilities of domestic and foreign financial markets, and the government will focus on reducing the budget deficit. This situation will create a danger of unsatisfactory calculation of cost priorities. Thus, the government will be more inclined to foreign financing and will place more debt bonds in the domestic market than necessary. The second direction is the position of the Ministry of Finance, which will determine the amount of the budget deficit without the consent of the monetary authority, while the financial capacity of the bond market will come to the fore, and the bank will provide the necessary funding from the monetary base. Given the level of market prices, inflation will begin to rise as demand for real money exceeds the growth rate. Of course, market instability and inflation will slow down the development of the domestic financial market. Both directions can improve the situation through the coordination of monetary and fiscal policies. As a result, the development of financial markets will have a mutually reinforcing effect on the unilateral development of monetary and public debt management procedures. This can help develop the national financial market with less damage to the economy as a result of effective coordination of fiscal and monetary policies. Effective management of fiscal and monetary policy in the country is of particular importance in macroeconomic regulation. The role of oil revenues in the formation of the budget makes the improvement of the relationship between fiscal policy and monetary policy especially relevant today, in the context of the coronavirus pandemic. The impact of measures taken to combat inflation in this period on economic and social processes must be taken into account. The success of the measures taken depends on the population's understanding of the nature of the problem. When the economic balance is disturbed, the government will focus primarily on maintaining consumer prices and possible stability of wages. The interaction of the two policies is also related to the transfer of the Central Bank's profits to the state budget. This amount is determined annually by the Milli Majlis when the budget is approved. This is somewhat dangerous for macroeconomic stability in the context of the economic situation, ie inflation, as in such a situation the Central Bank may make harmful decisions to perform its duties in accordance with the conditions. The Central Bank usually spends its money through the issuance of banknotes and deposit operations. In such circumstances, the Central Bank and the Ministry of Finance should act in joint consultations. As can be seen, the fiscal and monetary effectiveness of both policies is to finance the budget deficit with the state's monetary resources

and to manage the monetary sphere at all times, especially during periods of inflation in the economy. If the goals of both fiscal and monetary policies are properly coordinated, it is possible to create conditions for the development of the national financial market by allowing the economy to achieve these goals with minimal damage, taking into account the pandemic during this period [2]. Every activity carried out in the process of economic regulation of the national economy has a direct impact on the production costs of enterprises. Because all sectors of the economy interact with each other in the context of economic activity, a change in one area has an effect on all areas, either positively or negatively. Recalling the "resource-output" model, we can say that the matrix is relevant. By "inter-sectoral balance", both parts of the product are considered to be consumption and production. Proper regulation facilitates the regulation of intersectoral balance. In this context, the main instrument of government influence on the economy is the regulation of money supply or tax system, fiscal and monetary policy, which provides for the level of aggregate government spending. The socio-economic component of the policy pursued in Azerbaijan is tax policy. It should be noted that in accordance with the conditions of the pandemic, it is updated in accordance with today's challenges and requirements of both the global and national economies. However, fiscal policy in the country still has some delays in the proper management of budget revenues and expenditures, domestic and foreign public debt, which is its main goal. It also includes the creation and centralized use of centralized and decentralized monetary funds of the state. In our opinion, the optimal result of this policy should take into account the business activity of changes in tax rates, the impact of changes in budget expenditures on inflation and interest rates, and the budget deficit on macroeconomic equilibrium, because fiscal policy is not only monetary policy, but also the economic cycle. also depends on This can have both positive and negative sides. In our opinion, during the pandemic, if the "fiscal phase" applied by the Central Bank is used as a contour-cycle, it can be assessed as a positive situation in terms of macroeconomic stability. It is likely that the Central Bank will need to identify its non-inflationary sources in order to minimize the state budget deficit in Azerbaijan for the medium term. The International Monetary Fund's recent forecasts for economic growth have tended to be declining. At the same time, these cases mentioned in the introduction, ie trade wars and disintegration tendencies, were accompanied by a weakening of economic activity. The information on the average price of oil on the world market, which confirms the IMF's economic growth forecast, is a decrease of 12% from \$ 72 in 2018 to \$ 64 in 2019. During the coronavirus, the IMF also predicted that the global economy would shrink by 4.4%. The recession was forecast at 5.8% for developed countries, 3.3% for developing countries and 7.1% for Azerbaijan's trading partners. To mitigate the decline, some countries have announced fiscal stimulus packages and implemented expansionary monetary policy measures to support households and businesses. In 2020, world commodity prices will be as volatile as in Azerbaijan. The effects of the pandemic have led to a decline in trade and investment, especially foreign investment. However, in the report of the Central Bank of Azerbaijan for 2021, despite all this, in 2020, the current account of the balance of payments accounted for a deficit of 0.7% of GDP. The main component of the balance of payments - the foreign trade balance - was positive, although significantly reduced. The country's strategic foreign exchange reserves have remained stable, with foreign exchange reserves exceeding \$ 50 billion. However, aggregate supply and demand declined, and the confidence index fell to a negative zone in 2020 [3]. Uncertainty in the economy decreased by 4% in 2020 compared to 2019. During this period, the economic downturn in the non-oil sector slowed, but aggregate output remained in the negative zone. During this period, the government and the Central Bank aimed to regulate anti-crisis measures by supporting contour-cyclical fiscal policy, soft monetary policy and macroprudential concessions, focusing on supporting areas affected by the crisis. In 2020, the Central Bank's monetary policy was mainly aimed at managing inflation, while monetary policy

was also aimed at preventing a sharp decline in aggregate supply by neutralizing the negative effects of external and internal environment on macroeconomic stability in a pandemic. The uncertainty created by the pandemic and the contraction in aggregate demand as a result of declining consumption and investment spending were the main anti-inflationary factors, as the rise in world market prices also affected the rise in consumer prices. Among these factors, inflation expectations in the non-oil refining industry, trade, services, as well as the construction sector also had an impact. At the same time, keeping inflation at the target level is aimed at maintaining stability in the foreign exchange market. In this regard, the Central Bank accelerated dollarization in the domestic market by holding auctions of currency sales of the State Oil Fund, which led to an increase in demand in the foreign exchange market. The ability of banks to work effectively in this area has created stability in the foreign exchange market. As a result of the relative recovery of oil prices on the world market and the stabilization of partner countries in the foreign exchange markets, it was possible to ensure stability in the foreign exchange market. Such a policy is aimed at easing the monetary situation at the expense of both the value of money and the quantity of money. The steps taken by the monetary authority in the country to ease monetary policy are aimed at increasing the role of banks in the process of promoting economic activity, making loans more accessible. [1] In this situation, the Central Bank mainly went to interest rates. In our opinion, this should be considered the right step for this period. Because interest rate cuts will have a positive impact on the stability of the dynamics of the manat, which in turn will have a positive impact on reducing inflation and a certain recovery in demand. The weakening of demand must be prevented from affecting the growth of the monetary base. World experience shows that both the regulation of the purchasing power of money and the regulation of budget revenues during periods of economic instability are of particular importance, as noted above. In our analysis, we noted the impact of fiscal policy in Azerbaijan during the pandemic on the implementation of revenue and expenditure targets, as well as the implementation of regulatory measures, which is one of the main priorities of the state. As we know, the profit tax is related to the processes of material production of the state budget. This fact creates conditions for the implementation of state regulation of the economy in all economic conditions. Unlike other taxes, such as VAT, the income tax has a regulatory nature, but it should be noted that the state must be careful in the context of the "principle of equal tax". Especially in today's conditions, taking into account the measures to be taken by the state in connection with the specifics of the field in which entrepreneurs are engaged in entrepreneurship and business. Theoretically, however, this principle is that when a single rate of income tax is set, companies with large profits will have a tax advantage, and the tax burden will fall on small businesses, so a progressive tax should be kept in focus. Because in this case, each high degree is limited to a sequence, but only to the lower and upper limits, and will be applied to a well-defined part of the income. In this case, government agencies, the Ministry of Finance and the Ministry of Economy, through our tax policy, in our opinion, should work the right mechanisms of concessions, and in this case, should not harm the stimulating function of the tax. This is because investment in both foreign and domestic investment, which has already declined worldwide during the pandemic, must be sensitive to tax credit. Even in times of pandemic, we must not forget that this loan provides equal potential for development for all sectors and enterprises of the economy. Tax breaks, even tax exemptions for some businesses during this period, actually reduce the amount of taxable profit, requiring a higher nominal tax rate. Our approach to income and consumption taxes during the pandemic would be more appropriate to shift more attention from income taxes to consumer spending taxes. This system will facilitate the transition of the regulatory cargo center to cash circulation, which can be better integrated with monetary policy instruments. Ironically, the state is interested in getting more money, the taxpayer is paying less, and some are even trying to use various methods to evade taxes.

This should be kept in mind as it is dangerous both socially and in terms of the shadow economy. The development of entrepreneurship and further improvement of business activity, which is a key factor in the economy during the pandemic, the fight against corruption in the country, minimizing the level of the shadow economy, increasing the effectiveness of tax incentives are still in focus. I would also like to note that today in Azerbaijan, in order to minimize the rate of decline in all sectors of the economy, monetary and fiscal policy should be aimed at using international experience and standards in order to improve the lives of society. The goal is to develop innovative areas in the country in the future, stimulate investment, increase revenues in these areas, and, accordingly, increase budget revenues to increase budget revenues. It should be noted that domestic investment in the country has a significant share in the structure of total investment, 64.0%. Therefore, against the background of a significant increase in foreign investment, there was no increase in total investment [1].

3. IMPLEMENTATION OF BUDGET TAX POLICY IN THE COUNTRY ON INCOME AND EXPENDITURE IMPLEMENTATION IN 2021 DIRECTIONS AND DIRECTIONS

The period of transition to a market economy was a period of intense economic decline for Azerbaijan. There were two ways to get the country's economy out of this tense economic situation: either by effective management of available resources, economic reforms, especially privatization, denationalization, comprehensive development of all forms of private property, development of entrepreneurship in all sectors of the economy at least 14-15 He had to get out of this situation and achieve economic development for a year, or to achieve economic development of the country by relying on the energy sector and providing foreign exchange inflows to the country by exporting the most valuable oil and gas resources to the world market. Of course, the "Contract of the Century" was signed because the most efficient way was the second way. As a result, the inflow of foreign currency into the country was ensured, and in a period of 30 years, the country's economy became a developed independent state of the region. The country has been successfully integrating into the world economic system within a market economy with successful development until the pre-pandemic period, which is consistent with sustainable development. In accordance with our relevant analysis, in this section we would like to make some analysis of the problems that need to be implemented in the priority areas of fiscal monetary policy and the work to be done in this direction. In this analysis, we will refer to the forthcoming budget and tax policy, referring to the measures, decisions and orders envisaged by the state for this period. First of all, the state specifically envisages revenue targets for 2021, during which 48.8% of budget revenues will come from the non-oil sector, ie 5674.0 thousand manat through the tax authorities, 33.5%, ie 3900.0 thousand manat through customs authorities, 7.6% or 880.0 thousand manat transfers from the Guarantee Fund of public debt and guarantees, 2.1% or 250.0 million manat from the Central Bank's profit, 8.1 % or 947.0 million manat will be other revenues [1]. In our opinion, in order to achieve this priority, the state should focus its fiscal policy on stabilizing the economy by mitigating the existing fluctuations during the pandemic, maintaining the current level of GDP and creating conditions for its possible growth, achieving full employment of all resources. and make effective use of all possible mechanisms to ensure price stability in order to regulate supply. At the same time, public procurement, taxes and transfers should be directed to the future economic situation. Pandemic payments, unemployment benefits, etc. from internal regulators. social payments should be indicated, ways of providing export goods and services should be sought. The boundary between production and tax revenues should be regulated. To this end, investment programs should be developed to expand production within possible opportunities, sources should be identified, internal and external sources should be identified, a tax environment should be created to create conditions conducive to investment-innovation development

through the application of new technologies. Those who implement high-value investment projects through tax incentives that stimulate entrepreneurship's investment and innovation activity should be exempted from taxes, either in full or in part, within a specified period, and the costs associated with borrowing should be reimbursed.

4. CONCLUSION

In our opinion, in accordance with the fiscal monetary policy pursued in the country during the pandemic, taking into account the provision of financial stability, the following should be done:

- 1) The activity of all sectors of the economy must be ensured, the existing natural, labor, capital, land, intellectual, innovative, etc. Efficient management of resources should create conditions for the development of the private sector, entrepreneurship in the ratio between the development of the private sector and the public sector, and ensure its superior development. In this regard, in order to reduce the dependence of the economy on the oil sector, the increase in non-oil budget revenues should be continued in the coming years, specifically in 2021. In our opinion, this can facilitate more effective coordination of fiscal and monetary policies and more effective regulation of both economic policies by the State Central Bank, the Ministry of Finance, the Customs Committee, the Ministry of Economy to ensure financial stability, dynamic economic development and economic growth. In this regard, it will first of all minimize the dependence of payers operating in the non-oil sector on shocks in the oil sector, which has a high share in the formation of budget revenues, and expand the geography and range of non-oil exports.
- 2) In order for the country to have positive results not only in fiscal and monetary, but also in all economic mechanisms, economic and social policies, the fight against corruption and the shadow economy must be carried out consistently and purposefully to eliminate this economic and political situation that directly affects budget levels.
- 3) To develop relations between taxpayers and tax authorities based on mutual trust, to expand the application of a single control mechanism for budget revenues, as well as to create favorable conditions for the payment of tax debts, to ensure transparency in the field of tax administration.
- 4) Achieving an increase in tax revenues by reducing the shadow economy, corruption, the application of more advanced cooperative management methods in public enterprises, each economic entity should focus on developing mutual trust between taxpayers and tax authorities, ensuring timely and full payment of financial obligations.
- 5) Improving the institutional environment for digital payments, and improving legislation in the field of e-commerce. To use the services of this sector effectively during the pandemic.
- 6) To pay attention to the provision of socially oriented budget expenditures and the financing of programs and measures to be implemented in this direction at the expense of the state budget and to ensure its transparency.
- 7) In order to reliably protect the health of the population in the fight against the constantly evolving coronavirus pandemic, special attention should be paid to the health sector, the allocation of appropriate budget funds for the implementation of government programs in this sector. The sanitary-epidemiological situation in the country should be controlled by the state and its relevant bodies, the social protection of medical workers involved in measures to combat coronavirus infection should be strengthened, necessary medical equipment to prevent pandemics, effective organization and operation of modular hospitals in relevant regions.
- 8) Taking into account the current economic situation in Azerbaijan, in our opinion, the main goal of fiscal policy is to eliminate the shocks of oil prices, as well as the consequences of coronavirus - COVID-19 infection, not only with the current, but also in the next few years (about 2-3 years) to ensure budget balance and sustainability by supporting conservation

measures. Of course, the state should focus on reducing the share of oil sector revenues in budget revenues at the expense of revenues from the non-oil sector.

- 9) In order to maintain macroeconomic stability, in our opinion, strengthening the coordination of fiscal and monetary policies in order to maintain stability in the exchange rate of the national currency, taking into account economic reforms, slowdown in dollarization and other factors to keep the national currency - manat against the dollar regulation, to ensure a positive impact on social welfare indicators of the population. In our opinion, the easing of monetary policy at the expense of both money and money supply should continue in the context of pandemic and inflation.

ABSTRACT

The article reflects the achievements of recent socio-economic reforms in Azerbaijan, as well as issues such as ensuring sustainable development of the regions, the formation of an innovation-oriented economy in line with modern conditions. We must keep in mind that sustainable development combines economic, environmental and social components in the selection and implementation of human development indicators. The most important goal here is to move resolutely towards sustainable development and to achieve the development of a concept of sustainable development of the country, region and city. Thus, the current stage of development based on market relations presupposes the formation of the economy and its effective integration into the world economic system and, above all, ensuring the competitiveness of the country's economy. At the current stage of reforms that can ensure sustainable economic development of the country, a systematic approach to the economy, the development of innovation-investment and structural policies require the implementation of targeted programs that can stimulate the comprehensive development of the country's economy. The essence and purpose of economic reforms in our country is to create an innovative economy in the country and regions, to successfully implement socio-economic problems, to achieve economic growth in the development of innovative entrepreneurship. Effective use of the economic potential of the regions, ensuring its sustainable socio-economic development, more successful implementation of the adopted programs and the development of new programs in this direction require a study of the essence of such concepts as region, region and economic region. From this point of view, back in the 70s of the last century, the main focus in the country's economy was on the study of theoretical views on regional reproduction and distribution of wealth by regions, as well as the practical application of scientific and theoretical views. At the same time, the issues of using the development potential of new forms of self-government remain insufficiently studied and discussed in the development of models of sustainable socio-economic development of the efficient use of local resources. Such issues include effective management of the economic potential of the regions, formation of local and regional markets, as well as their infrastructure, implementation of appropriate investment policies, proper use of property of various forms of ownership, ensuring efficient use of local resources, intensification of full and efficient use of existing potential.

Keywords: *sustainable development, innovation, investment, reforms, regions, socio-economic*

1. INTRODUCTION

Regulation of socio-economic and sustainable development of all sectors of the economy, including the regions that are one of its components, has been and continues to be one of the main strategic directions of the state's economic policy at all stages of the historical development of society. The modern concept of the mechanism of implementation of Azerbaijan's economic relations with other countries should be based on the fact that our national economy is an integral part of the world economic system. The formation and level of development of the national economy depends on the level of competitiveness of the country's economy. The experience of developed countries shows that the basis of sustainable socio-economic development in the country depends on modern scientific and technological progress and the application of advanced technologies in production.

The competitiveness of the national economy in the country must be established and developed on the basis of ensuring the economic security of the state, the economic policy of the state. From this point of view, ensuring economic efficiency in the regions in the conditions of market relations, development of scientific and technical progress, formation of free enterprise, further improvement of production and economic relations, activation of investment activity, production of high quality competitive products are all key tasks of sustainable development. It should be noted that during 2000-2015, Azerbaijan was at the forefront of the world in terms of the pace of socio-economic development. Infrastructure has been modernized, the basis for the development of the non-oil sector has been created, social welfare has been improved, strategic foreign exchange reserves have been created at a level comparable to the state's assets and GDP. Weakening of economic growth in the country as a result of the sharp decline in oil prices and the economic crisis in trading partner countries since 2014, institutional and structural challenges, balance of payments and non-oil budget deficit, new developments in the financial and banking sector There is a need to move to an economic development approach. Taking into account this need, in accordance with the Decree of the President of the Republic of Azerbaijan dated March 16, 2016 on approval of the main directions of the "Strategic Road Map for the national economy and key sectors of the economy" and related issues, a total of 12 strategic The road map was prepared and approved by the Decree of the President of the Republic of Azerbaijan dated December 6, 2016 "On approval of the Strategic Road Maps for the national economy and key sectors of the economy". The strategic roadmaps cover the short, medium and long term, the development strategy and action plan until 2020, the long-term vision for the period up to 2025, and the target vision for the period after 2025. Strategic roadmaps state that the goals and objectives set and adopted in the strategy, program and other documents adopted in connection with the country's development will be implemented on the basis of a qualitatively new development model, taking into account modern world and regional processes, global regional challenges and their impact on the country. which are policy documents. These documents emphasize the transition to a post-oil development model based on the concept of sustainable development in the country in the long run. Thus, the "Strategic Roadmap for the National Economic Perspective of the Republic of Azerbaijan" stipulates that by focusing on new "avant-garde" sectors that will ensure sustainable development in the long run, the structure of the economy is more private than state-owned. It will be rebalanced through the superior growth of entrepreneurship, high-skilled labor-intensive sectors compared to low-tech sectors, high-income markets relative to low-income markets, and high-value sectors relative to low-value sectors. It should be noted that the main goal of social policy in the country is to further improve the living conditions of the population, including citizens living in the regions. In general, regional governance should operate in both tactical and strategic modes. Strategic plans for socio-economic development of the region are of great importance. Let's look at these plans:

- the strategic plan identifies the region's strengths and weaknesses, identifies the region's competitive advantages by developing business and improving people's living conditions, and engages it in development;
- the strategic plan reflects the principles that guide producers of goods and services, governments, investors and the population, based on vision.
- strategic plan is a combination of short-term and long-term foresight;
- the strategic plan is the result of the joint efforts of all regional forces as a result of mutual partnership activities.

It should be noted that the planning of socio-economic development of the region is a continuous process. As the world experience shows, the main condition for achieving sustainable economic and social development in a country is to achieve regional development

in that country. Organization of production with efficient use of local resources, natural and human resources in the regions during regional development, creation of new enterprises and jobs, reduction or elimination of disproportions between socio-economic development between regions, reduction of inefficient interregional labor force establishment, establishment and development of education, health, science, cultural centers and other similar activities and measures. In general, in order to achieve sustainable development of the regions, special attention should be paid to the following principles:

- productive forces in the regions should be placed proportionally and their dynamic development should be ensured;
- different production areas should be closer to the sources of raw materials;
- differences between cities and villages in the regions should be eliminated, socio-economic development should be brought closer to each other;
- natural resources in the region must be used efficiently and nature must be protected;
- labor resources should be effectively allocated and used in the regions.

It should be noted that in Azerbaijan, as in developed countries today, special attention is paid to regional development. Thus, since 2004, the State Programs on socio-economic development of the regions (2004-2008, 2009-2013, 2014-2018) have been consistently approved in this direction. Despite all this, a decree of the President of the Republic of Azerbaijan on the approval of the "State Program of socio-economic development of the regions of the Republic of Azerbaijan in 2019-2023" was signed recently. The main goal of the program is to ensure the sustainable and balanced development of the regions in the Republic of Azerbaijan, including the creation of a competitive economy based on the principles of sustainable development, social welfare that meets high standards, efficient use of natural resources and environmental protection. consists of.

2. THE CONCEPT OF SUSTAINABLE DEVELOPMENT

One of the most characteristic features of the economic policy pursued in our country in recent years has been the correct definition of priorities. It is no coincidence that over the years, taking into account the absolute advantages of Azerbaijan, the country's oil strategy has been formed, the basis for socio-economic development of the regions has been created, accelerating entrepreneurship, developing the non-oil sector, ensuring food and energy security. Since the end of the twentieth century, the deepening social inequality between people has led to problems arising from the mismatch of economic and social factors, the inefficient use of natural resources, which could pose a serious threat to the future. That is why the principle of "development without destruction" was created, and it is gratifying that the concept of sustainable development has emerged. The term sustainable development was first used by Gro Harlem Brundtland in a 1983 report by the International Commission on Environmental Protection. Today, the concept of sustainable development is supported by the world scientific community and society in general, and the principles of sustainable development are widely applied in practice and in business. The concept emphasizes the importance of a holistic approach based on three fundamental principles of sustainable development: economic growth, social progress and environmental sustainability, and overcoming existing barriers to development. What is the concept of sustainable development? The concept of sustainable development is understood as development that can meet modern requirements, the level of application of environmentally friendly technologies, the quality and structure of total capital (natural, human, material, cultural, etc.), the use and export of environmentally sound products. The essence of this concept is to "meet the needs of current generations in a socio-economic and ecologically normal way without endangering the lives of future generations."

The report, entitled "Our Common Future," prepared under the direction of G.H.Bruntland, was distributed in various countries at the initiative of the UN General Assembly [1]. It should be noted that the main logic of the Sustainable Development Concept is the efficient and economical use of the planet's natural resources, the preservation of the natural environment, the proper satisfaction of human needs and the social, economic and environmental development of world and future generations. holds. The concept of sustainable development mainly includes the following factors: socio-economic aspects; efficient use and protection of natural resources in order to ensure sustainable development; strengthening the role of key human groups; means of implementation of issues related to sustainable development, etc. The practical implementation of sustainable development in the concrete example of any country is a logical sequence: a systematic analysis of the level of development of the national economy; definition of goals; requires that the existing system of economic relations meet the national interests, as well as to determine and evaluate the form, method, scale and means of its regulation. It should be noted that in addition to the aspects mentioned in the development of the concept of sustainable development, the factors of civilization, economic thinking, the policy of forming an effective economic policy of the state should not be overlooked [2]. In the mid-1990s, under the leadership of National Leader Heydar Aliyev, many necessary measures were taken to ensure the country's transition to sustainable development. Based on the recommendations of the UN Development Program, national leader Heydar Aliyev made many important contributions to the development of our country in order to fulfill the commitments made at the UN Conference on Rio de Janeiro (1992), the Millennium Forum (2000) and the Johannesburg Summit (2002). made decisions. Let's look at these decisions: 1. By the order of the national leader H.Aliyev dated March 2, 2001, the "State Program on Poverty Reduction and Economic Development" was prepared. 2. By the order of H.Aliyev, the Cabinet of Ministers of the Republic signed a decree dated October 30, 2001 on the preparation of the "Strategy for Sustainable Human Development in Azerbaijan". 3. On July 18, 2002, the National Report on Sustainable Development was presented to the public by the order of H.Aliyev. 4. By the order of H.Aliyev dated February 19, 2003, "National program on ecologically sustainable socio-economic development in the Republic of Azerbaijan" and "National program on restoration and increase of forests in the Republic of Azerbaijan" were approved. [3] The first steps towards sustainable development are:

- development of the concept of sustainable development of the country, region, city and analysis of the situation (environment, investment attractiveness, etc.);
- preparation of the country taking into account the normative leading world experience in the field of sustainable development of the country, region, city;
- development of a strategy for the gradual application of the principles of sustainable development;
- preparation of a detailed plan for application, level of infrastructure development, analysis of social and environmental normative-legal base.

Ensuring sustainable development is one of the important challenges facing and successfully implemented by Azerbaijan. Apparently, this implies a comprehensive, diversified, all-encompassing development of the country's economy. The Sustainable Development Goals, reflected in the "Agenda for Sustainable Development 2030" adopted by world leaders at the important UN summit in September 2015, officially entered into force on January 1, 2016. Azerbaijan Sustainable Development Report - 2020 "ranked 54th among 166 countries on the "Sustainable Development Goals Index " [4]. In 2019, under the leadership and initiative of the President of the Republic of Azerbaijan and the First Vice President of Azerbaijan, two social packages were introduced, which gave impetus to further strengthen the social security of citizens.

These packages resulted in an increase in both the minimum wage and the average monthly amount by about 2 times. The average monthly salary and minimum pension increased by more than 93%. The reason for Azerbaijan's success is based on the consistent, multifaceted and complementary branches since 2003. Of course, the main reason for this development is the implementation of correct, transparent and purposeful reforms and achievements. The fact that the Gini coefficient, which represents inequality between people, is 38.6 in Azerbaijan, indicates the success of social policies in our country [5]. At present, the achievements of our country in the field of sustainable development allow us to speak about the Azerbaijani model of development. The strategic directions of this model, based on the logic of sustainable, dynamic development, can be characterized as follows:

- formation of a whole socially oriented economic system based on free market relations - an independent national economy;
- active involvement of the existing natural-economic, technical-production and scientific-technical potential in the country in the economic turnover;
- effective integration of the national economy into the world economic system;

This model currently promotes the sustainable and rapid development of the Azerbaijani economy. Here, the most important features of the tactics of economic policy implementation in the priority areas - it is very important to carry out activities in each of these areas on a coordinated program implemented in parallel. It is important to note that the strategic directions of the Azerbaijani model of sustainable development - the strategy of "turning black gold into human capital", the strategy of "green development", the strategy of "using the energy of youth and women" should form the basis of our state policy. The formation of a balanced society, a welfare society, an information society, an ecological society based on social equality within the framework of the Millennium Program should be a priority for the development of Azerbaijan. One of the global features of the concept of sustainable development is the efficient and economical use of the planet's resources, the preservation of the natural environment, the intelligent satisfaction of human needs and the maintenance of world peace, as well as socio-economic and environmental development.

2.1. Basic principles of the concept of sustainable development

Sustainable development is a way to grow the economy, keep it at an optimal level, manage human activity in a way that meets the needs of modern generations, and does not create barriers for future generations to meet their own needs. Increasing the use of renewable resources, including energy sources, their constant share in the total energy and raw material turnover meets the following requirements.

Sustainable development includes two key interrelated concepts:

- 1) The concept of needs, as well as priority needs (those necessary for the existence of the poor);
- 2) The concept of constraints on the environment that will meet the current and future needs of mankind (conditioned by the state of technology and the organization of society).

The reasons for the emergence of the concept of sustainable development are environmental, economic, social, demographic, global and regional problems. Another reason for the concept of sustainable development is the attempt to create a kind of regulation for the development of human civilization. The main task of sustainable development is to meet human needs and initiatives. Because sustainable development requires that the most important needs of all people be met and that everyone be given the opportunity to live a prosperous life on an equal footing.

The concept of sustainable development is the result of combining three areas:

- 1) Economic sphere - Thus, the concept of economic efficiency is considered from a completely different perspective.
- 2) Ecological field - Consideration of ecological resources can lead to the destruction of the environment and endanger the existence of all mankind.
- 3) Social sphere - This concept can play an important role in solving social problems aimed at reducing the number of conflicts that contribute to the preservation of cultural and social stability.

Speaking about the exceptional services of President Ilham Aliyev in the sustainable development of Azerbaijan, academician R. Mehdiyev writes: The successful implementation of reforms in all areas depends on the definition of specific goals for the development of the country. Azerbaijan has already defined its long-term development path. This is reflected in the adopted state programs and strategic roadmaps. These documents, in addition to characterizing program management in our country, also contain the goals of President Ilham Aliyev on political, socio-economic and institutional development [10]. Observations show that as society continues to develop, most people want to live healthier, longer and more comfortable lives. People want to see their children better educated, taking into account the needs of the social environment, and at the same time try to improve their living standards by using more products and services. In this regard, as production expands, so does consumption. At the same time, as people's financial situation, level of education and outlook increase, their political consciousness expands, all of which has a positive effect on the expansion of people's political freedoms.

3. THE PROBLEM OF SOCIO-ECONOMIC DEVELOPMENT OF REGIONS IN SUSTAINABLE DEVELOPMENT

Ensuring the comprehensive development of the country's regions in modern times is one of the main goals of the economic policy of the Azerbaijani state. It is clear from the experience of recent years of the Azerbaijani economy that in accordance with the requirements of sustainable development, it is necessary to determine the direction of improving the structure of the regional economy, identify their socio-economic problems, develop state mechanisms to ensure economic security and sustainable development. Regional development depends on the material and spiritual progress of the people living in the regions, as well as on the further improvement of material well-being in the formation of society by changing the economic, social, cultural, social and political characteristics of many countries. Although the implementation of certain processes in the regions is regulated by the state, the implementation of economic reforms, the study of the problems of the regions, affects the formation of their governance structures.

It is also regulated within certain targets as follows:

- socio-economic development of the regions;
- effective use of the potential of the regions;
- increasing the role of regions in the national economy;
- improving the living standards of the population.

The implementation of these goals in the regions is actualized by the directions of these multi-regional policies:

- 1) Establishment and integration of a single national market in all regions;
- 2) Elimination of problems between regional differences and development of economy in backward agrarian regions;

- 3) regulation of the urbanization process;
- 4) assessment of human and natural resources;
- 5) Implementation of new industrial projects.

Effective use of the economic potential of the regions, ensuring its sustainable socio-economic development, more successful implementation of the adopted programs and the development of new programs in this direction require a study of the essence of concepts such as region-region and economic region. From this point of view, back in the 70s of the last century, the main focus in the country's economy was on the study of theoretical views on regional reproduction and distribution of wealth by regions, as well as the practical application of scientific and theoretical views. Also, the use of the development potential of new forms of self-government remains insufficiently studied and discussed in the development of models of sustainable socio-economic development of the efficient use of local resources. Such issues include effective management of the economic potential of the regions, formation of local and regional markets, as well as their infrastructure, implementation of appropriate investment policies, proper use of property of various forms of ownership, ensuring efficient use of local resources, intensification of full and efficient use of existing potential. In order to increase the production of agricultural products, increase the level of employment of non-oil industries, including processing industry services and other infrastructure facilities and further improve the living standards of the population in the Republic of Azerbaijan, "Socio-economic development of the regions of the Republic of Azerbaijan The State Program for 2004-2008" was approved. The State Program "Socio-economic development of the regions of the Republic of Azerbaijan" (2004-2008) identifies the factors accelerating the development of the economy in different regions, the main directions of state policy and state support in this regard. In order to achieve this goal, the following tasks are envisaged: to increase the efficiency of the use of local resources; to establish various service centers in the regions to assist farmers and other agricultural workers in order to further accelerate reforms in the agricultural sector, to expand the seed base, and to improve the supply of machinery; to improve the provision of the population with public utilities; to encourage the creation of new jobs; to ensure the creation of the necessary infrastructure for the rapid development of the regions, etc. [6]. Not content with the successes achieved, our government has continued to take consistent and effective measures for the development of the regions. Thus, the State Programs approved by the regions of Azerbaijan in 2009-2013, as well as in 2014-2018 will accelerate economic development and increase the quality, increase the share of the middle class in society, further improve the living standards of the population, reduce poverty. , aimed at minimizing the budget deficit, rebuilding production and infrastructure in accordance with modern requirements, further improving the development of entrepreneurship, has played an important role in ensuring sustainable socio-economic development. It is also important to maintain macroeconomic stability in the country in order to achieve the above goals. The successfully implemented oil strategy has led to the integration of Azerbaijan into the international economic system, the maintenance of macroeconomic stability as a result of the efficient use of oil and gas revenues, and has created favorable conditions for the continued implementation of measures in this area. Taking into account macroeconomic stability, maintaining the average annual inflation rate and the national currency, which is one of the main conditions for the development of the economy as a whole, including the regions, in the coming years, setting optimal tax rates, increasing incentives for agricultural producers. The policy of stimulating the creation of new jobs, maintaining customs rates at an optimal level, and effective management of foreign debt is being successfully continued. Comprehensive implementation of measures aimed at the development of the non-oil sector in Azerbaijan will be possible through the application of appropriate economic mechanisms that accelerate the production of export-oriented products.

The development of the country's export potential, the export of Azerbaijani goods and services to foreign markets, the creation of favorable conditions for this, the implementation of measures to ensure the effective integration of the country's economy into the world economy will be a priority in the coming years. In order to effectively realize the country's export potential, create a healthy competitive environment in the domestic market, ensure consumer protection, bring standardization and metrology in line with international requirements, the following measures will be implemented: stimulating exports in the private sector and increasing the range of exports; strengthening the position of national producers in foreign markets; to further increase the level of services in trade, catering and household services and to implement measures to protect the domestic market within the framework of WTO principles; strengthening measures to combat unfair competition and implementation of measures related to the development of competition, involvement of entrepreneurship and consumers; strengthening control over the quality and safety of consumer goods; It is no coincidence that as a result of the high attention and care paid to the socio-economic development of the regions, our republic is recognized as one of the countries carrying out multifaceted reforms in all spheres of public life and maintaining investment attractiveness. At the panel meeting on "Strategic Vision Eurasia" held on January 22, 2020 within the framework of the Davos Forum, which is considered the world's "brain center", President Ilham Aliyev said: "... We will try to keep poverty below 5% at today's level. . We also have a long-term strategy to reduce foreign direct debt. Today, this debt is very low, accounting for 17% of GDP. However, our goal is to reduce it to 10 percent of GDP. Of course, we will work to keep inflation at a low level of 2.5 percent, as it was last year. People's incomes must always exceed inflation, and job creation must be more than demographic growth ... The country is stable, development is sustainable. We have on our agenda a wide range of reforms that we are implementing and that create great opportunities for our people" [7]. The "State Program of Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2019-2023" was approved on January 29, 2019 to further increase the economic activity of the regions. As a result of continuing the measures started in 2004 to accelerate the development of the non-oil sector, diversify the economy, achieve balanced regional and sustainable socio-economic development and the successful implementation of these reforms, the country has achieved high growth in macroeconomic indicators, socio-economic The implementation of development measures has played an important role in further improving the living standards of the population. Today, the development of entrepreneurship in the regions, further improvement of the business environment is one of the priorities of the economic development strategy of the President of the Republic of Azerbaijan. Azerbaijan's achievements are also reflected in the reports of international organizations and financial institutions. It is no coincidence that according to the World Bank's Doing Business 2019 report, Azerbaijan has risen 32 places from 57th to 25th place in the ranking compared to the previous year, and Azerbaijan has improved its position on 8 out of 10 indicators, according to the document. was included in the list and declared the most reformist country in the world. [8] The advanced world experience shows that flexible and effective management mechanisms, application of innovative solutions play an important role in the socio-economic development of each country, its regions, cities and villages. The main task now is to increase the efficiency achieved through the application of the best economic mechanisms approved in international practice. The independent and sovereign state of Azerbaijan is entering a strategic stage in the post-pandemic period, which is qualitatively new and covers the years 2021-2030. Global economic realities, as well as the goals set at the new stage of development, require the definition of the corresponding national priorities of the main directions of socio-economic development of the country's long-term development vector. Strengthening the successful link between society, business and the trinity for the long-term sustainable and rapid development of our country, effective and efficient management of the

role of the state in the economy through market-oriented reforms, strengthening private property institutions, business-friendly governance and further liberalization of trade regimes will be the main factors of economic growth. The development of private initiatives in the country on a creative and innovative basis will ensure that economic resources are directed to areas that create higher added value. Achieving these goals requires an effective macroeconomic policy that serves sustainable macroeconomic stability, the formation of frameworks, strengthening the medium and long-term "drivers" of economic development, expanding the digital economy, effective development of innovative economies in the regions and full economic sovereignty.

4. CONCLUSION

In recent years, the efficient use of oil revenues in Azerbaijan has led to the diversification of the economy and the development of the non-oil sector. The diversification of the economy, like all other areas, has created favorable conditions for the development of the agricultural sector in the regions. It should be noted that the opinions and suggestions of stakeholders and civil society institutions were taken into account during the preparation of draft strategic road maps in our country, which created favorable conditions for a broad approach to priority areas. The main goal in the implementation of strategic roadmaps is to ensure the competitiveness, inclusiveness and increase of social welfare of the economy on the basis of sustainable economic development in Azerbaijan. The planned projects cover oil and gas, agriculture, consumer goods production, heavy industry and engineering, specialized tourism, logistics and trade, affordable housing, vocational training, financial services, telecommunications and utilities [9]. According to our analysis, in our opinion, it is important to increase the general, socio-economic level of the regions, along with the agricultural sector, through the effective use of material, labor and financial resources of other sectors. It is also necessary to further expand the production of quality and competitive local products, increase the level of meeting the needs of the population, minimize food dependence on foreign countries and effectively address food security, develop entrepreneurship, eliminate inter-regional and intra-regional conflicts and inconsistencies. Finally, it is important to ensure economic security in the field of agricultural production of the country and its regions. Thus, future socio-economic measures in the regions of the country, mechanisms of state regulation of regional development and their improvement will contribute to the diversification of the national economy, balanced regional and sustainable socio-economic development, further improvement of living standards and Azerbaijan's international will create conditions for increasing socio-economic prestige.

ABSTRACT

Covid19 has a significant impact on the organizational life all around the world. Due to the restrictions from the governments based on the social distancing, employees have to work from home and accept new reality in every aspect of life. It has changed not only work, but families and their social life. This has caused changes in their behavior related to the work and daily activities. Due to this fact, managers and leaders of the organizations faced even more difficulties. They have to win on their own feelings and attitudes, adapt to the new reality very fast and manage new organizational reality effectively. Business continuity approaches show its vital need for the organizations. As the organizations who did not have business continuity plan found themselves in front of the high risks. Many of them had difficulties with financial issues, resource shortages and staff well-being. Due to this factors, peoples' behavior and attitude has changed. Their emotional level increased due to the uncertainty which continues even nowadays. As people vary by nature, personality, life-style, family conditions and other factors, they had dissimilar approaches to the new reality which had different impact in the behavior at work. Nature of the organizational conflicts has changed as well and its management has become more challengeable for managers and organizational leaders.

Keywords: Covid19, Current challanges, Management, Organizational confilct

1. INTRODUCTION

COVID-19 has shifted a significant portion of business around the world into a phase of economic uncertainty. (Paresashvili N., et al, 2021). This can change the nature of the conflict. Recognizing employee complaints and perceptions is critical to resolving future organizational disputes concerning coronavirus prevention strategies. Conflicts related to COVID-19 are likely to emerge from two causes: employees not following new guidelines or employers not responding quickly enough to employee concerns. Both causes can be addressed by strategizing to have office policies work hand-in-hand with maintaining good workplace relationships (Zurchhub, 2020). How to manage and how to solve conflicts are vital topics in the organization behavior research process. According to this fact, Covid19 will be focused on creating continuity in the organizational life. The purpose of organizational conflict management is to reduce adverse consequences of conflict on both individual and organizational level.

As a result of conflicts, there are at least three possible consequences: an individual or an organization may suffer from an emotional crisis, and it can lead to a lower productivity and satisfaction. On the other hand, conflict can enhance creativity in solutions or cause growth in cooperation between employees or organizations involved in the conflict. Conflict is defined as a gap between stakeholders' expectations which does not match their needs. By better understanding what may be causing the conflict, warning signs of aggression, and practicing self-management techniques, employees can feel better equipped to engage with others safely. To assist businesses and organizations as they navigate this difficult time, Michigan State university offered a course “Communicating through conflict during COVID-19” free of charge.(Gardner L, 2020)

2. REVIEW OF THE STUDIES

Numerous studies are conducting concerning the impact of Covid19 on different aspects of organizational life, including conflict managements. Employees face a variety of economic, social-psychological, and health related risks as either a direct result of COVID-19 or indirectly as a result of economic shutdowns associated with COVID-19 (Kniffin K.M, et al., 2021). In 2020, by Vaziri H, et al., have conducted a study in USA. Participants were recruited through Amazon Mechanical Turk (MTurk), who were required to work at least 32 hrs. per week. Total 379 complete responses were received. Aim of the study was impact of the Covid19 on the work-family conflict and enrichment, also, its implications for work attitudes (job satisfaction, commitment, and turnover intentions) and job performance (organizational citizenship behaviors and in-role performance). They have studied active, passive and beneficial profile transitions during Covid19. As a result, studies have shown, that employees who transition to a more negative WF profile during such events have more negative job attitudes and report fewer positive work behaviors. As such, employers have good reason to help workers manage work and home during societal turmoil. Those that offer emotional support from compassionate supervisors and instrumental support for new technology may ease WF transitions and benefit with committed employees who remain long after societal turmoil passes. Schieman S., et al, 2021, has conducted study on the Canadian workers from the C-QWELS. The first online survey was fielded from September 19 to September 24, 2019 (n = 2,524), second with these same study participants from April 17 to April 23, 2020, and then once again from June 17 to June 23, 2020. All study participants are members of the Angus Reid Forum (ARF), a built and managed panel of Canadians who have agreed to participate in research. Panel participants are recruited through a variety of online and offline channels, extensively profiled, and measured to ensure accurate representation of the diversity across Canada's adult population. According to the authors, those without children at home had less work-life conflict. Those who had children at home, on the other hand, had tendencies that varied depending on the youngest child's age. There were no decreases in work-life conflict among parents with children younger than 6 or between 6 and 12. Those who had adolescents, on the other hand, were no different from those who did not have them.

2.1. Case of Georgia

While discussing Covid19 impact on the individuals in context of organizational conflict, first thing comes to mind is the emotional resilience and inner state of the employees. People has different perceptions of the stressors and accordingly their response and behavior in conflict is different. Thus, to understand and respect of each other's diverse nature is vital. In Georgia, we conducted a study on conflict management in 2020. Respondents were from private and public organizations. Total 550 valid responses were received. As per this study, 76% of the respondents respect each other in spite of diversity. 9% disagrees and 16% partially agrees this view. 76% is not big part in the context of respect in the pandemic reality.

Today, more than ever, people need to understand one another and respect. This can lead to a positive psychological-emotional environment in organizations. From respondents of the study, 47% of them considers their psycho-social environment in the organization is positive, 43% - natural and 1% thinks it is negative (Diagram 1). Low number of the negative answers was predictable, as due to the Covid19, in every organization, at least few employees work remotely. The less is number of the employees in the organization, the lower is probability conflict person to be among them.

Diagram 1: Psycho-social environment in Organizations

94% of respondents do not consider themselves a conflicted person. It should also be noted that being a conflicted person does not evoke a positive association in people, and the answer to this question would most likely be the same. However, despite this answer, when asked how often they become involved in the conflict, 25% of respondents answered that periodically, 69% - almost never, and 6% finds it difficult to answer. The nature of the conflict in the Georgian organization is quite peculiar, its management requires a special approach from managers and in-depth analysis. The current events in the environment are the same, people's attitudes towards them are different. The study has shown that 78% of the respondents have negative attitude towards the conflict, 20% - natural and only 2% has positive (Diagram 2). Reason of it can be low level of knowledge and education. As in Georgia, there is a significant mismatch between the needs of the employer and the skills offered by the potential employee (Paresashvili N., Okruashvili N, Nikvashvili M, 2021).

Figure following on the next page

Diagram 2: Attitudes towards the conflict

As Covid19 has impact on every aspect of organizational life, including conflict management, let us go deeper and compare conflict resolution methods before Covid19 and recently. In 2018, about conflict management study results was published in 2017 by Paresashvili N, Maisuradze T. Comparison is given in Table 1. In 2017 studies total 120 respondents were interviewed.

Conflict resolution method	2017	2020
Collaborate	48.3 %	82%
Dominat	10 %	0%
Avoid	16.7 %	5%
Accommodate	1.7 %	4%
Compromise	23.3 %	8%

Table 1: Conflict resolution methods in Georgia in 2017 and 2020

We can see that method of domination is least used method in conditions of Covid19 is around. It has decreased from 10% to 0%. Also, the same tendency is with the avoiding method, from 16.7% to 5%; with the compromise – same, from 23.3% to 8%. The conflict methods which use has increased is accommodating (from 1.7% to 4%) and Collaboration with the biggest increment from 48.3% to 82%. If we remind the evaluations of Covid19 by the researchers from the organization science and from the medicine, these changes and tendencies can be easily explained. As per everyone claims and each of us have experienced on ourselves, Covid19 made us think about the sense of the life, reviewed goals and steps towards the achieving it, we have valued humanity and much more. In June 2020, Relyea G. and Cloke K., described lessons of Covid19 following way: “We have learned from the pandemic that we are all facing death, and are therefore one, connected by crisis and undivided by conflict. And we have also learned that we are facing it differently, and are therefore many, separated by race, gender, nationality, age, religion, wealth, occupation, social class, political beliefs, emotional vulnerability, and physical well-being, and divided by conflict”. Thus, people realize more, that instead of competing, it is better to collaborate. It seems, they realize context of the conflict and the view of opponent so, that feel more empathy and they choose collaboration. They don't feel like they are compromising or avoiding anything. Another issue is how all these will turn into the habits and people did not go back to pre-Covid19 life habits.

For understanding Covid19 influence on the organizational conflicts, let us observe how the frequency of the conflict has changed. Comparison of conflict frequency before and after Covid19 is given in Table 2.

Conflict frequency	2017	2020
Very seldom	71.7%	70%
frequently	25%	5%
Not happens	3.3%	25%

Table 2: Conflict frequency comparison in 2017 and 2020

This result also confirms the above mentioned view and can be explained by same logic, that the priorities has changed and together with the reason of remote working frequency of conflict has decreased. What has stayed unchanged is the main reason of conflicts. In 2017 study, the main reason of the conflict was working roles (56.7%) and in 2020 it is improper distribution of functions and duties (29%). Difference between years can be easily explained by looking at the second reason of conflict in 2020 – salary (20%). Seems, the pandemic, economic decline, high level of inflation (in March 2017-2.1%, in March 2020 – 5.8%. www.geostat.ge) and unemployment increases the importance of salary for everyone in Georgia. Lack of jobs is a more important issue for the population than territorial integrity, protection of humanrights, accessibility to medical care, education, etc (Paresashvili N., et al, 2020). Nowadays, communication has become more meaningful for employees and organizations. As HR managers of the Georgian organizations discuss on the webinars, communication was the key factor which helped them in adapting new reality successfully. Remote working made it clear for everyone, even for the people who could not work remotely due to the specific of their works. They have to communicate remotely to the colleagues working distance. This factor is vital also for conflict management. While asking respondents of 2020 study who the managers could manage conflict effectively, their answer was also communication (56%). Other options were creating proper organizational culture (25%) and gathering full information about conflict (12%) (Diagram 3).

Diagram 3: What can managers do for managing conflict effectively?

Here should be mentioned, that these studies have limitations as well. Respondents from the study 2017 can be different from 2020 study. Main tendencies would be stayed same, but it cannot be as accurate as it would be in case of the same respondents.

2.2. New tendencies

Besides the positive tendencies in overall conflict management mentioned above, due to the Covid19, new types of Conflicts arisen. In September 2020, on the website of SHRM - Society for Human Resource Management, has published article by Nagele-Piazza L., about resolving co-worker conflicts over coping with Covid10. She discusses about the conflicts which arisen after reopening workplaces. Employees have to protect recommendations from national health institutes and internal policies about preventing the spread of Covid19. As employees have different perceptions of the pandemic and its results, some of them is frightened and strictly protects all rules and make angry when see someone next to them not behaving like this. This causes conflict between these two persons. Besides, HR professionals struggle a lot as they are the persons watching and controlling the rule protection process and make disciplinary sanctions. The same ideas are given in the article of Coronavirus (COVID-19) resource hub by Zurich in October 2020. They note, that people always bring their day-to-day problems into the office with them and Covid19 can escalate those concerns.

3. CONCLUSION

As Covid19 is around us besides the vaccination and whole world struggles by its negative outcomes on the economic stability, it is uncertain how the current, newly visible trends will transform or what kind of new ones will arrive. Thus, its impact on the organizational conflicts will continue being attractive topic for the researchers. Of course, our study is limited due to the number of respondents and the time passed since Covid19 and due to the lack of researches around the world about Covid19. In Conclusion, based on the comparison of different studies, we have seen that the nature of conflicts has changed. Total number of conflict cases has decreased as work nature has changed. People are working remotely or partly remotely till now. They have meet each other rarely, which decreases probability of appearing stressors and develop conflict. As we know, for happening conflict it is must to have stressor, one party who has the reason for conflict and the opponent who reacts on the first party's reaction. Also, as discussed in the paper, people has realized that we are all together in the pandemic reality, what touches one person, touches another too. This made them be more empathetic, think that collaboration is best option for resolving conflict other than "battle" to win. But here should be mentioned that because of diversity of people and their unique personality, they perceive variously the same reality. It makes new types of workplace conflicts, such is conflict between employees or between employees and manager. Recommendation from the authors can be more communication with the employees despite the distance. By communication, organizational trust can be achieved. Guzzo F.R, at al., have conducted study on this topic and found out that Employees' gratitude and fear toward the organization affected organizational trust; through fear, trust declined when the message focused on business bottom-line and through gratitude, both focuses had positive effects on organizational trust. Trust will help employee job satisfaction. Job satisfaction affects a number of organizational behaviors and can greatly determine employee well-being (Paresashvili N, et al, 2021). Furthermore, HR professionals together with management should make more effort to feel employees involved in organizational processes again, to strengthen their organizational culture and adaptation motivational systems. Every organization has specific style, specific rules, policy and situations which can not be combine in general rules (Maisuradze T., 2017). So, they should be considered as well. Also, it should not be left beyond attention that stimulation of conflict can be very effective mechanism for organizational development with its constructive outcomes. The reasons, decreasing organizational conflicts, can be not as positive as it seems at this stage. May there are hidden stressors which needs a lot of attention from managers, as it is hard to see it and predict the conflict in case of remote working. This may manifest itself in the future, when everyone will return the workplaces. But all these needs further and continues research.

We should observe and analyze trends but should not forget about future. Also, as Zurich advises, employers can help relieve anxieties and grievances within their workers by having required knowledge, resources, and direct contact, and may be best able to effectively settle conflicts as they arise. Mindfulness can be future goal for the Management and HR professionals, as supportive association between fear of COVID-19 and work uncertainty can balance by mindfulness and connection between work uncertainty and emotional fatigue was reinforced by perceived organizational support (Chen H., Eyon K, 2021).

ASSESSMENT OF THE IMPACT OF THE LEADING PROCYCLICAL INDICATORS ON THE SOCIO – ECONOMIC DEVELOPMENT OF THE COUNTRY

Esmira Ahmadova

*Azerbaijan State University of Economics,
Istiglaliyyat St., 6, Baku, Azerbaijan Republic
fbc.baku@gmail.com*

ABSTRACT

The purpose of this article is to assess the impact of procyclical indicators on the main macroeconomic fundamentals of the development of the Azerbaijani economy. As a result, 11 different economic indicators were reviewed and analyzed based on the annual data of the State Statistical Committee from 2000 to 2020 inclusive. Method and methodology of the work. The methodology of the work is comprised of correlation - regression and graphical analysis, as well as fundamental works of foreign scientists and research by experts from the IMF and the National Bureau of Economic Research (NBER) of the United States. The article investigated and evaluated autocorrelation coefficients for the presence of lagged independent variables and their impact on macroeconomic variables with some delay. The versatile econometric tests carried out in the course of the research showed that the constructed econometric models meet all the basic postulates of econometric analysis, that is, they meet the conditions of specification, parameterization and verification and are sufficiently adequate to the real economic situation in the country. Consequently, the conclusions obtained in the study can be successfully applied to predict cyclical development during the period of diversification of the Azerbaijani economy. The novelty of the research lies in the uniqueness of the work. The study revealed a system of procyclical macroeconomic indicators that allow monitoring economic fluctuations in the Azerbaijani economy. The identified various groups of indicators, leading indicators, which, with a certain degree of reliability, make it possible to identify the phases of expansion and contraction of the economic system, to determine negative trends in the economy and to allow taking measures to eliminate them. Also, false procyclical indicators were highlighted, which in fact do not have any effect on macroeconomic indicators. As a result of the study, three multivariate linear and logarithmic regression models were assessed, the features of the influence of countercyclical indicators on Azerbaijan's GDP were revealed, and their significance was determined. The research results can be used both for monitoring the development of the Azerbaijani economy, and for forecasting, predicting the onset of the corresponding phases of the economic cycle, in order to adapt and reduce the negative impact of crises at the micro and macro levels.

Keywords: *indicators, factors, economic cycle, procyclical factors, correlation analysis, GDP*

1. INTRODUCTION

When studying fluctuations in the values of economic indicators during the economic cycle, pro-cyclical indicators come to the fore. Procyclical indicators move in the same direction as the economy. If everything is good in the economy, the economy expands - these indicators usually increase; if the economy is in a recession, it shrinks - procyclical indicators decrease. Gross Domestic Product is an example of a pro-cyclical economic indicator. The relationship between macroeconomic performance and financial indicators on the example of numerous currency crises in developed and developing economies was deeply studied by Aziz J., Caramazza F., Salgado R. [Zenkova 2009]. The IMF experts were also involved in identifying the leading indicators for identifying currency crises [Aziz 2000]. Herein, the work analyzes the crises of 50 developed and developing countries (1975 - 1997).

The 2019 IMF Report on Global Financial Stability provides an analysis of the impact of various macroeconomic indicators on financial stability. [Issue Report 2019]. According to the classification of the National Bureau of Economic Research of the United States and Western Europe, three groups of factors are distinguished:

- outstripping, or leading: reaching the maximum (minimum) before hitting the rise (decline) [Snieska 2019];
- lagging: reaching the maximum (minimum) after hitting a rise (decline) [Hansen 1997; McConnell 2003];
- coincident or corresponding: moving along with economies [Keane 1988; Zenkova 2005;].

It should be noted that economic performances are analyzed and published by many national and international organizations.

2. ECONOMIC ANALYSIS

So, the article presents an analysis of 11 indicators reflecting the cyclical development of the Azerbaijani economy in the period from 1998 to 2020. Symbols of indicators used in the study to analyze various types of indicators of the economic cycle are presented in Appendix 1.

Figure 1: Dynamics of GDP and procyclical indicators of Azerbaijan (in comparable prices) (Source: Statistical Bulletins of the State Committee; Statistical Bulletins of the Central Bank)

Figure following on the next page

Figure 2: Dynamics of increments of GDP and procyclical indicators of Azerbaijan
(Source: Statistical Bulletins of the State Committee; Statistical Bulletins of the Central Bank)

According to fig. 1 and fig. 2., procyclical indicators rise in the recovery phase and shrink in the recession phase of the short and medium term economic cycles. In addition, the volume of industrial production, monetary aggregates, industrial production price index, deflator, consumer price index of the Azerbaijani economy are not only procyclical, but also coinciding indicators, since they change almost simultaneously, in accordance with changes in economic activity. We tested our assumptions using statistical methods of correlation analysis and studying the lag component in time series. The results of the pairwise correlation analysis of Azerbaijan's GDP and its growth with procyclical indicators showed the presence of a close positive relationship between these indicators (Table 1.)

	ΔY	ΔP	D	ИПЦ	ИЦП	$\Delta M0$	$\Delta M1$	$\Delta M2$	$\Delta M3$	ΔI	ΔIm
ΔY	1										
ΔP	0,941808	1

ΔIm	0,64592	0,662157	0,532971	0,254889	0,227013	0,110197	0,1016	0,140562	0,43656023	0,519943	1

Table 1: Correlation analysis of GDP (Y), increment of GDP (ΔY) and procyclical indicators of Azerbaijan

(Source: Author's calculations)

Factorial influences on the macroeconomic dynamics of the economic system may not appear immediately. This is due to the characteristics of the indicator: leading, coinciding, or lagging. In the course of the study, the time lag arising between the involvement of the indicator in the cyclical dynamics and its influence on the output and increment of the output is estimated.

Any factorial influences on macrodynamics may not appear immediately; accordingly, the reaction of the economic system is delayed by a certain period. As a result of the analysis of the table of pairwise linear correlation coefficients of the annual increments of the regressors with the increase in the volume of GDP, the position (condition) was adopted that there can be no growth on expectations (negative lag). Thus, a lag was found, with a period of 6 years. It should be noted that the duration and time of turning points and periods depends on the intensity of the factor's impact on the economic cycle and the duration of the reaction of the economic system to this factor. This phenomenon is confirmed by statistical methods of analysis. In particular, the calculation of pairwise correlation coefficients with lagged explanatory variables is presented in Tables 1 and 2.

Lags (years)	Y			ΔY						
	Indicators			Indicators' increment						
	P	I	Im	ΔP	ΔM0	ΔM1	ΔM2	ΔM3	ΔI	ΔIm
0	0,972	0,944	0,945	0,922	0,633	0,897	0,850	0,974	0,664	0,572
1	0,950	0,905	0,903	0,218	0,053	0,148	0,118	-0,094	0,263	0,054
2	0,914	0,894	0,909	-0,028	-0,338	0,035	-0,077	-0,018	0,503	0,156
3	0,896	0,910	0,925	-0,162	-0,407	0,097	0,107	-0,405	0,299	0,178
4	0,914	0,923	0,931	-0,297	-0,134	-0,871	-0,884	-0,322	0,071	0,320
5	0,909	0,925	0,948	-0,036	0,113	-0,178	0,016	0,226	0,157	0,181
6	0,888	0,927	0,9471	0,237	0,211	0,299	0,414	0,328	0,362	0,188

(Source: Author's calculations)*

3. ECONOMETRIC ANALYSIS

As a result of econometric modeling in order to find dependencies and the influence of indicators on socio - economic performances, the following three multiple regression models were obtained by the OLS method, the econometric characteristics of which are presented in the Table. The volume of industrial production in Azerbaijan in million manat and the Gross Domestic Product of Azerbaijan for the period from 1997 to 2020 inclusive were taken as dependent variables. All the above – mentioned procyclical indicators were taken as independent variables. On grounds of the analysis, it was revealed that the data represents a time series. In order to avoid confusion and find false dependencies, the first differences were taken as the initial data for modeling. Using the differences allows turning non-stationary time series into stationary ones and avoiding high multicollinearity in the model.

Table following on the next page

	Model 1	Model 2	Model 3
	Dependent variable: ΔP	Dependent variable: $\ln \Delta Y$	Dependent variable: ΔY
	<i>Coefficient</i>	<i>Coefficient</i>	<i>Coefficient</i>
const	-	-11.7444 ** (-2.462)	1643.89 ** (2.188)
$\Delta M0$	1.06783 ** (2.642)	-	1.36307 *** (3.886)
ΔIm	2.09522 *** (4.353)	-	2.28390 *** (3.785)
$\ln \Delta P$	-	0.810304 *** (13.73)	-
$\ln D$	-	2.87641 ** (2.644)	-
R-squared	0,60	0.981606	0.575340

Table 3: Econometric characteristics of models 1, 2 and 3. OLS, using observations 1-21 (Heteroskedasticity-robust standard errors, variant HC1) (Source: author's calculations in the Gretl program)

So, as a result of econometric analysis of the influence of procyclical factors on the dynamics of the volume of industrial production in Azerbaijan, a multiple regression linear model 1 was obtained. According to this model, it was determined that the volume of industrial production is most influenced by the monetary aggregate M0, i.e. the amount of cash in circulation, and import. Both independent variables are statistically significant at the 5% and 1% levels, respectively. Thus, with an increase in imports by 1 million US dollars, the volume of industrial production in Azerbaijan increases by 2.0952 million manat. An increase in the money supply by 1 million manat leads to an increase in the volume of money supply by 1.0678 million manat. Model 1 is generally adequate because the Fisher statistic of this model is greater than the critical value of 7.09347 with a probability of 1%. Also, model 1 is a model without a constant (const), therefore, the interpretation of the coefficient of determination will be incorrect.

According to the multivariate logarithmic model 2, procyclical factors such as the volume of industrial production and the deflator affect GDP growth. The volume Industrial production is a statistically significant parameter in the model at all levels of significance. Thus, with an increase in industrial production by 1%, it leads to an increase in GDP by 0.81%. An increase in the deflator by 1% leads to an increase in Azerbaijan's GDP by 2.87%. The proportion of variance explained is 98%. According to model 3, the change in GDP is affected by the monetary aggregate M0 and imports. Both coefficients of the independent variables are statistically significant. This suggests that with an increase in the money supply by 1 million manat, Azerbaijan's GDP will increase by 1.36 million manat. With an increase in imports by US \$ 1 million, GDP increases by 2.28 million manat (1.34 million US dollars). All three models are adequate and significant. According to the econometric characteristics presented in the table, there is no multicollinearity in the models. All Variance Inflation Factors of all explanatory variables included in the models are less than 10. According to the Ramsey test, the null hypothesis of the correct model specification is accepted in all three models with a p-value greater than 0.05. When testing the models for the normality of the residuals, we also accept the null hypothesis of the normality of the residuals with a p-value greater than 0.05. The Breusch-Pagan test for heteroskedasticity also shows that we accept the null hypothesis that there is no heteroskedasticity in the model at a probability greater than 5%. Along with the independent variables included in the model, other procyclical indicators were also tested for functional linkages. But these indicators were statistically insignificant in regression models, in view of which they were excluded from further modeling. These include investments in fixed assets, consumer price indexes, industrial production price index, monetary aggregates M1, M2 and M3.

4. CONCLUSION

The study revealed a system of procyclical macroeconomic indicators that allow monitoring economic fluctuations in the Azerbaijani economy. Various groups of indicators, precursor indicators have been identified, which, with a certain degree of reliability, make it possible to identify in advance the phases of expansion and contraction of the economic system, to determine negative trends in the economy and to allow taking measures to eliminate them. Among the procyclical indicators, the factors that affect the GDP and industrial production of Azerbaijan and factors that are related but do not affect these macroeconomic indicators were identified. The indicators that directly affect GDP include the M0 monetary aggregate, deflator, imports and the volume of industrial production. The volume of industrial production is influenced by imports and the monetary aggregate M0. Thus, in the period of economic recession, a decrease in these indicators will lead to a decrease in the country's GDP, and during the growth and expansion phase, these indicators will increase and accordingly affect the GDP. Finally, the article carried out a qualitative correlation analysis, regression and graphical analysis. The dynamics of economic indicators during the period of economic recession, before the financial crisis and during the period of economic expansion is presented. On the basis of a qualitative analysis, hypotheses were put forward, tested in the course of further research using statistical and econometric methods. As a result of the study, three econometric models of multiple linear regression were obtained. All three models satisfy the Gauss-Markov conditions, are adequate and can be used for practical purposes.

APPENDIX*Application 1: Symbols of indicators used in the research to analyze various types of indicators of the economic cycle*

Symbols of indicator	Indicators, unit of measure
Y	Gross Domestic Product (GDP), million manats
ΔY	Increment Y
P	Azerbaijan industrial production, million manats
ΔP	Increment P
I	Fixed investment, million manats
D	Deflator, %
CPI	Consumer Price Index,% to the previous year
IPI	Industrial production price index, % to the previous year
M0	M0 money supply, million manats
M1	M1 money supply, million manats
M2	M2 money supply, million manats
M3	M3 money supply, million manats
Δ	Increment of relevant indicators
IM	Import, in millions of US dollars

EVALUATION OF THE BANKING SECTOR SERVICES INTENDED FOR THE KARABAKH REGION

ABSTRACT

Since the collapse of the Soviet Union in 1988, the Karabakh issue has been on the agenda of the world public opinion. This conflict has been experienced between Azerbaijan and Armenia in the Nagorno-Karabakh Autonomous Region, which has been a Turkish territory throughout history. This problem reached its peak when Armenia occupied 20% of Azerbaijani territories in 1992-1994. The Second Karabakh War, which took place after a long silence, was the most intense and longest war since the ceasefire agreement signed in 1994. This war resulted in the recovery of Azerbaijan's occupied territories with the contract signed on 10 November 2020 after the liberation of Shusha, the second largest city of Nagorno-Karabakh. Following the long-awaited victory for the development of the banking sector, PASHA Bank, one of the leading banks in Azerbaijan, opened a PASHA Bank branch in Shusha, using all its experience and knowledge to support government initiatives and reintegration into the liberated regions, as well as to develop entrepreneurship. He emphasized that it is ready to establish relations with partners both within and abroad. Purpose of the research: The liberated Azerbaijani lands, agriculture, precious metals, transport and logistics, tourism and hospitality, have a unique economic potential in many other parts of the real sector of the economy. In this study, the services of the banking sector for the Karabakh region, which has an effective economic potential, have been examined and evaluated. Research method: Both qualitative and quantitative methods were used in the study. In other words, secondary data such as reports, news, domestic and external academic publications published by state and private institutions were used. In addition, the opinions of the powers of some banks were taken and primary sources were applied.

Keywords: *Banking, Nagorno-Karabakh, Integration, Economy, Development*

1. INTRODUCTION

Humans are the most advanced creatures in nature and have diverse personalities. While some are happy to have their own property, others are always willing to annoy others by getting caught up in their ambition to have more. The "Karabakh" issue, which has led to debates about the borders in the South Caucasus for nearly 200 years and caused interim wars, is one such event. The most important factor causing this problem is the Armenians' dream of a "Great Armenia". Considering the geographical features of the Nagorno-Karabakh region, it has a very important position. It has been the sovereign area of many states from the past to the present and many states have fought for these lands. Throughout history, countries such as the Ottoman Empire, Iran, the Russian Tsar, and the Soviet Union have tried to influence this region. According to the 1970 list, the population of the Nagorno-Karabakh Autonomous Province was determined as 150.313 people. It is connected to the province of Khankenti, Asgeran, Hadrut, Agdere, Hocaent and Shusha. The Nagorno-Karabakh issue was brought up by the Russian Empire nearly two centuries ago for geostrategic reasons. At the beginning of the 19th century, Armenians were in the minority, while Turks, mainly Azerbaijanis, were in the majority in the lands that correspond to today's Armenia and Karabakh region. Most of the Armenians lived in the lands of the Ottoman Empire and Iran, while Karabakh is a Khanate, where the majority of

Azerbaijani Turks were formed. After the Russian Empire invaded the Caucasus, believing that it would benefit the administration of the region, it adopted a policy of increasing the population of Armenia. Therefore, Armenians who tried to live in Iran and the eastern part of the Ottoman Empire were settled in the Caucasus. While Armenians settled in the region, a part of the Muslim population, especially Karabakh, migrated to other regions of Azerbaijan and the lands of the Ottoman Empire. Since 1905, Armenians have committed extensive genocide against Azerbaijanis. The Armenian genocide against Azerbaijanis started to take a more disastrous shape in Karabakh. The genocides they committed in 1905-1906 were not enough. Doomed to bad luck in the rebellions they started against the Ottoman Empire in 1915, the Armenians began to continue the genocide against the Azerbaijani Turks by gathering their main forces in the South Caucasus and taking shelter under the auspices of Tsar Russia. This problem, which has been on the agenda of the world public opinion since the collapse of the Soviet Union in 1988, reached its peak when Armenia occupied 20% of the Azerbaijani territories in 1992-1994. Armenians killed a total of 613 people, including 83 children, 106 women and more than 70 elderly people, in the town of Khojaly, where they first closed their entry and exit with the support of the 366th Regiment in the region on the night of February 25, 1992, and seriously injured 487 people in total. 1275 people were taken hostage and 150 people disappeared. In the examinations made, it was seen that many of the corpses were cremated, their eyes gouged, and their heads beheaded. It has been found that pregnant women and children are also exposed to this savagery. The Azerbaijani Turks, who migrated to other regions since 1992, were obliged to live far from the lands where they were born and raised. The Second Karabakh War, experienced after a long silence, was the most intense and longest war since the ceasefire agreement signed in 1994. This war resulted in the recovery of Azerbaijan's occupied territories with the contract signed on 10 November 2020 after the liberation of Shusha, the second largest city of Nagorno-Karabakh.

2. SOCIAL AND ECONOMIC PERSPECTIVES OF THE KARABAKH REGION

Karabakh has maintained its feature of being an important center in almost every period of history. The fact that the Azikh and Taglar caves, which are among the oldest settlements in the world, are also in Karabakh indicates the importance of the region. Various studies show that the material and spiritual civilization of Karabakh is within the material and spiritual civilization of Azerbaijan. Karabakh is rich in natural resources; It has been the scene of wars in every period of history from past to present due to reasons such as being at an important crossing point, the importance of its geographical location, and the constant struggle of the forces in the Caucasus region to take over this region. Nowadays, the reason in question and the strategies of the great states regarding the region seem to be an important factor in the problem of Karabakh. Located in the southeastern part of the Lesser Caucasus, this region includes Jabrail, Fuzuli, Hocavend, Aghdam, Khojaly, Terter, Shusha, Khankendi provinces. Its nature is generally mountainous. The northern part of the economic geographical region of Upper Karabakh is the northeastern foothills of the Karabakh mountain range and the southern slopes of the Murovdag mountain range (the highest peak of the Lesser Caucasus, Kamis Mountain (3724 m)), the central, western and southern parts of the Karabakh mountain range (Kizkule Mountain). (2843 m), Kırkkız Mountain (2827 m), Büyük Kirs Mountain (2725 m), the northeast and eastern parts are covered by the western coasts of the Karabakh and Mil plains. It borders with the Islamic Republic of Iran in the south and southeast. The Murovdağ and Karabakh mountain range is divided into several side branches that descend towards the Garabagh and Mil plains. As a result of the fragmentation of the series and its tributaries by rivers, deep and steep valleys were formed. There are intermount pits in the areas where the middle mountain stream creeks expand. Forests in the region are 187.7 thousand ha.

At the same time, 4 mammals, 8 birds, 1 fish, 3 amphibians and reptilians, 8 insects and 27 plants were protected in these regions. It is possible to find more than 2,000 plant species in the region, which has rich vegetation. In the plains there are wormwood, steppe, semi-field, rocky, shibye, barren, gallows steppe and semi-steppe plants on the mountain slopes, bushes on the mountain slopes, broad-leaved forests (beech, oak, etc.). There are sub-alpine and alpine meadows above 2000-2300 m above sea level.

2.1. Social perspective

Before the USSR, at the beginning of the 20th century, winemaking, sericulture and cotton farming dominated the economy of Karabakh, where there were mostly agricultural and agricultural businesses: winemaking enterprises in Shusha of Garabagh were more than other cities. Karabakh sericulture was mainly Shusha and He was settled in Jabrayil. Cotton growing started to occupy an important place in the agricultural sector of Azerbaijan and hence Karabakh starting from the end of the 19th century and the beginning of the 20th century and it has developed from year to year. It is noteworthy that a significant amount of agricultural land has been allocated in the city of Shusha in order to create the necessary raw material potential for the cotton processing industry. Carpet weaving had an important place in the economy of Karabakh at the beginning of the 20th century. Carpet weaving in Karabakh has been centralized and developed in Shusha since the second half of the 18th century. The carpets belonging to the group of Karabakh carpets differed in their name and embroidery. Carpets woven in the towns of Shusha, Javanshir and Jabrayil in Karabakh had an important value in foreign markets. Especially there was a significant demand for Karabakh carpets in British and American markets. The industrial areas related to animal husbandry in Karabakh had a more primitive character. Examples of these industrial areas are leather and leather products, woolen cloth, oil and cheese. These areas were occupied in all the towns of Karabakh.¹⁸ In general and briefly evaluated, it is understood that the economy of Karabakh was developing at the beginning of the twentieth century, although it was not fast, and that this development was gradually capitalist.

2.2. Economic perspective (aboveground and underground resources)

The Nagorno-Karabakh Autonomous Region was established on June 7, 1923. When it was founded, it had an area of 4.4 thousand square kilometers.¹⁹ The fact that the Nagorno-Karabagh was included in the composition of Azerbaijan on the one hand, and its status as an autonomous region on the other, provided great opportunities for the economic development of the region. The economic development day by day increased the interest of Armenians in the region. Electricity stations and railways connect Karabakh to Azerbaijan, thus Karabakh was in a central position. Compared to other regions of Azerbaijan, the richness of Karabakh's natural resources and the opportunities provided by its geographical location played an important role in the development of the region. With these features, Karabakh assumed the function of locomotive power in the country's economy. During the Soviet Union period, the economy of Nagorno-Karabakh was mostly based on the agricultural sector, including grapevine, sericulture and animal husbandry. Its industry, on the other hand, focused on electronics, machinery production, weaving, wood products production, and furniture. The annual increase in industrial products production in Nagorno-Karabakh was generally higher than the rate of increase in the country. After 40 years (1923-1963) after the establishment of the Nagorno-Karabakh Autonomous Region, there have been great developments in the socio-economic indicators of the region. The 1.4 thousand tractors and 670 freight trucks that existed in the region in 1963 can be cited as an example of significant developments in the agricultural sector. In terms of expressing the level of development in the industrial sector, when compared to 1940, the increase in industrial production by 341% in 1963 and electricity energy production by

945% can be given as an example. The richest natural resources in Azerbaijan are generally in the Karabakh region. These; 5 gold, 6 mercury, 2 copper, 1 lead-zinc, 19 coating stones, 10 emery stones, 4 cement raw materials, 13 stone chips, 1 raw material for soda production, 21 pumice-volcano ash, 10 clay, 9 sand-gravel, 5 construction sand, 9 gypsum-anhydride, 1 perlite, 1 obsidian, 3 vermiculite, 14 ornamental stones (agate, jade, onyx, jad, pephritoid, etc.), There are 11 fresh ground water places and 10 mineral water deposits, which are important for the economic potential of the Republic of Azerbaijan. In addition, there are Shusha paving stone, Keçeldağ (Lisokor) clay, Shusa underground fresh water, Şırlan and Turşsu villages mineral water deposits in Shusa district. According to the economists, it can be said with pleasure that the lands liberated from the occupation have rich economic potential and the new economic value to be created on the basis of the integration of these lands into the country's economy as a whole will repeatedly exceed all financial costs of the Azerbaijani state for the restoration of the liberated lands. The favorable business environment to be created in the rescued regions, the formation of micro, small and medium-sized enterprises will accelerate the dynamic development of the non-oil sector, and as a result, the production of export-oriented products will increase with the increase in the volume and variety of imported substitute products through domestic production. The material basis for this trust will be the natural resources of the liberated lands, and the socio-economic base will be the selfless and proud people who return to their land. According to the Ministry of Ecology and Natural Resources of the Republic of Azerbaijan, there are 167 different mineral deposits in the liberated areas. 5 of these are cement and soda raw materials, 42 facades, cut and various building stones, 19 gypsum and clay, 14 colored and decorative stones, 14 sand-gravel and construction sand, 21 pumice stone and are volcanic ash deposits. According to preliminary estimates, there are 132.6 tons of gold, 37.3 thousand tons of lead, 129.8 million cubic meters of limestone, 147.1 million tons of cement, 2.1 million cubic meters of pumice in these fields, which are raw materials that play an important role in the development of the country's economy. The liberated areas are rich in various types of materials important for industrial and construction. The regions also have rich water resources that are exceptionally important for our country's industry and agriculture. There are approximately 120 mineral water deposits of different composition in the region of great therapeutic value. Overall, about 40% of the total geological reserves of Azerbaijan's mineral waters fall on the liberated areas. The energy resources of the region (hydro-energy, solar, wind and thermal energy potential) will play an important role in meeting the daily energy needs of the population as well as all sectors of the economy.

3. BANKS' INITIATIVES FOR THE REGION

Completing its 6th year in Turkey, Pasha Bank contributes to the development of trade between Turkey-Azerbaijan-Georgia. Pasha Bank, which wants to play an active role in the restructuring of the upper carabag after the liberation of Azerbaijan from the 30-year-long occupation of Armenia and provides private financing to every investor, points out that the investments in Azerbaijan will accelerate with the preferential trade agreement that will enter the country on March 1, 2021. Preferential trade agreement, which was signed for the development of commercial relations between Turkey and Azerbaijan, enters the country as of March 1, 2021. Turkey has an investment of 12 billion dollars in azerbaijan and 19.5 billion dollars in azerbaijan in turkey. The goal is to increase the trade volume between preferential trade agreement and Azerbaijan and Turkey. At the Azerbaijan Business Forum, which took place on February 18th, 11 agreements and memoranda of understanding exceeding \$ 100 million were signed between the institutions of 2 countries, non-governmental organizations and the business world. After the 30-year-long armenian occupation of the upper carabag region, a restructuring in many areas such as construction, agriculture, tourism and energy has begun in the region, the process will accelerate as of March 1, 2021.

Especially if Turkish contracting companies have undertaken 436 projects worth 15 billion dollars in Azerbaijan and when the Baku-Tbilisi-Kars railway line is taken into consideration, it becomes clear what an opportunity the region offers for investors. In spite of the pandemic, Pasha Bank, which has grown by 26% compared to 2019, has increased its active size to 2,179 million TL and its cash loans to 1,493 million TL by 37%, has been contributing to the development of trade between Turkey-Azerbaijan-Georgia since the 6 years it has been operating in Turkey. . Serving with investment banking and corporate banking products in order to provide resources and guidance to businesses investing in the region, Pasha Bank is ready to play an active role in the development of the blackbag region as Azerbaijan regains its lands that have been occupied by Armenia for 30 years. Pasha Bank general manager h. Cenk Eynehan said, “We want to be the first bank that comes to mind in the region for those who want to do business with Turkey, Azerbaijan and Georgia, and finance large projects in the region. We are able to finance trade and transfer money in the currencies of all three countries. There is a trade corridor here. We are now trying to grow by using new opportunities such as the iron silk road and the energy corridor. We are especially with the investors to play an active role in the reconstruction of the caravan. We are a boutique bank and we offer special financing alternatives to every company. ” He's in his explanations. PASHA Bank, the leading corporate bank of Azerbaijan, announced that it is ready to open a new branch in Shusha, which was liberated from the Armenian occupation. The relevant decision will be reflected in PASHA Bank's new Development Strategy for 2021-2023. According to Taleh Kazimov, Chairman of the Board of PASHA Bank, the liberation of the Azerbaijani land is a turning point in the modern history of our country. This was possible thanks to the strong political will of the President, the unity of the Azerbaijani people and the President's trust. The liberated regions have unmatched economic potential in agriculture, precious metals, transport and logistics, tourism and hospitality, IT and many other parts of the real sector of the economy. Following the long-awaited victory for the development of the banking sector, PASHA Bank, one of the leading banks in Azerbaijan, opened a PASHA Bank branch in Shusha, using all its experience and knowledge to support government initiatives and reintegration into the liberated regions, as well as to develop entrepreneurship. emphasized that it is ready to establish relations with partners both within and abroad.

3.1. About Pasha Bank

Pasha Investment Bank, 25 December 1987, Investment Bank a.s. was established in Istanbul with the title. Pasha Bank continues its activities in two main areas, corporate and investment banking. The bank, which has been serving in the management of different capital groups until 2015, has a capital share of 99.92 percent as of December 2015, transferred to Pasha Bank OJSC, a Baku-based regional finance institution. As of May 2018, the shareholding structure of the bank has changed to 51 percent Pasha Bank OJSC and 49 percent Pasha Holding LLC. There is no branch of Yuruten Pasha Bank, which operates in the general head office in Istanbul from March 2015 until today. Kapital Bank, one of the leading banks in Azerbaijan, made a statement on the intervention in the liberated territories: "According to the Decree of the President of the Republic of Azerbaijan Ilham Aliyev dated October 29, 2020 Work has begun. Almost all government agencies say that new projects will be implemented in the liberated areas, cities and settlements. We have always been sure that our branches in Shusha, Lachin, Gubadli, Aghdam, Fizuli and Jabrayil will return to Karabakh. Of course, we will move these branches to the regions where they bear their names as soon as possible. In addition, it is planned to open new branches in the Kalbajar and Zangilan districts around Karabakh, as well as in other important cities and settlements in Karabakh. In this regard, preparations have already begun at the bank's head office, and the opening of branches will be carried out as planned as soon as the conditions are created by the relevant authorities.

Our citizens, who were expelled from their lands as a result of Armenia's aggressive policy, will be able to use the bank's products and services in Kapital Bank's branches to meet their banking needs after returning to their native lands. The new branches will create all the necessary conditions and opportunities to provide a high level of customer service. At the same time, Avni Demirci, General Manager of Ziraat Bank Azerbaijan, also mentioned that the branch of Ziraat Bank Azerbaijan will be opened in Shusha, which was liberated from the Armenian occupation. He stated that he solved the problem and closed the bleeding wound. Demirci said, "The war is now over. We have entered a period when that region will be developed and integrated into the economy of Azerbaijan. In this period, as Ziraat Bank, we decided to do what we did since the first day we came to Azerbaijan in that region." Expressing that they want to take part in Shusha as an indication of Turkey's support, Demirci said, "We decided to open a branch in Shusha. We are completing our internal procedures regarding this. After obtaining the necessary permissions from the relevant institutions of the state, we will open our branch there. We are ready to open in a few months. But when we go and open up depends on the decision of the state." he spoke.

4. EVALUATION OF THE LEADING SECTORS THAT BANKS SHOULD SUPPORT

Banks are at the center of the country's economy, mediate between production and trade, agriculture and society. Commercial banks play a special role in the economic transformation process. The success of the country in developing the real sector depends on the effective operation of commercial banks. In general, the development of the banking system is one of the important conditions for the development of the country's economy, and the development of the banking system depends on the efficient operation of each commercial bank. The purpose of the banks is to make profit. A bank is more likely to make a profit if it follows the right policy, has enough resources, and moves them in the right direction, gaining the sympathy and trust of customers. Work has begun to restore infrastructure in the liberated areas, according to presidential decree. Domestic and foreign investments will be made to restore the lands liberated in Karabakh. Some countries want to support these investments. Banks also play an important role in all restoration work. Ziraat Bank plans to open a branch in Shusha and provide light loans to entrepreneurs in the region, both through government agencies and to cover their expenses. The Caspian Energy Club, represented by the Chairman of the Board of Ziraat Bank, will work to attract investments from Karabakh and Black Sea countries to Karabakh through its representation in Turkey. New bank branches are planned to be opened in these regions for our displaced citizens to benefit from the products and services of the banks. The branches opened will create all conditions for high quality customer service and will improve ATM and terminal networks. Kapital Bank, one of the banks that work as partners in social projects of state importance, will primarily send border guards, soldiers and other employees to these regions, while ATMs will be installed to receive their salaries with Kapital Bank cards. It is planned to establish new payment terminals in the future. According to the cooperation agreement signed between Ziraat Bank Azerbaijan OJSC and the Agricultural Credit and Development Agency of the Ministry of Agriculture of the Republic of Azerbaijan for support to agriculture, the bank currently offers privileged loans to real and legal persons engaged in entrepreneurship activities in the regions. In cooperation with the Agricultural Credit and Development Agency (AKIA), loans provided by the agency for the development of the agricultural sector will be provided at a rate of 7% per year and the use of innovative methods in the agricultural sector will be encouraged. to support entrepreneurial initiatives. It should be noted that the loan term is 3 years for breeding animals, 5 years for small and medium-sized loans, purchase of other agricultural production tools and large loans under concessional terms. In addition, we would like to point out that the maximum loan amount is 1,000,000 manats and credits over 200,000 manats are given only for the purchase of agricultural production tools.

The grace period for loans is up to 18 months for small and medium size loans and up to 24 months for large loans. During the grace period, the business entity only pays the interest debt and does not make any payments for the principal debt. Entrepreneurs pay loan and principal interest in equal installments every month, starting from the month after the grace period, according to the loan agreement.

5. CONCLUSION

Armenians had to withdraw step by step in the face of the successes of the Azerbaijani army in the conflict that continued for 44 days in the Karabakh lands of Azerbaijan, which has been under Armenian occupation for nearly 30 years. With the intervention of Russia, the Armistice Agreement signed between Azerbaijan and Armenia on November 9, 2020 by "accepting the defeat of Armenia" entered into force a day later and the occupied Azerbaijani territories (except for the Nagorno-Karabakh region, which includes Khojaly and Khojavend, Khankendi and Aghdere territories.) most of it was saved. A number of factors are of special importance for the efficient operation of banks, from which we can show liquidity, profitability, solvency and profitability. Profitability indicators are understood as the ratio of profit to expenses, and in this sense are characterized as an indicator of the efficiency of banking. The general economic meaning of profitability indicators is explained by the fact that profitability is measured by profit for every 1 manat spent by the bank. The overall level of the bank's profitability allows us to assess its overall profitability, as well as the profit generated by 1 manat of income. In general, the development of the banking system is one of the important conditions for the development of the country's economy, and the development of the banking system itself depends on the effective operation of each commercial bank. Being at the heart of the country's economy, banks mediate between production and trade, agriculture and society. Banks play a special role in the process of economic transformation. The country's success in developing the real sector depends on commercial banks operating effectively. It is impossible to imagine modern economic activity without the banking system. Improving the efficiency of banking is one of the most important issues for the Republic of Azerbaijan, which integrates into the world economy. The role of the country's banking system in the liberated lands is quite effective. The state should provide full support for the advancement of this sector.

ABSTRACT

In the article, the authors considered some issues of the development of the digital economy and the introduction of innovations in Azerbaijan. Based on the analysis of the State Programs and Decrees of the President of the Republic of Azerbaijan, the authors of the article noted the need to prepare measures to create legal, technical, organizational and financial conditions for the development of the digital economy in our country; revealed the concept and advantages of the digital economy and emphasized the impact of ICT technologies on the development of innovative economy of Azerbaijan. The coronavirus pandemic has forced humanity to expand the capabilities of information technology in practice and created the need for innovation in all areas of the economy. The authors of the article come to the following conclusions: the implementation of key government programs, the introduction of new technologies and business models requires a quick response to technological and economic failures and crises; the need to develop digital skills, since any technological breakthrough requires a highly skilled workforce. To accomplish all of this, the authors note that it is essential to invest in educational platforms, achieve rapid development of digital economy skills across the country, train and upgrade the skills of the workforce, implementing a model such as lifelong learning.

Keywords: *Digitalization of the economy, Information technology, Introduction of innovations, Newest technologies*

1. INTRODUCTION

Despite the presence of some problems, work on the introduction of innovations and digitalization of the economy continues successfully in Azerbaijan. In most sectors of the economy, digital technologies are being actively introduced, contributing to innovative solutions to existing problems. For the purpose of appropriate measures envisaged in connection with the expansion of digital payments in the "Strategic Card for the Development of Telecommunication and Information Technologies in the Republic of Azerbaijan", approved by Decree No. 1138 of the President of the Republic of Azerbaijan dated December 6, 2016 [8], a "State Program for the Expansion of digital payments in the Republic of Azerbaijan for 2018-2020"[10]. The strategic goal of the State Program is to significantly expand the non-cash payment environment between business entities and government agencies, to reduce to a minimum the volume of cash turnover. The goal of the Digital Economy program is to introduce and develop digital technologies in all areas of our life. This especially applies to such areas as the economy, to such a field of social activity as entrepreneurship, public administration, social sphere and urban economy. In general, the transition of the economy to digital is a matter of our global competitiveness and a matter of national security [5]. Today, at all forums, and even at the World Economic Forum taking place in Davos (in the report of Klaus Schwab) [6], the

need for the transition to the fourth industrial revolution (Industry 4.0) [11] is noted, the main goal of which is to ensure the transition to the Digital Economy. The economy of the Republic of Azerbaijan must be ready for these challenges. The Digital Economy program may be the first systematic look at this topic. The transition to the digital economy is a global project and affects various aspects of our life. Objective difficulties are possible at all stages of its implementation. Today, Azerbaijan cannot remain on the periphery of the processes taking place in the world, therefore it is necessary to launch this project. It should be noted that the Digital Economy program will provide an opportunity to prepare measures to create legal, technical, organizational and financial conditions for the development of the digital economy and will pave the way for integration into the digital economy of the region. At this critical moment in the context of the coronavirus pandemic, the problems of ensuring the security and stability of the development of society, socialization of people through the use of Internet technologies have become even more urgent. The global coronavirus epidemic has highlighted the enormous importance of the development of such areas as distance education, e-science, and online commerce. In this situation, there is a great demand for online applications, digital technologies, which increases the need to create a sustainable infrastructure in our country. In this study, the goal is to consider some issues of the development of the digital economy and the introduction of innovations in Azerbaijan.

2. ENHANCING OF THE ROLE AND ADVANTAGES OF THE DIGITAL ECONOMY IN MODERN SOCIETY

Of late years, a number of successful economic reforms have been carried out in Azerbaijan. Restructuring, development of the non-oil sector, etc. led to positive results. The necessary measures are being taken for the socio-economic development of the regions, and the improvement of the social status of citizens. One of the main directions of state policy is consistent activities for the development of the scientific sphere, education and culture. This also includes the protection of scientific and technical potential, the training of highly qualified personnel in the field of science and education, as well as the adoption of a number of important decisions to increase the authority of scientists in the country. All this is due to global changes in the world economy, the emergence and development of a new information society, the creation of a digital economy and the special influence of this economy on the development of the world's population. The basis for creating a digital environment is the formation of effective relations between government agencies, citizens and business structures. Thus, the provision of basic services to citizens in the online form, namely, services for the issuance of identity documents, various certificates, including the amount of income tax, and other labor services, will help government bodies to provide citizens with these services more efficiently. In addition, online business registration, social security services, corporate tax, as well as online property-related services will also help government agencies in providing quality and responsive services to citizens. In accordance with the Presidential Decree No. 685 of July 13, 2012, "ASAN xidmət" centers were established under the President of the Republic of Azerbaijan under the State Agency for Citizens Service and Social Innovation. "ASAN xidmət" centers are structures that ensure the implementation of services provided by state bodies in a unified and coordinated form. During the period of economic reform, government agencies should be able to work more efficiently and maintain stable relations with citizens and business structures. As a rule, the investment made in innovation in online services always pays off. Thus, e-government bodies will be able to reduce administrative costs by 15-20%. The digital economy is considered to be an area of the economy based on digital technologies. It is sometimes referred to as the Internet Economy or New Economy. The term "Digital Economy" appeared in 1995 (by Nicholas Negroponte) [1,p.17].

In 1997, this term was used by Don Tapscott in the book "Digital Economy: Advantages and Disadvantages of Network Intelligence" [7, p. 6]. This book has shown how the Internet can transform commerce. Thomas Mesenburg believes [4] that the concept of the "Digital Economy" can be identified by three components:

- infrastructure support (computer hardware, software, telecommunications, network, etc.);
- E-business (the organization carries out all work through computer networks);
- E-commerce (transfer of goods, for example, the sale of books, etc.) [4, p. 24].

However, in the comments of Bill Imlah [13], these boundaries are further expanded. It complicates this concept and adds other components to it, such as searching on social media networks and the Internet. This allows you to deliver new strategies to people and organizations through a global platform, collaborate, communicate, search for information, etc. A clearer definition of the characteristics of the digital economy is linked to the traditional economy. Thus, the digital economy is the main instrument underlying the "new economy", "information economy" and the information society. The emergence and rapid development of the digital economy has led to many changes and innovations in the traditional economy. The benefits of the digital economy are based on the benefits of digital technologies. For example, digital technology provides a large amount of information during the execution of information processes based on specific rules of encoding, exchange and use, that is, high speed, efficiency and memory during storage, transportation and transmission of data. In the process of information processing, digital technologies allow the use of precise mathematical methods, as well as various manipulations with information. As noted, the emergence of the digital economy has brought about significant changes in the traditional economy. In the classical, that is, traditional economy, capital takes on material form. This usually includes machines, buildings and structures, land, etc. Over time, the role of money in the economy strengthened even more and capital began to be accepted in the form of money. As a result, it was with the help of the mass of money that it became possible to acquire tools and means of labor. As a result of the emergence of the digital economy, the main defining role, function was assigned to information. Thus, information capital appeared. Capital efficiency analysis made it possible to distinguish between different types of assets. This includes current assets (working capital), fixed assets, investments (shares), intangible assets (trademarks, patents, copyrights, employee creativity, and other assets). Nowadays, information capital can be perceived as an asset that predicts the needs with purchasing power in the future, plans the financial and organizational structure of enterprises and ensures profitability. Without digital technologies, it is impossible to ensure the creation, distribution and use of information capital, the processes of its assessment and analysis. The use of digital technologies ensures the efficient use of this capital. The digital economy has advantages and disadvantages compared to the traditional economy. The most important advantage is that the product here, or rather the information product, that is, capital, is more active in movement and circulation. The use of high technologies and the presence of global connections ensure the production of products in the shortest possible time. In other words, you can search and select a market for a product, immediately make sales, as well as identify new products and assortments to offer to the buyer and constantly monitor the process of competition. Despite the fact that the digital economy is costly in terms of technological security and building large-scale connections, it has a very large area of activity. In the traditional economy, today there are such basic problems as: storage, packaging of products, proper marketing, organization of advertising, timely delivery of products to the customer, etc. Compared to the traditional economy, in the digital economy, most of these problems are at a very low level. Thus, in the digital economy, it is possible to more effectively carry out the development processes, the processes of preparing new projects, the processes of creating direct links with the consumer, the conformity of the qualitative and quantitative indicators of

products to the customer's requests [2, p. 94]. Despite all these advantages, the digital economy is not as widespread in the world. The main reason for this lies in the differences in the level of ICT development in different countries, which play an important role in the creation of the digital economy. On the other hand, a number of disadvantages of the digital economy also impede its widespread worldwide distribution. The digital economy also plays an important role in the development of the information economy based on the interconnected development of various sectors of the economy. Thus, the formation of just this kind of interaction is the basis for the development of the modern information society. The digital economy also plays an important role in ordinary household processes and the provision of various services in developed countries. This includes the retail sale of goods and services, etc. In addition, this includes buying goods in large markets and shopping centers, delivering them to customers, making payments, providing various utilities, medical and health services, education and training, job search, access to various information, etc. If the current advantages and opportunities of digital technologies are used properly, it will contribute to the emergence of a comprehensive balance in society. The expansion of the scale of the digital economy, covering more and more countries, depends on the use of the digital space [3, p. 7]. Digital capabilities play an important role in the implementation of the latest innovations in production, in the modern film industry, in organizing various festivals, gatherings, organizing major sporting events, holding conferences, international meetings, solving global problems and transferring information around the world. Thus, the use of these technologies in the economy, sports, art, tourism, etc. creates conditions for the emergence of new areas that generate income, large-scale investments, including in the organization of advertising, which also brings significant income.

3. INFLUENCE OF ICT ON THE DEVELOPMENT OF AZERBAIJAN'S INNOVATIVE ECONOMY

The restructuring of socio-economic relations in the republic, the democratization of the way of life require a radical change in the structure of information support in all spheres of society. The emergence of new state and public organizations, the change in existing or the emergence of new functions - all this indicates an increase in the need for information, a change in the direction of information flows and their composition. The processes taking place in the world economy pose for Azerbaijan the tasks of priority building and accelerated development of the digital economy, the introduction of innovative ICT technologies in all spheres of life. Today, the Republic of Azerbaijan has all the conditions for the digitalization of the economy and its sustainable development. Our country has a unique geographical location, rich in natural and human resources. A huge work has been done in the republic to develop the legal and economic foundations for digitalization of all spheres of the economy, the "Strategic Map for the Development of Telecommunication and Information Technologies in the Republic of Azerbaijan" [12] was approved and the "State Program for the Expansion of Digital Payments in the Republic of Azerbaijan for 2018-2020" was adopted. "[10]. In recent years, some work has been carried out in Azerbaijan in the field of introducing innovative ICT technologies. Significant progress has been achieved in the application of these technologies in some areas, more precisely, this area has become one of the priorities of the country's policy. In our country, serious work is underway to modernize the telecommunications infrastructure, introduce the latest technologies. As a result of cooperation of local companies with ICT companies from around the world, the experience and professionalism of our companies in this area is growing in Azerbaijan. Today Azerbaijani companies are participants in both regional and global ICT markets. At the same time, the geographical location of our country makes it possible for Azerbaijan to form as a center of innovative production and export, information resources and transit.

Building a digital economy directly depends on the prospects for the development of ICT technologies in the infrastructure of various sectors of the economy. The use of ICT technologies and the production of digital goods based on digital technologies are impossible without a stable and secure infrastructure. It is the modern technological infrastructure that is the main component of digitalization and the digital economy. Without a stable and stable infrastructure, it is impossible to provide communication services, both between countries and within the country, in accordance with advanced world standards. Currently, global communications services are growing rapidly. The number of users, both mobile and broadband Internet users, is also growing. Operators face the challenge of investing in infrastructure every year. For example, according to data from Analysys Mason, a telecommunications, media and technology consultancy, operators have invested more than US \$ 300 billion since 2014 in Internet infrastructure. Research shows that the number of devices connected to the Internet will also increase. For example, according to the Mobile Economy 2019 report by GSMA, the Association of Mobile Operators, between 2018 and 2025, global Internet connectivity (IoT) will triple to \$ 25 billion. The amount of profit received during this period from the Internet of Things will quadruple and amount to 101 trillion. US dollars. Digitalization and infrastructure development will result in an increase in the number of mobile Internet users. According to the report, from 2018 to 2025, the number of mobile Internet users will grow from 3.6 billion to 5 billion [13]. It should be noted that digitalization and building a digital economy raise the issue of forming a sustainable ICT infrastructure in Azerbaijan. The formation of a new technological infrastructure and the improvement of international relations services, the improvement of a stable technological base for the use of it by an even larger number of people is of great importance. Currently, the start of the implementation of the "Azerbaijan Digital HUB" program, which in the future will turn into the Regional Digital Center of Azerbaijan. It is based on the same idea. The Azerbaijan Digital HUB program, the main focus of which is the formation of a sustainable infrastructure, is carried out by AzerTelecom, which is the backbone Internet provider and a subsidiary of the first mobile operator of Azerbaijan, Bakcell. In this direction, work is underway to create a technological infrastructure both within the country and abroad. For example, jointly with Azərbaycan Dəmir Yolları CJSC, a project is being implemented to lay a fiber-optic cable along the main line of the protective strip of railways. Thus, the creation of a network connection with telecom operators of neighboring countries will be provided in the North-South and East-West directions. Within the framework of the Digital HUB program, it is planned to build a digital silk road on the historical silk road between Europe and Asia. For this, the Trans-Caspian Highway line will be built along the bottom of the Caspian Sea between Azerbaijan and the countries of Central Asia, which is an integral part of the main infrastructure project outside the borders of our country. The implementation of all of the above will ensure the formation of a stable technological base in the country that meets modern requirements, as well as the transit of excess Internet and content to the countries of the Asian region. At the next stage, the transformation of Baku into an Internet Exchange Center and the creation of a Regional Data Center in Azerbaijan will be ensured. Let's consider some statistics. (see Table 1) According to the State Statistics Committee, the number of Internet users per 100 people in Azerbaijan was 75 people in 2014, and 80 people in 2018, i.e. every 80 out of 100 people use the Internet. The number of broadband Internet users per 100 people is 75 people. In 2014, this figure was 65 people. The volume of international Internet channels per capita in Azerbaijan in 2014 was 35.1 kbps, and in 2018 - 83.5 kbps.

Table following on the next page

	2014	2015	2016	2017	2018
ICT Usage Rates in Enterprises					
Share of enterprises using computers in the total number of enterprises in%	58,6	63,1	65,3	66,9	67,2
The ratio of the number of employees using computers, in%	23,2	28,0	29,6	30,7	33,4
Share of enterprises with Internet access,%	45,7	48,0	51,6	52,5	52,9
The ratio of the number of employees using the Internet to the listed number of employees employed at all enterprises, in%	16,5	20,4	21,9	23,1	25,3
Share of enterprises with a web page (web page, web site)	10,4	11,9	11,9	12,2	12,3
Output of products and volume of services provided by ICT enterprises					
Production volume of electronic parts, thousand manats	758,8	242,9	258,2	264,0	181,5
Production volume of computers and peripheral equipment, thousand manats	93,1	12,0	468,7	1680,3	1199,2
Production of devices for recording sounds and displaying images, thousand manats	34427,4	23902,7	14655,0	14999,7	16620,8
Manufacture of household electronic equipment, thousand manats	215,3	35,9	22,5	20,3	-
Wholesale of computers, computer peripheral equipment and software, thousand manats	25045,6	27245,3	16909,5	22350,2	33332,6
Manufacture of electronic and telecommunication equipment and wholesale of their parts, thousand manats	238,1	428,9	179,0	41,0	44,1
Production volume in the field of wireless telecommunications, thousand manats	10,8	17,4	26,5	22,7	25,5
The volume of services in the field of satellite radio communications, thousand manats	10787,3	17360,4	26510,3	22751	25458,2
Volume of services in the field of software development, thousand manats	27191,8	35040,5	40008,1	57681,9	73443,6
Scope of work on activities in the field of design and production of information security means, thousand manats	133,4	257,7	850,3	1559,6	1353,0
Foreign economic activity of ICT enterprises					
Import of ICT products, thousand manats	214,4	268,6	371,1	565,1	883,8
import of computer and peripheral equipment thousand manats	74,6	60,0	99,2	168,4	315,8
telecommunication equipment, thousand, manat	92,5	99,8	160,5	244,0	328,6
electronic equipment, thousand, manat	19,6	34,0	74,9	99,8	145,9
import of other ICT products, thousand, manat	27,7	74,8	36,5	52,9	93,5
The share of imports of ICT products in the total value of all types of imported products in the country, in%	3,0	2,8	2,7	3,7	4,5

*Table 1: Economic indicators of ICT enterprises [9. 93]
(Source: www.stat.gov.az/information_society/)*

If in 2014 the proportion of the population living in the territory covered by mobile communications was 99.9%, then in 2018 - 100% of the population lives in the territories covered by mobile communications. The average tariff for using the Internet for 20 hours was 1.3 manat in 2014, and 1.2 manat in 2018. The average tariff for mobile communication for 100 minutes during the month was: in 2014 - 6.9 manats; in 2018 - 6.4 manats. The Internet Development Index in Azerbaijan increased from 5.79 to 6.33 from 2014 to 2018. According to the State Statistics Committee of the Republic of Azerbaijan, over the period from 2014 to 2018, the share of enterprises using computers in the total number of all enterprises operating in the country has steadily increased from 58.6% in 2014 to 67.2% in 2018, t .e. by 8.6%. Over the same period, the ratio of the number of employees using computers to the payroll number of employees employed in all operating enterprises increased from 23.3% to 3.4%, i.e. by 10.2%. Over the same period, the share of enterprises with Internet access in the total number of all enterprises also steadily increased from 45.7% to 52.9%, i.e. by 7.2%. The ratio of the number of employees using the Internet to the payroll number of employees employed at all enterprises in the same period increased from 16.5% to 25.3%, i.e. by 8.8%. The share of enterprises with a Web page (Web Page, Web Site) in the total number of all operating enterprises for the period from 2014 to 2018 also increased, albeit insignificantly: from 10.4% to 12.3%, i.e. by 1.9%. However, the volume of production of computers and peripheral equipment increased during the study period from 93.1 thousand manats to 1199.2 thousand manats. The production of devices for recording sounds and displaying images decreased from 34427.4 thousand manats to 16620.8 thousand manats, i.e. 2 times. The production of consumer electronic equipment decreased between 2014 and 2017. from 215.3 thousand manats to 20.3 thousand manats, i.e. 10.6 times. And in 2018, these products were not produced. Wholesale sales of computers, computer peripheral equipment and software increased over the same period from 24,045.6 thousand manats to 33,332.6 thousand manats, i.e. by 9287.0 thousand manats. The production of electronic and telecommunications equipment and the wholesale of their parts decreased from 158.5 thousand manats to 44.1 thousand manats, i.e. 3.6 times. All this suggests that there are still many reserves in this area in Azerbaijan. However, over the period under study, the volume of production in the field of wireless telecommunications has steadily increased and increased from 1,078.3 thousand manats in 2014 to 25,458.2 thousand manats in 2018. Consistently high performance in the provision of mobile telephony services. The volume of services in the field of satellite radio communication has grown more than 3 times. The volume of services in the field of software development increased from 27,191.8 thousand manats to 73,443.6 thousand manats, i.e. 2.7 times. The volume of work on activities in the field of design and production of information security products increased from 133.4 thousand manat in 2014 to 1353.0 thousand manat in 2018. It should be noted that it is impossible to overestimate the role of the digital economy in the formation and development of the innovative economy of Azerbaijan. Innovation encompasses the processes of introducing any new product, service, or manufacturing process. That is, innovation can be a commodity. This includes significant advances in technical specifications, components and materials, software, usability, and other functional features of a product or service. If we consider innovation as a process of developing the digital economy, then innovative processes come to the fore, making it possible to create new products that increase labor productivity (for example, automation of manual work, quality control mechanisms, the introduction of new software for managing product residues). The purchase of new equipment in order to start the production of new products can be attributed to both commodity and process innovation. Process innovation can involve producing and selling an existing product more efficiently and at less cost. Innovation does not always embrace new technologies. Organizational innovation can act as a new approach to business experience, organization of the production process and foreign economic relations.

Organizational innovations include improving the efficiency of a company by reducing administrative or operating costs, acquiring non-profit assets, or reducing procurement costs (for example, decentralizing decision-making and electronizing supply chain management). Today, as the corona virus pandemic has swept all countries of the world, hundreds of millions of people have begun to use digital platforms more actively, and the role and importance of information and communication technologies has grown globally. Naturally, all this will contribute to the fact that the level of development of science and technology in our time will allow us to find the necessary means to solve the problem of coronavirus in the near future.

4. CONCLUSION

It is becoming clear that the digitalization of the economy is the main condition for the formation of an innovative climate in Azerbaijan. The article indicates that Azerbaijan, which has the status of a Regional Energy and Transport Center, now has the opportunity to build a digital economy and, in the short term, become the Digital Center of the Region, using available resources and world best practices. Today digitalization covers all areas of our life. Active work is underway to form a digital economy in our country, create a digital government, and develop an information society. Through the introduction of innovation and high technology, we can accelerate the diversification of the economy.

The findings of the study are as follows:

- in order to increase the role of the digital economy in the formation and development of Azerbaijan's innovative economy, it is necessary to develop and implement more detailed road maps in accordance with key strategic goals and identify the most priority projects in order to identify areas where "quick wins" are possible, as well as to outline long-term strategic initiatives.
- to accelerate the pace of implementation of digital computer technologies, it is necessary to master new management mechanisms that would unite all the main stakeholders in participation in the decision-making and management process.
- it is necessary to securely fix the budgets and determine the financing mechanisms for all these processes.
- the government needs further in-depth investment in large-scale, smart and secure infrastructure capable of proactively driving digital explosive growth.
- the implementation of key government programs, the introduction of new technologies and business models requires a quick response to technological and economic failures and crises.
- it is necessary to develop digital skills, since any technological breakthrough requires a highly qualified workforce to modernize the economy.
- despite the traditional advantages in theoretical science, the republican education system lacks flexibility to meet the requirements of digital transformation in all spheres of the economy, including coordination between enterprises and educational institutions in the field of higher education and R&D.
- it is necessary to invest in educational platforms, achieve the rapid development of digital economy skills throughout the country, train and improve the skills of the workforce, introducing a model such as lifelong learning.

The practical significance of the study lies in the fact that ICT offers an approach to determining the competitive position of Azerbaijan in terms of telecommunications, computer and information services. At the end of the study, recommendations were made to enhance the role of the digital economy in the formation and development of the country's innovative economy.

PLACE AND ROLE OF INNOVATIVE DEVELOPMENT IN ENTREPRENEURSHIP

Gozalova Solmaz Mukhtar

*Azerbaijan State Economic University (UNEC), Azerbaijan
solmaz.gozalova@mail.ru*

ABSTRACT

The article focuses on the development of innovation-oriented economy, the creation of new technological processes, the effective use of scientific and technical potential in our country, entrepreneurship in new technologies and management and the emergence of new sales markets in a market economy. Building the country's economy through innovation depends on the creation and operation of a national innovation system. The role of innovation in achieving sustainable development of the national economy is very large. It is also important to note that in modern times, innovative entrepreneurship is very widespread in market economies. Innovative entrepreneurship is the discovery and implementation of innovations. Entrepreneurship in Azerbaijan has a long history of development. The various natural resources owned by our country have created invaluable conditions for the arrival of foreign businessmen in the country, as well as for the development of local entrepreneurship. Entrepreneurial activity is constantly supported by the state and creates conditions for improving the living standards of the population as one of the main directions of the state's economic policy. It should be noted that entrepreneurial activity is an independent, enterprising economic activity of members of the society, aimed at obtaining personal income or profit, carried out at their own risk and responsibility for their own property. One of the most widespread forms of entrepreneurship in modern market economies is innovative entrepreneurship. Innovative entrepreneurship is associated with the creation, acquisition of services, as well as their commercial use. Because in this process, it is important to come up with new ideas, evaluate ideas, develop a business plan, search for the necessary resources, create prototypes, conduct tests, research the sales market and introduce goods to the market. The role of entrepreneurship is mainly related to the creation of innovations, unpredictable products and a new combination of traditional factors of the economy (labor, land, capital). The task of entrepreneurs is to reform and revolutionize the method of production through the application of inventions, in other words, to reorganize the previous branch of industry and create conditions for the opening of a new field, using new technologies to produce new goods and new sources of raw materials or new markets. It is an object used in production as a result of innovation-scientific research or service discovery and differs from the previous analogue.

Keywords: *market economy, innovation, innovation entrepreneurship, entrepreneurship*

1. INTRODUCTION

The formation of a modern market economy, scientific and technological progress and the development of economic relations against the background of international legal aspects have led to the emergence of new organizational and legal forms of entrepreneurial activity. Entrepreneurial activity determines the principles of entrepreneurship, the rights and responsibilities of business entities, its methods of protection by the state, the entrepreneur's interaction with government agencies. Entrepreneurial activity is also an independent entrepreneurial activity carried out by individuals, their knowledge and skills, as well as legal entities in the form of their responsibility for profit or personal income, including in the form of production, sale and provision of services. Entrepreneurial relations are governed by international legal obligations, regardless of the form of ownership, type and field of activity.

An entrepreneur is a person who appreciates the usefulness of work, who can take risks and responsibilities related to the establishment of new enterprises or the development of a new idea (product) or service. Because entrepreneurship is a person who is able to assess the profitability of the work and responsibly implement the ability to more efficiently allocate available resources. Today, the development of entrepreneurship in the country is one of the priorities of economic policy. In this regard, it is consistently implementing comprehensive measures such as the development of state-entrepreneur relations, improvement of legislation and administrative procedures on the business environment, education, development of business relations of entrepreneurs and the provision of various services. One of the main problems facing the development of entrepreneurship in Azerbaijan is related to the provision of business activities with the necessary financial resources. The solution to this problem largely depends on the scale and effectiveness of the state's investment policy. As noted in the economic literature, only the implementation of an effective investment policy by the state can ensure high development of entrepreneurship and the economy as a whole in the near future [1]. At the same time, in this process, it is expedient to conduct an in-depth and comprehensive analysis of alternative profitability issues, risk assessment, and to focus investment on priority areas of the economy. Entrepreneurship development is one of the leading directions of the measures taken to diversify the country's economy, which is based on increasing the level of normative-legal, organizational and financial support in increasing business activity, activity in all priority areas of economic development. In order to ensure sustainable economic development, it is planned to accelerate the integration of entrepreneurship into the world economy, increase export potential and solve social problems, optimize the structure of entrepreneurship in terms of industry, region and technology, and expand ties between enterprises. It should be noted that recently, taking into account the further improvement of the business environment and the development of entrepreneurship as a key priority, the potential of the regions has been re-analyzed in terms of innovation orientation, support measures have been identified to meet their needs. More than 200 events were held in the field of consumer protection, covering all administrative districts. For the successful development of entrepreneurial activity, first of all, an appropriate socio-economic environment must be formed. Despite the specifics of individual countries, there are many conditions for creating a business environment:

- 1) Stable economic and social policy of the state aimed at protection of entrepreneurship;
- 2) Preferential tax system that creates incentives for the creation and expansion of new enterprises;
- 3) Existence of perfect infrastructure to protect entrepreneurship (existence of innovation and application centers financed by public and private business, specialized firms providing financial assistance to start-up entrepreneurs - new business "institutions", consulting centers on management, marketing and advertising).[2]

In order to ensure sustainable development, entrepreneurship development measures should be aimed at eliminating inequality in regional development at the current stage of economic development, the formation of an efficient sector structure of the economy, accelerating technological development, ensuring the optimal level of employment and accelerating the formation of the middle class. In our opinion, in order to achieve these priorities, first of all, the regulatory framework for the development of entrepreneurship should be improved on the basis of regular analysis, this policy should be aimed at limiting the economic functions of the state and increasing the efficiency of regulation. Secondly, the financial provision of entrepreneurship should be strengthened, along with targeted state funding in this direction, the necessary environment should be created for further activation of alternative financial sources, this activity should be stimulated, and opportunities for start-up capital formation should be expanded.

Thirdly, the scope of organizational measures aimed at the development of entrepreneurship should be expanded, and institutions providing continuous and systematic services in various directions should be established. In particular, in order to effectively realize the country's export potential, the effective operation of the Export and Investment Promotion Fund, which will support the production of products in export-oriented areas, their delivery to world markets and measures to increase competitiveness, must be ensured. It should be noted that the development trends of the private sector are observed in all sectors of the economy - industry, construction, agriculture, trade and services, transport, communications and social services. With the exception of the social sphere, the share of the private sector in all other areas is more than 80%, which indicates the high role of entrepreneurship in the country's economy. The experience of countries with developed market economies shows that their economic development is based on the effective interaction of public and private entrepreneurship. This is reflected in the state's creation of a favorable legal and economic environment for the development of various forms of the private sector, encouraging the development of business and individual initiative by various economic methods. This, in turn, helps the state in solving the tasks facing private entrepreneurship, socio-economic problems, financing and development of key sectors of the economy. The radical reforms carried out in Azerbaijan and the accumulated experience prove once again that better results are achieved when the regulation of state-entrepreneur relations is based on the principles of a modern market economy, and entrepreneurship becomes a major driving force of socio-economic development in the country. Entrepreneurship development in the country is considered not only as a profit, business activity, but also as a basis for economic growth, a social factor of socio-economic development and the creation of new jobs, as a result of population settlement. Taking into account these important factors, Azerbaijan continues to pursue a policy of economic reforms and improvement of the business environment for the development of entrepreneurship. World experience shows that it is more widespread and rapidly developing in countries where the liberalization of entrepreneurial activity is organically linked with the effective work of government agencies, active state support for small and medium enterprises and fair competition in the domestic market. It is also important to ensure the development of entrepreneurial resources and their efficient use for the development of the national economy. It is clear that further economic growth in the country depends on the application of modern technologies, increasing tax revenues from the private sector, solving food security problems, reducing unemployment, eradicating poverty, as well as the development of entrepreneurship and the formation of national entrepreneurship. In general, the development of the non-oil sector is possible due to the development of entrepreneurship. The business activity inherent in market relations is manifested in this area of activity. Entrepreneurship development is a key condition for the formation of a healthy competitive environment, which is an important element of the market mechanism. For this, the policy of free enterprise and liberal economy must be expanded. Thus, developing entrepreneurship - further development of employment in the private sector, the release of competitive products, services, payment of taxes to the state budget, improving the quality of services, etc. includes solutions to such problems. Today, as a result of economic reforms in Azerbaijan, entrepreneurship is developing in the country, the state promotes the development of the private sector through various means, various programs are adopted, infrastructure problems are solved, and so on.

2. MECHANISMS OF INNOVATIVE ENTREPRENEURSHIP IN MODERN PERIOD

In order to ensure the sustainability of socio-economic development in modern times, it is possible to achieve effective integration into the world economic system by increasing the competitiveness of the national economy based on the principles of economic efficiency, social justice and environmental security.

The concept of entrepreneurship policy development in the country will lead to sustainable development of the private sector in 2020 and beyond, continuous improvement of living standards and socio-economic situation of the population. According to the decree of the President "On additional measures in connection with the underdevelopment of entrepreneurial activity", a broader regulatory framework has been created by continuing targeted services to develop this type of activity and create a favorable business environment in the country. The state supports the registration of entrepreneurs in electronic form, mutual trade operations with foreign countries, the improvement of the cooperative management system, the protection of the interests of investment entities making investments. In his speech on the implementation of the State Program for different years, President Ilham Aliyev reiterated that "the state fulfills all its responsibilities, provides political support and protection to entrepreneurs, and provides them with about \$ 100 million in soft loans each year. separates. It implements infrastructure projects and takes an active part in strengthening social infrastructure in the regions so that people do not come to the cities from the regions." This strategic goal set by the President gave impetus to the development of entrepreneurship, new production areas began to develop in the regions, processing plants were opened, production and social infrastructure systems were established, and the migration of the population to cities gradually decreased. The high level of development of the market economy has given impetus to the development of an innovative business environment, the preservation of "entrepreneurship and trade" traditions in the country, laid the foundation for a new stage in the development of entrepreneurship, the production of competitive, import-substituting and export-oriented products. , as well as accelerated the development of innovative investment. The State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2004-2008, 2009-2013, 2014-2018 has been developed in accordance with the purposeful policy launched in 2004 and is aimed at expanding entrepreneurial activity in the regions, creating new enterprises and jobs, large-scale infrastructure. It has played an exceptional role in the implementation of projects, raising the level of utilities, and most importantly, further improving the welfare of the population and reducing poverty. In recent years, the state's financial support for the development of entrepreneurship has further improved, and the volume of soft loans has increased significantly. During the implementation of regional development programs with the support of entrepreneurship and increasing state care for this area, the National Fund for Entrepreneurship Support of the Republic of Azerbaijan provided AZN 1.2 billion in soft loans to 19.1 thousand businesses across the country, resulting in 110,000 jobs. [3] It is also important to note that the development of scientific and technological progress in developed market economies is associated with innovative entrepreneurship. In general, it is necessary to distinguish between two forms of entrepreneurship: the first is the discovery and implementation of innovations, which is called innovative entrepreneurship, and the second is pure market entrepreneurship, which is also called marketing. Innovation activity is the process of improving equipment, forms of production organization of labor objects, management using advanced technology and scientific and technical achievements. The modernization of enterprises, the application of modern and advanced technology, the production of products that can withstand fierce competition in the market depend on innovative entrepreneurship. First of all, the innovation process considers the following factors important:

- development of new products, modernization of the released product;
- involvement of new means of production in the production process;
- effective use of new technologies and production methods;
- more advanced forms of organization and management of production.

It should be noted that in a market economy, each company must produce new products and constantly modernize existing products in order to maintain its position in a competitive

environment. This can be achieved only by expanding innovation. The implementation of innovation in the enterprise in modern conditions should be based on the forms and methods of strategic management. An integral part of the latter is the innovation policy, the implementation of which includes the development of appropriate plans and programs for the current and future period of innovation activities; establishment of a working group; control over the development of new types of products and their application; implementation of a unified innovation policy in the field (enterprise); providing the sector's investment activity program with material and financial resources; providing innovative activities with qualified personnel; implementation of innovation measures in production. The formation of an effective innovation strategy involves an accurate assessment of the existing forms of innovation activity, which is reflected in all innovations in the field. Innovative entrepreneurship means the process of creation and commercial use of innovations in various fields. The task of entrepreneurs is to reform and revolutionize the method of production by applying inventions, to be more precise, to discover new goods or new sources of raw materials or new markets, to use new technologies to produce old goods in a new way, to reorganize the old industry and open new ones. is to discover new business prospects that are up to. There are many opinions about innovation. For example: innovations (changes) are changes in the original structure of the production organism, ie its transition to a new state of the structure; innovation is a complex process of creation, dissemination and use of new practical means (innovations to better meet the known needs of people); innovation - practical application, implementation and use of new ideas, proposals, people, scientific and technical decisions; innovation - a profitable expression of innovations in the form of new technologies, new types of products and services, organizational, technical, socio-economic decisions of production, financial, commercial administrative nature; Innovation - entrepreneurship is associated with the creation, development and commercial use of new products and services. This process includes new ideas, evaluation of ideas, development of a business plan, search for the necessary resources, creation of a prototype, testing, introduction to the sales market and the market, and so on. It should be noted that the adaptation of innovation entities to market relations, the development of the national economy, first of all, the launch of science-based, competitive industries - all this is the basis of entrepreneurial activity. Thus, this is primarily due to the fact that innovative entrepreneurship is usually associated with high risk. The state regulatory mechanism is one of the important issues, including the creation of innovative businesses that can adapt to market conditions, the restructuring of production and purposeful, adequate changes in the activities of scientific organizations and the reconstruction of organizational structures of the scientific and technical complex. Today, the development of innovative entrepreneurship in the country is one of the priorities of economic policy. Comprehensive measures have been taken in this direction, such as the development of state-entrepreneur relations, improvement of legislation and administrative procedures on the business environment, expansion of state support for entrepreneurship, education, development of business relations and provision of various services. [4] Accordingly, a conference on "Mutual trust in consumer and entrepreneurial relations" was held on March 15, 2021. In his speech, President of the National Confederation of Entrepreneurs of the Republic of Azerbaijan M.Musayev noted the high share of innovative entrepreneurship in providing the consumer market with relevant goods and services, in this regard, the importance of proper establishment and regulation of state-entrepreneur relations in the general market. He went on to say that today, if an entrepreneur receives the most complete information about his product directly from the consumer, it means that he can see more clearly the development trends of innovation in this development [5]. Today, in order to achieve the goals set for the development of innovative entrepreneurship, it can be considered expedient to fulfill these tasks: to determine the place, role, importance and development of innovative entrepreneurship in a market economy, to further identify innovative entrepreneurship and its

development stages in Azerbaijan removal; to study the impact of innovative entrepreneurship on employment as a modern form of economy; further improvement of the formation of a competitive environment in the conditions of innovative entrepreneurship; analysis of the current state of development of innovative entrepreneurship in the regions and the formation of a system of self-regulation; Increasing the role of innovative entrepreneurship in ensuring sustainable and sustainable development in Azerbaijan, etc. It should be noted that the priority of reforms in the country is competitiveness, the creation and development of a national innovation system, and the acceleration of the efficiency of economic and social development in the country is set as a key priority. Along with the production and application of new knowledge and technologies, innovation policy is reflected in Azerbaijan, where science and education, the sustainable development of a scientific society, the formation of universities as scientific centers, entrepreneurship institutions and the establishment of education on the basis of scientific innovations, the creation of entrepreneurship university model.

2.1. Efficiency of innovative entrepreneurship and its role in agriculture

It is known that the stable development of the country's economy in modern times, including the agricultural sector, is closely linked with the private sector and entrepreneurship. This type of activity plays an exceptional role in the formation and dynamic development of the market economy, enrichment of the domestic market based on local raw materials, creating a free competitive environment, creating new jobs and increasing employment, as well as improving their living standards and other social and economic problems. The experience of developed countries shows that the increase of innovation and investment attractiveness in the agricultural sector depends primarily on the renewal of production capacity, the application of the latest scientific and technological advances, as well as increasing the economic efficiency of agricultural production through the implementation of resource-saving technologies. The effectiveness of innovation development in each country is conditioned by the innovation policy implemented in the agricultural sector - the right choice of scientific and technical directions, the availability of the necessary economic, including financial support for agriculture. The innovation system in the agricultural sector is determined by the availability of material and technical resources and scientific and technical potential. The purpose of innovation policy is to create conditions for profitable production, and at the macro level to increase innovation activity, the formation of scientific mechanisms. The process of organizational, economic, technical and technological renewal of production is carried out with the help of these mechanisms. It is important to take into account a number of important factors in the formation of innovation entrepreneurship policy: forecasting strategic changes in the innovative market, economy, range of products and technologies; to express an appropriate attitude to the decisions made on innovative entrepreneurship and to prepare necessary measures to support them; identification of the initial conditions of innovation dynamics. The level of innovation activity depends on the education of personnel, the level of scientific and technological training, the availability of basic specialties. This factor also ensures the perception of innovation and a preliminary assessment of the expected efficiency of its use in production. When determining the conceptual directions of formation and development of innovative entrepreneurship in the agricultural sector, first of all, the following points are taken into account:

- Entrepreneur is a locomotive of economic activity, as well as an entity that is ready to respond quickly and adequately to the opportunities for activities that are expanding and innovative in rural areas;
- Entrepreneurial network with strong internal motivation can provide productive and efficient labor, strong incentives to influence production activities and on this basis promote progressive structural changes in the economy;

- Entrepreneurs are free to create purposeful and mobile associations to realize their potential in terms of mastering the relevant market segments, etc.

The modern market system requires entrepreneurs to constantly innovate in their economic activities. It is important to maintain this innovation so that economic activity cannot be imitated by competition. In order to be directly selected and to gain an advantage, it is first necessary to ensure the interests of consumers. Creating and improving innovation requires an abundance of information and an information environment. The policy pursued in connection with the development of entrepreneurship in Azerbaijan, the work done is also highly valued by influential international organizations. According to the World Bank's Doing Business report, the Republic of Azerbaijan has risen from 63rd place in 2016 to 25th place in 2019. According to the report of the Davos Economic Forum, the Azerbaijani economy ranked 35th among 188 countries in terms of competitiveness in 2018 and is the first among the CIS countries for 8 consecutive years [7]. The peculiarity of the regulation of the agricultural sector in the context of modern economic relations is characterized by the independence of innovative business entities and their activity. The laws adopted for the development of the agrarian sector and the laws that ensure the interests of entrepreneurs create conditions for the protection of their rights, customs tariffs, state registration, simplification of tax rules, the expansion of entrepreneurship. It is necessary to take the following measures for the effective development of innovative entrepreneurship in the agricultural sector and increase the role of international projects in this direction:

- creation of flexible organizational and economic structures that ensure the participation of all stakeholders in agriculture and their interests and allow to study the requirements of the market;
- formation of new economic relations in the agricultural sector, covering various stages of technological processes and aimed at obtaining the final finished product that meets international standards;
- establishment of cooperation bodies for production, supply and sale of agricultural producers in accordance with the voluntary pooling of their resources;
- proper formation and development of material and technical resources (means of production) and maintenance market in the agricultural sector;
- creation of a mechanism for uninterrupted supply of agricultural raw materials with minimal losses, ensuring equal conditions for different economic entities, etc.

In general, in order to determine the economic efficiency of production in the agricultural sector a system of indicators is used such as: gross output, final product, net product, net income (profit) per agricultural land, labor resources, production funds or fixed assets, current production costs, cost of goods sold separately), household income, etc. In the conditions of market relations, the increase in economic efficiency in the agricultural sector is associated with an increase in the volume of output, a decrease in labor and capital costs per unit of output, an increase in product quality and an increase in sales prices. Measures to develop innovative entrepreneurship and increase agricultural production continue in the agricultural sector. The innovation policy of the state bodies on agrarian management should be reflected in the creation of a favorable innovative business environment, the development and maintenance of scientific and technical potential, as well as the formation of a new system of mastering innovations.

3. DEVELOPMENT DIRECTIONS OF INNOVATIVE ENTREPRENEURSHIP IN AZERBAIJAN

Today, Azerbaijan is one of the leading countries in the world in terms of economic development. Numerous reforms implemented in our country have strengthened the pillars of

the state, formed a solid basis for further improving the welfare of citizens, and strengthened the position of our republic in the system of international relations. The complex measures taken in the country for the sustainable development of the regions, the reconstruction of social infrastructure, the elimination of the dependence of the national economy on the oil factor through the development of the non-oil sector have accelerated the country's success. Reforms in the country's governance structures and economic spheres have been considered an important step for the development of all economic sectors, including entrepreneurship. Expansion of entrepreneurial activity for the successful and sustainable development of the present and future development of Azerbaijan is always a priority. Scientific and technological progress in Azerbaijan, whose economy is developing at a high pace, is closely linked with innovative entrepreneurship. In general, great importance is attached to the discovery and application of various innovations in our country, the development of new innovative entrepreneurship. Today we can say with confidence that along with pure market entrepreneurship, new marketing and production entrepreneurship, innovative entrepreneurship, which is typical of the most developed countries, is on the path of sustainable development in our country. It is no secret that the innovation process requires, first of all, the development of new products, modernization of products, the involvement of new means of production in the production process, the use of new technologies and methods of production, the application of more advanced forms of production organization and management. Due to this, the quality of products produced in Azerbaijan is rapidly regulated, competitiveness and production efficiency are increased, limited resources are used sparingly, profits are increased by reducing production costs, innovations are also characterized by successful results in the social sphere. Our country attaches great importance to innovative technologies, rich natural resources and the proper organization of enterprises as a driving force in the development of both industries and the economy as a whole. Because the ultimate goal of the innovation process is to increase the commercial viability of the new product and the organization of mass production. The main stages of the innovation process are as follows: systematization of incoming ideas, development of new product ideas; analysis of economic efficiency of the same product; decision-making on the introduction of a new product in production; conducting testing in the market. As for the results of innovation, as a rule, the range of products is renewed, competitiveness increases, the needs of the population are met, and so on. Everyone who wants to become an entrepreneur in our country, in addition to making a profit, should contribute to public welfare, apply new technologies in Azerbaijan in their field of activity, create a firm or company based on innovative management methods, operate freely, achieve self-affirmation in society. can do. Today, there are small, medium and large business activities in our country. President of the Republic of Azerbaijan Ilham Aliyev said: "Along with the development of innovative entrepreneurship in Azerbaijan, there is a process of stimulating small and medium enterprises, both through the National Fund for Entrepreneurship Support and other lines, as well as the establishment of large enterprises and state support. is important" [8]. The Law of the Republic of Azerbaijan "On Entrepreneurial Activity" states: "Entrepreneurial activity is the activity of individuals, as well as legal entities for the purpose of gaining profit or personal income under their own responsibility and labor responsibility or on behalf of other legal entities or individuals. in particular, their independent entrepreneurial activities in the form of production, sale and provision of services" [9]. It should be noted that as a shining example of innovative entrepreneurship in Azerbaijan, on January 14-15, 2021, the Azerbaijan Youth Achievement Public Union organized an Entrepreneurship Seminar at the initiative of the UN Children's Fund. The seminar was held within the framework of the "Youth Leadership and Professional Development" program implemented with the financial support of the European Union, in cooperation with the Ministry of Youth and Sports of the Republic of Azerbaijan and the Youth Foundation [10].

The main purpose of the seminar was to stimulate the creative and innovative thinking of our youth without borders and increase their knowledge and skills in the field of entrepreneurship. Entrepreneurship is a key component for the successful careers of future leaders and innovators. It is very important for young people and students of all ages not to develop new projects for the further development of innovative entrepreneurship, but also to have creative thinking, risk-taking, coping with failure, as well as high technical knowledge, skills and talents. The tendency to continue to compete in the Azerbaijani economy and to strive for development by overcoming the difficulties here creates the basis for the search for and active use of new management tools that help innovative entrepreneurship and the rapid and productive solution of its problems. Important measures have been taken and are being taken to develop entrepreneurship in Azerbaijan. “National Fund for Entrepreneurship Support”, “Small and Medium Entrepreneurship Development Agency” and “Entrepreneurship Development” centers have been established in the regions. In general, the laws “On Entrepreneurship”, “On Enterprises”, “On Joint Stock Companies” and other laws providing for the establishment of a legal mechanism of a market economy, which are important for the formation of the business environment in Azerbaijan, have been adopted. Also, the Innovation Agency was established under the Ministry of Transport, Communications and High Technologies of the Republic of Azerbaijan.

4. CONCLUSION

The main goal of Azerbaijan, which is in a modern and dynamic stage of development, is to form and expand a diversified, efficient and innovation-oriented economy, to bring the welfare of the population to the level of international standards. Most countries of the world pay much attention to the innovation of economic processes and, in this connection, to the significant improvement of the state's innovation policy. It should be noted that the exchange of modern international technology and information is impossible without the appropriate legal, financial, organizational, innovation and technical support. The protection of the rights of users of intellectual property is a very important achievement in the development of information technology and law in the modern world. Thus, it plays an important role in the development of economic relations and the further spread of information technology. At present, it is possible to classify several areas of public policy to further improve the development of entrepreneurship in the activation of innovation activities: the formation of tax incentives; reduction of the tax burden on innovation enterprises; determination of the list of the main state innovation projects in the next few years and formation of the mechanism of their realization; lowering bank interest rates; creation of favorable conditions for the development of small and medium innovative entrepreneurship; providing comprehensive assistance to innovation-oriented enterprises; creation of conditions for attracting investments to the private sector by strengthening the investment activity of the state; creation of conditions for the formation of market infrastructure of innovative entrepreneurship and implementation of market-oriented institutional changes on scientific and technical development of the private sector; determination of priorities of the state innovation policy, etc. It should be noted that today efforts are being intensified to improve the business environment in the country, more comprehensive measures are being taken to diversify the economy and develop entrepreneurship in the non-oil sector. The development of entrepreneurship, the improvement of legislation to improve the business environment, stimulates the development of innovative entrepreneurship. All this shows that Azerbaijan's position in the World Bank's international rating "Doing Business" is growing. The sustainability of the reforms suggests that these ratings will continue to improve in the coming years.

ABSTRACT

Azerbaijan has one of the most stable economies among the countries of the region, thanks to a number of fundamental factors, such as rich natural resources, economic reforms and the trust demonstrated by international financial institutions. The global economic slowdown caused by the pandemic also affected the balance of payments of Azerbaijan. During 2020, both the export and import experienced a tightening, and the transactions associated with “Tourist services”, a sector that was one of the most actively growing industries, has practically ceased. This article analyzes the consequences of the pandemic for the current and the capital accounts of the balance of payments, and possible scenarios necessary to overcome them. The authors concluded that, despite the overall deterioration of the economic situation, the reserves accumulated in the previous years’ made it possible to maintain the stability in the balance of payments. And the attractive investment-enabling environment in Azerbaijan and the ongoing reforms will help overcome the negative consequences of the pandemic.

Keywords: *Balance of Payments, Current Account, Exports, Financial Account, Imports*

1. INTRODUCTION

Each year, a large number of countries are involved in the foreign economic relations of Azerbaijan. In 2020, over 200 countries were involved in the foreign economic relations of the country [1]. Over the past 15 years (other than 2020, due to the pandemic), Azerbaijan recorded a positive balance of payments, a result that facilitated increase in the foreign currency reserves. Azerbaijan’s foreign exchange reserves at the end of 2020 amounted to about USD 50 billion; covering more than three years of imports of goods and services (with the international adequacy ratio equal to 4 month). A current account surplus indicates that the country has significant savings, sufficient for both domestic and foreign investment. However, it is possible that the global recession and contingencies such as devaluation, fluctuations in world prices, and the pandemic, will lead to reduced imports and exports transactions. This is exactly the situation faced in Azerbaijan in 2020.

2. CURRENT ACCOUNT

The country’s balance of payments, including the current account, the capital account, and the financial account, reflects the results of economic transactions between that country and the rest of the world. The current account balance shows the ratio of savings to investments in the economy. When a country runs a current account deficit, it indicates that purchases of goods and services from abroad and income payable to non-residents exceed amounts receivable from residents of outside world [2]. This situation, where it takes a long time, is fraught with grave consequences for the economy. The inflow of external resources to a sufficient extent ensures necessary funding for current transactions.

During the period from 1995 through 2004, the current account balance, for several objective reasons, experienced a deficit, reflecting an excess of expenses of expenditures on the purchase of goods and services from abroad over export earnings. In 2005, this indicator turned positive for the first time and remained so until 2020. The dynamics of the current account are shown below.

	2010	2019	2020
<i>Credit (proceeds)</i>	30637	26239	18252
<i>Debit (payments)</i>	15597	21874	18480
<i>Gap</i>	15040	4365	- 228

Table 1: Dynamics of the current account (Millions USD)
(Source: Adapted from Balance of Payments of the Republic of Azerbaijan www.cbar.az/page-43/external-sector-statistics)

The current account surplus in the last 15 years was mainly conditional on the trade surplus. And it was precisely thanks to the trade surplus of USD 8.5 billion in 2019, the country saw a positive current account balance. Restrictions imposed because of the pandemic have limited economic activity and, at the end of 2020, the current account balance turned to negative in the amount of USD 228 million.

2.1. External trade

The country's intensive participation in the division of labor at the international level is one of the most powerful catalysts for economic growth, and it was possible by the liberalization of foreign economic activity. The table below shows the development of Azerbaijan's foreign trade during period subjected to analysis.

	2005	2010	2019	2020
<i>Exports</i>	7649	26476	19868	12588
<i>Imports</i>	4350	6746	11335	10076
<i>surplus (+) / deficit (-)</i>	3299	19730	8533	2512

Table 2: External trade balance (Millions USD)
(Source: *Ibid*)

In 2020, Azerbaijan had trade relations with 183 countries of the world. At the same time, only ten countries represent more than 3/4 of Azerbaijan's trade turnover. These countries include Italy, Turkey, Russia, China, Germany, Ukraine, USA, France, India, Georgia.

2.1.1. Exports of goods

Increased production by export-oriented enterprises of the oil and gas complex, as well as advantageous oil prices in 2005-2019, served as incentives for significant growth in gross exports. In 2019, compared to 2005, gross merchandise exports increased almost 2.6-fold to USD 19.9 billion [1]. The volume of exports in 2020 decreased by 40 per cent compared to 2019. This reduction was mostly caused by the drop in oil prices. The volume of exports of other industries decreased less significantly - by 4.3 per cent. Oil prices have been showing an upward trend since the beginning of 2021, and, analysts believe it will continue during the current year. The figure below reflects the commodity structure of Azerbaijan's exports in 2020.

Figure following on the next page

Figure 1: Azerbaijan Exports structure for 2020
 (Source: based on BOP data www.cbar.az/page-43/external-sector-statistics)

As seen from the graph, oil and gas products took a dominant role in commodity exports, accounting for 85.7 percent. It is worth noting that the country has launched reforms with an aim of reducing reliance on hydrocarbon exports.

2.1.2. Imports of goods

The overall worsening of the global economic environment due to the pandemic is seen in imports as well. In 2020, compared to 2019, the total imports fell by 11.1 percent to about USD 10.1 billion. The graph below shows the structure of Azerbaijan's imports in 2020.

Figure 2 Azerbaijan Imports structure for 2020
 (Source: based on BOP data www.cbar.az/page-43/external-sector-statistics)

The share of enterprises in the oil and gas sector accounted for 1/5 of overall structure of the total imports. A large part of the imports of goods, as seen from the graph, are accounted for by other sectors of the economy. If we look at the structure of imported products, the trend here is not unambiguous; i.e. the import has increased, for a number of items, such as pharmaceutical products, butter, and chemical products. The reduction in imports is seen in such goods as sugar, cars, furniture, tobacco, metal, alcoholic, and non-alcoholic beverages.

2.1.3. Services balance

The country's international services market is characterized by an underdeveloped service export structure, and, as a result, a persistent negative balance. To date, transportation services are the only revenue item of Azerbaijan's foreign trade in services, as evidenced in the table.

Table 3: Azerbaijan Services balance for 2020 (Millions USD)

	<i>Credit (proceeds)</i>	<i>Debit (payments)</i>	<i>Gap</i>
<i>Services balance:</i>	<i>2621</i>	<i>5461</i>	<i>-2841</i>
<i>-transport</i>	<i>1645</i>	<i>1302</i>	<i>343</i>
<i>-travel</i>	<i>304</i>	<i>412</i>	<i>-107</i>
<i>-communication services</i>	<i>65</i>	<i>90</i>	<i>-25</i>
<i>-other sectors</i>	<i>607</i>	<i>3657</i>	<i>-3050</i>

Table 3: Azerbaijan Services balance for 2020 (Millions USD)

*(Source: Adapted from Balance of Payments of the Republic of Azerbaijan
www.cbar.az/page-43/external-sector-statistics)*

Transport accounts for 62.8 per cent of services exports in 2020. Azerbaijan's export of transport services are represented by rail, sea, air, road, and pipeline transport. The construction of a new complex of the international airport and the accelerated development of the domestic merchant marine fleet, commissioning of oil and gas infrastructure facilities: Baku-Tbilisi-Ceyhan, Baku-Erzurum, Baku-Kars railway allows the country to more actively enter the external market with the offering of transit transportation services. As noted above, transport accounts for most of services turnover. The country saw some positive trends in 2020, compared to that of 2019. For example, exports of non-oil transport services rose by USD 1 billion. Although the country saw a deficit of USD 350 million in this item in 2019, the transport services experienced a surplus of USD 343 million in 2020. Concerning the tourism services, Azerbaijan, as well as the entire world, is experiencing a sharp decline in international travels due to the pandemic. In 2020, the number of Azerbaijani citizens traveling abroad decreased by 4.8 times, and the number of foreigners coming to Azerbaijan - by 4 times.

2.1.4. Primary income

In addition to the growth of imports of international services, a factor that determines the current account deficit, the country saw a negative balance of primary income. In 2020, USD 2.3 billion in revenues was received from non-residents. A large part of them (USD 1.7 billion) comes from repatriated earnings, mostly in the form of crude oil, to foreign investments in oil and gas consortium. Azerbaijan, in turn, has provided services to other countries amounting to USD 1.9 billion. As a result, the primary income balance deficit for 2020 compared to 2019 fell by 4.5 times to USD 456 million. This was possible by reducing the deficit in the oil and gas sector.

2.1.5. Secondary income

The balance of secondary income in the current account, like the trade balance, saw a surplus; however, its impact on the current account balance remains insignificant. In 2020, the overall secondary income account transactions with foreign countries were USD 1.8 billion. Of that, USD 1.2 billion was proceeds, and USD 630 million was payments. 92.1 percent of total proceeds on secondary income are comprised of remittances of individuals from foreign countries. It should be pointed out that money transfers to Azerbaijan came from 214 countries, and went to 191 countries. The table below shows individuals remittances for 10 countries accounting for about 85 percent of all remittances.

Country name	In favor of individuals to Azerbaijan		Country name	From individuals in Azerbaijan	
	Millions of USD	In percent of total		Millions of USD	In percent of total
RF	606.1	55.4	RF	148.4	26.7
Turkey	76.4	7.0	Turkey	117.4	21.1
USA	53.5	4.9	Georgia	59.5	10.7
Germany	37.0	3.4	USA	50.9	9.1
Georgia	34.9	3.2	Great Britain	25.2	4.5
UAE	32.5	3.0	Ukraine	22.5	4.0
Kazakhstan	30.3	2.8	Germany	21.3	3.8
Great Britain	26.6	2.4	Austria	7.3	1.3
Qatar	13.9	1.3	Canada	7.0	1.3
Saudi Arabia	13.5	1.2	UAE	5.4	1.0
Total for 10 countries	924.7	84.5	Total for 10 countries	464.9	83.5
For other countries	169.3	15.5	For other countries	91.6	16.5
Total for all countries	1,094	100	Total for all countries	556.5	100

Table 4: Individual money transfers for 2020
(Source: Ibid)

As seen from the table, more than half of all remittances received by individuals in Azerbaijan were transferred from the Russian Federation. USD 556.5 million was transferred from Azerbaijan to foreign countries with a surplus reached by USD 537.5 million.

3. FINANCIAL ACCOUNT

The impact of the pandemic was also seen in the financial account of the balance of payments for 2020. For example, the country's net financial liabilities decreased by USD 200 million over the year. This is mostly caused by the fact that the country managed to fulfill the obligations to repay the principal debt on previously attracted loans and advances during 2020, as per the agreements. At the same time, new proceeds from the listed items were much less than in 2019.

3.1. Direct investment

Analysis of the financial account transactions shows domination of foreign direct investment in the structure. With the development of the oil and gas sector, telecommunications, construction, and enterprises producing consumer goods, the inflows of non-state guaranteed foreign investments have become increasingly important. The share of these investments in the total foreign capital inflow to Azerbaijan was more than 90 percent. Over the past five years, the gross foreign direct investments inflow into the economy of Azerbaijan amounted to over USD 20 billion. Given the repatriation of capital, the net inflow of direct investment is estimated at about USD 5 billion. Most of these investments were made in the oil and gas sector by the international consortium involving companies from the USA, Norway, Turkey, UK, Russia, and Japan.

Figure following on the next page

*Figure 3: Main investing countries, 2020, in percent of total
(Source: based on BOP data www.cbar.az/page-43/external-sector-statistics)*

As seen from the graph, the listed countries account for 75.9 percent of all attracted foreign direct investment. The share of other countries combined is 24.1 percent. As noted, investments are mainly made in the oil and gas sector, although other sectors have seen a gradual increase in the volume of funds attracted until 2020. The pandemic has had a major impact on investment flows to other sectors, where foreign investment has fallen by 35 percent over the past year.

4. CONCLUSION

An analysis of the financial account for several years shows that the priorities in attracting foreign capital into the country's economy are: direct investment, long-term loans, mostly concessional, and creating conditions for the private sector to attract external resources. More than two-thirds of foreign capital is attracted in the form of direct investment and a small share of long-term loans from international financial institutions. The medium-term loans attracted by the private sector show a steady upward trend. In general, such a structure of attracted foreign capital is quite favorable from the point of balance of payments sustainability. However, the pandemic has also affected financial account transactions. Thus, the country saw a fall of USD 2 billion in foreign currency reserves in 2020, although they increased by USD 5.1 billion in 2019. To summarize, we can conclude that when choosing measures of state economic policy, it is not important how much the deficit or surplus it is, but what are the reasons that caused them. The ongoing economic restructuring in the country aims to gradually address reliance on hydrocarbon exports and achieve active development of green economy.

ABSTRACT

Independent Azerbaijan is at a historic crossroads in terms of economic, social, political, and cultural growth. The country's economy has been improved and modernized as a result of the socioeconomic reforms introduced during this period. The amount of the country's economy has more than tripled in the last 17 years, good socio-economic growth has been ensured, infrastructure has been built, and the level of poverty has decreased significantly in the context of positive dynamics. The rise in the minimum wage has resulted in a substantial decrease in illegal labor. Currently, the Republic of Azerbaijan's social policy, which is a priority of state policy, is followed by the country's sustainable development and an improvement in the indicators that characterize people's living standards. State budget spending for 2021 on public administration agencies, power systems, social policy implementation, real sector financing, and other expenditures according to the report, expenses related to the implementation of social policy account for 31.5 percent of total state budget expenditures. Expansion of the self-employment program, establishment of DOST centers providing 132 types of services, implementation of electronic appointment systems for 21 types of social security, ensuring accountability in the field of targeted social assistance and disability are great examples of this policy. The government's work in Karabakh to develop housing for families, disabled people, and internally displaced persons (IDPs) can also be considered a fruitful social operation. The conclusion was that the state should ensure a minimum wage, as well as help those who are unable to work and those who have temporarily lost their capacity to work. Azerbaijan government's social policy should be oriented to the establishment of an inflation-protection system, determination of the consumer basket's minimum level, economic growth, and population social situation, assisting the economy's improvement, ensuring the economy's sustainable development in order to enhance the country's socio-economic and demographic policy, equal social stability, an egalitarian society, and the balance of the capital and regions.

Keywords: *living standards, poverty, socio-economic reforms, social politics, social security*

1. INTRODUCTION

Social policy is one of the most important aspects of any state's domestic policy. A framework of policies aimed at improving the quality of life and the social condition of certain groups of the population is known as social policy. Social policy is an important part of the state's domestic policy, and it is expressed in the social services it implements, as well as the control of social interactions based on the interests of the population's major social classes.

The Azerbaijani state's social policy is a continuous and dynamic process aimed at establishing social justice, ensuring national wealth development, and implementing an equal distribution of national wealth through targeted programs. The Republic of Azerbaijan's key priority in terms of social policy is to establish a state of social welfare by implementing equal social security for all segments of the population. In recent years, the national economy's social orientation and reliance on the human element have been especially notable. Mr. Ilham Aliyev, the President of Azerbaijan, has repeatedly confirmed that our state's policy is focused on the human element, on the interests of people. The key aim of the President's multifaceted reform is to ensure that every person participates in the development process and use their available potential equally according to each individual's abilities and capabilities. In general, the average monthly volume of pensions has risen by 60% since the beginning of 2018.

2. THE IMPACT OF THE COVID-19 PANDEMIC ON THE WORLD ECONOMY

The COVID-19 pandemic, which is currently sweeping the globe, has put people to the test, and the battle against coronavirus employs a variety of tactics, techniques, and methods to bring residents of each nation out of the crisis with minimal losses. The next wave of the COVID-19 pandemic is likely to be covered in the June issue of the Asian Development Bank's Asian Development Outlook, which could lead to social instability and tension. In addition to these factors, the threat of trade tensions between the US and China escalating has been identified as a significant risk factor, as has been the case with other organizations during forecast revisions. Adjustments were made in the direction of reduction in this situation (Table 1).

Countries/regions	Data 2019	Forecast			
		Indicators in 2020		Indicators in 2021	
		Issue in April	Issue in June	Issue in April	Issue in June
Economic growth					
Developing countries	1,7	-0,3	-5,8	1,8	4,1
USA	2,3	0,4	-5,3	2,1	3,8
Euro zone	1,3	-1,0	-7,0	1,6	5,5
Japan	0,7	-1,5	-5,0	0,9	2,0
China	6,1	2,3	1,8	7,3	7,4
Kazakhstan	4,5	1,8	-1,2	3,6	3,4
Georgia	5,1	0,0	-5,0	4,5	5,0
Kyrgyzstan	4,5	4,0	-5,0	4,5	4,0
Uzbekistan	5,6	4,7	1,5	5,8	6,5
Tajikistan	7,5	5,5	-3,6	5,0	7,0
Turkmenistan	6,3	6,0	3,2	5,8	5,8
Azerbaijan	2,2	0,5	-0,1	1,5	1,2

Table 1: Asian Development Bank forecasts

(Source: ADB, Asian Development Outlook, April 2020, Asian Development Outlook Supplement, June 2020. The table is based on the above-mentioned sources)

The clarifications can be interpreted as taking into account the pandemic's extension and the correspondingly extended quarantine or isolation regimes, according to the chart. From a negative standpoint, and constructive dynamics are predicted for 2021. This is primarily due to the low base year impact, which is expected to rise in comparison to 2020 while also decreasing.

3. SOCIAL POLICY IS A PART OF THE STATE'S ECONOMIC POLICY

The state's general policy includes social policy. The management of social processes in the state of society, the provision of material and spiritual needs, and the normalization of each member of society's personality are all examples of social policy.

It governs the processes of social division that allow the realization of the socio-economic rights required for reproduction and growth. This strategy has an influence on the living standards of the population's key strata, classes, and categories. The state's social policy is based on the expectation of relationships between social classes, social strata, and within these strata. In the implementation of social policy, problems such as providing economic incentives to engage in the raid are addressed by regulation and social consumption of state social and labor relations. The core objectives of social policy are to ensure that every member of society has a minimum standard of living and to reduce income inequality as much as possible. The reduction entails creating conditions that enable every able-bodied individual to engage in productive economic activity. The primary goal of social policy is to protect the citizen, his legal and natural rights. The aim of social policy is to help and improve people, who are the most valuable asset of any society. The practical implementation of the social policy model depends on the political structure of the country, the level of economic development, property relations, and governance. The structure, history, historical features, and customs all play a role. The part of the created social product is the foundation of social policy. This division is based on various concepts. They can be attributed to the following models under some conditions:

- 1) The liberal model focuses on mitigating the effect of individuals and the state on the lives of the general public;
- 2) Social-democratic model (A socially focused market economy is one version of this model) - the role of the state in redistribution of income among different classes of the population, with social taking into account the needs of vulnerable groups;
- 3) A model focused on state property sovereignty and centralized production and distribution regulation;
- 4) Models that have been used in developed countries. In this case, the aim of social policy is to combat poverty, develop agricultural production, and address other problems, depending on the state of resources.

The Republic of Azerbaijan's social policy, which is a top priority of the government, is followed by the country's long-term growth and a rise in the indicators that measure people's living standards.

Figure following on the next page

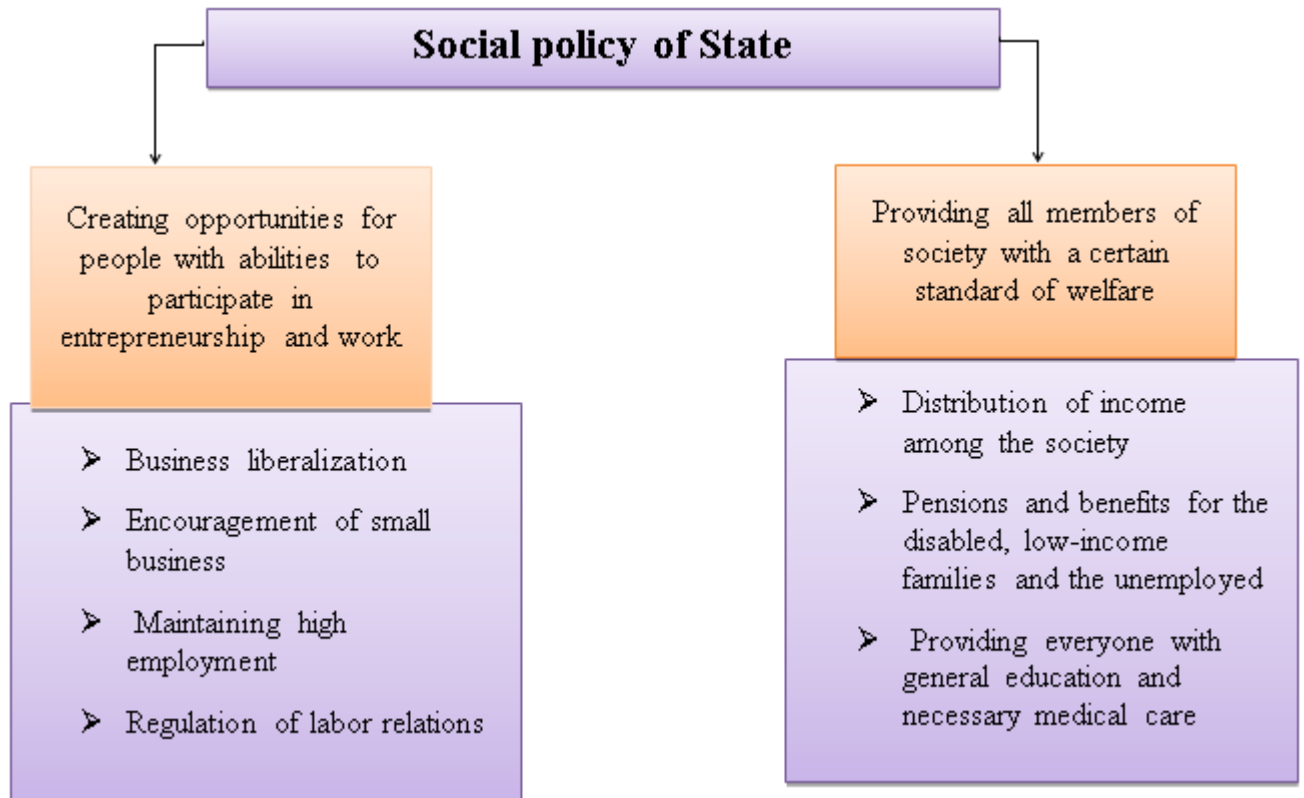

Figure 1: Social policy of State
(Source: The Great Economic Encyclopedia, Volume IV, Baku-2012)

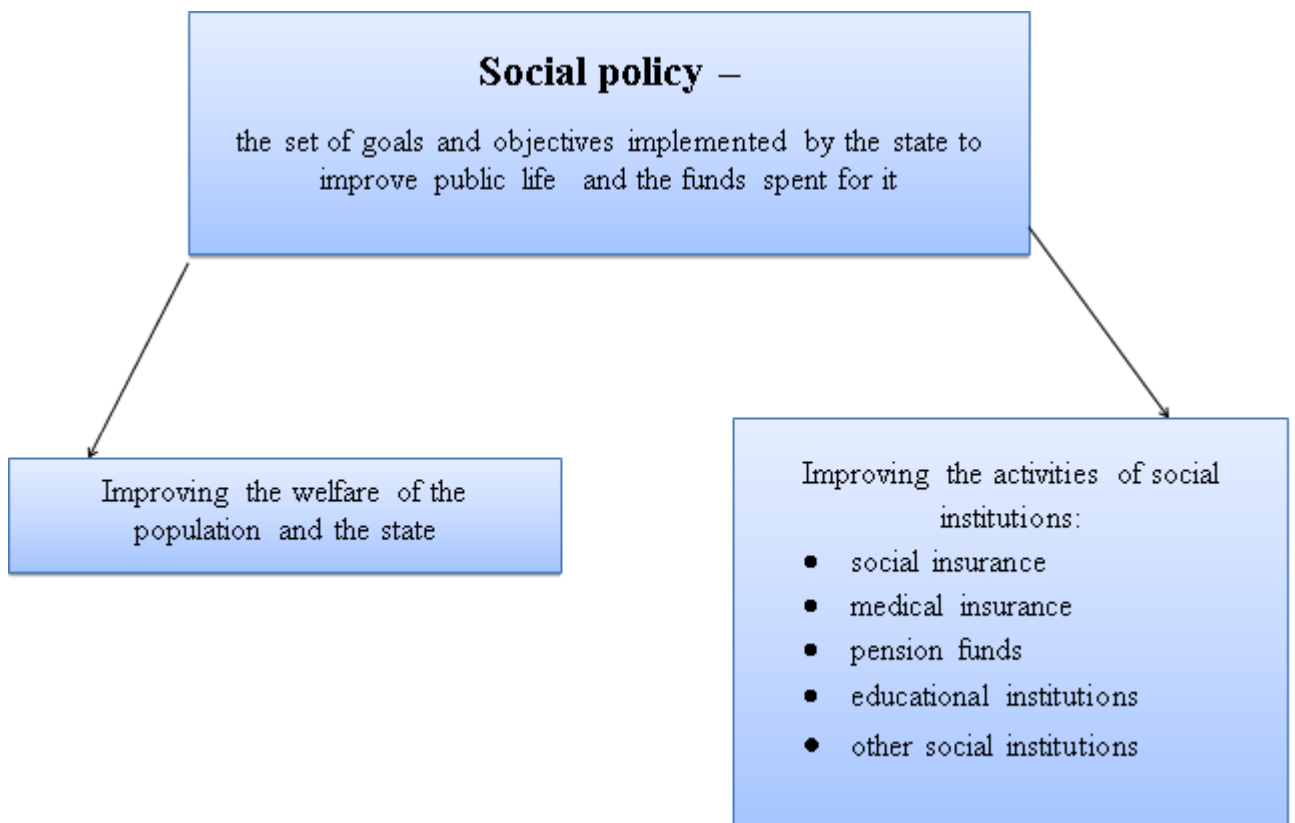

Figure 2: Social
(Source: The Great Economic Encyclopedia, Volume IV, Baku-2012)

The social policy pursued by states is directly related to the political regime and system of governance of those states. For this reason, states differ from each other in their social policies. For example, in a totalitarian state, social policy is limited by the totalitarian activities carried out in the social sphere, but in a democratic society, social policy is a function of a democratic state and a citizen. In order to incorporate complicated tasks that are typical of social policy and, in certain cases, eradicate a range of drawbacks and inconsistencies, the state undertakes comprehensive changes in a variety of areas. In Azerbaijan, the concept of social policy of the state includes the general features of the development of society. Thus, Azerbaijan, like other countries, forms a social policy in accordance with its development goals, and provides the necessary conditions for the implementation of this policy. The application of this policy is contingent on the correct understanding of state priorities and social policy objectives. The aim of social policy is to assist the government in achieving its objectives. One of the main issues in social policy is the formation of incomes for the members of society. In many countries, the term "social state" is used to refer to states that promote the development of members of society and help them to live in better conditions. The social sphere is an integral object of social policy. During the transition period, a number of social problems arose, and solutions to these problems played an important role in bringing issues such as social policy to the fore. We know that society is made up of a number of social groups, and the interaction of these social groups is inevitable. These reciprocal relations include confrontation, unity, privileged partnership, hostility, civil war, violence, and intimidation. All these forms of communication are in fact called policies and are divided into different areas. If social groups are concerned with economic problems, they are dealing with economic policy; if they are dealing with the state and the environment, they are dealing with environmental policy. This is a policy concerning the climate. Demographic, educational, and cultural factors all play a role in politics. Social policy is the improvement of people's social welfare, the satisfaction of material, social and intellectual needs of people, the formation of respect for the individual and society. It is a policy that has a direct bearing on stability in the world. The allocation of welfare and wages through the state budget is an important aspect of social policy aimed at the advancement of society's members. As a result, social policy, which is heavily affected by the human element because it is responsible for distribution policy, is inextricably linked to monetary policy and the state's tax policy. Social policy characterizes the social status of members of society, which is a complex characteristic of their life activities. The formation of market relations has led to a number of social problems. These include a number of social problems, such as income differentiation, declining employment, and rising unemployment. Government regulation is necessary to alleviate the consequences of the problems created by this revolution. State measures were primarily aimed at the social protection of various groups of the population. One of the factors complicating the implementation of the measures was the need for social protection not only for people with financial problems, but for all market participants. The new economic system has created the conditions to close a number of gaps. It is necessary to establish an atmosphere in which members of society operate in compliance with their activities, property is protected, and people are free to use their earnings. Social protection entails more than just the equitable allocation of land based on humane values and the abolition of income disparities. Because of this, everyone is forced to live in poverty at the same time. Social protection is a necessity that ensures the position of everyone and equality in a free, social society. People are divided into certain groups in society by their abilities, labor, and talents without the influence of others. For example: old and young, poor and rich, employed and unemployed. We are unable to categorize people into the first or second groups. While the state, some governments, and institutions provide social security, everyone should receive assurances from family members, members of the workforce in the workplace, and society. Social protection is not only the subject of the social sphere, but also the sphere of the economy.

Thus, with economic development, social protection will be more convenient for the state. Thus, social protection covers economic subjects. Now let's characterize social protection on the basis of economic subjects. Economic development can create certain social problems. High development of technology can lead to staff reductions, as well as technological unemployment. In addition, while economic development has led to positive results, such as the creation of new industries, it has also led to a decline in demand in certain areas. This creates structural unemployment. First of all, it should be noted that not all members of society belong to the employed population, that is, not all people can earn an income. For this reason, groups of people who are not able to earn income cannot meet their own needs. These groups include the physically handicapped, the chronically ill, and the disabled, who receive social protection from the state. They need to meet their needs. The employed population may also lose the ability to work for certain reasons (old age, accidents, illness, etc.). The employed population may also need social protection. The state can achieve the creation of a socially oriented society by creating conditions for members of society to freely and fully use market opportunities. Through this, people will be able to meet their material needs. Free access to market opportunities means that people can get an education, improve their skills, and do whatever they want within the law according to their labor and abilities. This means that people will be able to meet their material and social needs to the best of their ability, as well as people will be able to afford it. The state will provide for the needs of the people that cannot be met by.

World experience shows that the following systems belong here:

- Social assistance system
- Social security system
- Social insurance system

Management technique is both a criterion and an object of formal social sphere management. Three-tier pension system:

- **The first stage** is provided by the state as a minimum level of security provided by the state to all groups of the population who are not entitled to labor and insurance pensions and are not able to work, regardless of their employment. There will be a funded and basic social pension. Other categories will include special additions to the social pensions of other groups of retirees, such as those with disabilities from childhood.
- **The second stage** is the main stage, in which the legislation is based on the social insurance membership fee collected by the state social protection fund or independent insurance companies. The pension will be financed according to the norms provided by the law, depending on the length of service, the amount of earnings and the length of service.
- **The third tier** represents additional pension funds, and special pensions will be provided to individuals who have entered into a personal insurance contract with these pension funds and will be financed from a non-state pension fund. Membership fees can be paid by both the employee and the employer. The terms and amount of the additional pension will be determined in the individual contract concluded between the pension fund and the insured person on the basis of a standard contract of this type of insurance, which has been established in recent years. It is traditional for the state budget to be social in nature.

The republic's independence did not preclude it from facing difficult problems, as it has experienced a wide range of growth in both the social and other spheres. Azerbaijan became independent and transitioned to a new economic structure. Initially, the transition to an economic structure failed to prevent the economy from being paralyzed. The rise in the number of problems was also linked to the Nagorno-Karabakh conflict, which our country is currently dealing with, as the Nagorno-Karabakh conflict has displaced over one million people. Now, let us evaluate the current condition of the social sphere.

4. ASSESSMENT OF THE CURRENT STATUS OF SOCIAL SPHERES

COVID-19 pandemic resulted in sharp fluctuations in world energy and stock markets have an impact on the Republic of Azerbaijan's economy, macroeconomic stability, and employment prospects. The President of the Republic of Azerbaijan signed the order "On a number of measures to reduce the negative impact of COVID-19 on the subjects of the population" on March 19, 2020 aims to reduce the negative effect of the coronavirus pandemic on the country's socioeconomic existence and the prospects for post-pandemic growth. The Azerbaijani state, which prioritizes the social protection and social welfare of its citizens in its domestic policy, has reaffirmed its commitment to the people in these difficult times. President Ilham Aliyev mentioned on March 10, 2020 about reducing the negative effects of the Coronavirus pandemic on the country's economy and citizens' living standards. The Cabinet of Ministers prepared an Action Plan in accordance with the decree's implementation. Along with the financial and economic regulatory measures envisaged in the action plan, the government has taken important steps in the field of employment and social protection. The Azerbaijani state is a socially oriented state. The goal is to strengthen the social protection of our population as our economy develops. That is, economic income should be geared toward the population's social security and strengthening of social welfare. This has always been the case, and Azerbaijan's approach has always prioritized social policy. The review of state budget expenditures for 2021 on public administration bodies, power systems, social policy implementation, real sector funding, and other expenditures reveals that expenditures related to social policy implementation account for 31.5 percent of total state budget expenditures (Figure 3). At the same time, it should be noted that the share of budget expenditures for financing the real sector in 2019 and compared to the corresponding figure in 2020 was 7.0 and 0, respectively. The percentage of expenditures related to the implementation of social policy decreased by 4.8 percentage points and increased by 7.8 and 0.2 percentage points, respectively.

Figure 3: The total amount of individual expenditures for 2020 (in million manats), the share in the state budget and the ratio to GDP (in %)
(Source: Picture has been developed based on data provided by the State Statistics Committee of the Republic of Azerbaijan)

The State Social Protection Fund's budget, which functions under the Ministry of Labor and Social Protection of the Population, had revenues and expenses of 5146.0 million AZN. In order to balance the budget of this Fund, the funds allocated for the financing of the state budget liabilities amounted to 1631.5 mln. manats, which is 442.6 million manat more than the forecast

for 2020 (37.2% more). The Unemployment Insurance Fund budget had 157.8 million in revenue and expenses. The manat is projected to reach 6.6 million manats, up 4.3 percent from this year's estimate. The establishment of a legislative structure for this ("On Social Security," "On Individual Accounting in the State Social Insurance Scheme," "On Compulsory Medical Insurance," and Order of the National Leader Heydar Aliyev dated July 17, 2001 "Concept of Pension Reforms in the Republic of Azerbaijan") determines the conceptual basis for the establishment of a new pension system in the Republic of Azerbaijan. The Presidential Decree of 14 May 1998 "On the prevention of disability, rehabilitation and social protection of persons with disabilities for 1998-2001" has played an important role to comprehensively address the problem of disability. Steps such as the approval of the State Program on Social Development and so on have served to shape the social policy of the modern Azerbaijani state in accordance with the challenges of the new era. The social reforms initiated by the National Leader Heydar Aliyev have been successfully continued by President Ilham Aliyev since 2003. According to Mr. President Ilham Aliyev's decrees, "State programs for socio-economic development of the regions," education, health, social security, and demographic development are among the "State programs for socio-economic development of the regions." Hundreds of other initiatives in the fields of jobs, poverty reduction, affordable housing, IDP settlement, targeted social assistance, and self-empowerment have been introduced and are being implemented. Many social and humanitarian initiatives, including the introduction of mandatory premarital medical tests for married people, security of mothers and infants, thalassemia and hemophilia, have been launched at the initiative of Azerbaijan's First Vice-President Mehriban Aliyeva. Adoption of statutory acts relating to sick care, as well as the application of the state budget for the payment of tuition fees for children without parental care and children with disabilities in classes I and II are being employed. It is essential as the next step in health-care reform. As in other oil-dependent economies, the third stage of the global financial and economic crisis in 2014 resulted in a rapid depreciation of the national currency of Azerbaijan. Mr. President was able to quickly eradicate the detrimental impact of the crisis by effectively implementing the President's concept of harmonious regional integration and economic diversification. The "Strategic Roadmap for the Prospects of Our National Economy" adopted in 2016 identified 11 priority areas and stated that we have entered a new stage of our socio-economic development. The growth of our economy in 2018 has created financial guarantees to start a new phase of social reforms. The successful implementation of ASAN, ABAD, DOES services and self-employment programs should also be assessed as a practical result of social reforms. Mr. Ilham Aliyev, President of the Republic of Azerbaijan, has always said that the citizens of Azerbaijan and their social welfare are at the forefront of our policy. The President attended the opening ceremony of a residential complex for 1,000 IDP families in the Absheron area at the end of 2018, and then received a party of martyrs' families in the first month of 2019. He met with them and signed an order afterward to offer a lump sum of 11,000 manat to 12,750 people who were martyred between 1997 and 1997 but did not collect insurance premiums or collected insurance premiums at the time's exchange rate. About 130 million manat was allocated from the state budget for this purpose. 2019 has been quite a successful year in the life of our people and state. During this year, all the set socio-economic tasks have been fulfilled, the country's economy has grown, and the social welfare of our citizens has increased significantly. As a continuation of the economic reforms initiated by President Ilham Aliyev in 2018, deep social, governance and structural reforms were carried out in 2019. Two packages of social reforms, covering the recent decrees and orders, have provided financial guarantees for a significant improvement in the social welfare of 4.2 million citizens. Reforms in the field of taxation and customs, which began in 2018, and measures to limit the transparency and shadow economy in this system have brought more than 1 billion manat to the budget for tax and customs revenues. These funds are also aimed at improving the social welfare of our people.

The State Social Protection Fund's revenues increased by 364.4 million manat to 4 billion 116 million 700 thousand manat as a result of changes in the field of pension provision, and the total monthly amount of labor pensions in the country increased from 256 to 295 manat, a 15.3 percent rise. The minimum amount of labor pensions increased from 119 to 200 manat, in other words, by 72%. This increase has helped improve the living standards of 600,000 retirees. As a result of the reforms, Azerbaijan has risen to the first place in the CIS in terms of purchasing power of the minimum pension. The increase in pensions, an important component of the social security system, continued in the first quarter of 2021. In March, the average monthly amount of pensions increased by 11.8% compared to the beginning of the year and reached 332 manat as of April 1. The average monthly amount of old-age pensions reached 362.3 manat, which is 10.7% more than at the beginning of the year. They increased by another 10% compared to 330 manat. The average monthly amount of old-age pensions is 361 manat, the average monthly amount of disability pensions is 290 manat, and the average monthly amount of survivor's pensions is 267 manat, according to the Ministry of Labor and Social Protection. The indexed rise in pensions since the beginning of the year accounted for the majority of the increase. As a result of the reforms, the minimum wage in the country has almost doubled from 130 to 250 manat. The salaries of 1,350,000 workers in the country have increased significantly. In connection with the implementation of the decrees of the President, one-time payments in the amount of 11,000 manat were provided to 18,000 of the 12,000 martyrs. 640 million manat has been allocated from the state budget to solve problem loans, and the state has repaid the loans of about 900,000 citizens. During these years, the population's income exceeded inflation by 3 times, poverty was 5% and unemployment was 4.8%. The increase in the minimum wage has led to a significant reduction in illegal employment. Expansion of the self-employment program, establishment of DOST centers providing 132 types of services, implementation of e-appointment systems for 21 types of social security, and increased accountability in the area of targeted social assistance and disability. The successful work of the government in the social sphere is also reflected in the work done to improve the housing of the families of martyrs, disabled people of Karabakh, IDPs, who are vulnerable groups of the population. Tuition fees have been allocated from the state budget during the time of education of children of martyrs' families and children of disabled people from the Karabakh war who study on a paid basis in higher education institutions and secondary special education institutions of the republic. The country's legislation provides for a number of benefits and privileges for members of the families of martyrs and war veterans. In addition, 2 million people received social benefits. In 6 months, 590 million manat (27%) more was paid to the population than last year. State-sponsored social assistance is also available. About 15,000 lonely and disabled people over the age of 65 have received social services delivered to their homes. In social care institutions, around 1,000 individuals receive inpatient treatment. Food rations were distributed to low-income families in response to the spread of the COVID-19 virus. During this period, with the support of social partners, 100,000 families were provided with food rations twice. The allowance was extended for two months for people with expired disabilities, unemployment benefits, and vocational training (a total of 16,000 people). The limit of discounted electricity for the population in April-May is 100 kWh per month increased in volume. Employment and social welfare measures cover about 5 million people. Despite the suspension of activities in many areas of the public sector and the private sector in accordance with the requirements of the special quarantine regime, the employment of 900,000 people in the public sector (although 80% are not employed) location and salaries have been preserved. With the support provided to the private sector, 760,000 people were prevented from becoming unemployed. Since the beginning of the year, the number of employment contracts has increased by 120,000 (19%) and the salary fund by 15%.

Unemployed people and informal workers who lose their income due to the special quarantine regime have been paid a lump sum of 190 manat accordingly (subsistence minimum). Minimizing official-citizen communications to ensure population satisfaction in the field of services, as well as a high culture and humane approach to citizens' appeals, as well as consideration and provision of these appeals in a short period of time, would reinforce citizens' confidence in the state. The global coronavirus pandemic has been testing all nations and peoples since early 2020. When the leaders of many countries discussed the dilemma of "whether to save the economy or the people", the President of Azerbaijan, as a true leader of his people, said unequivocally and decisively: "Here we have to choose between two factors - economic activity, people's health. My choice is unequivocal - people's health!" The head of state added that there was a need to build new hospitals, despite the fact that the existing hospitals have enough facilities for the treatment of patients. For this purpose, the construction of modular hospitals was organized. To date, 9 modular hospitals have been commissioned. Also, an 800-bed hospital has been commissioned through the Ministry of Emergency Situations, and a 1,300-bed hospital will be commissioned by the end of the month. Thus, 2,100 additional beds will be created. In order to take precautionary measures, both Olympic Sports Complexes were turned into hospitals and were ready in a short time. Decree on tackling the Coronavirus pandemic (COVID-19), signed by the President on March 19, 2020, aims to reduce the negative impact of the coronavirus pandemic on the socio-economic life of the country and open up the prospects for the development of the post-pandemic period. As a result, a range of steps will be taken to mitigate the negative effects of sharp volatility in global energy and stock markets on the economy, macroeconomic stability, jobs, and entrepreneurship in the Republic of Azerbaijan. The decree is of great importance in terms of protecting the social protection of the population. As always under these difficult times, the Azerbaijani state, which has made social security and welfare a priority in its domestic policy, has reaffirmed its commitment to the people. The Cabinet of Ministers has pre-approved the implementation of the order of March 10, 2020 on reducing the negative effect of the COVID-19 on the country's economy and citizens' living standards. The Cabinet of Ministers' prepared an Action Plan and started its implementation accordingly. In addition to the financial and economic regulatory measures outlined in the action plan, the government has taken important steps in protecting employment and social protection.

5. CONCLUSION

Increasing the country's incomes should increase economic prospects, provide effective jobs and decent work for all segments of the population, and boost women's economic access. The required incentives should be provided to increase the private sector's share of jobs, and the number of workers should be dominated by private sector employers. It has also provided new opportunities for the effective implementation of the appropriate steps in this direction. In general, more than 50 decrees and orders have been signed over the past 15 years to increase state care for citizens and strengthen their social protection. Work is being done to improve society's social security, resources, and income, including salaries, ensure productive employment, increase the share of the private sector in employment, prevent informal employment, legalize income, and reduce poverty, in line with the high level of growth. Azerbaijan currently ranks first in the CIS in terms of purchasing power for the sum of the minimum pension and second in terms of purchasing power for the average pension. As a positive development, this is one of the measures of the success of social policy in our country.

ABSTRACT

The emergence and spread of the Internet at the end of the last century and the beginning of this century has become a major feature of the global process of globalization. This led to the formation of a single information space. This new stage of globalization can be called "digital globalization". The article examines the basics of the relationship between the digital economy and the current stage of globalization. Large-scale development of information and communication technologies has led to significant changes in the functioning of economic systems at various levels. At the present stage of development, digitalization has become the most important factor in the economic growth of the national and global economy. Under the influence of these factors, there is a transition from the introduction of individual digital technologies to the integrated construction of a digital ecosystem. The process of digitalization is particularly important, as it determines the transition to the fourth industrial revolution. Therefore, in most countries, digitalization of the economy is an important component of economic development. Digitalization of the economy is simultaneously becoming the basis for sustainable growth of production, improving competitiveness and living standards of the population. The article focuses on trends in the development of new global digital processes and risks that are generated by the digital economy. The study found that digital technologies are ubiquitous in traditional sectors of the economy and finance, and digital globalization should be viewed as a driving force of global economic growth, which provides companies with new business opportunities.

Keywords: *digital economy, digital globalization, digital platforms, economic growth, information and communication technologies*

1. INTRODUCTION

The emergence and spread of the Internet at the end of the last century and the beginning of this century has become a major feature of the global process of globalization. This led to the formation of a single information space. This new stage of globalization can be called "digital globalization". The article examines the basics of the relationship between the digital economy and the current stage of globalization. Large-scale development of information and communication technologies has led to significant changes in the functioning of economic systems at various levels.

Under the influence of these factors, there is a transition from the introduction of individual digital technologies to the integrated construction of a digital ecosystem. The process of digitalization is particularly important, as it determines the transition to the fourth industrial revolution. Therefore, in most countries, digitalization of the economy is an important component of economic development. Digitalization of the economy is simultaneously becoming the basis for sustainable growth of production, improving competitiveness and living standards of the population.

2. THE MAIN SOURCES OF GLOBALIZATION OF THE WORLD ECONOMIC SYSTEM

Globalization is a historical process of transforming the world into a single system with common characteristics. Historically, this system is generated by the action of globalization factors:

- electronic means of communication that can compress to a minimum the time and space that separates people;
- technological changes that allow the distribution of products around the world;
- formation of global ideologies, such as environmental or human rights movements.

The globalization of the world economy is the transformation of the world space into a single zone where information, goods and services, and capital move freely, where ideas are freely distributed and their carriers move freely, stimulate the development of modern institutions and debug the mechanisms of their interaction. First, globalization is caused by objective factors of world development, the deepening of the international division of labor, scientific and technological progress in the field of transport and communications, which reduces the so-called economic distance between countries. In the context of information integration of the world, technology transfer and borrowing of foreign economic experience is much faster. The second source of globalization is trade liberalization and other forms of economic liberalization, which have limited protectionist policies and made world trade freer. As a result, tariffs were significantly reduced, and many other barriers to trade in goods and services were removed. Other liberalization measures led to an increase in the movement of capital and other factors of production. The third source of the internationalization process and one of the main sources of globalization has become the phenomenon of transnationalization, within which a certain share of production, consumption, exports, imports and income of a country depends on the decisions of international centers outside the country. The leading forces here are transnational companies. Currently, 80% of the latest technologies are created by TNCs, whose incomes in some cases exceed the gross national income of certain rather large countries. Suffice it to say that TNCs rank 51st in the list of the 100 largest economies in the world. It should be noted that the sphere of activity of most of them is associated with the development of hypertechnologies, which include innovative technologies, network computers, the latest computer programs, technologies for shaping public opinion and mass consciousness, etc. Today, it is the developers and owners of such technologies that control financial markets and determine the face of the world economy. New technologies are one of the driving forces of globalization, but it, in turn, intensifies competition, stimulates their further development and distribution among countries. As a result of globalization, there is an increase in trade in services, including financial, legal, management, information and all kinds of "invisible" services, which are becoming a major factor in international trade relations. Although the bulk of the global product is consumed in producing countries, national development is increasingly aligned with global structures and becomes more multilateral and diversified. The fourth source of globalization is the achievement of global consensus in the assessment of the market economy and the free trade system. The fifth source lies in the peculiarities of cultural development.

We are talking about the tendency to form globalized homogeneous media, art, pop culture, and the widespread use of the English language as a universal means of communication. It is worth mentioning one more important feature of the globalization of the world economy — the rapid development of financial markets in the last years of the XX century [1].

2.1. Influence of digital technologies on the formation of digital globalization

The new role of financial markets (foreign exchange, stock, credit) in recent years has dramatically changed the architecture of the world economy. A few decades ago, the main goal of financial markets was to ensure the functioning of the real sector of the economy. In a word, the process of getting money from money has been greatly simplified due to the exclusion from it of the actual production of any goods or services. In globalization, two stages are traditionally distinguished:

- the first stage - the turn of the 19th – 20th centuries, the period of active development of international economic relations, which ended with the First World War;
- the second stage of globalization began in the 70s. XX century, and is associated with the integration of the world economy and the emergence of TNCs.

The widespread dissemination of digital technologies significantly influenced the formation of a new stage of globalization - digital globalization. Currently, digital flows of data and information are of great value, since they allow the movement of goods, services, finance and people and have a greater impact on the growth of world GDP than international trade [2]. In the context of digital globalization, the processes of production, distribution, cross-border exchange and consumption of information are becoming more important than other types of economic and economic activities, increasing the virtualization of the economy. As a result, a new system of economic relations is being formed – the global digital economy with its own laws and development trends. A significant consequence of the introduction of digital economy technologies has been the increase in non-material information flows between countries, regions, corporations and individuals. The digital economy offers great opportunities for information exchange, education, transparent business, and international cooperation, and is characterized by high growth rates, rapid innovation, and widespread use in other economic sectors. The use of digital technologies has already become a global process and plays a key role in improving the competitiveness of individual enterprises, countries and economic unions. Today the world community has embarked on the third stage of globalization - the digital transformation of society, first of all, under the influence of a large increase in cross-border data. The digital transformation of the economy is understood as the manifestation of qualitative, revolutionary changes that consist not only in digital transformations of individual processes, but also in a fundamental change in the structure of the economy. The potential for the development of information and communication technologies accumulated by the XXI century is the reason for significant changes in the functioning of economic systems at various levels – from the world economy to individual business entities, and digitalization is the most important factor in the economic growth of national and global economies. They are responsible for the transition from the introduction of individual digital technologies to the integrated construction of a digital ecosystem. Digitalization is an important component of the economic development of most countries and at the same time becomes the basis for sustainable production growth, improving the competitiveness and standard of living of the population.

2.1.1. The digital economy as a result of digital globalization

The "digital economy" is a system of social, economic and technological relations between the state, the business community and citizens, which functions in the global information space. In this system, digital network technologies are widely used and digital types and forms of

production are created, and products and services that are promoted to the consumer lead to continuous innovative changes in management methods and technologies in order to increase the efficiency of socio-economic processes. The above definition is quite General, so it is necessary to reveal the main features of the digital economy. These include:

- creation of cyberphysical systems in which a person and a machine represent a single, smoothly working organism.
- use of smart platforms in all areas of socio-economic activity.
- introduction of the Internet of people, Internet of things, Internet of services.
- application of Big Data technologies ("big data" processing).
- use of modern information technologies, such as blockchain, which ensure transparency of data transmission and reliability of data storage [5].

The digital economy is based on the decentralized cross-border blockchain technology, cloud computing, big data, cyber-physical systems, the Internet of Things, 3D printers, which together implement the concept of Industry 4.0 - a new approach to the integration of production and consumption. The use of digital technologies leads to the following positive economic and social effects: automation and intensification of traditional economic and technological processes, creation of new sectors of the economy; improvement of the business and investment climate by increasing the availability and efficiency of public services, transparency of business conditions; increasing the availability, quality and convenience of medical, educational, cultural, and financial services for the population; creation of comfortable and safe cities. Global digitalization is changing business models, which entails a revision of the principles of interaction with customers, suppliers and partners. Companies now have new opportunities to find the best suppliers, customers and talent around the world. Through digital technologies, people gain access to global markets for education, work, and more. Currently, the concept of the digital economy, evolving with the rise of digital technologies, has expanded beyond e-commerce and now includes doing business, maintaining communications and providing services in all industries (including transport, financial services, manufacturing, education, healthcare, agriculture, retail, media and entertainment). In recent years, digital infrastructure has developed rapidly. The use of digital platforms and digital solutions provides companies and citizens with new opportunities:

- companies can conduct business “without borders”, Internet technologies allow organizing global access to information and “instant” transactions (electronic commerce);
- the costs of transactions, marketing, interaction with customers in new markets are reduced;
- sales can be carried out in remote and fast-growing markets by organizing virtual teams interacting online [2].

A key factor in the development of the digital economy is the development of digital platforms. A digital platform is a set of technologies that ensure the creation of a digital interaction system in a specific and specialized field of activity. A digital platform is an enterprise that provides mutually beneficial interactions between manufacturers and consumers. It provides an open and efficient communication infrastructure for market participants, and sets new rules for interaction between business entities. The digital platform is a system of algorithmized, mutually beneficial schemes of relationships between heterogeneous, independent participants in the economic sector and is implemented in a single information environment. It is the basis of the digital transformation of the market. First, the digital platform contains basic services that are attractive to both manufacturers and consumers. They allow them to optimize the number of transactions and user costs. But linking to a digital platform restricts the freedom of business entities. On the other hand, the digital platform is sold to users, usually at a low price. Users are attracted by the low price, ease of use, and the effect of multi-channel marketing.

Thus, the digital platform expands its presence in the market and in production, monopolizing its influence on it. Market participants do not regard the owners of the digital platform as competitors and easily admit it into their value chain. They do not see a threat to their business and do not consider the role of the digital platform in this chain to be critical. Nevertheless, the digital platform, by increasing the power of an active community of participants, turns quantitative changes into qualitative ones, that is, structural changes take place. Doing business using the platform is becoming mainstream (the "main line" of development). After that, the digital platform possesses key information, controls the market, influences pricing, methods of supplying goods and services, completely capturing the value chain, and as capital accumulates, the digital monopoly turns into an economic monopoly. As a result, the digital transformation of the market can be said to be disruptive. That is, the digital economy affects the business climate in the country, forms the ecosystems of the country and regions. And the ecosystem of the country's economy, in turn, determines the conditions for the positive development of all economic entities, not excluding the competitive relations between them. A properly built digital transformation should ensure a favorable corporate business culture in the country.

3. PROBLEMS AND MAIN RISKS OF THE DIGITAL ECONOMY DEVELOPMENT

The introduction of the digital economy has its advantages and threats. The advantages of this process are: elimination of unproductive intermediaries (reduction of the product life cycle cost); direct sales channels (acceleration of business processes); lower marketing costs; increase in market volumes; increasing the transparency of operations and transactions, including in the provision of public services; improving the quality of life of the population. At the same time, there are certain opportunities: the formation of new markets; creation of databases on consumer preferences and producers' capabilities; stimulating the development of markets and new business; stimulating export growth; improving the structure of the economy; increasing the productivity of sectors of the economy and the quality of services provided. The weak points of implementing the digital economy are: the financial costs of creating and using a digital platform; the need to restructure corporate processes and improve the corporate culture of business; the lack of effective formalized regulatory tools; and the lack of development of regional, national and international legislation. When implementing a digital economy threats can be: loss of control over the market infrastructure (intercepted by the owners of the digital platform); loss of control over distribution channels; the emergence of new competitors, monopolization of production, as a result of the influence of digital infrastructure; negative consequences due to the lack of tools to control the actions of the owners of digital platforms; loss of control over the internal market in the event of the intervention of external digital platforms. It can be concluded that reducing the price of the product lifecycle and directly accelerating business processes as the strengths of the digital economy implementation should cover the losses arising from the financial costs of creating and using a digital platform. In addition, the loss of structural adjustment of corporate processes and improvement of corporate business culture should compensate for the remaining threats due to the loss of control over the market infrastructure and the loss of control over sales channels. And the losses from the development of regional legislation should compensate for all the above-listed threats. Properly structured digital transformation is expected to provide a favorable corporate culture of the business in the country. In this case, these conditions are determined by the mechanisms of regional regulation of economic activity and the availability of development resources. Thus, the digital transformation of the market is not evolutionary, but revolutionary. This means that there may be negative consequences of this process. Digital technologies carry both benefits and risks, including technological, social, political, the risk of increasing crime in its new manifestations, the risk of social, environmental and personal degradation. The technological risk is related to the fact that the advantages of digital technologies can be fully manifested only

with the balanced development of organizations in the real sector of the economy. But if one segment of real production works at an accelerated pace and with high quality, and the other slowly and poorly, then as a result, the entire economy will work unsatisfactorily [10]. As a result of the development of digital technologies, there will be a radical transformation of the work organization system in the future, which will lead to a sharp reduction in the traditional relationship between employee and employer. Digital platforms make it possible to organize economic activities in such a way that the bulk of the functions traditionally performed by full-time workers within a given organization can be transferred to a group of sole proprietors and “online workers”. The result is an economy that is based not on full-time employment but on short-term relationships with “online workers”. Among the risks and threats posed by the digitalization of the economy and society, a particular danger is the social risk associated with a significant transformation of the labor market and a reduction in employment, as well as the risk of the spread of a new form of crime - cybercrime. The global digital economy is helping to develop complementary skills and qualifications. In addition, digital platforms will create employment opportunities for new high-paying jobs created by the digitalization of professions. Thus, the above social risks will be offset by the increased demand for specialists needed to create the infrastructure of the digital economy. Political risks are especially dangerous. According to experts, in the cross-border world of the digital economy based on blockchain technology with its decentralization and lack of a regulator, the role of the state should be reconsidered. It should take the form of a simple territorial entity with a certain population. This will lead to the abolition of the governing and controlling role of the state, the weakening of state regulation of the economy, the loss of the ability to exercise its functions and protect its sovereignty, and the emergence of private cross-border systems for managing economic, social and political processes [7]. The basis for such systems is provided by global social-information and trade-information networks and cryptocurrencies, the Internet of things and other depersonalized information means of making transactions that take international trade and Finance beyond national jurisdictions. Citizens can opt out of government systems to protect their interests by relying on network structures and using blockchain technologies and smart contracts [8]. In the global digital economy, businesses and people face increasing risks in the area of digital security and personal information protection. A world connected to the Internet opens up new opportunities for cybercriminals who collect personal data to use it for fraudulent transactions, or implement ransomware-malicious software that can block devices or encrypt data and demand money in exchange for a decryption key. The risks of violating personal data privacy are added to consumer concerns about the possibility of online fraud. There is a misconception that the digital environment minimizes the risk of fraud, but this is true only for low-tech types of fraud. In the new era of Internet dominance, every organization becomes digital by definition and, in one way or another, uses online technologies in its activities. Such conditions create opportunities for hacker attacks, and they can be both massive and targeted at a specific organization. Experts predict an increase in the scale of cross-border computer crime, because now, being in one country, with the help of simple manipulations, you can get the necessary information stored in the data Bank of the computer system of another country, then transfer it to a third country, while achieving the goal - to steal and appropriate funds. The risk of increasing corruption in the digital economy should also be considered, since a person, leaving for virtual reality, can use material benefits (for example, cryptocurrencies) anonymously, without revealing their identity. It seems possible to find him and punish him only by organizing constant and continuous monitoring of the corrupt official and comparing the expenses committed by him with his personality. The expansion of digital technologies and their introduction into everyday life transforms the internal and external world, which takes on more individual, but contradictory features.

This is facilitated by:

- individualization of production, in which the products produced will meet the needs and needs of each individual consumer;
- virtual and augmented reality that creates an individual artificial world for each person;
- human life itself, which is becoming more and more "digitized", analyzed, controlled, directed and regulated, as a result of which a person loses his identity, identity;
- loss of a person's freedom and ability to independently form their own personality;
- increasing the ability of the authorities to segregate people, determine and shape their life paths, as well as the right employees [4].

4. CONCLUSION

Digital globalization of economic processes is becoming a fundamental trend and principle of development of the modern economy. It is determined not only by revolutionary technological changes, but also by the laws of the evolution of the economy as a whole, and contributes to the growth of labor productivity and product quality. The consequence of digital globalization is international economic integration. And thanks to this integration, non-traditional cross-border flows of goods, loans and investments are growing rapidly, and the global exchange of information, ideas and technologies is intensifying. This leads to the fact that national economies become part of a single global digital economic system. In this regard, it is necessary to form a national digital security policy and constantly update it. This should become one of the most important activities of the leadership of our country. The state must prevent discrimination of any kind, protect consumer rights, intellectual property and personal data, and ensure that citizens have an adequate level of education and digital literacy. At the same time, excessive national protectionism can hinder the development of the global digital economy. The desire to store all data on the servers of only one's own country, the protection of confidential information are barriers to cross-border trade and hinder digital globalization [11].

ABSTRACT

The tourism sector is a mirror of the commitment of the world's countries to civilized values, the rule of law and its socio-economic situation. In recent years, the development of tourism has become one of the priorities of economic development of the regions of Azerbaijan and there are great opportunities for realization of this development strategy. Like other regions of Azerbaijan, the Garabagh (Karabakh) region has great tourism potential as well. There are great opportunities for the reconstruction and development of various forms of tourism in both lowland and upper Garabagh - eco-tourism, mountain tourism, winter tourism, medical tourism, hunting tourism. The article approaches the tourism sector as a complex, dynamic and stochastic economic-cybernetic system and was shown that cybernetic characteristics specific to this sector, in particular, necessitates the use of econometric modeling, which is a mechanism for assessing the validity of economic laws in the study of existing dependencies in the tourism sector is based on statistical concepts and approaches. The article tests the stationary nature of the time lags of statistical indicators characterizing the tourism sector by the correlogram method, and these lags are brought to the stationary. The Granger test also assessed the existence of a "cause-and-effect" relationship between the statistics involved in the study. As a result of econometric studies, multi-regression models of quantitative dependencies in the tourism sector have been developed and their practical significance has been assessed.

Keywords: *Tourism sector, economic - cybernetic system, econometric modeling, stationary time lags, non-stationary time lags, correlograms, multi-regression model, Granger test*

1. INTRODUCTION

44-day war that left an indelible mark on the history of Azerbaijan! The victorious Azerbaijani army put an end to the 30-year occupation of the Armenian aggressors, "drove the enemies away from the holy land like dogs" and liberated our native Garabagh. The Azerbaijani people and the victorious Azerbaijani army, rallying around the Supreme Commander-in-Chief, President Ilham Aliyev, like an "iron fist", demonstrated their indomitable strength to the whole world and restored our territorial integrity. Now a new historical period begins in the life of our native Azerbaijan - life must be restored in the liberated from occupation and devastated by the hated enemy of Garabagh. Both the Garabagh region and Azerbaijan as a whole have great potential for the development of the tourism sector. Therefore, attention should be paid to the development of this sector of the economy, the development strategy of this sector should be developed and implemented in a comprehensive manner. There the tourism sector must be approached as a complex cybernetic system and the vector of optimal behavior and development of this sector should be determined on the basis of econometric modeling method to achieve this goal.

2. RESEARCH

The liberation of Garabagh opens new opportunities for the development of tourism in the country. Your age is unknown! How much have you endured! Indeed, Azerbaijan, one of the cradles of human development, has always fought for its freedom and peace, and in order to achieve this sacred goal, its children rose to the top of martyrdom. At the end of the 20th century, our native Azerbaijan was subjected to a new aggression by our hated neighbors - the Armenian fascists, and part of our territory, Nagorno-Garabagh and 7 regions of Aran Garabagh were occupied by the enemy. The hated enemy committed the Khojaly genocide on our lands, our native Shusha was lost, Fizuli, Zangilan and other regions were defeated... However, the Azerbaijani state responded to this terror, which lasted almost 30 years, with dignity and dignity. We have returned!!! The people of Azerbaijan and the victorious Azerbaijani army united around the Supreme Commander, like an iron fist, crushed the Armenian terrorists in the 44-day Patriotic War and restored our territorial integrity. The whole world understood the truth that "Garabagh is Azerbaijan!" After the historic victory in the Second Garabagh War, Azerbaijan set a new task - to restore our territories, which were liberated from occupation and treacherously destroyed by Armenian terrorists. This goal set by President Ilham Aliyev as a national issue - the realization of the goal of reviving our liberated territories - has already begun and initial positive results have been achieved. As noted by President of the country Ilham Aliyev, in this case, it is not a question of carrying out reconstruction in those areas, but of carrying it out radically. Thus, during the years of Armenian occupation of our territories, they completely destroyed Aran Garabagh, which is around Nagorno-Garabagh and has an area of 10,000 square meters, and even demolished the rocks of these territories. That is why the return of our occupied territories has been identified as a national issue under the name "Construction of Garabagh". The experience of recent months shows that the Azerbaijani people and leadership have great confidence that Garabagh will soon be restored to the highest standards. As in the 44-day war, the solidarity of national forces will serve as a source of inspiration and driving force in this work. Therefore, we can say with full confidence that by mobilizing all the internal resources of the country, in a short time it will turn our Garabagh, destroyed by Armenian vandals, into a nightmare, and the real owners of these lands - our compatriots living as refugees will return to their ancestral lands. It is gratifying that the construction of the international airport in Fizuli is already underway. A highway is being built to Shusha, railway lines are being restored, gas and water pipelines are being laid. The President declared a "green zone" of the liberated territories. In other words, in these lands, preference will be given to the use of energy from renewable sources (solar, wind, etc.) rather than traditional energy. As it's been mentioned above, the Garabagh region of Azerbaijan was one of the oldest cultural centers in the world. This region also has a rich tourism practice and has long attracted the interest of both the population of the former USSR and foreign countries. In fact, the tourism potential of Garabagh is very rich, and there are great opportunities to rebuild and develop various forms of tourism in these liberated areas - eco-tourism, mountain tourism, winter tourism, medical (medical) tourism, hunting tourism. Shusha, the cultural capital of Azerbaijan, located at an altitude of 1400 meters above sea level and distinguished by its flora and fauna, historical, cultural and religious monuments, unique architecture, Kalbajar and others, distinguished by the thermal treatment water "Istisu". it is a mirror of how vast these possibilities are (Nazim Mammadov, 2010). The tourism sector acts as a mirror of each country's commitment to democratic values, the rule of law and its socio-economic status. From this point of view, the Republic of Azerbaijan has an ancient and rich tradition in the field of tourism. The development of tourism in Azerbaijan, the expansion of tourism geography dates back to the 70s and 80s of the twentieth century and is associated with the name of the great leader Heydar Aliyev.

In recent years, the development of tourism has been recognized as one of the priorities of economic development of the regions of Azerbaijan, and there are great opportunities for its implementation (Naghisoylu M., 2017). Our country, which has won a great victory over the "visible enemy", or rather the Armenian terrorists, and expelled them from our lands "like dogs", is still facing an "invisible enemy" - the coronavirus pandemic (covid - 19). Like other sectors of the economy, the tourism sector has been in decay as a result of the pandemic crisis (It should be noted that since tourism is associated with population displacement and border crossings, the destructive impact of the pandemic on the tourism sector is stronger). First of all, this decay is reflected in the fact that the number of tourist flows to our country has decreased significantly compared to previous years. So, if in the first 4 months of 2018, about 630,000 tourists from 157 foreign countries came to our country, in 2019, about 611,000 tourists, the number of foreign citizens who came to our country in January 2021 was only 36.1 people (from 105 countries) and this figure was 6.3 times less than the corresponding period of 2020. It should be noted that the vast majority of this contingent came to our country not as tourists, but mainly for non-tourism purposes. There are a number of negative aspects in the development of the tourism sector in Azerbaijan. Thus, the tourism sector in our country has not gained the status of a "people's" sector and has a more "elite" status. For example, in neighboring Georgia, a large part of the country's population (about 70%) works in the tourism sector, which has already received the status of a public business. In Azerbaijan, before the lockdown, only 20,000 people worked in this sector. Georgia's \$ 3 billion in tourism revenues in 2018 is also significantly higher than in Azerbaijan. So, our country has great and feasible prospects for the future development of the tourism sector. Although a number of successes have been achieved in the development of the tourism sector in our country, Azerbaijan has not yet become a global tourism industry, and the share of this sphere in the formation of GDP for the country is insufficient. One of the reasons for this situation in the tourism sector is the unsatisfactory material resources and the need to reform it. There is a great need for state data on the tourism sector in Azerbaijan, tax exemptions, the construction of relatively cheap and simple hostels, the creation of an affordable hotel chain, the simplification of visa procedures, and even visa-free travel for some countries. The strategic roadmap for the development of the tourism sector of the Republic of Azerbaijan states that the creation of a quality system of national tourism was chosen as goals that will stimulate the development of the tourism sector in our country with a view to fully realize the tourism potential of Baku at the expense of foreign tourists, to create a favorable environment for the development of the tourism sector in the country, to develop regional tourism, to increase tourist satisfaction. Of course, the liberation of Nagorno-Garabagh and surrounding areas from Armenian occupation and the expulsion of terrorists from our lands have created new realities and the development of tourism in Aran and Nagorno-Garabagh should also be considered as one of the goals of the development of the tourism sector in our country. Achieving these goals will maximize the mobilization of available resources for successful and sustainable development in the tourism sector - ie will create conditions for the creation of free economic zones, freeing the tourism sector from the tax burden, providing a favorable lending system and, finally, attracting foreign investment in the country's tourism sector.

3. ECONOMETRIC ANALYSIS OF THE DEPENDENCIES BETWEEN THE INDICATORS OF THE TOURISM SECTOR

The study of the tourism sector of our country should be based on a systematic analysis. So that, This sector by its nature acts as an economic cybernetic system of a complex, dynamic and stochastic nature with numerous direct and indirect relationships with other environmental systems. These cybernetic characteristics, especially stochasticity, which are characteristic of the tourism sector, makes it necessary to use econometric modeling which is a mechanism for

assessing the validity of economic laws in the study of existing dependencies in this sector and consists mainly of stochastic concepts and approaches. The purpose of our research is to identify the relationship between the economic indicators that characterize the tourism sector and, on this basis, to quantify the development prospects of this sector on the basis of econometric analysis (Chistaya G.O.,2018). We believe that the results obtained will adequately reflect the prospects for the development of tourism in the Garabagh region, which was liberated from the Armenian occupation. Data reflecting changes in the main economic indicators of travel agencies in the tourism sector during 2006-2019 were used (Table 1) As a statistical base of research.

	Income earned by travel agencies (in thousand manats) SG	Number of tourist trips sold (in units) TY	Number of travel agencies (in numbers) SA
2006	8480	20256	96
2007	15966,6	26008	117
2008	17120,5	27055	123
2009	17839,6	28509	124
2010	19065,3	34121	126
2011	22634,8	42583	141
2012	27121,5	62866	170
2013	29600,9	65448	197
2014	31107,1	66233	218
2015	36482,2	44615	243
2016	36758,3	36978	273
2017	41034,2	44066	339
2018	56439,1	49992	374
2019	63363.8	63885	432

Table 1: Dynamics of key economic indicators of travel agencies in the tourism sector (Source: The state Statistical Committee of the Republic of Azerbaijan)

As can be seen from Table 1, the economic indicators that characterize the tourism sector are expressed in three chronological order (time sequence):

- 1) Time sequence SG, which reflects the revenue generated by travel agencies.
- 2) Time sequence TY representing the number of travel trips sold.
- 3) Time sequence SA, reflecting the number of travel agencies.

Time lags play an important role in econometric modeling. An important feature of these lag is that they are evenly distributed and statistically independent. Therefore, the application of traditional correlation-regression analysis methods to the study of economic indicators expressed in the form of time lags may give incorrect results. An example of this type of error is the wrong decision about the existence of a connection. Therefore, before constructing a regression model of a relationship based on time lags, the time lags must be analyzed and the necessary changes made. Adequacy of econometric research to the studied real conditions and validity of the obtained results is directly related to whether the time lags of economic indicators used in the research process are stationary or non-stationary. Thus, if the stationarity of the time sequence is violated, then it is practically impossible to determine the statistical characteristics of such a time lag (Damador N. Gujerati, 2012). Saying the stationary time lags we understand such lags that their probabilistic properties remain constant over time. Rather, the stationary time sequence is such that it has a fixed mean, and the value of the lag revolves around a certain fixed variance around this mean.

Thus, $\{y_t\}$ ($t = \overline{1, n}$) time sequence is considered stationary if time sequence is considered stationary if its mean value and variance be constant, and covariance between its τ laga Y_t and $Y_{t+\tau}$ lags be dependent on length of τ value and independent on the time:

$$M(Y_t) = m,$$

$$D(Y_t) = M(Y_t - m)^2 = \sigma^2,$$

$$\gamma_t = M[(Y_t - m)(Y_{t+\tau} - m)] = \sigma^2 \rho(\tau)$$

Studies show that for a time lag to be stationary, its structure should not have a trend condition, seasonal component and random balance homoscedasticity. To check the stationaryness of time lags graphical analysis, as well as correlogram and single root tests can be used (Green, William G., 2016). Now, let's test the stationary nature of the time lags of tourism sector indicators shown in Table 1. In the process of our econometric research we tested the stationary time lags SG, TY and SA of the economic indicators of the tourism sector of the economy of the Republic of Azerbaijan, reflected in Table 1, using the correlogram method (This method is often called the ACF and PACF autocorrelation function method) (Hadjizalov Y.I, Huseynova L.N, 2013). To check the stationaryness of these lags The failure to use the Dick-Fuller single root test (This test is often called the DF, ADF, KPSS and PP test) is due to the small number of n observations in the time lags ($n = 15 < 25$). To assess whether the revenue (in thousand manats) earned by travel agencies is fixed in the SG time lags, first of all, let's look at the graphical description of the lags. (Figure 1)

Figure 1: Graphical description of travel agency revenues by time lags (SG lags)

According to the graphic description, this lag is non-stationary. So, as can be seen from the graph, there are additive leaps in the SG time lags in 2018 and 2019. Below is a correlogram showing the time lags (SG) test results of stationary income of travel agencies as shown in Table 1 (Figure 2).

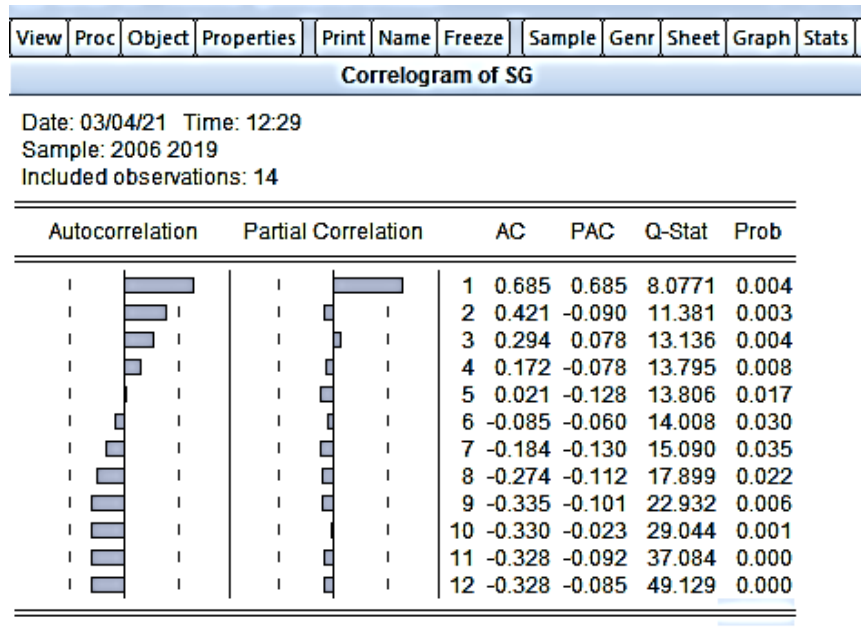

Figure 2: SG time lags correlogram

Analysis of the correlogram shows that the SG lag is not stationary because for this lag the value in ACF (1) approaches the unit, and then the correlogram decreases with a sinusoidal interval. So the lag is non-stationary. This lag is an integrated lag. If we use the increment function to bring the SG sequence to a stationary state, then we will obtain the following correlogram for this lag (DSG lag) (Figure 3).

Figure 3: DSG time lags correlogram

Analysis of the correlogram shows that the ACF and PACF values for the DSG lags do not exceed the 95% reliability limit and are stationary at the range levels. A graphical description of the time lags (TY time) of the number of sold tourist trips is as follows (Figure 4).

Figure 4: Graphical description of the TY time lags

This lag is non-stationary. Thus, as can be seen from the graph, there were additive leaps in 2012, 2013, 2014 and 2019. Analysis of the correlogram shows that the TY lag is not stationary, because for this lag the value in ACF (1) approaches the unit, then the correlogram gradually decreases along the sinusoid. So the lag is non-stationary. This lag is an integrated lag. If we use the growth function to bring the TY lags to a stationary state, we see that although there is a sharp increase in the ACC (1) and PACF (1) autocorrelation functions in the 3rd lags for this lag, such values are small and the values do not exceed 95% confidence intervals. If we analyze the time lags (SA lags) of the number of travel agencies in a similar way. According to the timeline graph, there has been a sharp increase in the indicator since 2015, according to the correlogram analysis, the value in ACF (1) is close to the unit, and then the correlogram gradually decreases on the extinct exponent. So the lag is non-stationary. Rather, this lag is an integrated lag. If we use the increment function to stabilize the SA lag, the SA lag is stationary with respect to the 1st difference in growth rate relative to the correlogram, because the values of the ACF and PACF functions do not exceed the confidence intervals. Now let's examine whether there is a cause-and-effect relationship between the indicators of the tourism sector involved in the study. Let's use the Granger test for this purpose. There were reflected the results of verification of the existence of a long-term relationship between the number of sold tourist trips and the natural logarithm of the time lags LN_TY between LN_SG lags, which is a natural logarithm of the SG time lag of income of travel agencies in the tourism sector in the table below by the Granger test (Table 2).

Pairwise Granger Causality Tests
 Date: 03/04/21 Time: 16:16
 Sample: 2006 2019
 Lags: 1

Null Hypothesis:	Obs	F-Statistic	Prob.
LN_SG does not Granger Cause LNTY	13	0.28495	0.6051
LN_TY does not Granger Cause LNSG		5.74801	0.0106

Table 2: Granger test statistics for LN_SG and LN_TY time lags

The test results show that the number of tourism trips sold has a significant impact on the revenue generated by travel agencies. Since $F\text{-Statistic} = 5.75 \Rightarrow p(F) = 0.01 < 0.05$, it can be assumed that the number of tourist trips sold plays a role in Granger's reason for the revenue indicator earned by travel agencies. This fact is consistent with economic theory. The income generated by travel agencies in the travel sector was tested by the Granger test for a long-term relationship between the natural log of the time lag SG, the LN_SG sequence, and the number of travel agents (Wooldridge J.M., 2012). The test statistics show that the number of travel agencies significantly affects travel agency revenues. Since $F\text{ statistic} = 20.54 \Rightarrow p(F) = 0.00 < 0.05$, it can be assumed that the number of travel agents plays a Granger causal role for the revenue generated by travel agencies. Taking all of the above into account, if we take the travel agency revenue as the dependent variable (dependent variable "y"), the number of travel package travel packages sold (free variable x1) and the number of travel agencies (free variable x2) sold as explanatory regressor, the mathematical description of the econometric analysis of the relationship between these indicators is as follows:

$$Y(SG) = -3385,86 + 0,118x_1(TY) + 133,99x_2(SA) \quad (1)$$

$P(0.17)(0.07) \quad (0.00)$

(1) The quality of the regression model is quite high. Since the value of the coefficient of determination is $R = 0.97$, the number of travel goods sold and the number of travel agency regressors account for 97% of the revenues received by travel agencies. However, it should be noted that according to this statistic, the number of tourist trips sold (TY) is insignificant (regressor x2) because $(P = 0.07 > 0.05 = \alpha)$. Therefore, taking the logarithm of the parameters included in the model (1), in terms of the exponent (based on $e = 2.71828$) let's built a new econometric model of this type:

$$LNY(LN_SG) = \beta_0 + \beta_1 LNX_1(LN_TY) + \beta_2 LNX_2(LN_SA) + \varepsilon \quad (2)$$

According to these statistics, the following logarithmic model is obtained.

$$LN_SG = 2.10 + 0.31LN_TY + 0.91LN_SA + \varepsilon \quad (3)$$

$P(0.07) \quad (0.03) \quad (0.00)$

The quality of the model is quite high. The coefficient of coefficient explains 95% of the revenue earned by travel agencies by the number of travel packages sold and the number of travel agencies, and all commentators are 95% significant. According to DW statistics, it falls into the zone of uncertainty ($0.905 < DW = 1.46 < 1.551$). (3) The correlogram of autocorrelation infection of the linear multi-regression model is shown below (Figure 5).

Figure following on the next page

Figure 5: (3) Correlogram of autocorrelation testing of a multi-regression model

Analysis of the correlogram shows that there is no first-order autocorrelation in the regression model (3). Thus, (3) the model of multi-regression can be considered as a model that fully meets the Gauss-Markov conditions and adequately reflects the real situation in the field of tourism. According to the economic interpretation of this model, a one-unit increase in the number of travel items sold increases the revenue of travel agencies by 0.31 units, and a one-unit increase in the number of travel agencies increases the revenue of travel agencies by 0.91 units. The high quality of the econometric model we have received allows us to use this model as an effective mechanism for forecasting the development of the tourism sector.

4. CONCLUSION

As a result of the unprecedented victory of the victorious Azerbaijani army over the Armenian invaders in the 44-day homeland war the new opportunities opened by the liberation of Garabagh and the restoration of its territorial integrity were considered. It was determined that, one of these new opportunities is in Aran and Nagorno-Garabagh, which have been liberated from the clutches of the enemy. As well as the development of the tourism sector in other regions of Azerbaijan. Therefore, the tourism sector of the country's non-oil sector was approached as a complex economic-cybernetic system and has been researched in terms of a systematic approach. The stability of the time lag of indicators related to the tourism sector was checked with the help of special tests and non-stationary time lag were brought to stationary time lag in the process of econometric analysis. With the help of the Granger test, it was determined whether there is a cause-and-effect relationship between the indicators of the tourism sector. In the process of econometric analysis, a multi-regression model was established to quantify the existing dependencies in the tourism sector and its quality was assessed using special tests.

ABSTRACT

In addition to providing macroeconomic balances for the economies of the country, sustainability of these balances has become an important issue. One of the issues raised in the recent period regarding sustainability is the concept of financial sustainability, which covers the sustainability of budget deficits and debts. Financial sustainability is recognized as a necessary condition for the co-ordination of a sound and consistent economic policy and monetary policy. An unsustainable fiscal policy carries risks that may cause economic growth to slow down due to high interest rates in the future. Azerbaijan left the USSR on October 18, 1991 and announced its independence. The main reason for the sound functioning of all institutions in the market economy is the regulations in banking and other financial institutions. The reason for this is that the market economy consists of banks and financial institutions. It is not correct to talk to the market system from a healthy transition without creating healthy financial institutions and realizing free banking system in the country. This study begins with the development of economic policies in Azerbaijan since 1991. For this purpose, the economic crises and policies implemented over the last twenty-seven years have been read from the example of Azerbaijan. The aim of the study is to empirically analyse the financial sustainability in Azerbaijan for the period 2006-2020. Firstly, unit root test was applied to the data used in the study and the results showed that the data were not stable at the levels. All variables were found to be static at first differences. The long-term co-integration relationship was then investigated using the Johansen (1988) test. Finally, Engle-Granger cointegration test were used to test financial sustainability. This study for the first time in the financial sustainability literature includes an innovative view. For the purpose of revealing the effects of public revenues and public expenditures separately, the analysis was performed by separating these items. The results show that the financial sustainability in Azerbaijan for the period 2007-2020.
Keywords: Azerbaijan Economy, Fiscal Policy, Sustainability, Financial Sustainability, Financial Competence, Government Budget Constraint, Unit Root Test, Co-integration Test

1. INTRODUCTION

The concept of sustainability nowadays means different things to different people, and a large part of humanity around the world still live without access to basic necessities. Sustainable development is often an over-used word, but goes to the heart of tackling a number of inter-related global issues such as poverty, inequality, hunger and environmental degradation. In theory, development that is not sustainable and not damaging to the planet is very possible (Augaitytė, 2013). In a world where environmental pollution has accelerated over the past 15 years, the philosophy of sustainability has become one of the most often debated topics.

Sustainability is described as achieving stability and economic development while saving the environment. Another concept of sustainable development is "meeting today's needs without jeopardizing future needs fulfilment" (Yeni, 2014). For more than 15 years, the idea of sustainability has become a major concern in many aspects of our lives. The term "financial sustainability" is a crucial part of the meaning of the term "sustainability." This idea is critical for future stability and economic development (Chapman, 2008). Following the global financial crisis, the topic of financial sustainability has become increasingly relevant, especially in developed and developing countries. Financial stabilization ensures that the country will be able to fulfil its loan repayment obligations as quickly as possible. Fiscal sustainability refers to how the government can finance its deficit in the future (Ilgun, 2015). The financial policy should be in line with current macroeconomic targets such as economic growth, inflation, payments. The purpose of this study is to define the concept of financial sustainability and to investigate whether financial sustainability is being achieved in Azerbaijan. This paper would look at how successful Azerbaijan's financial policies have been since independence. The paper contained a literature summary, an explanation of the principle of financial sustainability, and the analysis results in the final chapter.

2. FINANCIAL SUSTAINABILITY CONCEPT

Financial sustainability means that financial policies are also applicable in the future (Emirkadi, 2017). In recent years, most developing countries have increased public spending and have led to a significant increase in the public debt measured according to GDP. This debt accumulation questions the sustainability of budget imbalances in these countries after a major recession (Paniagua, Sapena, & Tamarit, 2017). The overdebt of the state restricts its choices, such as lending, printing money and taxation. That's why the state's overdebt savings are a problem. Therefore, fiscal sustainability is the issue that governments must always keep in mind (Akram & Rath, 2020). Financial sustainability does not have a single theoretical measure. In general, if the state is unable to pay its debt in the long term, it can be said to be unsustainable. The most commonly known and most commonly used definition is that the state cannot organize a pyramid chain (Rajan, Giap, & Yam, 2014). The state's total debt stock is often found in the way that the state's expenditures within a year are removed from revenues. Public expenditure is more than public income, which can result in a budget deficit. For financial policies to be sustainable, the budget deficit must be at a long-term payable level, but these policies should not create more debts (Yavuz, 2011). According to Ayshe Kaya (2013), fiscal sustainability is equal to one of the state's budget expenditures and revenues today. So, the budget deficits that can arise during a certain period and the budget surplus are balanced. Financial sustainability analysis is the discovery of the findings by investigating whether any financial and monetary policy set by the state is sustainable. If these policies are causing the debt to not be repaid, they are unsustainable. This time goes to state policy change (Emirkadi, 2017). Governments, on the whole, strive to find a financially viable direction that allows them to keep their debt under control. Although macro economists agree on the need for manageable debt ratios, they differ on the thresholds below which national debt becomes a threat to the economy (OECD, 2015). Fiscal sustainability is the ability of the state to obtain or maintain its own expenditures and revenues without Bording (Bolat, 2013). In some of the various studies on this issue, they are focusing on public income to ensure financial sustainability, while in other studies, they are focusing on public expenditure and expenditure. In this way, discussions are still being discussed about the definition of the concept of financial sustainability (Kokcu, 2016). There are many definitions of the concept of financial sustainability in the literature. The concept seeks to answer the question of whether current fiscal policies can continue in the future. However, research has concluded that it is difficult to measure financial sustainability.

If the current fiscal policy distances the state from the payoff force in the future, it can be perceived as unsustainable. Therefore, to measure the sustainability of finance, it is necessary to check the government's terms of affordability (Croce & Juan - Ramon, 2003). The concept of financial sustainability in literature is often used. If state policies can manage the country's budget correctly, the country is sustainable financially (Bolat, 2013). Financial sustainability policies can affect state income and expenses, private sector savings and investment behavior. To determine whether the current fiscal policy stance is sufficient to ensure sustainability, certain assumptions about the behavior of each of these variables are needed. Factors impacting income and interest rates, on the other hand, can limit the opportunity to begin financial restructuring in order to satisfy budget constraints (Croce & Juan - Ramon, 2003). But we need to know that the budget restriction has been provided is not necessary for financial sustainability, but not a sufficient requirement (Kokcu, 2016). There are factors that influence financial sustainability. Changes in the stock market are one of these effects. If the stock price increases, people start to consume more. Because these increases in stocks make consumers feel richer. Increased consumption means more sales. That means increased sales tax revenues. However, housing markets are one of the factors that influence financial sustainability. The increase in housing sales also leads to increased sales tax revenues. Of course, the decrease in stock prices and housing sales will also affect fiscal sustainability as it will reduce tax (Chapman, 2008). We face financial sustainability as the capacity to sustain the current financial situation without the need for regulations in tax or expense policies. In other words, financial sustainability can also be expressed as budgetary stability protection without serious deterioration in the balance of income and expenditure of the budget (Eroglu, 2019). Fiscal sustainability refers to how public debt evolves over time and where it is based as a percentage of GDP. In this scenario, one might argue that as long as the real interest rate exceeds real GDP inflation, the government's debt will continue to rise indefinitely. On the contrary, it is true. To reduce the debt-to-GDP ratio, economic growth must surpass interest rates if a government expects to offer a primary opening (Rajan, Giap, & Yam, 2014). As countries have some economic goals to do, it is important that they continue to achieve these goals. Financial sustainability is realized by continuing the economic goal in the long term (TUNA, 2017). Because the world debt crisis occurred in early 1980, various studies on the issue emerged during the 1990 years, and discussions on public debt have started to grow significantly. Fiscal sustainability is a mandatory analysis used by a state against excessive debt build-up (BOLAT, 2013). A few steps are taken to know if a country is financially sustainable. Fiscal sustainability is estimated based on several years of macroeconomic data (usually 5 years). Inflation, money supply, income, expenses, investment in this macroeconomic data, imports and exports and other factors are the property. Another step to measure sustainability is to estimate debts. The increased debt rate is one of the main reasons for concern. In this case, alternative scenarios will be required (Chalk & Hemming, 2000).

3. LITERATURE REVIEW

Recent concerns about global climate change, people in poverty, tensions brought by increasing social inequalities among societies have given more importance to sustainable development. Because the concept of sustainability exists in many places, different definitions have been introduced over time (Giovannoni & Fabietti, 2013). The concept of sustainability that is used in many areas means that it is about the human future and that the resources of its space are saved and protected (Ozer, 2015). Financial sustainability, which is the subject of the article, is defined differently by different researchers, so there is no definitive definition of the word (Rai, 2012). According to Ulf Papenfub (2014), public agencies and other entities are particularly expected to report accurately regarding money, tax, loans, and financial statistics deposited for financial sustainability.

According to Kuriyan and others (2006), the poor's wellbeing and the private sector's benefit can all be improved by financial sustainability. However, there is still the question of political danger. This vulnerability is a political charge that the government only supports the needs of special interests. If the government places so much emphasis on financial sustainability, merchants will be forced to deal with consumers who are able to pay a high price in exchange for high income. In the other hand, if the state places too much emphasis on the project's social growth path and entrepreneurs fulfill the poor's development needs, the state will be compelled to fund these entrepreneurs. According to Meltem Koylu (2017), the development of the economic system is undergoing strengthening of the financial structure. The financial system creates financial institutions that mediate financial markets and trading transactions. Payment terms and systems must be effective in order to improve financial relationships. Different financial institutions, banks, have a big role in this. Financial sustainability, according to Ibrahim Can (2019), is the long-term financial performance that allows a business to recover more than its financial resources that value each stakeholder, and the confidence to prevent financial problems that threaten it. According to Mirat Gecim (2020), good financial sustainability contributes positively to the country's well-being. It is essential that the management and control committees of the institution are completely transparent, responsible, reliable and fair, and that the institution is able to provide financial sustainability. Financial resilience, according to Eppich and Grinda (2019), can be evaluated in five categories: revenue identification, cost analysis, monitoring, strategic planning, and project support. The financial sector's growth, according to Memmedov and Ahmedov (2021), involves both financial expansion and financial deepening. The Azerbaijan state has created a financial support system for entrepreneurs to influence the country's financial sustainability. The Republic has begun to receive the results of its regulations. Since 2013, scientific studies on finance and economic structure have also seen a visible increase (Koylu, 2017). Mammadov (2020) has tried to show how exchange rate and stability in financial markets can stimulate the economy and entrepreneurship. In the research, the monetary policies used by the state were determined and discussed to see that the policies developed against devaluation were successful.

4. FINANCIAL SUSTAINABILITY ANALYSIS

Although several theoretical and empirical studies have been carried out on fiscal sustainability in recent years, it is observed that the number of studies carried out in Azerbaijan is very limited. However, monitoring financial sustainability in a country is a very important issue for a country. The target of monetary policy cannot be achieved without financial discipline. Unit root tests and cointegration testing are often used in financial sustainability research. We can assume that financial stabilization has been provided if the series are constant and there is a cointegration relationship between budget revenues and budget expenses (Al, 2019).

4.1. Method

In the analysis of financial sustainability, there are two basic methods: The method of economic indicators and the econometric method (Shen at al, 2010). In this study, it is preferable to use the econometric method because the results obtained have shown more precise findings in the analysis of financial sustainability. Unit root test (ADF and PP) and cointegration test (Engle-Granger) were used to analyze whether financial sustainability was achieved in the study. Studies using econometric methods, of course, require analysis of a long period (Al, 2019). The study used data for the period 2006-2020 on budget revenues and budget expenditures as a ratio to GDP. This data is quarter data and is obtained from the official site of the Azerbaijan Central Bank.

4.2. Unit root analysis

This method is a standard approach to testing the sustainability of budget deficits and has been used in many studies. The unit root test method can be applied to series as well as the budget deficit series, as well as to series of budget deficits for the past years and total interest payments that constitute a significant part of public expenditure, to test whether financial sustainability exists. The following are the Augmented Dickey-Fuller (ADF) and Phillip-Perron (PP) unit root tests for the series selected to test whether there is financial sustainability in Azerbaijan. The ADF and PP tests use a method that controls high-degree autocorrelation in the series. The PP unit root test has been developed as a method that takes into account the impact of a structural change (structural break) in the series (Shen et al., 2010). Therefore, the series have been tested for ADF and PP unit root respectively. Unit root tests have been applied to the corresponding series and the findings obtained are presented in Table 1;

R = Income G = Spending		ADF		PP	
		Intercept	Trend and intercept	Intercept	Trend and intercept
R	Level	-6.084274 [0.0000] (0)	-6.374004 [0.0000] (0)	-6.033437 [0.0000] (2)	-6.339188 [0.0000] (2)
	1st difference	-11.33275 [0.0000] (2)	-11.23390 [0.0000] (2)	-26.77329 [0.0001] (25)	-27.27736 [0.0001] (24)
G	Level	-6.669761 [0.0000] (0)	-2.109616 [0.5292] (3)	-6.669778 [0.0000] (2)	-7.355506 [0.0000] (2)
	1st difference	-11.93266 [0.0000] (2)	-11.81549 [0.0000] (2)	-25.36225 [0.0001] (14)	-25.06086 [0.0001] (14)

Table 1: Unit root test results

(Source: compiled by the authors on the basis of: stat.gov.az, cbar.az, <http://etsim.az/> (accessed on 10.04.2021))

Figure following on the next page

Figure 1: Unit Root Graph R/GDP

(Source: compiled by the authors on the basis of: stat.gov.az, cbar.az, <http://etsim.az/> (accessed on 10.04.2021))

Figure 2: Unit Root Graph R/GDP

(Source: compiled by the authors on the basis of: stat.gov.az, cbar.az, <http://etsim.az/> (accessed on 10.04.2021))

In the table, the values in the brackets show the probability values and the values in the other second parenthesis show the appropriate lag lengths. Both variables are constant. Therefore, the Engle-Granger cointegration test can be used to investigate the cointegration relationship between the relevant variables.

4.3. Engle-Granger test

In the case of a constant combination of two universally integrated series at the same level, the Engle and Granger test is often used in the literature for testing the cointegration relationship that is stated to exist between the two series (AL, 2019). The long-term relationship between budget revenues and budget expenditures has been tested by Engle-Granger cointegration testing and findings have been presented in Table 2;

Dependent variable	Independent variable	t-Statistic	Probability
R	G	-8.794014	0.0000
G	R	-13.71920	0.0000

Table 2: Engle-Granger test results

(Source: compiled by the authors on the basis of: *stat.gov.az*, *cbar.az*, <http://etsim.az/> (accessed on 10.04.2021))

The empty hypothesis in the Engle-Granger cointegration test is “H0: No cointegration between the series”, while the alternative hypothesis is “H1: cointegration between series”. According to the data in the table, H0 hypothesis is rejected. Therefore, the series in question are cointegrated. This result shows that financial sustainability has been achieved in Azerbaijan.

5. CONCLUSION

Fiscal sustainability demonstrates that the government's available fiscal policies can continue to be effective in the future. The government, which cannot pay its debts in the long term with existing policies, is deemed unable to provide financial sustainability. In this study, it has been investigated whether financial sustainability is maintained in Azerbaijan. The quarterly data on GDP, budget revenues and budget expenditures that are relevant to the research purpose 2006-2020 was taken from the official website of the Azerbaijan Central Bank and included in our work. The existence of a cointegration relationship between budget revenues and budget expense sequence has been investigated in this regard. The ADF and PP unit root tests were run first, and the series concluded that they are constant. Due to the constant of both factors, the Engle-Granger cointegration test was determined to be feasible. According to the findings obtained from this cointegration test, these variables are cointegrated. The fact that there is a cointegration between budget variables is interpreted as providing financial sustainability. According to the Engle-Granger cointegration measure, Azerbaijan is financially sustainable in this sense.

ABSTRACT

The main purpose of our research is to investigate how the crisis created by the COVID-19 pandemics has an impact on certain sectors in the Stock Exchange Istanbul. In order to conduct our investigation, we used data from shares of companies that have been traded for at least six years, starting in 2015. Investors' portfolios were compared before and after the pandemic to see if there were any discrepancies in stock selection. In our research, 4 sectors, 4 companies, and 16 shares were used in total. Data obtained from the "Borsa Istanbul (BIST-100)" index was covered in 2 periods: i) COVID -19 pre-pandemic period – 2015-2020 and ii) COVID-19 pandemic period – 2020-2021. The daily returns of shares and the covariance matrix were calculated with the help of Microsoft Excel. The covariant matrix is obtained using Excel Solver (Microsoft Excel Add in). The remainder of the work was completed in MATLAB R2016b using the genetic algorithm process. Simple genetic algorithms and multipurpose genetic algorithms are the two types of genetic algorithms used in MATLAB. Using the multipurpose genetic algorithm, you can use two different functions. The first is to reduce risk, and the second is to increase profit. The results of the MATLAB analysis have been interpreted, and the results have been collected. There were variations between pre and post pandemic as a result of the study. Significant variations were observed in the wholesale, retail, and industrial sectors before and after the pandemic, although minor improvements were observed in the banking and aerospace sectors. During the pre-pandemic and post-pandemic periods, the shares that will be weighted in the portfolio in the wholesale, retail, and industrial sectors have changed dramatically.

Keywords: *portfolio optimization, genetic algorithm, COVID-19, pandemic*

1. INTRODUCTION

At least two shares are included in the portfolio. Investors and fund managers strive for a portfolio that yields the highest possible return while posing the least amount of risk. According to traditional theory, lowering portfolio risk is a crucial criterion for determining the best portfolio and must be varied to do so (ÇANKAL, 2015). Markowitz's model gave birth to modern portfolio theory, which considers the importance of risk and potential returns, as well as their equilibrium. Markowitz's Modern Portfolio theory is synonymous with the phrase "don't throw all the eggs in one basket." The most critical factor for an investor, according to Markowitz, is that the portfolio's valuation is maximized. He does, however, want to minimize his risk. As a result, investors often diversify their portfolios to reduce risk. Thereby That the creditor is not totally ruined if the value of one of the shares in the portfolio sinks too much. Investing in other shares allows you to diversify your portfolio and reduce risk. As a consequence, Markowitz's Mean-Variance model, which he added to the literature, helps us to maximize return while minimizing risk. There are many approaches to portfolio optimization, but genetic algorithms are the most powerful and efficient. In physics, economics, and other fields, genetic algorithms are often used to solve optimization problems.

Selection, crossover, and mutation operators affect the performance of genetic algorithms. As a consequence, these operators have been subjected to research and development (Kroll & Liu, 2016). The purpose of this study is to create portfolios with the multipurpose genetic algorithm and to compare the pre-pandemic and pandemic period of the portfolios created in 4 specific sectors.

2. PORTFOLIO MANAGEMENT

The term "portfolio" refers to a set of shares for investment purposes. According to portfolio theory, investors want to minimize risk while maximizing return (REILLY & BROWN, 2012). The first aim in fund management is to choose from a range of securities the best investments for risk and return for the portfolio (Tung & Jo, 2020). The most important risk that an investor takes is the risk of porföy. If each investor had to choose between the two securities, he or she would choose the one with the lowest risk in terms of equivalent returns. Using the same rationale, if he has to pick between two securities of equivalent risk, he will choose the one with the highest yield (REILLY & BROWN, 2012). The majority of investors are concerned with selecting securities for inclusion in the portfolio, assigning weights to them, and combining these securities to satisfy risk/return criteria. Having too many securities in the portfolio means diversification of the portfolio. The benefit of portfolio diversification is that instability is minimized and if the value of one security decreases, the value of others will rise to compensate (Wiksuana, Artini, Rahyuda, & Purnawati, 2019). Securities included in the portfolio are usually made up of stocks, bonds and alternative investment tools (Michaud & Michaud, 2008). It is very difficult to keep track of a portfolio of various investing tools and shares through various industries. That in this situation, the investor must be aware of the progress of each sector to keep track of any changes (Wiksuana, Artini, Rahyuda, & Purnawati, 2019).

2.1. Modern portfolio theory

Only diversification was proposed in traditional theory for reducing risk in fund management. Markowitz created the first statistical model for fund management that took a risk and return into account (Goldfarb & Iyengar, 2003). Markowitz devised a method for calculating the portfolio's cost and return. The relationship between shares (correlation), according to Markowitz, should be included in the portfolio (CURTIS, 2004). Markowitz argues that securities with negative correlation should be found in a portfolio, as the price of positive correlation securities varies simultaneously (Tung & Jo, 2020). Markowitz's Mean-variance model consists of the fact that the portfolio returns are kept constant at a certain value and the weight that makes the portfolio risk a minimum. The weights are determined by the formula to provide the investor with a low return for high risk and a high return for low risk (Altaylıgil, 2008). The following are the formulas for Markowitz's mean-variance model, i.e. risk and predicted returns:

$$\text{Minimization} = \sum_{i=1}^n \sum_{j=1}^n x_i x_j \sigma_{ij} \leq \text{Risk}$$

$$\text{Maximitation} = \sum_{i=1}^n x_i r_i \geq \text{Return}$$

Where x_i refers to the weight of the property value within the portfolio, the weight of the x_j j property value in the portfolio, the covariance value between the σ_{ij} two securities, and r_i refers to the expected return of the i property value.

3. GENETIC ALGORITHMS

Genetic algorithms are a technique that provides a natural solution to optimization problems. Developed by Holland in GA 1960, later defined by Goldberg (1989) (Lin & Gen, 2007). In genetic algorithms, the population is made up of chromosomes, and chromosomes are made up of genes. Genes are considered the basic building blocks of algorithms. The chromosome made up of genes is used in genetic algorithms to encode the solution (Mirjalili, 2019). The first step in the implementation of a genetic algorithm is to produce a population of chromosomes, which is normally done at random. The scale of the population is one of the most important topics in genetic algorithms (Lin & Gen, 2007). The genetic algorithm contains 3 basic processes: Selection, crossover and mutation. GA is research algorithms that apply the evolution mechanism with the help of these operators. Instead of a single solution to problems, these algorithms produce a set of solutions consisting of different solutions (ÖZTÜRK , PAKSOY, & ÖZTÜRK, 2018). Given the need for a partner to be chosen in genetic algorithm operators, we can say that this is based on the principle that the most appropriate one should survive. To produce new chromosomes, the chosen chromosomes are added to the mating pool (Kramer, 2017). Crossover, a second operator from GA operators, combines the characteristics of two chromosomes to form a new generation (Lin & Gen, 2007). Mutation - the third GA operator, has the function of changing one or more genes in the chromosome. This is used to preserve genetic diversity (Chakroborty, Roy, & Seal, 2015).

4. PORTFOLIO OPTIMIZATION USING GENETIC ALGORITHM

Genetic algorithms are an approach that finds a valid solution to optimization problems in finance and many other areas. When used in portfolio optimization, each chromosome represents the weight of assets in the portfolio (Chang, Yang , & Chang, 2009). The GA delivers faster and more reliable results in problem resolution than other techniques. Pandemic, war and other extraordinary events have an impact on investors' portfolio selection. Some companies are positive from these extraordinary events, some are negative, others are not affected at all. The main purpose of our research is to investigate how the crisis created by the COVID-19 pandemic has an impact on certain sectors in the Stock Exchange Istanbul. The data of the shares of companies that have been traded for 6 years since 2015 has been used by the purpose of our investigation.

4.1. Method

In our study, the genetic algorithm method was used to solve the portfolio optimization problem. The multipurpose genetic algorithm in the optimization tool of the MATLAB R2016b program was used for the study. In MATLAB, the genetic algorithm can be used in 2 types: Simple genetic algorithms and multipurpose genetic algorithms. It is possible to use two purpose functions using the multipurpose genetic algorithm. The first is to minimize the risk and the second is to maximize the return. The daily and average returns of shares were found by the statistical operations section in the formulas section of the Excel program. The covariant matrix was obtained using Excel Solver. The other part of our work has been carried out in MATLAB R2016b.

4.2. Analysis Results

In the application section, the program was run separately in 2 different periods for each sector. The number of shares in the portfolio and the weight of each stock was found with the help of the program. 6 different portfolio has been created for each sector. Findings before the COVID-19 pandemic for the wholesale and retail sector are shown in Table 1;

			BIM	MGROS	SELEC	BIZIM
Getiri	Varyans	H.S.Say	x_1	x_2	x_3	x_4
0.010	0.019	3	0.101	0.588	0.311	0.000
0.015	0.028	3	0.507	0.083	0.000	0.410
0.020	0.032	3	0.348	0.000	0.251	0.401
0.025	0.084	2	0.457	0.000	0.000	0.525
0.030	0.070	3	0.580	0.075	0.000	0.345
0.035	0.087	3	0.605	0.379	0.016	0.000

Table 1: Findings before the COVID-19 pandemic for the wholesale and retail sector

Table 1 contains 6 different portfolios. These portfolios were acquired in the MATLAB program using genetic algorithms. Share weights vary in the portfolio obtained. For example, the variance of the portfolio providing 0.01 returns was calculated as 0.019. This portfolio consists of 3 shares. The highest weight (0.588) in this portfolio is given to the MGROS stock. Other portfolios can be interpreted like this. When the 6 portfolios is considered, the total maximum weight in the pre-pandemic wholesale and retail sector was found in the BIM stock. One of the things to be aware of is the increased risk of the portfolio as diversification decreases. If it is necessary to choose the optimum portfolio for the pre-pandemic retail sector, this portfolio will consist of 3 shares, with a return of 0.020 and a portfolio at risk of 0.032. Findings before the COVID-19 pandemic for the industrial sector are shown in Table 2.

			ARCLK	TUPRS	PETKM	CEMTS
Getiri	Varyans	H.S.Say	x_1	x_2	x_3	x_4
0,010	0,022	2	0,000	0,291	0,709	0,000
0,015	0,052	3	0,551	0,203	0,246	0,000
0,020	0,068	3	0,101	0,308	0,591	0,000
0,025	0,088	2	0,000	0,811	0,189	0,000
0,030	0,085	2	0,000	0,542	0,458	0,000
0,035	0,122	2	0,000	0,956	0,000	0,044

Table 2: Findings before the COVID-19 pandemic for the industrial sector

Table 2 contains 6 different portfolios. These portfolios were acquired in the MATLAB program using genetic algorithms. Share weights vary in the portfolio obtained. For example? the variance of the portfolio providing 0.015 returns was calculated as 0.052. This portfolio consists of 3 shares. The highest weight (0.551) in this portfolio is given to the ARCLK stock. Other portfolios can be interpreted like this. When the 6 portfolios is taken into account, the total maximum weight in the pre-pandemic industry was found in the TUPRS stock. If it is necessary to choose the optimum portfolio for the pre-pandemic industry sector, this portfolio will be 3 shares, with a return of 0.020 and a portfolio at risk of 0.068. Findings before the COVID-19 pandemic for the banking sector are shown in Table 3.

Table following on the next page

			SKBNK	GARAN	YKBNK	ISCTR
Getiri	Varyans	H.S.Say	x_1	x_2	x_3	x_4
0,010	0,031	2	0,266	0,000	0,000	0,734
0,015	0,040	3	0,476	0,208	0,000	0,316
0,020	0,087	2	0,841	0,000	0,159	0,000
0,025	0,092	2	0,666	0,000	0,000	0,334
0,030	0,097	3	0,574	0,240	0,000	0,185
0,035	0,119	3	0,143	0,760	0,000	0,097

Table 3: Findings before the COVID-19 pandemic for the banking sector

Table 3 contains 6 different portfolios. These portfolios were acquired in the MATLAB program using genetic algorithms. Share weights vary in the portfolio obtained. For example, the variance of the portfolio providing 0.015 returns was calculated as 0.040. This portfolio consists of 3 shares. The highest weight (0.476) in this portfolio is given to the SKBNK stock. Other portfolios can be interpreted like this. When the 6 portfolios was taken into account, the total maximum weight in the pre-pandemic banking sector was found to be in the SKBNK stock. If it is necessary to choose the optimum portfolio for the pre-pandemic banking sector, this portfolio will be 3 shares, with a return of 0.015 and a portfolio at risk of 0.040. Findings before the COVID-19 pandemic for air transport sector are shown in Table 4.

			THYAO	PGSUS	CLEBI	TAVHL
Getiri	Varyans	H.S.Say	x_1	x_2	x_3	x_4
0,010	0,033	4	0,065	0,474	0,144	0,317
0,015	0,058	2	0,000	0,000	0,835	0,165
0,020	0,063	2	0,000	0,235	0,582	0,183
0,025	0,083	3	0,078	0,000	0,645	0,277
0,030	0,063	3	0,070	0,000	0,492	0,438
0,035	0,094	3	0,150	0,000	0,757	0,093

Table 4: Findings before the COVID-19 pandemic for air transport sector

Table 4 contains 6 different portfolios. These portfolios were acquired in the MATLAB program using genetic algorithms. Share weights vary in the portfolio obtained. For example, the variance of the portfolio providing 0.010 returns was calculated as 0.033. This portfolio consists of 4 shares. The highest weight (0.474) in this portfolio is given to the PGSUS stock. Other portfolios can be interpreted like this. When the 6 portfolios are considered, the total maximum weight in the pre-pandemic transport sector was found to be in the CLEBI share. If it is necessary to choose the optimum portfolio for the pre-pandemic transport sector, this portfolio will be 3 shares, with a return of 0.030 and a portfolio at risk of 0.063. The findings for the COVID-19 pandemic period for the wholesale and retail sector are shown in Table 5.

			BIM	MGROS	SELEC	BIZIM
Getiri	Varyans	H.S.Say	x_1	x_2	x_3	x_4
0,010	0,041	3	0,800	0,176	0,000	0,024
0,015	0,036	3	0,285	0,687	0,028	0,000
0,020	0,061	3	0,652	0,234	0,115	0,000
0,025	0,074	3	0,586	0,352	0,000	0,062
0,030	0,053	3	0,179	0,376	0,445	0,000
0,035	0,069	3	0,231	0,203	0,561	0,000

Table 5: Findings for the COVID-19 pandemic period for the wholesale and retail sector

Table 5 contains 6 different portfolios for the period of pandemic. These portfolios were acquired in the MATLAB program using genetic algorithms. Share weights vary in the portfolio obtained. For example: The variance of the portfolio providing 0.020 returns was calculated as 0.061. This portfolio consists of 3 shares. Other portfolios can be interpreted like this. When the 6 portfolio was taken into account, it was observed that in the retail sector, the highest total weight was in the SELEC stock during the pandemic period. Before the pandemic, BIM was replacing this stock. If it is necessary to select the optimal portfolio for the retail sector during the pandemic period, this portfolio will be 3 shares, with a return of 0.030 and a portfolio at a risk of 0.053. Findings for the COVID-19 pandemic period for the industrial sector are shown in Table 6.

			ARCLK	TUPRS	PETKM	CEMTS
Getiri	Varyans	H.S.Say	x_1	x_2	x_3	x_4
0,010	0,079	3	0,644	0,243	0,000	0,113
0,015	0,057	3	0,256	0,572	0,171	0,000
0,020	0,062	2	0,734	0,266	0,000	0,000
0,025	0,067	3	0,279	0,237	0,000	0,484
0,030	0,076	3	0,021	0,000	0,035	0,944
0,035	0,077	3	0,000	0,101	0,266	0,633

Table 6: Findings for the COVID-19 pandemic period for the industrial sector

Table 6 contains 6 different portfolios for the period of pandemic. These portfolios were acquired in the MATLAB program using genetic algorithms. Share weights vary in the portfolio obtained. For example: The variance of the portfolio providing 0.015 returns was calculated as 0.057. This portfolio consists of 3 shares. The highest weight (0.572) in this portfolio is given to the TUPRS stock. Other portfolios can be interpreted like this. When the 6 portfolio was taken into account, CEMTS stock was found to have the highest overall weight in the industrial sector during the pandemic period. Before the pandemic, TUPRS was replacing this stock. If it is necessary to choose the optimal portfolio for the industrial sector during the pandemic period, this portfolio will consist of 3 shares, with a return of 0.035 and a portfolio at a risk of 0.077. Findings for the COVID-19 pandemic period for the banking sector are shown in Table 7;

			SKBNK	GARAN	YKBNK	ISCTR
Getiri	Varyans	H.S.Say	x_1	x_2	x_3	x_4
0,010	0,023	2	0,251	0,000	0,000	0,749
0,015	0,055	3	0,428	0,000	0,472	0,100
0,020	0,092	2	0,613	0,000	0,387	0,000
0,025	0,089	2	0,591	0,000	0,000	0,409
0,030	0,056	3	0,568	0,183	0,000	0,249
0,035	0,090	2	0,599	0,000	0,000	0,401

Table 7: Findings for the COVID-19 pandemic period for the banking sector

Table 7 contains 6 different portfolios for the period of pandemic. These portfolios were obtained in MATLAB by means of genetic algorithm. Share weights vary in the portfolio obtained. For example: The variance of the portfolio providing 0.030 returns was calculated as 0.056. This portfolio consists of 3 shares. The highest weight (0.568) in this portfolio is given to the SKBNK stock. Other portfolios can be interpreted like this.

When the 6 portfolios were taken into account, the total weight in the banking sector during the pandemic period was found to be in the SKBNK stock. The SKBNK shares remain the industry leader in the banking sector before and during the period of the pandemic. If it is necessary to choose the optimum portfolio for the banking sector during the term of the pandemic, it will be a portfolio of 3 shares, with a return of 0.030 and a risk of 0.056. Findings for the COVID-19 pandemic period for the air transport sector are shown in Table 8.

			THYAO	PGSUS	CLEBI	TAVHL
Getiri	Varyans	H.S.Say	x_1	x_2	x_3	x_4
0,010	0,046	3	0,653	0,000	0,067	0,280
0,015	0,059	3	0,393	0,184	0,424	0,000
0,020	0,083	3	0,068	0,000	0,638	0,294
0,025	0,099	2	0,302	0,000	0,698	0,000
0,030	0,083	2	0,492	0,000	0,508	0,000
0,035	0,087	3	0,266	0,055	0,685	0,000

Table 8: Findings for the COVID-19 pandemic period for the air transport sector

Table 8 contains 6 different portfolios for the period of pandemic. These portfolios were acquired in the MATLAB program using genetic algorithms. Share weights vary in the portfolio obtained. For example: The variance of the portfolio providing 0.015 returns was calculated as 0.059. This portfolio consists of 3 shares. The highest weight (0.424) in this portfolio is given to the CLEBI share. Other portfolios can be interpreted like this. When the 6 portfolios were taken into account, the total weight in the transport sector during the pandemic period was found to be in the CLEBI share. CLEBI shares remain the industry leader in the transport sector before and during the period of pandemic. If it is necessary to choose the optimum portfolio for the transport sector during the pandemic period, this portfolio will be 3 shares, with a return of 0.035 and a portfolio at risk of 0.087.

5. CONCLUSION

In this study, GA is used to solve the portfolio optimization problem since it provides more reliable results than other methods. In the study, Markowitz's Mean-Variance model was tried to be optimized with a multipurpose genetic algorithm. Within the scope of the study, daily data of shares included in BIST-100 was obtained for the period 2015-2020 and 2020-2021. Based on daily data, daily returns were then calculated for the average return on each stock. The covariance matrix was then calculated using Excel Solver. The resulting covariance matrix and returns have been entered into the MATLAB program within the purpose function. The program was run after the constraints were included. The variance was used as a risk criterion in the study. The program has calculated the minimum risk for a specific return rate and how much weight should be given to each share. The calculation result was 6 different portfolios with the reputation of each sector and period. Industry leader has varied between pre-pandemic and pandemic period in the Retail and Industry sectors. Prior to the pandemic, it was seen that it was a retail sector-leading BIM stock and an industry-leading TUPRS. During the period of the pandemic, it was seen that it was a retail sector leader SELEC stock and that it was an industrial sector-leading CEMTS. Although there are differences in the banking and transport sectors, industry leaders remain the same. Other results are shown in the tables and their descriptions.

THE HUMAN CAPITAL AND THE PROBLEMS OF ITS DEVELOPMENT IN CONTEMPORARY AZERBAIJAN

Alijan P. Babayev

*Professor, Head of the department of “Economic Theory”,
Azerbaijan State University of Economics (UNEC), Azerbaijan
ababayev@rambler.ru*

ABSTRACT

The author suggests and proves the possibilities and perspective ways of further development of human capital in contemporary Azerbaijan. The author also reminds of theoretical sources of the very category “human capital” in economic science as far as about its appearance in practice; there is also given the estimation of meaning of “The Human Capital Index” in international comparisons. In his analysis of current situation in the Republic of Azerbaijan the author emphasizes current tasks connected with the struggle against covid-19 viral epidemic consequences alongside with long-range tasks of improving the life conditions and life activities of the population according to situation in our country. The special attention is given to priorities in suggested governmental policy in social activities; according to this analysis the author also suggests such term as social competitiveness of national state in sharpening global competition in contemporary world. According to special position of such branches of social activities as healthcare and education which define general situation of human capital in contemporary state, the author explains those achievements of Azerbaijan in these branches since 2010 which were marked on international level. Then he proves possible directions of their further development in the nearest years as far as in long-range future and also suggests some concrete measures of such development.

Keywords: *human capital, qualitative development of the human capital, improving the life conditions of the population, social competitiveness of national state, prior directions of governmental policy in social activities, healthcare and education*

1. INTRODUCTION

Today, the whole world is facing not only the problem of overcoming the severe consequences of the global economic crisis caused by the covid-19 viral pandemic, but also the choice of a new long-term development paradigm. At the same time, it is already obvious that the economic recovery itself can stretch into two stages. The first stage involves the gradual resumption of economic activity in the context of directly overcoming the dangers of a sluggish pandemic, the threat of relapses of which has not passed at all, as evidenced by the situation in a number of countries, including our neighbors. During the second stage, the socio-economic losses incurred as a result of the pandemic are actually compensated.

2. THE TERM “HUMAN CAPITAL”: HISTORY AND CONTENTS

According to abovementioned, it is necessary to make some important remarks. First, today it is already becoming clear that the entire process of economic recovery will require not one or two, but a number of years. At the same time, the choice of a long-term development strategy assumes that it will not begin to be implemented "sometime in the future", but should already cover the specified recovery period and extend to subsequent years, which – as it is now clear – will differ in new approaches to the problem of economic growth itself. In this regard, and secondly, it should be noted that one of the leading components of the new growth will be the unevenness of the future sectoral and branch development. This means that not all sectors and areas of the national economy and specific industries will make up for today's losses by already proven methods, achieving a purely quantitative recovery.

In some cases, obviously, this will be possible, but for other industries and industries, the priority will be not just survival, but a qualitative breakthrough under new conditions and with new components. This task is extremely difficult, but its implementation will be able to provide a truly qualitatively new stage of economic growth in the future. And in these conditions, the most important distinguishing feature of the new stage of economic growth will be its indispensable strongest social component. In these circumstances, the quantitative and, to an even greater extent, qualitative improvement of human capital becomes, without exaggeration, of key importance, it assumes the most harmonious and comfortable and at the same time sustainable development of the entire human habitat and life activity, designed, as we have already said, for the long term. Based on this, we can conclude that it is the comprehensive improvement of a person as the main subject of all economic and social activities that becomes not just important – which has already been the case for a long time - but a decisive condition for the success of the entire subsequent stage of economic development. Human capital has been discussed for decades and on various international platforms. In this regard, it should be recalled that the very concept of "human capital" originally appeared in Western economics at the turn of the 50s-60s of the last century; in particular, it is actively used by such prominent representatives of the neoclassical school in economic theory, as T. Schultz and G. Becker, who later became Nobel Prize laureates in economics. In their collective monograph "Human Capital and Education", dedicated to this issue, the scientists of Moscow University note that the approach of T. Schultz and G. Becker differs in that they focused their economic analysis on the "new quality of the human factor" in the conditions of the modern scientific and technological revolution. What is the expression of this "new quality"? First of all, as the authors of this monograph believe, "in the growing level of labor skills and professional knowledge, which are, first, the result of the development of education and provide, second, a high increase in labor productivity» [1,p.10]. At the same time, it must be remembered that much earlier, the question of the abilities of a person as a subject of production was repeatedly addressed by the classics of political economy W.Petty, A. Smith, D. Ricardo. Thus, W. Petty used the category of "living active forces of man" [2, p. 324], which can be interpreted as a kind of forerunner of the concept of "human capital". Subsequently, prominent representatives of other scientific schools also addressed similar concepts in relation to various aspects of analysis. Nevertheless, for all the seemingly elaborate development of this term in the literature and in the socio-economic practice of the last decades, there is still virtually no canonical, verified definition of this concept. At the same time, just as "in fact", at present, the category of "human capital" both in scientific circles and in international organizations includes the totality of physical and spiritual capabilities of a person, as well as – what is very important to emphasize – the dynamics of their changes at the national and state level. At the same time, the specified population itself can be considered both from the quantitative and mainly qualitative side. Here, too, there are possible options. For example, according to Professor Paul Savchenko (Russian Academy of Sciences), human capital can be quantified as the value of the accumulated human capital [3, p. 249]. Developing this idea of Prof. Savchenko, we can assume that in general, such a "human fund" consists of a set of physical, social and spiritual potentials of an individual, which he receives at birth and increases in the course of subsequent life. In turn, it is natural that the degree and the very possibilities of such an increase directly depend on the quality of functioning of each of the national-state levels in the modern world, on what each of the states is able to offer the individual for his self-realization. In other words, the quality of public administration in general and the socio-economic policy pursued by the state ultimately have a decisive impact on the development and improvement of human capital. That is why, for several years now, following the long-familiar measurement of the country's human development index (HDI), which includes a number of indicators (such as GDP per capita production, average life expectancy and the level of education of citizens), a special report "Human Capital Index" for

countries of the world is published annually at the international level. The calculation of this index includes such important indicators for the very existence and development of a person as:

- life expectancy ("survival rate") of the country's population as a whole and separately by age group;
- estimations of the quality of education and health care.

As we can see, this index – in contrast to the same HDI - is a more objective indicator, since it focuses specifically on the human dimension in the development of nation-states, does not include quantitative macroeconomic indicators, focusing on qualitative results. We can say that the human capital index shows the social competitiveness of the national state in the conditions of general aggravation of competition. This study is conducted by the World Bank, and the number of States covered by it increases every year. The latest at the moment "Human Capital Index 2020" (World Bank Group. – The Human Capital Index. 2020. Update), published in September last year, contains data for 174 countries, which allows us to draw the most reasonable and reasoned conclusions about the place of each country in the field of ensuring the quality of life of the population and specifically about the progress made in this area.

3. ACHIEVEMENTS OF HUMAN DEVELOPMENT IN AZERBAIJAN

According to this international rating, Azerbaijan is in the top ten countries where the rate of human capital growth has been the highest since 2010. It is particularly important to note that the greatest contribution to such a high assessment of our country was made by the progress made in Azerbaijan in the field of education and health [4]. Thus, we see confirmation of the above-mentioned fact that this international index allows us to truly evaluate, first of all, qualitative, rather than quantitative results in improving human life, and to show them in dynamics, that is, to demonstrate the comparative significance of certain social results on a global scale. Let's start with health care, taking into account the specifics and acuteness of the current moment, as well as the most important fact that it is precisely because of the specifics of the moment that the requirements that are currently being placed on the problem of improving our entire national economy are focused on health care. Let's turn to the statistics. During the period covered by the international study we are considering, the volume of budget financing of healthcare in our country in quantitative terms increased from 429.2 million manats in 2010 to 709.9 million manats in 2018, or about 1.65 times [5, p. 400]. The growth itself is considerable in the context of the constant turbulence of the world economy that took place during this period, and the impact of global crisis phenomena on our national economy. Not all – even much more developed and formally rich-countries of the world can demonstrate comparable growth during this period. However, we emphasize once again that as we see there are not only these quantitative indicators that have influenced the high assessment of Azerbaijan's success in the field of human capital development. Speaking about health care, we mean the obvious qualitative improvement of medical services for the population of the Republic of Azerbaijan. Let's take for example such a fundamentally important indicator as periodic inspections. In the period from 2010 to 2018 inclusive, the total number of annual medical examinations increased: from 3.35 million people to more than 3.7 million people, respectively. Regular preventive medical examinations are in themselves a huge social achievement of modern society, and the increase in their number shows the real concern of the national state for its population. However, even here, the qualitative component of this phenomenon is of great importance. So, if we consider this indicator for individual age categories, we will see, for example, a significant increase in preventive medical examinations for young people aged 18 to 29 years – from 270.6 thousand to 326 thousand annually, that is, more than 1.2 times. As we can see, almost all the student youth of Azerbaijan falls into this sample, which is extremely important from the point of view of improving the human condition

of our people, since it is at this age that, on the one hand, the final physical formation of a person takes place, on the other hand, the spiritual and intellectual formation of him not only as a qualified specialist in. An equally important component of the indicator of periodic medical examinations concerns the categories of persons aged 30 years and older. In the period we have noted – from 2010 to 2018 - the number of such "age" examinations increased as much as possible, almost 1.4 times – from 713 thousand to 975 thousand people [6, p.75]. This fact should be emphasized in particular. The detail we have noted is of fundamental importance because we are talking about those age categories (especially not even 30-year-olds, but people of older ages) for whom periodic medical examinations are not just particularly significant, but sometimes literally vital. Therefore, a well-formed and effectively functioning national system of regular medical prevention can rightly be considered as a significant contribution to the increase and improvement of human capital. This trend towards an increase in medical examinations for older people, which in itself – as we have seen – is important and has been outlined, as we can see, even in the pre-crisis period, today, after all that happened in 2020, it is becoming extremely significant. On the one hand, the practice of the past 2020 showed that older age groups of the population were more exposed to the covid-19 virus, and this in itself requires more medical attention. On the other hand, older people are objectively characterized by chronic diseases that are dangerous in themselves, but which, in combination with infection with the same covid-19 virus or simply escalating in a tense situation, pandemics threaten much greater dangers for their health and life itself. Therefore, it seems to us that the prevention of such serious diseases as cardiovascular diseases or diabetes mellitus, which was previously "under control" by the medical community, is now becoming one of the priorities of the entire subsequent socio-economic policy of the state. In this regard, the well-established practice of periodic medical examinations in our country needs all possible support and further development, including through the allocation of "spot" funding for these purposes and investment in the appropriate infrastructure. At the same time, it is necessary to realize that what happened to all of us in 2020 encourages us to consider the priorities of budget financing and, in general, investment in certain social areas in a different way. In this regard, it is obvious that the organization of mass vaccination of the population is imperative to come to the fore in 2021-2022; therefore, certain changes in the direction of budget funding flows will inevitably be required, in other words, changes in the distribution of already planned budget expenditures on health care. Besides, in addition to the above-mentioned reallocation of planned expenditures, when forming the budget for 2022, additional financial measures are possible, in our opinion, to provide a kind of anti-accident "safety cushion" for the population of our country. This is necessary in case of relapses of the covid-19 virus, additional vaccination for some part of the population, ensuring an emergency regime of self-isolation and similar emergencies, one way or another related to the fight against the pandemic. On the other hand, despite the importance of today's tasks, the problem of vaccination, which has now become the number 1 state concern, nevertheless, in our opinion, can by no means be considered as a one-time problem that will automatically be resolved with overcoming the threats and immediate consequences of today's pandemic. And the point here is not even in the features and dangers of the current pandemic, although medical experts, including from the World Health Organization (WHO), warn about the validity of concerns about both the repetition of possible variations of the covid-19 virus, and the occurrence in the future of similar epidemics in scope and danger. Therefore, it seems to us that in these new conditions, the country needs a national vaccination system, which would provide the population of Azerbaijan with affordable doses of the vaccine and maintain the proper order of vaccination itself in the event of a recurrence in the future of any emergencies associated with the threat of mass infection or any other mass diseases. This means holding such events without national shocks and with the possible minimization of material losses.

Thus, we can say that the fight against serious diseases, many of which are becoming more acute due to the covid-19 viral pandemic, and its accompanying measures on a national scale are a significant contribution to the improvement of human capital. This will require, in particular, special attention to the further priority development of such advanced areas of medicine as ultrasound diagnostics, nuclear medicine, radiology, computer (CT) and magnetic resonance tomography (MRT), and a number of others. The development of such areas in itself becomes another of the priorities of the entire state social policy, requiring a corresponding increase in financing and organizational and technical support from state authorities and management. As historical experience shows, it is only through the accumulation of efforts and resources of medical science and science in general, the state budget and the investment community that it is possible to create conditions (primarily of a material and financial nature) under which the country will achieve long-term progress in the fight against diseases that pose a socially significant threat to the whole society. It should be particularly recalled that at the same time, the tasks of improving public administration as a whole are being solved, identifying its most successful forms and methods in relation to the tasks of improving the entire national efficiency and competitiveness, which were already discussed above. Therefore, paying special attention to strengthening the coordinating role of the state and improving its social policy in terms of the development of new areas of health care, it is necessary to emphasize such organizational opportunities as the wider use of public-private partnerships and the possible creation of investment consortia (with appropriate incentives for private investors) in order to select and implement the most promising medical projects. Based on such forecasts, we can assume that the new challenges of global economic development will require greater use of artificial intelligence in almost all areas of economic and social activity in modern society. This is due not just to technical convenience, but to the already occurring complication ("intellectualization") of the processes of production of goods and services and the widespread aggravation of the above-mentioned competition at all levels. In turn, the accelerated development of artificial intelligence systems and digital technologies in healthcare and related areas, and within the national economy as a whole, will require an increase – it is possible that in some cases, multiple - loads on human intelligence. It is he who performs and will continue to perform the expanding and increasingly complex functions of the operator and controller of all electronic information systems, and it is he who will ultimately determine the effectiveness of these systems. Increasing the load on a person's physical strength will also require appropriate emotional and medical relief, and this, in turn, implies completely new opportunities for national health care. In connection with all the above, it seems that the main requirements for the national health system in the context and in order to improve human capital are:

- increasing the availability of not only medical care in general, but also the possibility of effective treatment of the most severe and socially dangerous diseases;
- improving the quality of medical services at all levels of the health system;
- uninterrupted provision of the national health service with qualified personnel.

It is clear that the last of these requirements and, of course, the entire complex implementation of current and strategic tasks in the context of overcoming the pandemic crisis also imply new opportunities for the national education system. At the same time, if we conditionally limit ourselves only to the personnel needs of healthcare, it should be noted that the modern world faces considerable problems in the field of training of medical personnel. Suffice it to recall that, according to WHO estimates, by 2035, there will be a shortage of almost 13 million qualified doctors, midwives and nurses in the world. In such a situation, a country with a developed system of personnel training will definitely win.

Here, Azerbaijan has some achievements to build on, which, as we have already found out, is recorded in the last year (2020) "Human Capital Index". Even the quantitative indicators of state participation in the development of education are impressive. Thus, the volume of budget financing of education only in the period from 2010 to 2018, cited, as noted above, in the mentioned World Bank study, increased respectively from 1.2 billion manats to 1.97 (that is, almost two) billion manats, or 1.66 times. Without exaggeration, this significant increase in state allocations will look even more impressive if we recall that it "crowned" the large-scale financing of the educational sector from the state budget of the Republic of Azerbaijan, which took place in previous years. Thus, for a relatively short time period in 2005-2010, the volume of such financing in absolute figures increased from 372.5 million manats to almost 1.2 billion manats, or 3.2 times [5, p. 400]. This amount of state support, of course, served as a strong basis for further qualitative improvements in the training of qualified and highly qualified personnel in our republic, which is reflected in the "Human Capital Index" of the World Bank. In the light of the new challenges facing our national economy, further qualitative changes in the system of higher and secondary specialized education in our country will certainly be required. In the context of all the above, we can say that Azerbaijan will first of all need, on the one hand, highly qualified personnel of higher and secondary medical personnel, on the other hand, specialists in the field of applied mathematical and engineering-physical disciplines necessary for further modernization and improvement of the overall intellectual level of our economy. Of course, this does not detract from the importance of representatives of other specialties, primarily chemical – biological and humanitarian areas, which form the intellectual potential of our nation and, in general, its human capital. In addition, we must not forget about the traditional - including "heavy" - sectors of the economy (metallurgy, mechanical engineering, and a number of others), which have so far made a significant contribution to the creation of the overall economic power of our state and may currently experience – as mentioned above – certain difficulties in connection with the way out of the current crisis.

4. CONCLUSION

The improvement of the human capital of our country will be impossible without:

- first, ensuring the growth of labor productivity in these industries through the transfer of advanced means of production and management solutions;
- secondly, the organization of a constant influx of new technologies into these industries from more "advanced" sectors of the economy.

In this regard, in our opinion, the further development of industrial parks and technoparks provides significant opportunities for improving human capital in our country. The accumulation of a significant number of highly qualified specialists, as well as highly intelligent potential, within the framework of advanced scientific and technological projects, creates conditions for providing breakthrough technological solutions that are necessary for our entire economy. At the same time, of course, we should not lose sight of the problem of efficiency in the formation of the technoparks themselves, in no case being carried away by quantitative indicators to the detriment of qualitative results. The existence of a serious problem here is confirmed, in particular, by the experience of our neighbors, including Russia. Thus, according to the most recent estimates of the Association of Clusters and Technoparks of Russia, at the end of 2020, no more than 22 percent of the total number of formally functioning technoparks could be called effective [7, p.4]. This means that there is simply no talk of any breakthrough intellectual development within the vast majority of technoparks. Such examples in the practice of our country should be avoided. All of this, as has been repeatedly emphasized above, will require significant investment, which can be accumulated by improving the interaction of the state with mixed companies and interested private investors.

THE STRENGTHENING OF THE ROLE OF SCIENTIFIC & EDUCATIONAL FACTOR OF DEVELOPMENT OF THE AZERBAIJANI ECONOMIC MODEL IN THE CONTEXT OF OVERCOMING THE CONSEQUENCES OF THE GLOBAL CRISIS

Aysel A. Guliyeva

Azerbaijan State University of Economics (UNEC), Azerbaijan
aqliyeva5@gmail.com

ABSTRACT

In the proposed article there are shown objective reasons of strengthening of the role of science and education in nowadays realities of the struggle against the consequences of the crisis that was caused by the covid-19 viral epidemic, alongside with increasing of the importance of abovementioned branches in forming the long-range model of further stable growth in the Republic of Azerbaijan. The whole contemporary world experience confirms the special role of science and education and their decisive position among all other branches of economic and social life. There have been examined concrete results which have been achieved in our country during the period before crisis in improving situation in science and education branches and there are also have been suggested possible directions of their further qualitative development. The author demonstrates the key meaning of scientific & educational development for achieving that positive result of social & economic modernization which has been taking place in Azerbaijan during last several decades. Alongside with this the author emphasizes that the problem of supporting of the post-crisis stable growth remains the key one for the whole global economy, including the most developed countries. So, as far as Azerbaijan is concerned, we need qualitative improvement of the existing economic model just now; that will make us possible not only compensate losses after crisis but also provide basis for stable development. The further increasing of such quality is possible, first of all, because of strengthening of the role of scientific & educational factor.

Keywords: *improving of the Azerbaijani economic model, long-range basis of future growth, overcoming the consequences of covid-19 viral epidemic, strengthening of the role of science and education, social & economic modernization, post-crisis stable development*

1. INTRODUCTION

The general economic situation in the modern world continues to develop under the conditions and under the influence of the covid-19 viral pandemic. And if in the period up to the pandemic, the world economy continued to feel the consequences of the global financial and economic crisis that broke out in 2008-2009, then in the foreseeable future we all face the problem of making up for the losses caused by the virus crisis of 2020. The International Monetary Fund's latest forecast to date, issued in October last year, explicitly warns that "the recovery will be long, uneven, and not guaranteed" [1].

2. THE NEW ROLE OF SCIENCE AND EDUCATION IN THE MODERN WORLD

This refers to the recovery of the entire world economy, but no national economy will be able to develop steadily further without overcoming the consequences of the crisis of 2020, which, as we can see from the above forecast and the current situation in the world, may also be delayed. One way or another, the problem of ensuring sustainable growth remains a key one for the entire global economy. As for Azerbaijan, it is already necessary to make a qualitative improvement of our economic model, which should allow us not only to make up for the losses from the crisis, but also to provide a foundation for sustainable development, which we mentioned above.

Such improvement, in our opinion, involves a whole set of directions and measures in various areas. For example, a comprehensive improvement of the human environment and, through it, the improvement of the general conditions and quality of life and all work activities is of key importance. At the same time, it is obvious that such an improvement is not only a strategic foundation for future development, but becomes almost decisive in the context of simultaneous elimination of the consequences of the coronavirus pandemic, which in one way or another affected the majority of the population and which must be dealt with today. In solving these problems, the leading place belongs to advanced science, which is designed to generate a set of ideas and transform them into practical proposals for the qualitative improvement of the economic and social environment in which modern life takes place. In turn, the most important activity of any modern society for its own improvement is education. Thus, the activities of the United Nations Educational, Scientific and Cultural Organization (UNESCO) in the field of education are designed to ensure the possibility of education for everyone, at all levels and throughout life, because education plays a major role in the formation and development of the individual, economic growth and strengthening of social ties. At the same time, it is an important tool in the fight against poverty and one of the foundations of sustainable development [2]. At the same time, it should be recalled that the entire modern stage of economic, including industrial, development is characterized by a wide use of the latest results of fundamental and applied science in the form of improving and applying technical, technological, organizational and managerial achievements, as well as by deepening the relationship of material production industries directly with the social sphere and-what is especially important to emphasize - the natural environment as a human habitat. Therefore, based on the above-mentioned special role of science and education in the modern world, it is necessary to identify their defining place among other areas of economic and social life. Accordingly, it seems to us that the growing importance of these industries – whether the world is facing an epidemic or not - should be re-emphasized and highlighted from a twofold point of view:

- first, in connection with their role in creating a competitive national economy;
- secondly, in the process of forming - by increasing the overall level of development and intelligence - a highly moral, intellectually developed personality.

Once again, we emphasize that the importance of the scientific and educational factor in the modern world is increasing regardless of whether people are facing crisis phenomena or their consequences at a particular moment, whether the world economy and most national economies are experiencing a period of recovery or, on the contrary, a decline, which we, for example, are facing today. Science and education have acquired the role of a permanent engine for the development of the general progress of modern human society. We can see and feel the importance of the development of education together with science with our own eyes on the example of Azerbaijan, since they are largely associated with the positive result of the socio-economic modernization that has been taking place in our country over the past few decades. Of course, if we turn to foreign experience, we also see that education and science are the main factors of social and economic progress in developed countries; the main capital of these countries is increasingly becoming intelligence. As a result, the intellectualization of the economy is accompanied by the penetration of knowledge into all spheres of human activity, into the production of almost any product, and the concept of a knowledge-based economy is increasingly used in the sense of widespread use of scientific developments in improving not only production itself, but also the economic system as a whole. It is a time when the intellectual factor in economic development is becoming increasingly important so that we can talk about the real digitalization of our economy.

3. THE MAIN FACTORS OF THE IMPROVEMENT OF AZERBAIJANI ECONOMIC MODEL

The digitalization of the economy, which has covered almost all developed countries of the world over the past 10 years as part of the implementation of the concept of the "fourth industrial revolution", suggests that overcoming the consequences of the coronavirus crisis will be carried out by further strengthening the role of scientific achievements while accelerating their transfer to the economic life of most developed countries. This shift will be supported and accompanied, in particular, by the improvement of the system of continuing education, which allows for the uninterrupted training and retraining of highly qualified personnel for a rapidly changing economic environment. These same factors – scientific and educational – will play a crucial role, we emphasize once again, in determining the promising directions of post-crisis development, and for a long period. Therefore, based on all the above, we can make a reasonable conclusion that science and education will have a significant impact on the improvement of the entire Azerbaijani economic model. Let us turn once again to the question of the connection between education and science. Both foreign experience and our own experience, already accumulated in Russia, show that only a diversified structural, institutional and substantive modernization of education can give a systemic effect of innovative development of the country. It is necessary to continue to pay great attention to improving the quality of education, training highly qualified personnel, promising scientific research, the production of high-tech products and high technologies, and the export of intellectual developments. Now let's look at the situation with the financing of the entire scientific and educational complex. In Azerbaijan, the leading role in the financing of science and scientific and technical research belongs to the state for the entire previous pre – crisis period of development. And this leading role is reflected not only in the specific amounts of funded investments, but also, in our opinion, in the fact that in our country, along with the growth of funding for education and science in quantitative terms, the situation has begun to improve somewhat qualitatively – in terms of the attitude of society, including young people. In particular, among young scientists there was a desire to work in domestic science. At this particular moment, we believe it is important that this trend continues as borders are opened up to deal with the consequences of the coronavirus pandemic. At the same time, it is equally important to emphasize that the leading role of the state in the financing of science and scientific research does not negate the task of greater involvement of private investment in this area, and it should be said that in this direction in modern Azerbaijan in the pre-crisis period, certain progress was made. In our opinion, the importance of private investment, despite the current crisis, all its consequences and objective financial difficulties, will be very significant both for overcoming all these consequences as soon as possible, and for further accelerating the development of our national economy. Let's look at how the situation in our country developed in the pre-crisis period based on specific data. Thus, the share of funding for the scientific sphere from the state budget in the total amount of funding for science increased from 60 percent in 2005 to 71.3 percent in 2019, and the volume of budget funding for science in quantitative terms increased during this period from 9.3 million manats to 122.3 million manats, that is, almost 13.2 times [5, p. 351]. Once again, in our opinion, it should be emphasized that such an increase in state investment in science and research development in itself indicates an increase in the financial capabilities of the Azerbaijani state as a whole, and this, in turn, would not have been possible without the general economic successes achieved, which were discussed above. At the same time, speaking about the growth of public investment in the scientific sector, it is necessary to make some important clarifications. First, over the specified period, in general, despite the marked increase in the budget financing of science in quantitative terms, there was a relative decrease in the share of expenditures on it in the total state budget expenditures of the Republic of Azerbaijan – from 1.2 percent to 0.5 percent, that is, more than twice.

In other words, it turns out that the growth of the state budget of our country, reflecting the overall success of the economic policy, is not simultaneously accompanied by a corresponding increase – in relative terms – in spending on science and research. In our opinion, this, unfortunately, means that the branch of science has not yet received priority state significance and attention, expressed through qualitative changes in the structure of budget expenditures. Secondly, within the time period we took, there were shifts that confirm the above conclusion. Thus, the share of financing of the scientific sphere from the state budget in the total volume of all expenditures on research activities reached its maximum in 2010, amounting to 99.4 percent. However, it should be noted that by this time there was already a trend to reduce the share of expenditures on it in the total volume of state budget expenditures, as mentioned above: this share was only 0.8 percent. In the future, as already noted, it decreased to 0.5 percent [4, p. 351]. Accordingly, there was a consistent decline in the share of budget funding in total expenditures on research and development: to 96.5 percent in 2014, to 92 percent in 2015, [3, p.351] to 85 percent in 2016, to 83 percent in 2017, to 78.4 percent in 2018, and, as noted above, to 71.3 percent in 2019. However, at the same time, it should be noted once again that in quantitative terms, the state budget expenditures on scientific activities in 2019 increased to a maximum value of 122.3 million manats [5, p. 351]. What do these figures indicate? In the foreseeable future, when, simultaneously with overcoming the consequences of the coronavirus for our economy, the long-term foundations of future growth will be laid, based on a significant strengthening of the role of the scientific factor, as already mentioned above, a certain revision of the state budget policy will be necessary. Science, as we believe, should take one of the priorities and inviolable from the point of view of possible reduction of places in state funding. In other words, it is necessary to provide for the possibility of increasing the state funding of the scientific industry by increasing the share of expenditures on science in the state budget. Despite the importance of other items of public expenditure, it is necessary to remember that it is the leading positions in science – first of all, fundamental and theoretical, but also applied – that will be able to provide our country with the solution of such tasks as:

- the final overcoming of the raw material orientation of the economy;
- providing sustainable growth to the manufacturing industry, especially in the advanced electronics industries;
- changing the structure of national exports at the level of the standards of the most developed countries of the world.

Of course, in today's conditions, support for public health in the context of the fight against the coronavirus pandemic and its consequences is added to these tasks. This fully applies to such an industry as education. Thus, if we take into account quantitative indicators, the volume of funding for the education sector from the state budget of the Republic of Azerbaijan in absolute figures increased from 372.5 million manats to almost 1.967 billion manats, or almost 5.3 times. However, it should be taken into account that at the same time during this period there was a decrease in the share of education in the total expenditure part of the state budget, which amounted, respectively: in 2005 – 17.4 percent, in 2010 – 10.0 percent, in 2014 – 8.3 percent, in 2015 – 9.0 percent, in 2016-2017 – 9.9 percent, in 2018 – 8 percent. At the same time, it is important to take into account that the entire expenditure part of the state budget for the period 2005-2018 increased by 10.6 times [6, p. 400]. On the other hand, during this period, the share of education in the total budget expenditures in the direction of "Social and cultural activities" also decreased from 44.2 percent in 2005 to 38.4 percent in 2018 [6, p. 400].

4. CONCLUSION

Thus, as in the above example with the scientific industry, in our opinion, there is a certain underestimation of the importance of public investment in the field of education in terms of its current and future role in ensuring the competitiveness of our economy and the country as a whole in the global world, despite all the undeniable achievements in the development of education in Azerbaijan. This situation, in our opinion, needs to be corrected as soon as possible.

ABSTRACT

Accelerating globalization processes in the modern economy contribute to increased competition in the market. Therefore, companies, in order to effectively develop their activities, must form and strengthen competitive advantages. Currently, the main source of maintaining the competitiveness of companies is innovation and scientific and technological advances, which have become the main driving force of economic and social development. The development of new products and services allows enterprises to modernize production, maintain a leading position in the market, achieve financial stability and capture new markets. The tourism business is innovatively capacious, due to the fact that in this area it is not goods that provide communication between producers and consumers of tourism services, but information flows in the form of payments and services. The development of the tourism business can only be based on the introduction of new ideas, improving the production processes of goods and services, expanding the range of tourism products, development of management system on the basis of innovation methods. One of the most effective innovative methods of tourism business development is the cluster approach, thanks to which tourism business companies can maintain their competitiveness in the market. The development of the tourism business in Azerbaijan is one of the strategic directions for the development of the national economy. Currently, Azerbaijan has numerous factors for the development of this business, but there are many problems that do not allow Azerbaijani tourism to develop in accordance with the existing potential. Therefore, innovation should become the main component in the development of tourism in Azerbaijan. Only thanks to the innovative development of tourism, our republic can occupy its niche in the competitive environment of the global tourism business.

Keywords: *innovation, tourism business, innovative technologies, management, innovation methods, competitive advantages, the cluster approach, Azerbaijani tourism*

1. INTRODUCTION

Intensive processes of integration and globalization in the modern economy change the content of many economic processes. Strengthening globalization processes contributed to increased competition. Currently, enterprises in various sectors of the economy, in order to develop their activities, must form and strengthen competitive advantages, which are characterized by dynamic changes, while the main source of competitiveness is innovation and scientific and technological achievements, which have become the main driving force of economic and social development. The development of new products and services allows enterprises to modernize production, maintain a leading position in the market, achieve financial stability and expand their position in the markets.

2. THE ROLE OF INNOVATION IN THE MODERN WORLD ECONOMY

For the first time the concept of "innovation" as an object of scientific research appeared in the 19th century. Austrian economist Josef Schumpeter in his scientific work "Theory of Economic Development" first explored the role of innovation in the process of overcoming economic crises, based on the introduction of new products, new technologies and new production processes.

In his theory, Schumpeter identified five innovative changes:

- 1) Production of new goods and services.
- 2) Using new sources of raw materials.
- 3) Using a new production method.
- 4) Introduction of new organizational forms.
- 5) Opening new sales markets [1]

A significant contribution to the study of the role of innovation in economic development was made by such scientists as E. Mansfield, R. Foster, B. Twiss, M. Porter, R. Solow, representatives of the neoclassical theory of innovation M. Kalecki and G. Mensch, T. Brian. According to the American researcher B. Twiss, innovation is a process in which an invention or idea acquires economic content: “This is a unique process that unites science, technology, economics and management. It consists in obtaining novelty and lasts from the inception of an idea to its commercial implementation, covering a complex of relations, production, exchange, consumption” [2]. As mentioned above, innovation creates an opportunity for enterprises to maintain their competitive advantage. The American economist M. Porter devoted his theory of competitive advantage to this issue. In his writings, M. Porter noted that changes in production are of an evolutionary nature. In Porter's opinion, accumulated small changes sometimes yield more results than major technological breakthroughs. Innovations are the result of not only research and development work, but also the improvement of the organizational structure, active investment. Innovations make it possible for enterprises to achieve a competitive advantage in the market. Porter in his theory, considering the determinants of competitive advantage, an essential role emphasizes the role of developed factors of production, one of which is innovation [3]. In the context of globalization, competition between countries and between enterprises within individual countries is intensifying. But, unfortunately, the processes of globalization lead to the asymmetric development of the world economy. A group of countries specializing in knowledge-intensive and high-tech industries, highly qualified services, with a new structure of employment, is characterized by high incomes of the population, high living standards, low unemployment and developed infrastructure. This group of countries includes developed countries such as the United States, Germany, France, Japan, and the Asian tiger group. These countries are characterized by a high contribution to R&D, a predominance of innovative products and high-tech products that dominate the export structure, and at the same time, these countries have a competitive advantage in the world market. Developing countries, due to their specialization in raw materials, economically lag developed countries and cannot fully compete in the world market. Innovative activity should be present in all spheres of business: in trade, production, advertising. This work is aimed at finding and implementing new ideas, thanks to which can get additional profit in various activities.

3. FACTORS OF INNOVATIVE DEVELOPMENT OF TOURISM BUSINESS

The tourist business is one of the important components of the post-industrial society, in which the service sector plays a predominant role. Tourism is a rather complex socio-economic sphere, which includes various activities for the provision of services to tourists. Therefore, the tourism business, in turn, cover the domestic and foreign markets, can multiply the development of related sectors of the economy, stimulate the development of regions, contributing to increased employment in the regions and an increase in the welfare of the population. At the same time, tourism can have a positive effect on the structure of the country's balance of payments based on the development of international tourism, providing an inflow of foreign currency. In the field of tourism, as well as in other areas, there is fierce competition. Therefore, the use of innovative achievements in the tourism business is an important condition for the further

development and maintenance of the competitiveness of tourism enterprises. Innovation in tourism is a complex of research, organizational, economic measures aimed at improving the tourism product in accordance with the increasing and changing needs of consumers. Innovation in the tourism business can be divided into innovation in the tourism product itself and innovation in the production process of the tourism product. If we talk about improving the tourism product itself, this means the creation and popularization of new types of tourism, for example, ecological, agritourism, adventure tourism, etc.

Goals of innovation in the tourism business:

- 1) Improving the efficiency of interaction between travel service providers and their consumers.
- 2) Search for new ways of providing services, that is, continuous improvement of the process of providing services.
- 3) Effectively satisfaction the needs of the clients of tourism services.

On the basis of these goals, the main directions of innovation in the tourism business are formed, such as:

- 1) Use of new tourism resources.
- 2) Introduction of new tourist routes in accordance with the changing needs of potential customers and changes in the situation in the tourism market.
- 3) Expansion and improvement of the provided hotel service
- 4) Application of new methods of organizing tourism business.

Several factors determine the need to use innovative methods in the development of tourism business (Fig. 1).

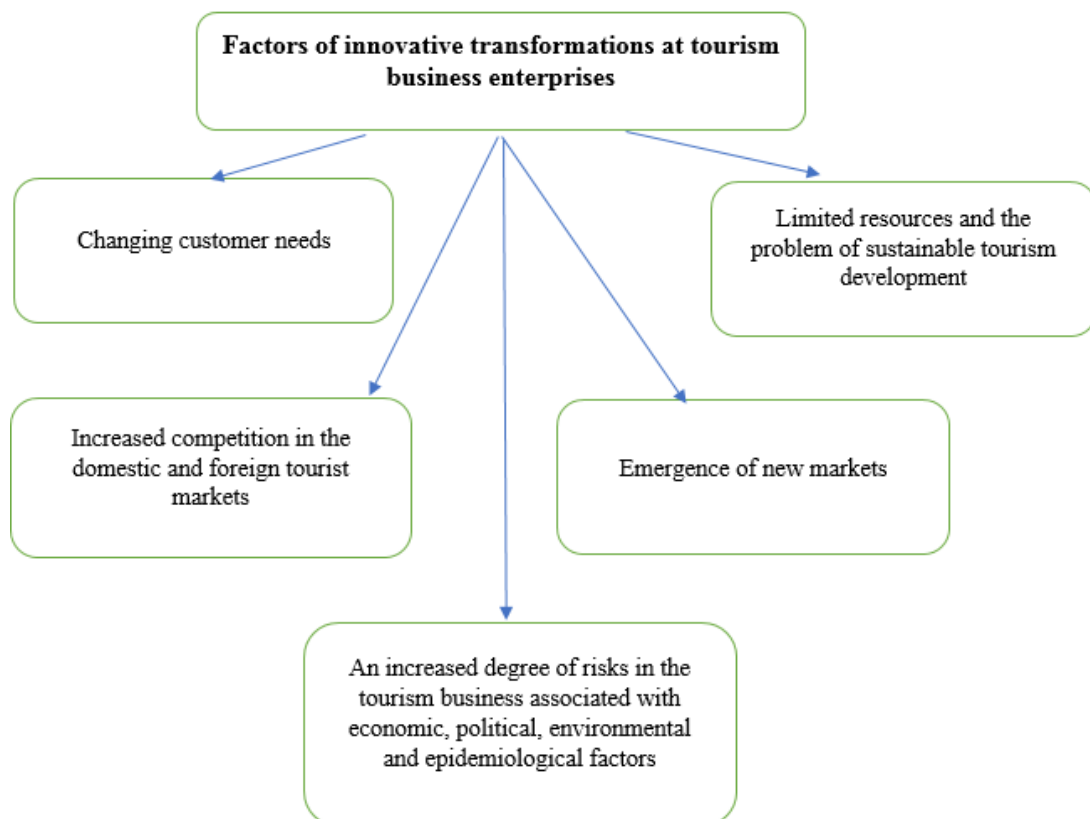

Figure 1: Factors of innovative tourism development

The formation of a consumer society is the main characteristic feature of the country's economic development. On the one hand, a free market forms a consumer society, and on the other hand, the existence of a market is impossible without individual consumption. In the process of market exchange, the individual tries not only to satisfy the basic needs for the product, but also tries to obtain additional benefits, the symbolic value of the product. On the other hand, manufacturing becomes consumer-oriented. That is, in modern society there is not the production of products, but the production of "differences" and "symbols". The consumer needs not just a car, but a whole set of symbols, not just clothes, but a way to stand out from the crowd, not just a watch, but a recognizable watch. That is, modern society is a society of global consumption. In the field of tourism, everything is the same. With the development of society, the needs of tourists increase and change. So, today in the world there are more than 300 types and subspecies of travel, which, due to the influence of many factors, are constantly supplemented with new varieties that can satisfy the most diverse desires and needs of the tourist. The problem of limited resources has become especially acute for mankind since the second half of the 20th century. At this time, such concepts as strategic planning and innovative development appeared. Tourism, like other sectors of the economy, is faced with the problem of a lack of resources, therefore the problem of sustainable tourism development is an important factor in an innovative approach to the development of tourism business. Sustainable tourism development means long-term development, in which a balance is achieved in the implementation of economic, environmental, social and cultural development goals. In the context of sustainable development of tourism, the interests of tourists, tourism businesses, and the local population are considered based on the rational use of tourism resources [5]. In today's global marketplace, there is global competition, which some experts call hypercompetition. In the context of hypercompetition, previously isolated factors of the competitive environment begin to collectively influence the activities of enterprises, including in the tourism business. In conditions of tough competition, when non-price competition dominates, the requirements for the process of creating a tourism product and, accordingly, the need to use innovative approaches are increasing. In particular, there is a growing need to find new ways to fight for a market segment, use new technologies and innovative solutions, new resources and modern forms of cooperation with competitors. Those travel companies that can offer their customers high quality products and services through the introduction of innovative achievements will be able to withstand the competition. In particular, there is a need to improve the services of the hotel, transport industries, as well as to improve tour operator and travel agency activities. For example, in the context of the COVID-19 pandemic, it became necessary to use an integrated automated and computerized service system in the hotel business, which will make it possible to minimize contacts of hotel employees with customers. According to the innovative approach used in the field of tourism, it is necessary to note an automated unified management system, which includes a computer reservation system, a unified traffic flow system, an electronic money transfer system, telephone networks, and means of communication. Thus, this system combines the interconnected activities of all components of the tourism industry (tour operators, travel agencies and transport companies, hotel and entertainment industry). An integral part of modern business are risks that negatively affect the business. Risks can sometimes lead to irreversible consequences, right up to the bankruptcy of the company. Any tourism company in its strategic development plan must clearly identify all types of risks that the company may face in the course of its activities. There are many types of risks, which differ from each other in reasons and specific characteristics that threaten the activities of any travel organization (hotels, transport companies, tour operators, travel agencies, etc.). All risks that a company may face in the course of its activities can be divided into internal, which the company can manage, and external, which are difficult to manage, and sometimes impossible to foresee.

So, the group of external risks includes world economic and political crises, environmental and epidemiological disasters. The COVID-19 pandemic has caused and continues to cause significant damage to the all global economy, including the tourism industry. The world tourism business is in a state of complete collapse and, as many experts assume, after the end of the pandemic, significant changes will be made in the management this industry. At the same time, the sophisticated technology of customer service will require new forms of control and decision-making, will present new requirements for the professional level of employees of tourism companies. Thus, in order to reduce the level of risks, tourism business enterprises need to use strategic innovative planning, thanks to which it is possible to conduct a thorough analysis of the internal and external environment of a tourism enterprise, to identify factors that can potentially threaten or stimulate the development of the company. Based on this analysis, the tourism company can plan innovations that will further develop the company and strengthen its market position.

3.1. Cluster approach in the development of tourism business

As noted above, one of the unique features of tourism is its multiplicative impact, which stimulates the development of small and medium-sized businesses. Tourism unites not only enterprises directly related to the tourism sector, but also enterprises related to tourism industries and enterprises indirectly involved in the tourism business. In recent years, the cluster method of business development has been actively used. In our opinion, the use of the cluster approach in tourism can increase the efficiency of this industry and contribute to the innovative development of the tourism business. The cluster business is the joint development of the main and related companies, which are united by a single territory, infrastructure, human resources and other components that allow to optimize the production process. The founder of the cluster theory is the American economist Michael Porter. Based on the cluster method, Porter developed the concept of a competitiveness strategy. The introduction of a cluster form of business creates a real opportunity to ensure the competitiveness of the company, based on the consideration of the main factors (determinants) of competitive advantage. According to M. Porter's theory, it is not the countries that are initially competitive, but the national companies of these countries. To compete successfully, firms must have one of two advantages: low production costs or a high-quality product with a high price level. According to Porter's theory, a country's international specialization is determined by those sectors of the economy in which its national producers are most competitive. According to the classical theories of A. Smith, D. Ricardo, as well as the theory of Porter, no country in the world can be absolutely competitive in all spheres, since its limited resources affect. An important task is to use the country's resources in the most rational way, and to specialize in the most efficient competitive segments of the economy [3]. According to Porter's model, competitive advantage consists of four determinants that form the environment in which a business operates:

- Factor conditions
- Demand conditions
- Related and supporting industries
- The structure and strategy of firms, intra-industry competition.

Let's consider each of the determinants in more detail. Condition factors are necessary for successful competition in a particular industry. M. Porter in his theory actually expanded the list of factor conditions included in the neoclassical three-factor Heckscher-Ohlin model. At the same time, he differentiated factors into basic and developed ones. Developed factors, according to the author, are more significant for the company's competitiveness. These factors, as a rule, are not automatically inherited from previous generations, but are created in the labor activity.

The developed factors that determine international competitiveness include scientific and information potential, skill labor force, capital, infrastructure and innovation. The next determinant of competitive advantage is the state of domestic demand. The country gains a competitive advantage in industries in which domestic demand provides companies with an initial understanding of customer needs. Domestic buyers pressure companies to innovate and thereby gain a competitive advantage. It is also important that domestic must match to global market trends. If we consider this theory on the example of tourism business, the development of domestic tourism is a very important component of increasing the competitiveness of the tourism industry. Strengthening the role of the development of domestic tourism has become very relevant in the context of the COVID-19 coronavirus pandemic, because international tourism is in a global crisis. The tourism industry combines several sub-sectors and is closely related to other sectors of the economy. To ensure the competitiveness of the tourism business, the role of related industries (restaurant business, entertainment business, retail trade, etc.), as well as supporting industries (health care, education, banking, media, advertising, etc.) is essential. According to Porter, due to the multiplicative influence of tourism, not only individual industries become competitive, but also an entire cluster in which companies are integrated vertically and horizontally. To achieve high competitiveness, it is necessary to ensure close and effective interconnection of all components of the cluster. Strategy and intra-industry competition is the fourth component of Porter's Rhombus. The success of the company depends on the correctly chosen strategy, and with it the success of the whole country. As you know, there are enough tourist-attractive countries in the world and all of them can provide almost the same range of services. Therefore, it is necessary to find an effective method of attracting tourists to your own country. For this, it is necessary that the country has a clear strategic plan for the development of the tourism industry, in the development of which the state should play a significant role. Intra-industry competition is very important in the development of the tourism business. To improve the quality of the tourism product, it is necessary that there are many national tourism companies in the country, because in the process of competing, they reduce costs, improve the quality of products, stimulate the development of scientific and technical progress and actively use innovative methods in creating a tourism product and in company management. The activities of government institutions, albeit indirectly, can significantly affect the competitiveness of the tourism business, and this influence can be both positive and negative. For example, long-term support of an object by the state can lead to a slowdown in innovation processes and a loss of competitive advantages. But, at the same time, the government, with the adoption of appropriate laws, can stimulate companies in their development. Correctly chosen tax policy, personnel policy, support for innovative development of the economy, stimulation of investment attraction are the driving factors in the formation of a competitive tourism business in the country. Finally, the chance factor, while not the main determinant of competitive advantage, can lead to tangible problems. For example, companies cannot foresee global economic crises, wars and political conflicts between countries, natural phenomena, environmental disasters, epidemics. For example, the 2008 global financial crisis had a significant impact on the economies of tourism-oriented countries. The COVID-19 pandemic has had even more devastating consequences for all global economy and especially for the tourism business.

Figure following on the next page

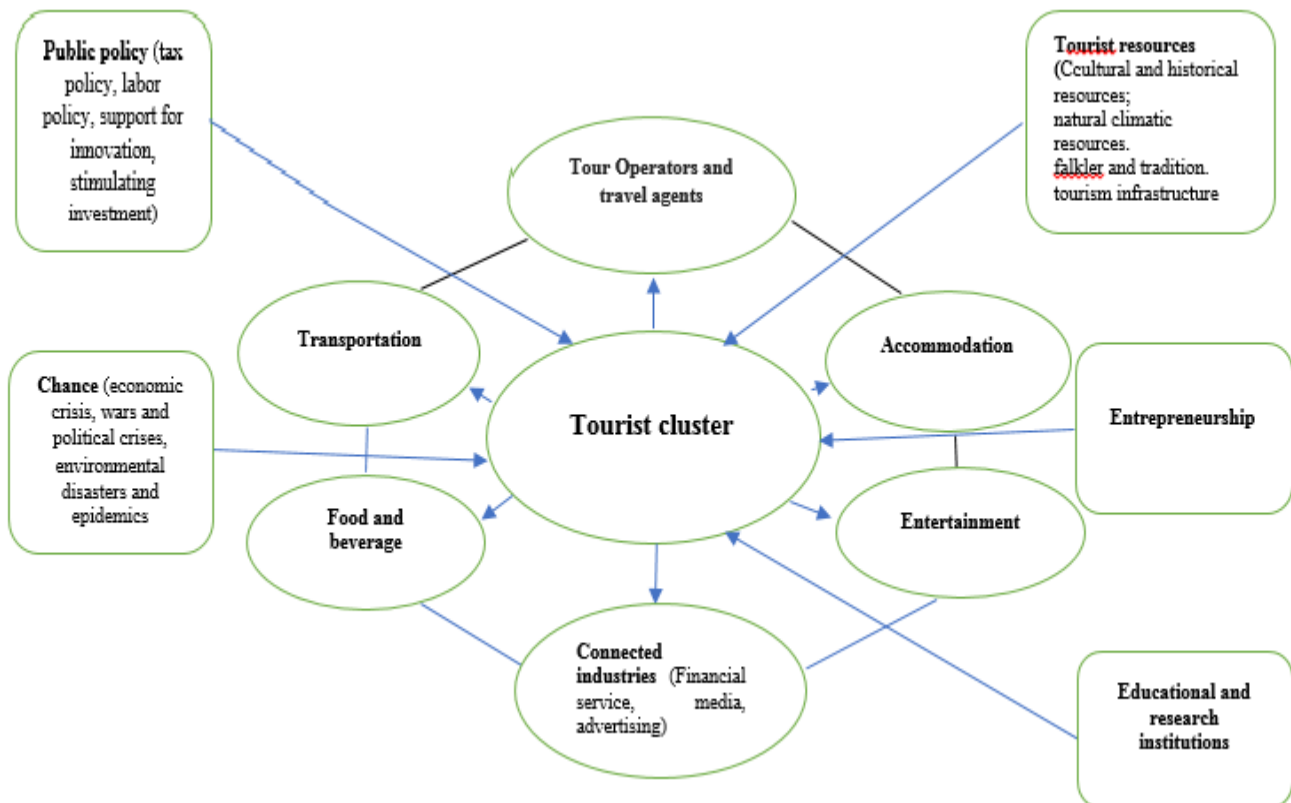

Figure 2: Tourism cluster
(Source: Developed by the author)

Based on Porter's diamond model, we propose a tourism cluster model, which illustrates the relationship between the main components of the tourism industry and the relevant institutions, on the activities of which the efficiency and competitiveness of the tourism business significantly depends. The cluster approach in the development of the tourism business can help to increase its competitiveness through the implementation of effective interaction between cluster members, access to skill labor, necessary information, and innovative achievements. In addition, the cluster approach can facilitate the effective attraction of domestic and foreign investment in the tourism business, as well as its entry into the global value-added chain.

4. PROSPECTS FOR THE DEVELOPMENT OF TOURISM BUSINESS IN AZERBAIJAN

Tourism in Azerbaijan is recognized as one of the priority and strategic directions for the development of the national economy. The importance and prospects of the development of the tourism business have especially increased as a result of the liberation of the Karabakh region of the country after many years of occupation. It should be noted that this region has significant potential for tourism development. The "Strategic Roadmap for the Development of the Tourism Industry Specialized in the Republic of Azerbaijan" includes measures such as supporting the development of the tourism sector within the stipulated time frame, creating high-quality and competitive tourism services on the international and domestic markets, attracting new investment projects based on modern ideas and innovations, and the introduction of innovative forms of management in the tourism business. Currently, Azerbaijan has numerous factors for the development of this business, such as geographical location, historical heritage, geopolitical position and dynamic economic development. In recent years, there has been a dynamic in the development of tourism in Azerbaijan, which is reflected in the growth in the number of tourists to our country. (Fig. 3).

Figure 3: Dynamic of inbound and outbound tourism in Azerbaijan in 2010-2018 (thousand people)

(Source: State Statistics Committee of the Republic of Azerbaijan)

But there are many problems that do not allow Azerbaijani tourism to develop effectively in accordance with the existing potential.

- 1) Lack of an integrated approach to the development of the tourism business, while it is vital to develop a mechanism for the integrated management of the tourism business based on innovative methods.
- 2) Problems in the accommodation industry, associated with the ineffective development of the hotel base. Expensive 5 and 4-star hotels prevail in the country, and there are practically no 3-star hotels with appropriate quality and price. As you know, it is three-star hotels that are necessary for the development of mass tourism.
- 3) Expensive air transportation
- 4) Lack of qualified personnel who meet modern market requirements.
- 5) Imbalance between price and services in the tourism industry
- 6) Insufficient support of small and medium-sized businesses in the tourism sector
- 7) Weak and ineffective cooperation between government, commercial and non-profit organizations.
- 8) Weak development of domestic tourism.

It is especially necessary to note the problems in the development of domestic tourism. According to Figure 3. Azerbaijani tourists prefer to rest outside the country. High prices, low quality of services provided are the reasons for the prevalence of outbound tourism. At the same time, in the context of the COVID-19 coronavirus pandemic, the role of domestic tourism in all countries specializing in tourism development is growing dynamically, and domestic tourism should play a decisive role in the survival of the tourism business. According to UNWTO data, there is a demand for domestic tourism in the USA, Germany, France, Russia, China and other Asian countries. Azerbaijan must certainly take into account this global trend and begin the effective development of domestic tourism and the use of innovations in this process should play a decisive role. Only thanks to the innovative development of tourism, our country can find its niche in the competitive environment of the global tourism business.

5. CONCLUSION

To achieve and maintain a competitive advantage by tourism business enterprises, it is necessary to take into account the modern characteristics of society:

- 1) Competitive advantage can be maintained only through the introduction of innovations.
- 2) The globalization of the tourism business is forcing companies to consider national and international interests.
- 3) The tourism business has a complex mechanism of functioning, since its development depends not only on directly related enterprises, but also on indirectly related industries, therefore it is necessary to work out an appropriate development strategy.
- 4) The role of government and various public institutions are important in elaboration an effective strategy for the development of the tourism business.

Summarizing the above, we can conclude that the use of the cluster approach in tourism development is the most effective method of increasing the productivity, efficiency and competitiveness of the country's tourism product and tourism services using innovations.

ABSTRACT

The article highlights the current state of export potential on the basis of modern economic challenges, its development, as well as the integrated use of export potential, production of competitive goods and services using modern achievements of scientific and technological progress, ensuring their free access to international markets. In the current period of relations with the world market, the main directions of the state's foreign economic strategy should be to increase its export potential, improve the structure of both export and import operations, as well as access to world markets of competitive products that meet international standards and requirements. Today, one of the main priorities of Azerbaijan's foreign economic strategy is to be actively economically integrated into modern world economic processes, to respond adequately to new trends in the global economic space. At present, our main goal is to increase the competitiveness of the national economy and its effective integration into the world economic system, increase the volume of exports of priority sectors of the non-oil sector, accelerate the development of entrepreneurship and stimulate export potential. is to do. Today, the export of products produced in Azerbaijan to most countries in the world gives reason to say that there are enterprises in Azerbaijan that produce high quality products in accordance with world standards, and their number is constantly growing, which is also one of the priorities of state economic policy. The high quality of the products increases the competitiveness of these products in the export markets, as well as ensures the right of our consumers to consume quality products. Therefore, in order to protect the domestic market from unfair competition, strengthen control over the compliance of imported goods with relevant quality standards and ensure the rights of consumers, work is underway to further expand the activities of the State Service for Antimonopoly Policy and Consumer Protection.

Keywords: *world market, international market, export potential, export stimulation, export tariff*

1. INTRODUCTION

The global COVID-19 pandemic and minimizing the impact of the economic crisis on the Azerbaijani economy are the main priorities and goals of economic reforms. Azerbaijan's economy can also be characterized by the post-oil period, which has its own characteristics, which have shaped the economic processes that need to be addressed in the economy. As difficult as these problems are, especially in the foreign sector, not only for Azerbaijan, but for all countries of the world, the solution of this problem again focused on increasing the international competitiveness of the economy, reducing dependence on imports and substantially increasing exports of non-oil products.

In this regard, in order to expand the export potential of Azerbaijan in such a difficult situation and have a positive impact on the export potential, the relevant structures, such as the Ministry of Economy, aimed to simplify export procedures, export promotion mechanisms, as well as export lending branding, logistics, export potential stimulation. To this end, a state program in the foreign trade sector must be developed and implemented, taking into account the potential of economic resources in the lands liberated from Armenian occupation. The quantity that characterizes the share of exports in the country's GDP, export quotas should stimulate and implement various sectors of the economy, as well as goods and services for enterprises, based on world experience. This quantitative indicator is the set volume of production, shipment of products for the export of certain goods, in which case the export quota is aimed at regulating foreign economic activity at the national and international levels, in world trade. Export quotas are also used to regulate the supply and demand of certain types of goods in the domestic market. In the current situation, international multilateral or bilateral trade agreements may be the basis for export quotas. It should be noted that today the efficient use of export tariffs is of particular importance. The use of export tariffs in the Republic of Azerbaijan is based on the task of ensuring protection against uncontrolled exports of goods, which are the basis for the potential of the Azerbaijani market and guarantee the bulk of foreign exchange earnings [1]. In general, we believe that the stimulation of export potential, the use of export tariffs, the application of tax and customs benefits in accordance with the decision to promote investment, this condition, which is important for the development of entrepreneurship, will have a positive impact on the development of both regions and non-oil sector. This is because when entrepreneurs engaged in investment activities in priority areas receive investment incentives, the imported machinery, technological equipment and facilities are exempted from customs duties for a period of one year.[2] We would like to highlight the Export and Investment Promotion Fund, which supports the development of the country's export potential in today's conditions. It should be noted that even at a time when the pandemic is straining the stimulation and realization of exports, the country must improve living standards and welfare in such a difficult period, creating conditions for increasing foreign exchange earnings and accelerating the pace of development of all sectors of the economy.

2. PRIORITIES AND DEVELOPMENT PROSPECTS OF FOREIGN TRADE IN AZERBAIJAN

The primary goal of any national economy that enters the path of independent development is to assert itself at the forefront of the international division of labor. The modern world system strengthens the interdependence of countries. The main conditions for this are the economic and political independence of each national economy, market competitiveness, antitrust policy, the level of state regulation of the economy, tax and bank interest rates, favorable investment climate, political stability, etc. depends to a large extent. Separated from the former Soviet Union, Azerbaijan's national economy, like many other national economies, has undergone extensive transformation processes in the foreign trade sector, as well as in other areas. In this process, it was possible to form the mechanisms of activity of the foreign trade sector and the stimulating state policy. It is an activity based on free agreements accompanied by economic freedom, economic relations based on international norms. In modern conditions, as in other areas, the priority issues in terms of effective regulation of activities in the international trade sector must be brought to the fore and implemented. This is especially important in a pandemic. In our opinion, the most pressing issues today are: improving the structure of imports and exports, increasing investment, achieving the development of the non-oil sector through innovative methods, stimulating the inflow of foreign capital, increasing the purchasing power of the national currency, ensuring stability against foreign currencies, to provide employment in the export sector, to further develop cooperation with international financial institutions to

ensure its sustainability, to increase state control over some problems, especially the level of foreign debt, dependence on foreign capital and oil revenues, the level of modernization of creative society and economy. In the center of the country's foreign trade concept, in our opinion, economic competitiveness should be brought to the fore in all areas. After gaining economic independence, Azerbaijan's foreign trade sector was hampered, first of all, by the current socio-economic and political situation, the potential assessment of the potential as soon as possible, the development of a system of measures to achieve the goal and the collapse of traditional production ties with the collapse of the USSR. regulate the normal recycling process [2]. Despite the fact that the positive trends in the development of foreign trade relations in Azerbaijan are undeniable. However, it should be noted that the commodity structure of imports and exports is still not very efficient. Although exports are still raw material-oriented, they are mainly consumer-oriented. In our opinion, among the priorities of foreign trade, first of all, export stimulation and effective systematization of state support, ie state support for exports should be integrated in economic, informational and organizational order, and state support for export stimulation should be promoted, lending to export-oriented production Factors characterizing foreign trade relations should be highlighted and regulated. These include economic, production-technological, social and legal factors. On the basis of the foreign trade strategy, the close connection of foreign trade with economic development should be taken into account, the possibility of applying the relevant industrialization strategy to the mutual industrialization strategy should be explored and conditions should be created for export-oriented industrial strategy. To this end, the state must implement protectionist measures in trade for the necessary goods and services and systematically and effectively use the possible opportunities of strategic foreign trade policy. It is this approach that has led to a conceptual generalization of the problem of foreign trade efficiency [3]. One of the main problems facing the country in the context of rapid implementation of modernization policy in all areas is the sustainable growth of foreign trade turnover and increasing economic efficiency. This will create conditions for the structural improvement of foreign trade relations by ensuring the production of competitive goods and services, their introduction to the world market through the effective use of the achievements of scientific and technical progress of foreign trade relations. As we know, as an element that creates a trade system, in addition to playing an important role in the implementation of sustainable development of the country, it is associated with most elements of socio-economic problems of the country and is directly related to GDP. We believe that the liberation of 20% of our lands under Armenian occupation today, the natural resources of these territories will have a positive impact on the resource-rich foreign trade sector in this regard. We would like to note that the foreign economic policy pursued since 2003 has resulted in the intensification of large-scale investment flows to the country since 2003, rapid growth of oil production and exports, acceleration of economic development, income growth, poverty reduction. provided. It is no coincidence that the growth of exports in the country reached its peak in 2008. This growth continued until the pandemic. Compared to 1991, to this day, along with this growth dynamics of foreign trade turnover, fundamental changes continue in the commodity structure of exports and imports, as well as the number of countries with which trade relations are established and trade turnover. However, when we analyze the commodity structure of foreign trade relations, we see that the tendency to monostructure in the country's import-export operations still prevails. In the context of globalization, in addition to increasing the foreign trade turnover of the state, it is important to systematically address the production of competitive goods and services, ensuring their free access to international markets, using modern achievements of scientific and technological progress to increase its economic efficiency. The decree signed by the state in connection with the "Development Concept of Azerbaijan 2020" has significantly highlighted the need to modernize the socio-economic life of the country as a whole [4].

Examples of such documents are the "Long-term vision for the period up to 2025" and "Targets for the period after 2025". Each of these documents was a state call to stimulate the export potential of non-oil sector products, which were measures aimed at expanding foreign trade relations and increasing the export potential.

3. TAX POLICY IN THE STIMULATION OF AZERBAIJAN'S EXPORT POTENTIAL

As we have noted, economic integration into the world economy, the expansion of foreign trade relations is one of the main advantages of the modern world and has a rapid impact on the economic development of these countries, which have become economically integrated into the world economic system. Changes in the world market affect the development of national economies and the quality and quantity of participation of national economies in the world market. Even in highly developed countries, the weakening of foreign trade can lead to declining exports, creating socio-economic problems, creating political problems in the country, economic tensions, economic downturn, inflation and rising unemployment. From this point of view, export support is an important factor in national economic development within the framework of state interests, regulatory mechanisms of the state, stimulating policy in support of exports, foreign trade, effective organizational-economic, legal policy. Many factors affect the foreign trade, ie export potential of each national economy. These factors include improving the use of production assets, scientific and technological progress, improving the workforce, discovering minerals, further expanding international economic integration, and so on. includes. However, these factors do not initially affect the specific export potential as a whole, but the individual components that make it up, and thus the export potential is formed on the basis of the export potential of its internal components. It is no coincidence that we also agree with this statement: "In developing countries, export stimulation is especially important for the realization of development" [5]. As in all areas, the tax system is the basis of the mechanism of state regulation of the economy in the foreign sector. The efficient operation of each country's economy depends on an efficient and well-organized tax system. The tax system aimed at improving the socio-economic welfare of the country's population is aimed at creating a transparent environment for the development of economic activity, stimulating investment in the economy, fair distribution of the tax burden among taxpayers, lowering tax rates, etc. Such factors form the basis of tax policy. However, as we know, in world practice, tax policy is implemented in two main ways. This is:

- a) economic development policy;
- b) maximum tax policy.

In economic development policy, the state seeks to stimulate taxpayers by taking into account their interests by ensuring its fiscal interests. It provides softening concessions to economic entities engaged in entrepreneurial activities. Reduces its costs and spending on social programs. The main goal of this policy is to prioritize the development of capital and stimulate investment. In contrast to the tax on economic development policy, in the maximum tax policy, the state sets high tax rates, does not go for tax breaks and increases the number of taxes. The state, which implements such a tax policy, thinks not of its citizens, but of its own expenses, and thus has a negative impact on economic development. However, it should be noted that the maximum tax policy is applied by states in special cases of war, economic crisis and emergencies. We can say unequivocally that a stimulating tax policy is applied in Azerbaijan. The purpose is to stimulate the development of technoparks by developing innovations in economic development, discounts on investments in the territory of technoparks, if the entity is a new resident and continues the project, tax benefits are applied until the end of the project. Unfortunately, we would like to note that there is no significant provision in the Tax Code of the Republic of Azerbaijan to stimulate exports or specific foreign trade, but even if this is not

the case, we consider it expedient to pay attention to some issues related to income tax. It should be noted that the state pays special attention to the development of the private sector. According to this course, simplification of licensing, suspension of inspections in the field of entrepreneurship, introduction of investment and export promotion mechanisms, reduction of preferential lending rates, measures to develop small and medium enterprises, expansion of e-services, improvement of tax, customs and social payments will increase the share of the private sector. The share of the private sector in industry was 83.2% in 2018 and 82.5% in 2019. [6] They play an important role in the development of the non-oil sector in the country. The application of new models of advanced mechanisms such as industrial parks and neighborhoods, agro-parks opens up great opportunities for the creation of innovative enterprises, the expansion of production of export-oriented products. Incentives are applied in the field of tax policy, as well as customs. Accordingly, residents of industrial parks are exempt from labor, land, income or profit taxes for a period of 7 years from the date of registration. They are exempt from VAT and customs duties when importing machinery, technological equipment and installations imported for production purposes. Modern infrastructure is being created in industrial parks at the expense of state funds, thus stimulating entrepreneurship to invest. The results of recent years allow us to say that 300 million manat of the 1.5 billion manat worth of products produced in the country's industrial parks are exported to foreign countries. It should be noted that these successful measures also create new jobs in the country and its regions. An effective tax policy also stimulates the application of the investment promotion mechanism as a progressive method in the country, the legal entity that obtains this document is exempted from 50% of profits for 7 years. It accelerates the development of import-substituting export-oriented industry in the country.

4. CONCLUSION

According to our brief analysis, we can say the following. Stimulation of export foreign trade is regulated by economic interests in the national interests of each country. Tax regulation in the country is carried out taking into account the existing structure and potential of the country's economy, which has the effect of effectively regulating the problems associated with foreign trade or exports. It is not expedient to apply tax incentives to increase the export potential of the oil sector in the country. The low share of the non-oil sector in the country's export structure makes it necessary to apply a preferential, stimulating tax policy in these areas. Application of tax incentives for all types of export-related activities of export-oriented industries in the country. Stimulation of tax incentives for all types of activities aimed at the development of industry in the country.

ABSTRACT

This article is devoted to the distance learning or education which implies an approach to learning a foreign language in universities. This form of learning allows the students to choose the time and place for training, as well as to use new informational technologies in training. Informational technologies of distance education allow conducting classes in a foreign language in a videoconference mode and provide to control independent work of students. Today new information technology influences on students' knowledge level. Distance education becomes more and more popular in the form of education; it allows the student to study in their pace where they are. It is clearly differentiated from the traditional education in terms of a student's or teacher's physical presence and live communication. Distance education increases topicality of problem development private methods of application of technical training tools. These are primary contradictions between tradition and distance education. The bases of the educational process in distance learning is purposeful and controlled intensive independent work of the student, who can study due to an individual schedule having a set of special training tools and agreed opportunity to contact to the teacher by phone, e-mail and regular mail. Distance education it is type of training based on educational interaction of teachers and student, who are remote from each other and implemented using telecommunications technology and internet recourses. Foreign language learner has an opportunity to communicate with varies communicants and this process is not limited to any time. Advantages and disadvantages of distant education, differences and similarities of traditional and distant education are indicated in this article. Also some difficulties of distant education such as lack of distant learning experience, preferring classical education, insufficient of computer literacy, poor using of standards of distant learning, the problem of finding specialists are noted. Synchrony and asynchrony formats of distant education are differentiated and explained. As a result, it was concluded that distant education has a positive impact on academic achievements of students in terms of reduces costs, saving time and increasing accessibility of education as well as enhances academic performances.

Keywords: *distant education, individual approach, remote teacher, technology, traditional education*

1. INTRODUCTION

Today people all over the world are connected with each other in a big way through social networking sites. This has led to increase popularity of online education. The only requirement is a computer system with the internet connectivity. The power of computers and the internet in the current century enables all learners to study at their home without having to attend a regular face-to-face course or school. In other words, recent developments in Information and Communication Technologies have brought about various improvements, facilitating people's lives.

Developments in science and technology are fundamentally altering the way people live, connect, communicate and transact (Humbatova S. and Abidi S., 2021). Distance education appears in the educational field as a new technic because of the increasing demand for the flexible and convenient aspect. Learners who are unable to attend classes for one or another purpose can study at their own pace independent from time and place. The global student community grabbed the opportunity with both hands and millions globally are currently taking online education. Having created the terms in which every student is able to get necessary knowledge by using his cognitive opportunity (Симеонова Н., 2018). Distant education is a type of learning based on the educational interaction of teachers and students, who are remote from each other and implement to use telecommunication technology and internet resources. Distance learning also called distance education, e-learning and online learning, form of education in which main elements include physical separation of students and teachers during instruction and the use of various technologies to facilitate student and student communication. Reconstruction of high education is the catalyzer of tradition education system changes. Today non-state educational institutions appear offering services which headily diversify on increasing not only innovation of pedagogical methods but also informational technology. These are the stimulus on increasing student's motivation in this case. It gives great opportunities to everyone: the student have new mechanism of multidiscipline realization and social culture connection by using the most modern forms of information exchange of system and multisystem interaction. A learner who is willing to educate must get necessary knowledge. Didactic features of given informational technology must be use to this purpose (Курбанов А., 2015).

2. LITERATURE REVIEW ON DISTANCE EDUCATIONS

The reality of communication entails the desire of the leaner to communicate more in a foreign language. The mechanism of such communication is an information learning environment based on hypermedia technology with access to the global Internet. In the process of distance education in different programs, students take varies courses depending upon their majors. Actually, students' thoughts and perceptions about this courses and whether this courses meet their needs or not of great importance for the success and motivation of students. They can take various courses for diploma, certificate or a degree via distance education in a more flexible and interactive atmosphere. The introduction of multimedia technologies and the internet in learning in many universities has been observed as a means of improving accessibility and quality of delivery and learning among the student and teachers. Research on the attitude of the students towards distance language learning is limited (Glisan et. al). Two aspects of distance language learning are realized by the researches: achievement and attitude. Distance programs could have a positive effect on achievement and attitudes. The result of the research indicates that there is a positive attitude toward distance learning. Female students' attitudes are found to be more positive compared to males (Ali Hakan Işık et al.). The main advantage of distance education as well as the technology on the internet is the shift of emphasizes from verbal methods of teaching a foreign language to the methods of search, creative activity. Distance education should not replace text books and manuals, the should form the basis for the organization of educational and cognitive activity of students. The emergency of distance education has led to the need to develop and implement distance learning technologies. Many researchers believe that technology is a tool that used to remove geographical barriers and to facilitate learning (Ho, C.-L., and Dzung, R.-J. 2010). Nowadays bright examples of distant education is an educational platform. A lot of platforms are existed in the world, which give the students the opportunity to get education at any time, in any place. The major approach of education process in modernity increases knowledge level through self-education (Пичугина Г.А., 2018) without using a new learning technology, it is impossible to get qualified specialists. The major problem of distant education in learning English is a personal-orientation approach

to a group of student as to an individual schedule. “It is necessary for us to know not only skills and opportunities of each student, however his physically features” (Гарбузова И.В., 2014). Distance education of a foreign language presents a set of educational-computer program. They are intended for solution of definite educational issues. Such approach to education implies an individual approach either. Some students with upper level of knowledge receives educational information quickly, but the majority of students with the low level of knowledge very slow. Such systems allows all student to achieve high results regardless their initial level of knowledge. It allows to study in any distance from small auditory, completing in different countries. Distance education concentrates the followings:

- to work with delivered material
- the assistance of a remote teacher
- to deliver educational material on time
- to increase informational culture
- possibility of getting knowledge in any accessible place of the world, any time you like
- accessibility of a person, removed from educational institutions of high education

The delivered materials must contain:

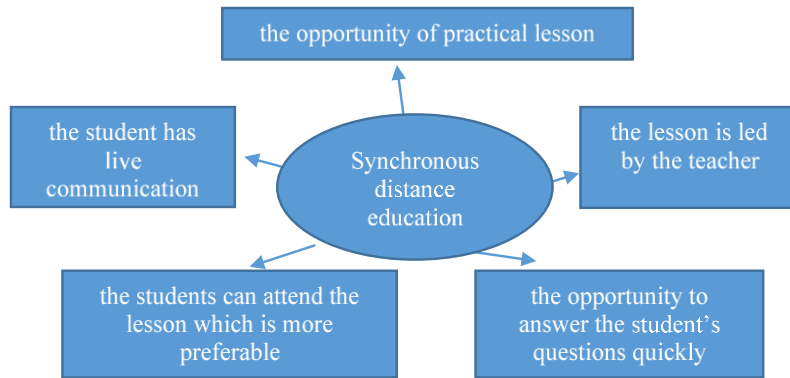

- a) educational methodical program
- b) educational facilities
- c) the list of literature
- d) questions and tests for practical work
- e) exercises and tasks are given to consolidate the material
- f) summarizing the control work.

The delivered educational materials are printed in the form of electronic hypertexts aids. Some companies are specialized in the producing of materials for self-education and self-preparation. In this case text books are the supplements to the common educational material, but not the main study guide. Depending on the approach, it can be text books or education methodical facilities. Learning English by books has negative and positive sides. Students cannot spend time on the way to the tutor or can study in a convenient place in free time. We prefer such distance courses, which offers feedback. For example, after reading the text by the students on the learned theme, it is necessary to do exercises on a reading text which is controlled by the remote teacher. To teach the speech activity can be possible only by communication (live communication) (Иванова И.В., 2012). The teachers are recommended from time to time to produce circularization of educational material and to organize an access to informational channels.

3. THE FORMATS OF DISTANCE EDUCATION

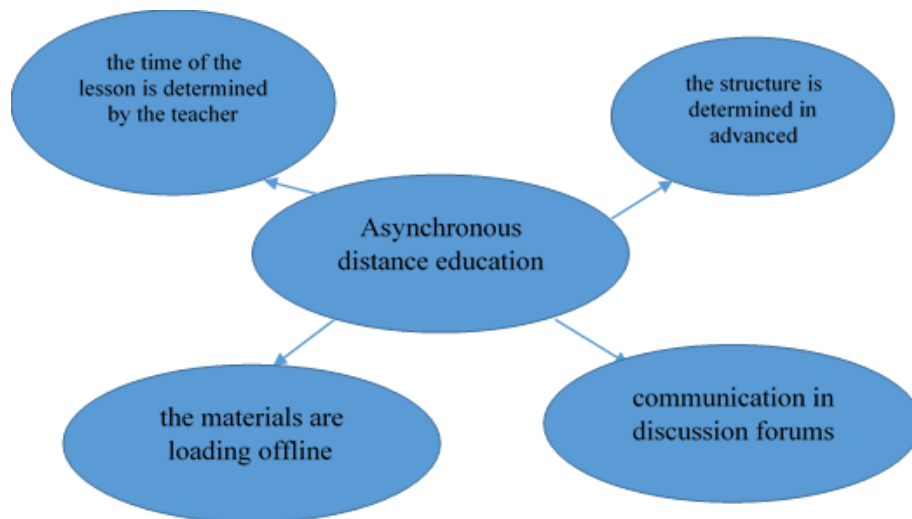

Distance education has two formats: synchronous and asynchronous types. Both of them requires strong technologies. These types of distance education are the two formats of conducting lessons. Synchronic education is the format of education in the regime of real time, the lessons are not held in the definite place. Synchronous distance education are offered by the instructors of the lesson and it includes:

Figure following on the next page

*Figure 1: Features of Synchronous distance learning
(Source: Prepared by the author on the basis of theoretical materials)*

Asynchronous education is a format of education when the delivering process of knowledge transmission or ability is not connected with the definite place. This type includes:

*Figure 2: Features of Asynchronous distance learning
(Source: Prepared by the author on the basis of theoretical materials)*

4. ADVANTAGES AND DISADVANTAGES OF DISTANT EDUCATION

Distant education has vast potential. It has advantages and disadvantages while understanding it. The advantages are:

- distant education is cheaper;
- the student can pursue a job with along studies: a student who does not want to give up their jobs, but want to get higher education. They can study on the weekends when they are back from work or even in the middle of the night;
- the student can save time and money: students who are looking economically options can go for a distance learning program. There is no wasted time in going to and from collage. Your classroom is right in your bedroom – the study material on your desk or the material in your computer;
- the student can study whenever and wherever: the student can go to study in his garden or in the comfort of his own bed;
- flexibility: student mostly do not attend regular classes in the form of lectures and seminars. Everyone can learn as much as they want personally necessary for the development of the discipline and getting the necessary knowledge on the chosen specialty.

The disadvantages are:

- hidden costs: the student might have to incur some initial expenses like installing a computer and getting a reliable internet connection. The student need to buy additional resources, such as a printer, a web camera and so forth. Lack of direct face to face communication between a student and a teacher, when there is no person who could emotionally color knowledge, it is a significant disadvantage for the learning process. It is difficult to create a created atmosphere in a group of students. The need for a personal computer and access to the internet, the necessity of constant access to information resources;
- high costs: high system of building the system of distance education. At the initial stage of creating a system significant costs of creating distant learning. Systems, purchase of technical equipment.

5. DIFFERENCES AND SIMILARITIES OF TRADITIONAL AND DISTANT EDUCATION

There are a great amount of differences and similarities between online and traditional learning. The differences in distant education are:

- the courses are taken online, which does not restrict the student to particular location
- it requires more self-education and discipline in order to get coursework completed on time
- online feedback can be slower
- the student must not leave his place that makes the system accessible for students from remote inhabited locality
- a student economy his time, expenses and can combine his work with activity
- it is also a proses a transmission of knowledge it leads self-education
- no personal factor
- the role of technology and virtual interactive is great
- virtual visual aids are prepared in advance

The traditional education:

- live communication
- getting more qualitative education
- the process of the lesson depending of teacher's methods
- the presence of individual factor
- the formal environment is classroom
- the system is based on a fixed schedule where students and teachers must coincide in a physical space

Similarities:

- the preparation of the lesson by the teacher and student in advance
- the knowledge evaluation of the student by the teacher
- the lesson meets the requirement of a qualitative educational standards
- the teacher demonstrates his skills and knowledge during lessons
- communication needs are implemented
- there are some similar aim of the education
- motivation of students

6. THE MANAGEMENT OF THE LESSON

The major workload is undertaken by the teacher in management of the lesson. The teacher contacts the students before the lesson. He is open and concrete during the communication in order to create correct relations with the students the teacher must pay attention to his

communication tone and to be open to discussion. He is the organizer of the education process. He plans active learning opportunities and uses active tools, creates effective communication process. The level of the lesson depends on the teacher's qualification and skills. The teacher chooses the time and the place himself. They discuss the aim of the lesson in advance. The teacher gives instructions to determine the place where the students can get technology support. Both sides understand the responsibility during the process of the lesson. The teacher demonstrates his technical ability, explains the aim the structure of a lesson and usage of technical facilities. How and which theme will be thought are also indicated by the teacher. He selects educational material (the material must be complied very attentively).

7. CONCLUSION

Distant education problem is not enough researched topic. The major basic constructive component is the teacher's technical discipline ability in order to distinguish the main regularity which is under consideration of pedagogical phenomena, taking into consideration the problems and goals of professional activity by using psychological and pedagogical methods of teaching in educational activity of technical profile (Черкасова О., 2017). The organizer of all educational process is a teacher. He plans the lesson and students level depend on the teacher's skills. University teacher's goal is produce highly-skilled specialists of industry and different economy. Respectively, a foreign language is not only necessary tool for such specialist but also the most important component of cultural and humanistic activity (Пичкова Л. and Чертовских О., 2019). We think that computer is a great facility to learn English which allows to make some changes in traditional process of education. Given method of getting education is used with great popularity, the goal is to possess English when such factors as remote location of education centers and unstable schedule cannot become an obstacle to achieve necessary objectives. The rapid spread of distance education in the world not only offers students and teachers great opportunities, but also brings a lot of challenges. Learners are unsupervised, self-directed, independent and expected to be more autonomous. As a result, it can be noted that the choices of system education are depend on student's consciousness and opportunities.

ABSTRACT

The main purpose of this publication is the research and study of the impact of the global coronavirus pandemic on the financial statements of companies since the beginning of 2020. Especially the probability of “continuity of operations” used in International Financial Reporting Standards, recognition of income, valuation of inventories, determination of fair value, impairment of goodwill, etc. such as issues are discussed and recommendations are made to reduce the risks. According to the article because of the ongoing uncertainty due to the pandemic, to maintain the quality of the financial statements the effects that are expected and likely to occur due to the application of skepticism should be detailed in the financial statements. The article conducted a regression analysis of gross profit using linear multiplicity and nonlinear multiplicative of econometric modeling methods to assess the relationship between the gross profit of the organization, cash flows, current assets, current liabilities, private capital and debt capital. As a result of the research, it was found that “Azersu” OJSC (The organization in charge of state policy and strategy in the field of water supply, drinking water supply and sanitation services to consumers in a centralized manner) has a negative linear relationship between cash flows, vehicle assets and total capital and total profit, as well as between current liabilities and total profit, a positive linear relationship. The article can play a positive role in enriching the scientific and practical knowledge of experts involved in accounting and auditing. To avoid the research limitations more practical information and reporting indicators is required. The need for econometric modeling, based on the regression equation of dependencies, the audit of the financial statements of the audited entity and its improvement.

Keywords: *continuity of activity, econometric modeling, fair value measurement, financial statements, profit, regression analysis*

1. INTRODUCTION

Restrictive measures taken in connection with the coronavirus pandemic have brought almost all sectors of the economy to a standstill around the world, including the Republic of Azerbaijan, which in turn has affected many activities, including financial reporting. The economic consequences of the crisis are already looking serious. Due to the simultaneous shortage of supply and demand, economic activity in key European, North American and Asian markets declined more than during the 2008-2009 global financial crisis. According to the OECD (The Organisation for Economic Co-operation and Development) forecast, subject to the development of events according to the baseline scenario, world GDP this year will decrease by 4.5%. The contraction of the economy is expected in all G20 countries, excluding China. In 2021, a recovery is projected at an estimated 5% volume. This means that global GDP at the end of 2021 will reach a level roughly corresponding to the end of 2019: a decline approximately equivalent to 7.5-8% of world GDP, which roughly corresponds to the combined

annual GDP of France and Germany. In a less favorable development of events, the size of losses in two years will approach 13% of world GDP, in a more favorable scenario, they may be limited to 4.8%. Such a prospect, for all its grimness, represents an improvement over the spring: the authorities managed to react and soften the initial blow. As the quarantine restrictions were lifted, many were able to resume economic activity. However, in many countries, it appears that stagnation is already beginning, and confidence in the future is far from growing, given the new outbreaks of the virus practically around the world. The economic impact on the Eastern Partnership countries is compounded by the recent drop in oil prices, as it directly affects Azerbaijan and Belarus, and also affects other EaP countries, especially Armenia and Georgia, as it affects trade and remittances. The fall in oil prices for the second time in five years has pushed Russia into recession: the EBRD predicts a 4.5% decline in real GDP this year (COVID-19 crisis response in Eastern Partner countries, 2020). In order to ensure the implementation of the Order of the President of the Republic of Azerbaijan No. 2300 dated September 5, 2016, which approved by the Resolution No. 257 by the Cabinet of Ministers of the Republic of Azerbaijan dated June 4, 2019 "Assessment of the effectiveness of the activities of legal entities in which the control package of shares (stocks) belongs to the state" evaluation of the results of the activities of these enterprises is carried out periodically by calculating the efficiency indicators and efficiency indicators are based on the ratios obtained from the financial statements. The aggregate efficiency coefficient is calculated on the basis of the forecast efficiency indicators submitted to the regulatory authorities before November 1 of the year preceding the reporting year, after the ending of the reporting year, the actual ratio and the forecast ratio are compared and the satisfaction of the enterprise is determined depending on the scale of the deviation. As can be seen, in Azerbaijan, as in the rest of the world the coronavirus pandemic by affecting the financial statements of enterprises and causing sharp changes in efficiency indicators has created certain risks in assessing the performance of enterprises.

2. IMPACT OF THE CORONAVIRUS PANDEMIC ON FINANCIAL STATEMENTS

Although China first time had informed the World Health Organization about the presence of an unusual coronavirus on December 31, 2019, the world's population had begun to receive more detailed information about the symptoms and risks of the virus in 2020. In Azerbaijan, restrictive measures against the pandemic had begun to apply in early March. From an accounting point of view, the main impact of the virus began to be felt in most parts of the world in January-March 2020, so it did not create an "adjustment" effect for the 2019 financial statements. This effect should be fully reflected in the financial statements for the period ending 31 December 2020 (Abdulshakour, Saddeq, 2020). To understand the effects of the coronavirus pandemic requires grouping the effects into first, second, and third degree. Also, the assessment of these effects is a very complex process and because of that a comprehensive approach is needed. Direct economic effects reflected in the financial statements of enterprises are primary effects. Uncertainties regarding the valuation of assets and liabilities may be classified as secondary effects. Tertiary impacts are related to the probability of "continuity of activity" in International Financial Reporting Standards and audit issues (Pulejo, Massimo, and Pablo Querubín, 2020). Because of the large fluctuations in market prices all three of accounting, financial reporting and auditing activities is widely affected and because of the widely scale of the impacts and given the need to make greater use of accounting probabilities, enterprises should first be interested in preparing interim financial statements-IAS 34 Interim Financial Reports (Guidelines of the International Accounting Standards Board, 2021). Economic conditions force businesses to defer non-essential secondary costs, also enterprises pay salaries to employees when they do not receive income, and apply various benefits to customers and borrowers.

From this point of view, when preparing financial statements, there is a need for complex calculations, and in this case, the issue of quality of financial statements comes to the fore. In this regard, after the end of the reporting period, accountants may be required to provide an opinion on whether the events that occurred are “corrected” or “uncorrected”. The interpretation of accounting standards for revenue recognition is of particular importance in the context of declining revenues in a pandemic. In this regard, the signed contracts should be re-evaluated against the background of price discounts, refunds, etc (Bettner, Mark S. , 2018). Before the recognition of income it is important that the terms of the contract are fully understood in accordance with IFRS 15. Recognition of loss created by impairment of assets because of assets prices fall sharply in financial markets should be more closely monitored. Temporary closures of production facilities due to the coronavirus, restrictions on travel, import and export operations can be considered as a sign of impairment of assets, because it is not possible to restore the value of these assets through their use and sale. In other words, the company is considering decreasing incomes, breakage of supply chains, and so on. must regularly test assets against impairment. Another sensitive point in financial reporting is the impairment of goodwill. If the amount of goodwill reflected in the statement of financial position of enterprises operating in areas most affected by the pandemic is large, the impairment loss of goodwill will have a greater impact on the profitability of the enterprise. At the same time, direct government subsidies to mitigate the effects of the pandemic, such measures as tax cuts, soft loans, etc. one of the points of interest is the study of the impact on the financial statements (Shodiev, Dr. Tursun, 2020). Measuring fair value is also one of the most affected activities due to uncertainty and price fluctuations in the markets. Statements about the impact of the pandemic in measuring fair value must be reflected in the financial statements. In particular, the measurement of the fair value of financial instruments and investment property is of particular importance. When measuring the fair value of these assets, changes in market participants' expectations about future cash flows from assets or liabilities caused by the coronavirus pandemic should be investigated in detail. The profit and loss statements of the enterprises such as energy, heavy engineering, automobile production, etc. operating in capital-intensive areas will be more affected because of removal of material and goods and uncertainty regarding income recognition. One of the activities where the significant negative impact of the coronavirus pandemic will be felt is valuation of inventory. Compulsory closure of some areas, a sharp decline in demand, a decrease in the net realizable value due to non-performance of sales contracts should be taken into account in the assessment of inventories. If it is not possible to calculate the balance of the warehouse, the subjective approaches of accountants will be of particular importance. "The Expected Credit Loss" model is usually used to create provisions for bad debts. This model predicts expectations based on the company's historical data so due to the coronavirus pandemic, this model will lose its relevance and a new model will need to be built. Delayed taxation is one of the issues affected by the coronavirus pandemic. This includes the recognition of deferred tax assets and liabilities, the method of reversal and the interim reporting tax rate. If an entity has made a profit in previous years, it is possible to recognize a deferred tax asset without dispute. In other entities, a deferred tax asset should only be recognized when there is strong evidence that it will be taxable in the future. So, it will not be possible to recognize a deferred tax asset in an environment of uncertainty about future profitability (Fathutdinov R. A., 2014). On the other hand, the Effective Tax Rate must be applied as required by International Accounting Standards (IAS) 34. Intensification of government programs aimed at mitigating the effects of the pandemic will increase uncertainty about the composition of taxable income in this regard (Seago, W. Eugene, 2018). One of the problems caused by the coronavirus pandemic is the probability of business continuity. To clarify this probability, auditors will need more documentation and evidence during the pandemic.

According to the instructions of the International Accounting Standards Council, the management of the enterprise is responsible for assessing the probability of continuity of activities. To this end, the probability of continuity in the sectors most affected by the pandemic (travel, media, hotels, etc.) should be reconsidered (Sage, Andrew P., and William B. Rouse, 2011). Another issue related to the continuity of operations is related to cash flows. In other words, the answer to the question of whether the amount of money received can last for 12 months is one of the most important points (Acikgoz, O., & Gunay, A., 2020). In this regard, the risk analysis of the probability of business continuity should be reflected in the notes.

3. ECONOMETRIC MODELING OF DEPENDENCIES BETWEEN INDICATORS OF ECONOMIC ENTITIES

As it is known, the main purpose of the audit is to provide a comprehensive assessment of economic and financial performance. In this regard, the use of economic analysis in auditing is a necessity. However, the proper use of economic analysis in auditing is associated with a number of problems. Thus, the analysis of individual factors does not allow to overload the audit materials used in the audit and to draw appropriate conclusions (Hay, David, 2020). From this point of view, economic analysis should be used only in a limited form, in the form of mutual and logical interrelation of factors (Elena V. Sibirskaya, Lyudmila V. Oveshnikova, Lilia A. Mikheykina, Innara R. Lyapina, 2018). Between Azersu OJSC's gross profit (GP), its cash (X1-C), current assets (X2-CA), current liabilities (X3-CL), equity (X4-E) and debt capital (X5-DC) To assess the dependence (using the data of the financial statements from 01.01.2016 to 01.01.2021 (azersu.az.static, 2020). set the specification of the linear multi-regression type econometric model:

$$Y = b_0 + b_1 C + b_2 CA + b_3 CL + b_4 E + b_5 DC \quad (1)$$

Let's clarify the question: to what extent are the quantitative characteristics of the direct relationship of X_i ($i = 1..5$) regressors with the dependent variable Y (GP) reliable? As a result of econometric analysis conducted on the basis of EViews software package, the following empirical values of $Y = b_0 + b_1 x$ double regression equations were obtained.

- $Y \rightarrow X_1$ (GP \rightarrow C)

$$GP = 83,72 - 10,78C \\ P(0,00)(0,00)R^2 = 0,65; E = 0,91$$

- $Y \rightarrow X_2$ (GP \rightarrow CA)

$$GP = 149,87 - 1,64CA \\ P(0,00)(0,00)R^2 = 0,67; E = 2,42$$

- $Y \rightarrow X_3$ (GP \rightarrow CL)

$$GP = -14,39 + 0,11CL \\ P(0,10)(0,00)R^2 = 0,74; E = 13,58$$

- $Y \rightarrow X_4$ (GP \rightarrow E)

$$GP = 18,91 + 0,13E \\ P(0,00)(0,00)R^2 = 0,76; E = 0,57$$

- $Y \rightarrow X_5$ (GP \rightarrow DC)

$$GP = -16,16 + 0,09DC \\ P(0,00)(0,00)R^2 = 0,94; E = 1,43$$

So we get according to the pair of regression equations we get:

- In Azersu OJSC, there is a fairly close regression relationship between cash and gross profit, and the established regression equation explains the distribution of the value of gross profit by 65% ($R^2 = 0.65$). The equation shows that as a result of an increase of 1 unit of regressor X_1 , the total profit in the OJSC decreases by 10.78 units (the value of the coefficient b_1 is negative). The value of the elasticity coefficient $E = 0.91$ indicates that the gross profit decreases by 0.91% as a result of a 1% increase in cash.
- Azersu OJSC has a fairly close regression relationship between the amount of current assets and gross profit. The established regression equation explains 67% of the distribution of the value of the total profit of the OJSC ($R^2 = 0.67$). According to this correlation equation, an increase of 1 unit of current assets in the company leads to a decrease of 1.04 units of gross profit. As a result of a 1% increase in current assets according to the elasticity coefficient $E = 2.42$, the total profit of Azersu OJSC decreases by 2.42%.
- In Azersu OJSC, there is a close regression relationship between current liabilities and gross profit, and the established regression equation explains the distribution of the value of GDP by 74% ($R^2 = 0.74$). According to this correlation equation, a 1 unit increase in current liabilities in the company leads to a 0.11 unit increase in gross profit (the value of the coefficient b_1 is positive). According to the established regression equation, a 1% increase in current liabilities in society increases GDP by 13.6%.
- In Azersu OJSC, there is a fairly close regression relationship between private capital and gross profit, and the established regression equation explains the distribution of GDP by 75% ($R^2 = 0.76$). The equation shows that as a result of an increase of 1 unit of private capital, the total profit of the OJSC increases by 0.13 units. The value of the elasticity coefficient $E = 0.57$ shows that the gross profit increases by 0.57% as a result of a 1% increase in private capital in society.
- Azersu OJSC has a very strong regression between debt capital and gross profit (the value of the coefficient of determination ($R^2 = 0.97$) is very close to the unit. The value of the correlation coefficient is $r = 0.97$). According to the established double regression model, as a result of a 1 increase in debt capital, the company's total profit increases by 0.09 points, and a 1% increase in this regressor results in a 1.43% increase in GDP.

Now let's give a regression analysis of the total dependence of the total profit Y (GDP) on all explanatory variables (X_1, X_2, X_3, X_4 and X_5), which we chose as the variable explained in Azersu OJSC. The statistics of the econometric analysis are shown in the following table:

Table following on the next page

Dependent Variable: UMT
 Method: Least Squares
 Date: 04.05.2021 Time: 20:50
 Sample: 1998 2021
 Included observations: 21

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-1.914659	115.3903	-0.016593	0.9870
Cash	-4.342606	0.207565	-20.92170	0.0000
CA	0.128184	1.390293	0.092199	0.9278
CL	-0.037006	0.118086	-0.313386	0.7583
E	-0.035807	0.006747	-5.307269	0.0001
DC	0.114840	0.125998	0.911439	0.3765
R-squared	0.998246	Mean dependent var		44.06667
Adjusted R-squared	0.997662	S.D. dependent var		20.17261
S.E. of regression	0.975462	Akaike info criterion		3.023146
Sum squared resid	14.27290	Schwarz criterion		3.321581
Log likelihood	-25.74303	Hannan-Quinn criter.		3.087914
F-statistic	1707.658	Durbin-Watson stat		0.487504
Prob(F-statistic)	0.000000			

Table 1: Regression analysis statistics

(Source: Prepared by the author on the basis of the website <https://azersu.az/az/static>)

Thus, the multivariate regression model of dependence is as follows:

$$GP = -1,91 - 4,34C + 0,13CA - 0,04CL - 0,04E + 0,11DC$$

$$P(0.98) (0.00) (0.92) (0.76) (0.00) (0.38) R^2 = 0.998 (2)$$

Analysis of the statistical characteristics of the regression model (2) shows that despite the high value of the determination coefficient, the coefficients b_0 , b_2 , b_3 and b_5 are statistically insignificant in this model, and model (1) cannot be considered a generally satisfactory and highly adequate model. On the other hand, according to the statistics of the model, the value of Durbin-Watson statistics is $DW = 0.49$, so the model also has a positive autocorrelation. In model (2), let's move away from the study of any of the regressors whose coefficient is considered statistically insignificant - for example, the explanatory variable $X_5(DC)$. The statistics of the econometric analysis conducted for this option are shown in the table below.

Table following on the next page

Dependent Variable: UMT
 Method: Least Squares

Log likelihood	-26.30901	Hannan-Quinn criter.		3.035784
F-statistic	2157.187	Durbin-Watson stat		0.377916
Prob(F-statistic)	0.000000			

*Table 2: Regression analysis statistics for the new composition of regressors
 (Source: Prepared by the author on the basis of the website <https://azersu.az/az/static>)*

Based on these statistics, the following multi-variable regression model is obtained for the correlation dependence between the indicators studied in Azersu OJSC.

$$GP = 103.23 - 4.31C - 1.14CA + 0.07CL - 0.03E$$

$$P(0.00) (0.00) (0.00) (0.00) (0.00) R^2 = 0.998 (3)$$

Elimination of positive autocorrelation in econometric analysis can be obtained by logarithmicization of all indicators of the model (3):

Table following on the next page

Dependent Variable: LOG(UMT)

Method: Least Squares

Date: 04.05.2021 Time: 21:57

Sample: 1998 2021

Included observations: 21

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	3.476266	0.758307	4.584245	0.0003
LOG(PV)	-0.436259	0.059399	-7.344581	0.0000
LOG(CA)	-1.298170	0.132546	-9.794083	0.0000
LOG(CÖ)	1.094821	0.094105	11.63401	0.0000
LOG(XK)	-0.136450	0.030051	-4.540551	0.0003
R-squared	0.984056	Mean dependent var		3.659231
Adjusted R-squared	0.980070	S.D. dependent var		0.547924
S.E. of regression	0.077353	Akaike info criterion		-2.076628
Sum squared resid	0.095735	Schwarz criterion		-1.827932
Log likelihood	26.80459	Hannan-Quinn criter.		-2.022654
F-statistic	246.8765	Durbin-Watson stat		1.286463
Prob(F-statistic)	0.000000			

*Table 3: Regression analysis statistics based on complete logarithmization
(Source: Prepared by the author on the basis of the website <https://azersu.az/az/static>)*

Then the following equation is obtained as a model of nonlinear regression of dependence:

$$\ln(GP) = 3.47 - 0.44\ln(C) - 1.30\ln(CA) + 1.09\ln(CL) - 0.13\ln(E)$$

$$P(0.00) (0.00) (0.00) (0.00) (0.00) R^2 = 0.984 (4)$$

To test the multicollinearity between the explanatory regressors included in model (4), compile the VIF matrix:

Variance Inflation Factors

Date: 04.05.2021 Time: 21:57

Sample: 1998 2021

Included observations: 21

Variable	Coefficient Variance	Uncentered VIF	Centered VIF
C	0.575030	2018.178	NA
LOG(PV)	0.003528	20.48335	1.863545
LOG(CA)	0.017569	1065.204	1.694423
LOG(CÖ)	0.008856	1193.214	3.641594
LOG(XK)	0.000903	78.46789	3.447880

Table 4: VIF matrix

(Source: Prepared by the author on the basis of the website <https://azersu.az/az/static>)

As can be seen, the VIF <5 condition is met for all indicators, ie there is no multicollinearity among the explainers of the model.

One of the conditions of the Gauss-Markov theorem is that the mathematical expectation of the residuals of the econometric model is zero. Otherwise, the normal distribution of residues is disturbed, either due to specification error or instability of variances. Let's use the Jarque-Bera test to determine whether the remains of model (4) are subject to normal distribution.

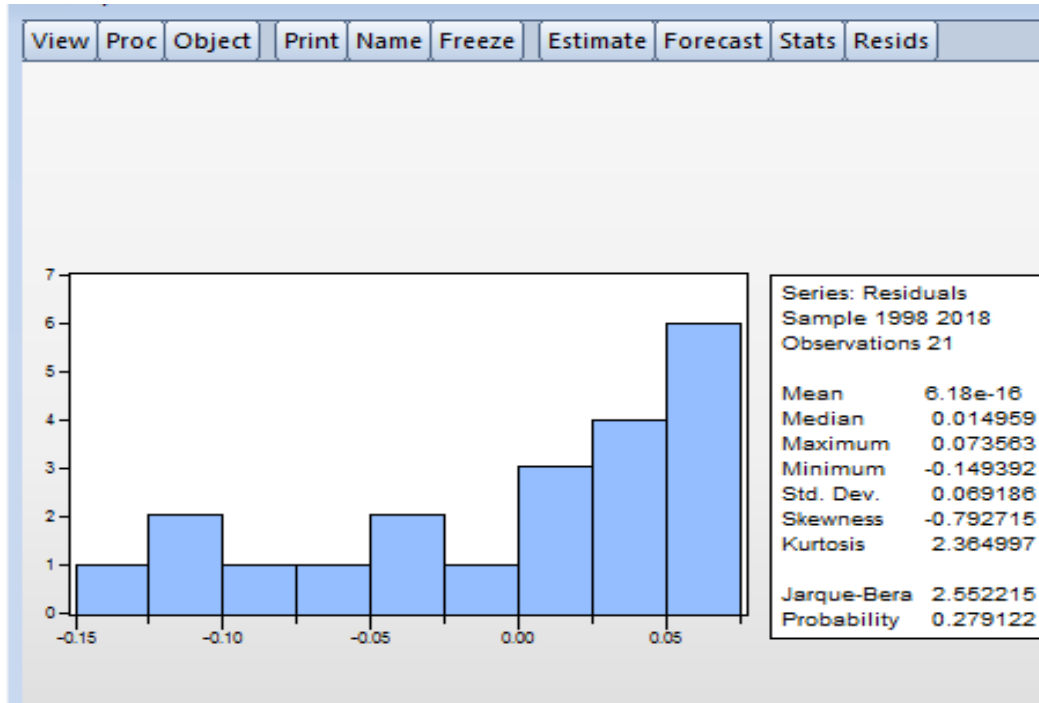

Figure 1: Jarque-Bera test

(Source: Prepared by the author on the basis of the website <https://azersu.az/az/static>)

4. RESULT

The P-statistic of the Jarque-Bera test is 0.28. Since this value is insignificant at the reliability level $\alpha = 0.05$, the remainder of the model is subject to normal distribution. Thus, the econometric model (3.18) is qualitative in all its statistical characteristics and adequately reflects the dependences on the economic object under study. According to this model, Azersu OJSC has a negative linear relationship between cash (PV), current assets (CA) and gross return on equity, and a positive linear relationship between current liabilities and gross profit. As for the quantitative characteristics of dependencies, there is a positive linear dependence. As for the quantitative characteristics of dependencies, a single increase in cash in the OJSC reduces gross profit by 0.44%, a single increase in current assets reduces gross profit by 1.30%, a single increase in equity reduces gross profit by 0.13%. A single increase in liabilities increases gross profit by 1.09%. Undoubtedly, the impact and scale of the global coronavirus pandemic on the world economy is enormous. In this regard, financial markets face a variety of risks. The financial effects of a pandemic on financial statements are significant and must be reflected in the financial statements in detail and in a timely manner in order to gain or lose the confidence of the parties involved (Drobotova O.O. , 2018). In order to ensure the implementation of the Order of the President of the Republic of Azerbaijan No. 2300 dated September 5, 2016, approved by the Resolution No. 257 of the Cabinet of Ministers of the Republic of Azerbaijan dated June 4, 2019 "Assessment of the effectiveness of the activities of legal entities in which the control package of shares (stocks) belongs to the state" risks associated with the application of the rule show the importance of studying the impact of the pandemic on financial statements in Azerbaijan.

ABSTRACT

The article outlines the essence of the state's regional policy and determines its main directions. Specifically, the criteria for determining the backward regions, which are of crucial importance in the formation of the regional policy of the state, have been substantiated. The article also substantiates the directions of financing the social and economic development of the regions. These justifications cover energy, transport and social development issues. The article outlines the factors that necessitate the state support to the development of the rural areas. The density of the population was noted as the main factor supporting the development of rural areas. Thus, in rural areas, due to low population density, both production and sales of products require large expenditures in comparison with urban areas.

Keywords: *Regional policy, spatial inequalities, financing rural development, state programs*

1. INTRODUCTION

Provision of regional development at the present stage of Azerbaijan's economic development is one of the most important priorities. Development of all regions of the country leads to overall development and increase of living standards of the population. Regional development policy is aimed at ensuring economic growth and sustainability of economic development. Based on the detection and elimination of structural problems in the country, state policy focuses on forming the necessary conditions for the development of regions and raising their competitiveness. The state's regional development policy, direct and indirect coordination of long-term economic decisions in order to address the challenges posed by regional development, in some cases, income, consumption, employment, investment and so on in regions can be seen as the conscious attempts of the state directed to control over the parameters. This policy is, first of all, related to the amount of public spending on the objectives of eliminating the differences between the regions on the development of regions and the level of socio-economic development. Thus, reaching any of the goals depends on decisions about the distribution of limited economic resources. This applies directly to one of the functions of finance. Second, regional development policy covers the impact of economic agents' decisions on the location of production and investment activities. So, the activity of any subject is related to the location. From this viewpoint, the state will have the opportunity to influence the selection of such a space. By influencing the formation of income of farmers, the state affects their decisions regarding the location of production.

2. METHOD

The method of the research is based on a technical-economic analysis of the statistical data on local and regional progress and material well-being in Azerbaijan. The article uses an application-oriented approach to define areas of financing for regions.

3. SOCIO-ECONOMIC DEVELOPMENT OF REGIONS IN AZERBAIJAN

Space is an integral part of economic, social, ecological, political and cultural attitudes and processes, and their geographies define the conditions and forms of societal methods of how these processes can be developed (Markusen A. (1987) *Regions: The Economics and Politics of Territory*, Rowman and Allenheld, Totowa, NJ.). The unevenness or differentiation of the economic space has a significant impact on the state structure, the structure and efficiency of the economy, the intuitional changes and the tactics of socio-economic policy (p.41) (*Regional development: the experience of Russia and the European Union.* / A.G. Granberg, Moscow: ZAO "Izd-vo" Economics ", 2000, 435p.). Local and regional progress and material well-being depend on the continued growth of employment, income and productivity, which is an integral part of economic development (STORPER M. (1997) *The Regional World. Territorial Development in a Global Economy.* Guilford, London.). From this point of view, the concept of "regional development" is related to the change in the number of population, employment, income and value-added regional productivity. It also means social development, which includes the health and well-being of the community, the quality and creativity of the environment (*Theories of Local Economic Development: Perspectives from Across the Disciplines/Edited by Richard D. Bingham and Robert Meir.* London: Sage Publications, pp. 319. C.27). In our view, the socio-economic development of the country is related to the socio-economic development of the regions and the elimination of differences between them. Regional development depends on geographical and demographic factors, specialization and productivity, physical and human capital, infrastructure and innovation. As the factors on the regions differ, their developmental levels also differ. This situation is widespread even in developed countries. For example, in Belgium the gross domestic product (GDP) per capita in the capital is 2 times more than in the province of Flanders, 2.8 times than in the province of Wallonia, and in the Netherlands this indicator in Antwerp is 1.8 times higher than the province of Eno (*Regional policy of the EU countries.* IMEMO RAS, Moscow: 2009, 230 p. from. 14.). Studies carried out in 1995-2007 by member states of the Organization for Economic Cooperation and Development (OECD) have shown that 32 percent of economic growth has been achieved by about 4 percent of the regions. The emergence of such a situation affects the geographical position of certain regions, their natural vulnerability levels, climates, and the quality of land, but in many cases market forces deepen regional inequality. The main purpose of the regional economic (or socio-economic) policy is to express the compromise between economic efficiency and social justice, although it is expressed in different ways in different countries (A.G.Granberg. *Bases of regional economy.* Moscow: State University Higher School of Economics, 2003, 495 pp., P. 350). For example, in most OIC member countries, regional equilibrium (justice) and efficiency (growth and competitiveness) are based on regional policies. Examples of regional balances include the priority of the development of the backward regions in Denmark, the regional balance in Finland, the territorial integrity of France, and the equal living conditions in Norway (pp. 14) (*Regional Development Policies in OECD Countries.* Paris:OECD Publishing, 2010, 388 p.). The scale of the development of the regions has a significant impact. It is assumed that the rural area has a higher position in the distribution of economic resources than cities. In such a situation, the development of infrastructure for improving the competitiveness of vulnerable regions can be ensured by the allocation of economic resources to the benefit of vulnerable regions due to the state's funding.

Thus, the region's competitiveness has a significant impact on the speed and value of material, financial and information flows in that region.

4. RESULTS, CONCLUSIONS AND RECOMMENDATIONS

According to the socio-economic development of the forces, the role of the market in reducing regional inequalities is limited and this usually causes concentration of production in separate regions. Therefore, the state implements the redistribution of economic resources in favor of the regions with low development levels to reduce disproportions in the territorial structure of the national economy. In such circumstances, it is necessary to determine the criteria for the implementation of the resource allocation. For example, in the European Union, these criteria are the gross domestic product per capita, the unemployment rate and the rate of job creation, rural and agrarian regions (9. A. Cappelen, F. Castellacci, J. Fagerberg, B. Verspagen. The Impact of Regional Support on Growth and Convergence in the European Union. Eindhoven Centre for Innovation Studies, The Netherlands Working Paper 02.14, September 2002, 27 pp, p. 7.). Thus, in the European Union, if the per capita Gross Domestic Product in the region is 75% of the average, this region is considered to be the backward. Also, the gross domestic product per capita and the share of agriculture in employment is one of the factors that are considered in determining the state support to the regions. From this point of view, it is possible to identify the regions in Azerbaijan that need to be supported. Although the gross domestic product is not calculated in the regions, the gross output per capita on key areas in the regions in 2012 varied from 5.1 per cent to 39.1 per cent of the country's average (Except for the Nakhchivan economic region, this figure is 95.8 percent in this region). As you can see from this criterion, all regions (except for the city of Baku only) are included in the category of regions that must be supported. Also, in 2012, 37.7 percent of the employed population accounted for agriculture, forestry and fishing, which is mainly covering the regions. In this regard, supporting the development of agriculture in the regions, as well as the development of non-agrarian spheres should be prioritized. At present, the Azerbaijani government has the necessary capacities to finance the development of the regions. Successful implementation of oil strategy has increased the volume of revenues in the country. An important part of these revenues remains at the disposal of the state. So in 2011, 50.1 percent of the remaining revenues in the country were aimed at saving and only 42.4 per cent of these resources were directed towards implementing investments across the country. Also, 62.0 percent of total savings in the country in 2011 were at the disposal of the state, of which only 44.3 percent were used. Over the recent years, the state's overfulfilment of the consolidated budget revenues has led to an increase in the assets of the State Oil Fund of Azerbaijan. Thus, the resources of this fund will be \$ 34.1 billion USD by the end of 2012, which is approximately half of the gross domestic product. Limitations of financial opportunities in the regions of Azerbaijan and poor development of institutional structures significantly increases the role of the state in regional development. Despite the implementation of two regional development programs in the country over the past 10 years: State Program on Socio-Economic Development of the Republic of Azerbaijan (2004-2008) and State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan in 2009-2013, the difference between Baku and other regions has not diminished significantly. Taking this into account, the Government of Azerbaijan has adopted the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018. In our view, the precise definition of regional development programs is crucial in terms of the effectiveness of the limited economic resources distribution. These goals are different in different countries. For example, the goal of a regional policy in the UK is to achieve a high and stable level of economic growth and employment across the country by providing full use of the existing potential of each region. In Poland, regional policies are aimed at supporting economic growth pole (large cities), in addition to stimulating the development

of the backward regions, especially southern regions. In general, in the European Union, regional programs covering 2007-2013 include goals such as mergers, competitiveness, employment and foreign co-operation (Governing Regional Development Policy: The use of performance indicators. Paris: OECD Publishing, 2007, 198 p, p.34.). From this point of view, it is important to identify the objectives of regional development programs. The main objective of the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018" is the continuation of measures to develop non-oil sector, diversification of the economy, rapid development of regions, especially infrastructure and social services as well as further improvements. In our opinion, the main goal here is to accelerate the rapid development of the regions (including the development of the non-oil sector and the diversification of the economy). Nevertheless, the mentioned program would provide a high tempo of economic growth by identifying development poles in the country and directing resources to the development of these poles. To achieve the goal set out in the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018", it is intended to achieve further improvement of the provision of infrastructure in the regions, including the provision of communal services to the population, accelerating the development of entrepreneurship in the direction of export-oriented and competitive products, increasing the employment rate of the population, especially the rural population, and the continuation of measures to reduce the poverty level. One of the most important tasks facing the government is to increase employment in the regions. Thus, by the end of 2012, the population in the country increased by 33.2 per cent compared to 1989 and 17.6 per cent in comparison to 1999, while the number of able-bodied population increased by 66.5 per cent and 43.4 per cent respectively. As a result, the share of those who are able to work in the total number of the population increased from 55.4 percent in 1989 to 56.8 percent in 1999, and to 69.2 percent in 2012. It should be noted that this figure reached its peak, 69.3 percent in 2011. As you can see, at present, the country has entered into the most aggressive period in terms of employment. In 2012, the share of Baku in the country's population was 23.0 percent, while its share in hired workers was 44.7 percent. Also, the latter figure increased by 1.8 percent compared to 2000. In 2012, the share of hired workers in the total number of the population was 30.7 percent in Baku, whereas in economically distant regions this figure was 11.4 percent. In particular, the rate of natural increase in rural areas in the country being relatively high, increases the importance of rural development and employment promotion. For this purpose, the following measures are envisaged in the field of employment in the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018:

- expansion of regional economic relations;
- Formation and development of a fair competition environment, ensuring compliance with labor legislation;
- directing a portion of revenues from oil exports to human capital development and applying advanced technology and innovations to the development of science-intensive industries;
- Creating a balance between the proposed workforce and the number of jobs available;
- Reduction of population migration through further development of social and communal infrastructure in rural areas;
- Increasing the level of employment of women and youth.

In general, the creation of new jobs in the country is one of the key factors that determine the economic policy of the state and it will depend on the measures taken to improve the competitiveness of the regions. One of the main directions of raising competitiveness of the regions is related to the development of infrastructure. One of the important areas in the development of the regions is the development of transport. Investments in transport infrastructure increase the region's internal and regional ties with other regions.

This leads to the improvement of conditions for production, tourism and commerce, as well as the increase in competition and concentration across the country by reducing the time of transportation as well as the quality and price ratio of transportation services. The development of transport infrastructure in the country is also a necessary condition for the specialization of regions. It should be noted that the development of transport infrastructure has a direct, indirect, and derivative influence on the development of employment in the regions. Direct and indirect impacts are related to the creation and operation of transport infrastructure, whereas indirect impacts result from the impact of transport infrastructure on the region's competitiveness. As a result of the development of transport infrastructure, the time and cost savings, increased access to transport services, and reliability increase productivity in production. For example, the increase in the quality of motor roads can increase the vehicle lifetime and reduce its current operating costs. Also, increasing access to markets leads to increased productivity by creating new opportunities for business and raising competition. Thus, the development of transport infrastructure has a significant impact on employment and economic growth by increasing labor productivity. The energy supply is crucial in the formation of competitiveness of the regions. Expansion of the electricity grid causes a reduction in system costs associated with investment projects in the regions. Over the past 2004-2013, 17 power plants with a total capacity of 2000 megawatt have been built in the regions, more than 10,000 kilometers of power lines and more than 1,500 substations have been constructed or reconstructed. During the mentioned period, 40,000 kilometers of gas lines were constructed or repaired in the field of natural gas supply, and the level of gas supply in residential houses reached 83.4 percent from 34 percent. At the same time, economic growth in the regions may require additional energy resources. One of the key priorities in the development of the regions is the financing of housing and communal services. So, in most regions of Azerbaijan, in housing and utilities sector, the current level is significantly below the established norms. For example, in 2012 the average per capita housing area in Azerbaijan was 13.1 m², whereas in Sweden this indicator was 52 m², in the UK 34.5 m² and in the US 96 m². Also, the proportion of housing commissioned in the country in 2012 was about 1.9 times less than in 1990. Also, if we accept the amortization period of a residential building for 50 years, then we come to a conclusion that the depreciable part of the country's housing stock is more than 2141.2 thousand square meters of housing put into use in 2012. As it is evident, increasing the housing construction is needed to improve the living conditions of the population in the country. Also, according to a survey conducted by the State Statistical Committee in 2010, an average household in the country consumed 2966.7 kWh of electricity in 2009. This figure was less by 907.6 kWh in Nagorno-Shirvan economic region, 772.4 kWh in Guba-Khachmaz economic region, 1040.8 kWh in Sheki-Zagatala economic region, 505.8 kWh in Ganja-Gazakh economic region, 412 kWh in Nakhchivan economic region and 756.8 kWh in Lankaran economic region. In the mentioned year, the average gas consumption per household was 2143.0 cubic meters, which was less by 619.9 cubic meters in the Nakhchivan economic region, 68.0 cubic meters in the Ganja-Kazakh economic region and 426.7 cubic meters in the Lankaran economic region m, and 345.2 cubic m in the Aran economic region. In 2012, 54.8 percent of households lived in urban areas, 45.2 percent in rural areas, while households with central heating systems account for 12.8 percent, households with network gas - 75.2 percent, the water pipe share of households was 78.8%. Also, one of the priorities is the implementation of measures to improve the population's housing coverage in conditions of population growth. In this area, the continuation of reforms in the housing and communal sector in the regions, supporting the development of the real estate market, provision of low-income citizens in need of housing in the regions, including young families, reconstruction and improvement of the water supply and sewerage system measures are planned to be implemented in 2014-2018. For example, within the project "Reconstruction of water supply and sewerage system of Lankaran city", it is planned to build ultrasonic cleaning plant based on a new

technology with the output of 30,000 cubic meters per day. The project envisages construction of 15,000 cubic meters of water reservoir, pumping station, 200 km of various diameter distribution network, 180 km long sewerage network and 8 sewage pumping stations. In recent years, large-scale investments have been made in education in the regions, but this sector still remains a priority. In particular, the coverage of regions with pre-school institutions is low. For instance, in the Lankaran economic region, the level of provision for kindergartens is 15 per cent, in Nagorno-Shirvan economic region - 8.2 per cent and it is 23 per cent in Sheki-Zagatala economic region. Also, the calculations show that the number of seats in the regions is smaller than the numbers specified in the standard (AzDTN 2.6-1). From this point of view financing of construction of cultural facilities is one of the priority areas. It should be noted that, in addition to investment costs in the aforementioned areas, a substantial part of maintenance costs should be provided through the state budget. From this viewpoint, it is required to link the revenues of state budget with increasing costs. In 2012, 60.9 percent of the population in the economic regions of Azerbaijan (excluding Baku) was made up of rural population. In this regard, the social well-being of a significant part of the population depends on the development of rural areas. As already mentioned, geographically, economic growth is mainly based on scalability and concentration in certain regions and cities. That is, the regions that can not mobilize enough opportunities to obtain employment and income are left behind. From this point of view, rural areas have a number of shortcomings. Thus, rural areas do not have a density which has a positive impact on the growth of the economy in a certain space. For example, according to the definition of the Organization for Economic Co-operation and Development (OECD), if less than 150 people fall per square meter, then such communities are considered as rural communities. If the share of the rural population exceeds 50 per cent in the region, then such region is mostly considered rural, if this share is less than 15 per cent then it is considered an urban region, and finally if it is between 15 and 50 percent, then such region is considered to be a middle-sized region...(OECD Rural Policy Reviews: Germany. Paris: OECD Publishing, 2007, 200 p, p.31.) In general, the American economist J.Makal has included the following factors limiting the development of rural areas (Magill, John (2003), "Rural Economic Development" in Sammis B. White, Richard D. Bingham and Edward W. Hill (eds.), Financing Economic Development in the 21st Century, M.E. Sharpe, Inc., New York, pp. 266-276.):

- Great distance to markets;
- Individual meetings of people living in rural areas (these meetings differ in comparison with towns);
- Limited access to capital (low competition among the rural lenders causes the capital price to be high);
- Limited scalability capabilities;
- Limited network of entrepreneurs;
- Deficiencies in information and business services;
- Restrictions on the relationships of rural economies with the rest of the economy;
- Lack of qualified personnel.

The above mentioned bring the state promotion of rural development to the fore. Also, agriculture is a key element of rural livelihood and is closely linked to other economic, environmental and social development forces in these regions. From this point of view, the development of agriculture affects the well-being of the rural population. In 2012, 37.7 percent of the employed population accounted for agricultural, fishing and forestry, whereas those employed were 38.4 percent of those living in rural areas. Also, about 59.1 percent of the working-age population living in rural areas operated in this area. In 2012, the economically active population in the country was 50.4 percent of the total population. Given these figures, estimates show that around 76 percent of the economically active population in rural areas are

involved in agriculture, fishing and forestry. It should be noted that in the countries included in the Organization for Economic Cooperation and Development, only 10% of existing labor resources in rural areas are engaged in agriculture and forestry, and their support is needed (The New Rural Paradigm: Policies and Governance. Paris: OECD Publishing, 2006, 168 p, p.13.). At the same time, income per capita in agriculture is typically lower than in other sectors of the economy. So in 2012, an average of about 135 AZN added value was created per month for a person engaged in agriculture, fishing, and forestry, then we come to the conclusion that in rural areas income from employment is relatively small. From this point of view, the state is required to support rural areas as well as agriculture. The measures to support the development of the agricultural sector are multilateral. Thus, the development of the agricultural sector affects food security, raw material supply, and ecological status. Thus, in 2012, 55.1% of the country's land was used for agricultural purposes, and 29.9% of these land areas were irrigated lands. From this point of view, agriculture has the potential to reduce land quality and to seriously affect water pollution. In such circumstances, policies for agricultural development should include environmental protection and biodiversity conservation. Also, since rural areas are at a distance from major markets, due to the low concentration in these places, infrastructure density and development levels are low, thus causing additional costs comparing to urban areas. Therefore, it is necessary to provide a state support to the development of rural areas, especially the agricultural sector. A modern approach to rural development envisages the implementation of large-scale investment projects, along with granting subsidies to the development of regions dominated by agriculture. These investments are made in order to create favorable conditions for living in the regions and to increase their competitiveness. This is related to the provision of necessary production and social infrastructure to rural areas. Also, the competitiveness of the agricultural sector depends largely on the development of the fields serving this area and staffing. In this regard, establishment of warehouses in the regions, agro-services serving agriculture, improving the quality of veterinary and phytosanitary services, seeds, fertilizers and pesticides, development of necessary sales channels, such as the organization of information and communication services for agricultural producers, are factors that determine the competitiveness of the agricultural sector. Development of agricultural products processing industry in regional centers and rural areas plays an important role in the provision of developing rural areas. There are great opportunities for the development of the food industry in the republic. Thus, in 2012, the volume of production of food products, including beverages, amounted to about 25 percent of the 1990 level and this decline was mainly due to a decrease in the production of export-oriented food products. Also, the complex processing of raw materials in the food industry is of crucial importance. Thus, in the processing of agricultural raw materials, products and production waste are also obtained along with the main product. For example, except for meat products, the waste of cut animals - hair, nails, horns, bones, gut, blood, etc. are also obtained in meat production. These waste products are used in various types of products (combinations, buttons, brushes, musical instruments etc.) and more than 40 medicines, animal feeds and so on. can be produced by using these wastes. The absence of waste recycling facilities reduces the efficiency of production. Therefore, the complex development programs for separate areas of food products should be developed in the republic, and this program should take into account the processing stages of agricultural raw materials. In general, the development of small and medium-sized businesses on the basis of administrative district centers is crucial for the creation of developmental poles in the country. Meanwhile, the specialization of agricultural products in separate regions, the creation of specialized warehouses, transportation economies and processing facilities can play an important role in the development of the regions. Along with the food industry, there are available opportunities for the development of light industry, mechanical engineering and metallurgy industry, building materials industry in the regions.

It should be noted that the development of local raw materials based on the "State Program on socio-economic development of the regions of the Republic of Azerbaijan in 2014-2018" has been identified as a priority in this area. Nevertheless, it would be expedient to further define industry development opportunities within the framework of the mentioned program.

In our view, it is required to conduct research in the following areas to identify industry development trends:

- available natural resources and their estimated quantities in the country;
- structure and volume of agricultural production;
- volume of future demand for certain consumer products;
- volume of import;
- successfully developing industries in countries with similar volume and structure of existing financial, labor and natural resources;
- possible interaction of the existing fields in the country with local and foreign related areas;
- opportunities for development based on vertical or horizontal integration of existing production;
- possible diversification of existing production;
- capacity to increase production volumes due to the scale of production.

It should be noted that there are limited opportunities for the development of many areas of industry at the expense of only domestic market. Only industrial products that are oriented to the domestic market ultimately lose capacity to scale-up and are not competitive in the long term. Therefore, it is possible to develop the country's industrial potential by creating relatively large industrial companies. At present, the creation of such industrial companies in the country is mainly possible with state participation and financial support. In such circumstances, certain actions can be taken in specializing in certain industries of separate regions in the country. In recent years, the black and non-ferrous metallurgy industry in the country has been primarily developed in the Ganja-Gazakh economic region. In our opinion, while the areas of food and light industries are mainly developed in line with their specialized agricultural products in the regions, it is advisable to develop industrial production based on raw materials and employment factors. The role of staff in achieving success in the above-mentioned direction is crucial. Therefore, the training of staff and raising their knowledge and skills in the country should be one of the main directions of government policy. In recent years, state funding of education in foreign countries, the development of vocational education and etc. steps are among the measures taken in this direction. Nevertheless, the development of separate regions should be clearly defined and the training of personnel in these areas should be financed. Thus, direct and indirect financial support of the state is required in these areas. Determination of the role of the state in the financing of socio-economic development of the regions is also made based on the evaluation of the opportunity to participate in this development of the private sector. Thus, regional policy in Azerbaijan is aimed at raising competitiveness in the regions, creating new jobs and increasing social security. Measures in this direction cover both economic and social and environmental issues. Since 2004, regional development programs in Azerbaijan have led to an increase in the overall level of development of the regions, but did not substantially reduce the difference between Baku and other regions due to the level of income. Meanwhile, five-year regional development programs implemented since 2004 have played a crucial role in mobilizing financial resources and promoting regional development.

ABSTRACT

2020 was mainly a year of struggle against the global COVID-19 pandemic. The dramatic contraction in global trade, supply chain disruptions, job losses, and growing uncertainty have negatively impacted global economic activity, causing sharp fluctuations in commodity prices. According to the World Bank, the economic slowdown caused by the COVID-19 pandemic last year will increase by 4 percent in 2021. However, it will still be 5 percent lower than the pre-pandemic level. After the damage caused by the pandemic, economic growth is expected to slow to 3.8 percent in 2022. In particular, the impact of the pandemic on investment and human capital is expected to disrupt growth prospects in emerging markets and developing countries and undermine key development targets. A comprehensive policy effort is needed to revive strong, sustainable and equitable growth. A series of reforms aimed at increasing investment in human and physical capital and increasing female labor force participation could help prevent the expected impact of the pandemic on potential growth over the next decade. The World Bank's "Global Economic Prospects" says economic recovery is possible only if countries implement economic reforms that contain the pandemic and increase investment. Azerbaijan's GDP in 2020 amounted to 72.4 billion manats (42.6 billion dollars). Compared to the same period last year, the gross domestic product decreased by 4.3 percent. The main goal of the article is to determine the prospects for economic recovery in Azerbaijan in the post-pandemic period in accordance with the state program "Azerbaijan 2030: National priorities of socio-economic development."

Keywords: *economic recovery, COVID-19, investment, human capital, economic policy*

1. INTRODUCTION

Despite the slowdown in global recovery in the short term caused by the re-acceleration of the spread of COVID-19 virus, trust in the ongoing vaccination, the gradual improvement in consumption and trade suggest that economic recovery will advance in 2021-2022. In 2021, strong growth in East Asia and the Pacific and China, and the weakest in the Middle East, North Africa, and sub-Saharan Africa are predicted. The COVID-19 pandemic has brought about major disruptions in the global economy. Economic activity has declined due to both lockdowns and individual decisions made by private entrepreneurship; uncertainty surrounding the post-pandemic economic landscape and policies has hindered investment; delay in continuity of education has slowed the development of human capital; and the existence of global value chains and concerns about the course of the pandemic have exacerbated the situation in international trade and tourism. A comprehensive policy effort is needed to revive strong, sustainable and equitable growth. Several reforms to boost investment in human capital and physical capital and increase the participation of female workforce could help prevent the expected impact of pandemic on potential increase over the next decade. In 2021, global GDP is projected to be 5.3 percent lower than pre-pandemic forecasts, or about \$ 4.7 trillion. Global trade collapsed last year due to the suspension of international supplies of goods and services

because of border closures and supply disruptions. Commodity trading has recovered and revived more rapidly than it did during the global financial crisis, while trade in services remains weak. Global trade is projected to rise in parallel with the recovery in global activity. This growth is expected to fall to 8 percent in 2021, and then to 6 percent in 2022. The lasting barriers to international travel and tourism have led to continued poor services. Although international travel has been restored to some extent, it is much below pre-pandemic levels. The tourism industry lost about \$ 1.3 trillion in export earnings in 2020. The recovery of the travel sector will be slow since the new COVID-19 strains cause governments to keep using travel bans to prevent the virus from spreading. Travel experts are now very cautious about their predictions, and most do not expect the turnover rate of tourism to return to pandemic levels by 2023.

*Figure 1: Duration of tourism recovery in the pre-pandemic period, prepared via a survey by experts of the World Tourism Organization
(Source: World Tourism Organization)*

The food and raw material need of the world's growing and wealthy population will stimulate demand for agricultural products over the next decade. According to the FAO forecast, total food consumption is expected to grow steadily by 2028. According to the projected income growth in high-income countries, by 2029, the share of food in total household spending is expected to fall from about 8% in the base period to 6%. The population is the main determinant of total food consumption. Income, relative prices, other demographic factors, consumers' preferences and lifestyle, a person's desires determine the food basket. Considering the significant gains per capita income in all regions, the expected 11% increase in world population (842 million increase between 2017-19-2029) stipulates 15% increase in total food consumption by 2029. The Asia Pacific region, the world's most densely populated region, will continue to play a key role in shaping global food needs as it is projected to reach 53% of the global population (4.5 billion people) in 2029. According to the IMF's Global Economic Review, published in January 2021, uncertainties and risks to the global economy still remain topical even though vaccination process against Covid-19 has begun. In general, international financial institutions note that the following are the main risks for the global economy:

- Liquidity and insolvency risks;
- Growing unemployment and poverty;
- Belated commencement of vaccination in developing countries and low economic activity in these countries;
- Rising interest rates and risk premiums.

The World Bank's "Global Economic Prospects" report says economic recovery is possible only if countries implement economic reforms that overcome the pandemic and increase investment. The political and economic priorities for the near future are to control the spread of the Covid-19 pandemic and to ensure the rapid and extensive spread of vaccination. To support economic recovery, the authorities need to facilitate reinvestment centered on sustainable development, which is less dependent on public debt. The greatest opportunity a pandemic can provide is to realize the potential of a global digital society for states and individuals. Due to the transition of the global economy to digital base and platforms, significant changes keep happening in the structure of world commodity, service and labor markets - many traditional industries, services and products are losing their significance and being replaced by new ones. The global economy is going through a period of profound structural change, which has a serious impact on consumer tastes. In this regard, the ability to consider global challenges and changes and respond to them quickly is an important feature of national socio-economic security. The 21st century is a century of destructive innovations, high technologies and deep knowledge and competencies. The main drivers of the 21st century economy are personnel with high intellectual capacity, modern technology, "smart" products, knowledge and experience gained by national science and education centers, and regional integration. The international competition has further increased while the revolutionary technological changes were observed in the world economy in recent years. In the future, life will be characterized by profound digitalization, active application of new technologies and the rapid development of the most modern areas without human intervention. In the future, the digital society, which supports the state-of-the-art technologies and innovations, will become a leading force in development.

2. THE CURRENT MACROECONOMIC SITUATION IN AZERBAIJAN

In 2020, Azerbaijan's GDP was 72.4 billion manat (\$ 42.6 billion). Compared to the same period of the last year, gross domestic product decreased by 4.3 percent. The industrial sector mainly accounts for the gross domestic product. So, in 2020, 33.7% of GDP belonged to industry, 11.5% trade and vehicle repair, 7.7% construction, 7.1% transport and warehousing, 6.9% agriculture, forestry and fisheries, 2.0% information and communication, 1.2% tourist accommodation and public catering facilities and 20.2% other sectors. Net taxes on products and imports made up 9.7% of GDP. The GDP per capita was 7262.8 manat (4272 USD).

Azerbaijan's real GDP growth forecasts

Figure 2: GDP growth forecast of the World Bank and Fitch Agency
(Source: Author)

Azerbaijan has a strong fiscal resilience, with total debt liabilities of \$ 8.9 billion in 2020, or 21.3 percent of GDP. The total foreign-exchange reserves of the Central Bank and the State Oil Fund together amounted to \$ 50 billion. Foreign trade turnover in 2019 amounted to \$ 24.2 billion, \$ 13.5 billion or 55.7% of trade turnover was the value of exported products, and \$ 11 billion (44.3%) was the value of imported products. As a result, there was a positive balance of \$ 2.7 billion. In 2020, Azerbaijan had trade relations with 184 countries. 14% of foreign trade was with the CIS member states and 86% with other foreign countries. Compared to 2019, foreign trade turnover decreased by 26.8% in actual prices, 21.9% in real terms, including 36.0% in imports and 12.0% in exports. The main export products are oil and oil products, and from the non-oil sector tomatoes, gold, cotton, fruit, electricity, plastics etc. The main export countries in the non-oil sector are Russia, Turkey, Switzerland, Georgia and Ukraine. In 2020, the main import products included precious metals, pearls and jewelry, machines, mechanisms, electrical equipment, vehicles, lubricants, iron, steel, cereals, medicines, tobacco products etc.

Graph 1: Total merchandise trade, by value

Graph 2: Total services trade, by value

Figure 3: Trade turnover on goods and services for 2006-2019
(Source: UN Comtrade)

The total amount of foreign investments in the form of direct investments was \$ 4.3 billion. The share of the oil and gas sector in the structure of direct investments in the country's economy was 78.3%. According to estimates, the total amount of direct investments in the non-oil sector was \$ 930.1 million. In 2019, Azerbaijani companies made direct investment of \$ 2.4317 billion abroad (an increase of 38.1%), including \$ 978.8 million in the oil and gas sector (an increase of 54.5%), \$ 1.4529 billion in other sectors (an increase of 28.9%). Foreign direct investments in the non-oil sector in Azerbaijan were made by Turkey, Great Britain, the Netherlands, Russia, the United States, the UAE, Switzerland and others.

Countries/ years	FDI inflow						FDI outflow					
	2014	2015	2016	2017	2018	2019	2014	2015	2016	2017	2018	2019
Azerbaijan	4430	4048	4500	2867	1403	1504	3230	3260	2574	2564	1761	2432

Table 1: FDI inflow to Azerbaijan (in millions of US dollars)
(Source: World Investment Report 2020)

In January-December 2020, 17 billion manat was invested in fixed assets from all financial sources for the development of the economy and social spheres in the country.

Figure 4: Real growth rate of total investments in fixed assets in 2020, in %
(Source: Central Bank of Azerbaijan)

69.9% of the fixed capital investments were domestic investments and 30.1% were foreign investments. During the corresponding period, 11 billion manat (65.5%) of the total investments in fixed assets were used in the development of the non-oil sector, and 5.9 billion manat (34.5%) in the development of the oil sector. The President of the Republic of Azerbaijan signed Decree No. 1950 dated March 19, 2020 "On a number of measures to reduce the negative impact of the coronavirus (COVID-19) pandemic and, consequently, sharp fluctuations in world energy and stock markets on the economy of the Republic of Azerbaijan, macroeconomic stability, employment and entrepreneurship". The Action Plan covers three areas - support for economic growth and entrepreneurship, support for employment and social welfare, and macroeconomic and financial stability. So, the areas in need of state support and the principles of state support for these areas have been identified starting from the first period of the pandemic. The Azerbaijani government has allocated \$ 2 billion to support businesses and individuals facing serious economic problems during the pandemic. The government has undertaken to create social jobs on a paid basis (at the expense of the state) as an obligation. Return of part of the value added tax to consumers should also be considered as a tax deduction for consumers. All this has allowed minimizing the impact of the pandemic on the Azerbaijani economy compared to other countries. There was no significant decrease in the average monthly labor force, and the decline in GDP was around 4 percent, and unemployment rose from 5 percent to 7 percent.

3. WAYS AND PROSPECTS OF ECONOMIC RECOVERY IN AZERBAIJAN IN THE POST-PANDEMIC PERIOD

Currently, economic recovery in all regions is moving at different paces, depending on many factors, such as income group, the rate of vaccination, economic support mechanisms and dependence on the tourism sector. Economic recovery is particularly difficult in countries with large share of tourism and exports. The recovery process in the labor market also faces problems due to the lack of clear criteria for unemployment. Despite social support mechanisms through stimulus packages around the world, unemployment has risen, and it has increased to an average of 1.5 percent in all developing countries. The projected recovery process varies depending on the severity of the country's health crisis, the degree of economic imbalance (due to countries' dependence on highly affected areas), cross-border trade spills and, most importantly, the effectiveness of economic and political policy support to limit permanent damage.

The main scenario of economic recovery and future economic growth trajectories in the post-pandemic period of Azerbaijan are defined by the "Azerbaijan 2030: National Priorities for Socio-Economic Development" approved by the Decree of the President of the Republic of Azerbaijan dated February 2, 2021. National priorities cover 5 areas that fully meet global challenges: a steadily growing, competitive economy; a dynamic, inclusive society based on social justice; areas of modern innovations and competitive human capital; the great return to the territories liberated from occupation; a clean environment and a country of "green growth". The adopted national priorities are in line with the goals of the concepts of developed countries for the future. So, the EU Cohesion Policy adopted in the European Union for 2021-2027 sets 5 goals - Smarter Europe, Greener Europe, Connected Europe, More Social Europe, Europe closer to citizens. In general, the first priority for all countries in the post-pandemic period should be to avoid the economic crisis. Close international cooperation is essential to achieve these goals and for emerging markets and low-income countries to continue to bridge the gap between their living standards and the living standards of high-income countries. First, a fair distribution of vaccines is mandatory in the health care system, and the nationalization of vaccines is absolutely unacceptable. In addition to addressing issues rooting from the pandemic, countries need to work harder to increase efforts to reduce climate change and address economic issues caused by trade and technological tensions, and to close gaps in the rules-based multilateral trading system. Based on the latest trends in international tax policy, efforts should be continued to limit the change in cross-border profits and prevent tax evasion. Although the goals of economic policy are similar, the policies needed to achieve them must be tailored to the individual conditions of the countries. These policy priorities are divided into certain stages according to the order of implementation: urgent measures; initiatives to ensure recovery; and measures to build a more sustainable, inclusive, and environmentally sustainable economy for the post-COVID-19 world. The next priority should be investing in the future. Increasing economic growth and productivity can be one of the main goals in this area. The International Labor Organization (ILO) has identified labor productivity as one of the most important conditions for economic growth, competitiveness and living standards. According to the ILO 2019 report, Azerbaijan ranks first among the South Caucasus countries in terms of labor productivity. However, despite our achievements in this area, labor productivity in our country is lower in comparison with developed countries. Although it is difficult to investigate the root causes of low labor productivity, we need to increase investment in education, research and infrastructure to increase productivity and efficiency. One of the main problems in the post-pandemic period is the reduction of unemployment. Unemployment may remain high due to workers who are discouraged by the effects of the crisis in the early days (Blanchard and Summers, 1986). Accumulation of human capital and future earnings are also affected by long-term unemployment, skills depletion, late entry of young people into the labor market and failures in education. Targeted stimulus assistance, productivity support and increased investment can boost labor market activity.

4. CONCLUSION

For Azerbaijan, 2020 will be remembered not only as a year of pandemic, but also as a year of victory - the liberation of our lands after the 44-day war, which were occupied for 30 years. Unlike the other countries, 2021 and the further period require not only post-pandemic recovery but also post-war economic recovery. As noted in the 4th direction of "Azerbaijan 2030: National Priorities for Socio-Economic Development", the Great Return to the territories liberated from occupation for the next 10 years is one of the most important issues facing the economy and society of Azerbaijan. Noted that the great return to Karabakh has a two-way effect on the economy. So, the process of returning to Karabakh is not only a goal of economic recovery, but also a driver of economic recovery.

Every manat invested in Karabakh will provide conditions for accelerating economic recovery and increasing economic activity, creating added value with a multiplier effect. Investments in these areas, especially in construction, agriculture and tourism, will play a special role in increasing employment. On the other hand, the new realities in the region after the great victory will increase Azerbaijan's prestige in the South Caucasus and neighboring regions, making it a key part of many projects of international importance in the future. The soon-to-be-implemented Zangazur Corridor will provide Azerbaijan and regional countries with access to the Persian Gulf and the Gulf of Oman and the Indian Ocean via the Iranian port of Bandar Abbas, the Middle Corridor, and the Istanbul-Islamabad railway. Finally, the economic crisis caused by the pandemic opens up new opportunities for countries along with negative effects. The key issue in the post-pandemic period is whether countries see these opportunities. Azerbaijan can achieve rapid economic growth by appreciating these opportunities, fully responding to the new challenges of the world economy, reintegrating Karabakh into our economy, applying digital transformation in all areas and building a modern governance model.

chingizibrahim@unec.edu.az*

ABSTRACT

During the COVID19 pandemic, companies faced great difficulties in adapting their business processes and employees. In addition to the ability of employees to work remotely, the lack of software to support the ongoing implementation of existing processes also played a major role. Despite all this, during the pandemic, companies have already managed to reorganize their activities. The new form of employment - home-office / remote work - brought with its new forms of application in software and tools. This article examines the changes in software requirements during the COVID19 pandemic, the functionality of the tools needed by HR managers, the limitations of current software, and the impact of this experience on the post-pandemic period as a result of a survey of human resources professionals in Azerbaijan. It is undeniable that the experience gained by employees during the pandemic will play an important role in the post-pandemic period. During the pandemic period, the assignment of tasks to employees, the application of methods and tools used to monitor the implementation of tasks during the pandemic period was of great importance. Ensuring the observation and monitoring of the remote work process during the pandemic has also revealed very complex ethical dilemmas. This article aims to compare the current situation in Azerbaijan with relevant approaches in other countries.

Keywords: Covid19 Pandemic, Human resource management, Use of ICT

1. INTRODUCTION

Remote form of work is a way of organizing work, in which the employee performs the most important functions related to his work, using information and communication technologies, while being at home. The development of ICT has created opportunities for alternative ways of organizing work, including telecommuting, which means a new and evolving way of organizing work outside of production facilities or workplaces. According to the International Labour Organization Employers must provide employees with the appropriate tools, materials, equipment and technical means that are necessary to perform tasks in the conditions of the distant working, unless otherwise provided by the provisions of labor contracts, collective agreements or internal regulations (An employers' guide on working from home in response to the outbreak of COVID-19, 2020). Since March 2020, the management of the activities of remote employees in Azerbaijan has become vital in enterprises and organizations due to the pandemic. The organization of this remote activity depended on several factors. The first of these was the establishment of a fundamental connection between employees and the enterprise. The situation was not kind of a situation, in which people and businesses in the country were prepared in advance. Therefore, it took some time for employees to adapt to the new work structure and to carry out most of their activities remotely. The second important factor was to provide employees with hardware and software to organize remote activities. And finally, the most important factor was the new mindset of management, which was 180 degree different from the classic type of management. By the new mindset, we mean, even managers in the beginning of the pandemic, could not easily adapt to the new type of work model, which was nothing like from 9 a.m. to 6 p.m. physical presence at office.

The lack of the new mindset made psychological aspects of distance work more crucial. Because of COVID-19, many managers have switched to remote control, which requires different skills than working in an office. The transition was so fast that almost no one was ready. Adaptation was easy in some industries, while others were found to be unsuitable for remote work. As a result, the new work regime seemed more difficult for some managers - they could not cope with their work, and thus put greater stress on their subordinates. In general, even before the pandemic, it was not easy to manage remote workers. Studies show that leaders who do not see their subordinates sometimes think that they have done nothing. In this case, they demand that people be in constant contact with them. Thus, they upset the balance of work and personal life of employees and lead to greater stress.

2. MANAGING REMOTE WORK

It will be easier for employees to work remotely / from home at the point where companies make their current processes as much as possible that do not require manual load and paper work (Hope, 2020). Therefore, focus on this form of employment will continue. Skype, Webex, Microsoft Teams, Zoom, etc. are the tools that provide communication such as virtual. The function of these tools is to both ensure business continuity and help employees to establish professional and social interactions that they are accustomed to accomplish in their daily lives by ensuring seamless connection. One of the prominent headlines among the return to work approaches that came to the fore with the normalization process is the partial return of employees to the office. Due to various reasons, especially the health and safety of the employees, it is not right for all employees to be in the office at the same time due to social distance rules and physical conditions. In this context, the remote working model that entered our lives with the COVID-19 crisis seems to be one of the elements that will shape the future of the working world. It is clear that using this new working model in the long term brings some difficulties with it.

According to EY, there are 3 main obstacles in implementing distance work form (Why remote working will be the new normal, even after COVID-19, 2021):

- Structural implementation of working from home: Institutions' rapid transition to remote working model without structural adjustment risks causing productivity loss among employees and stakeholders.
- Ensure teleworking infrastructure security: The telework paradigm has transformed and digitized our working environment. This digital transition has resulted in some security concerns. Organizations are more vulnerable to cyberattacks than ever before in this period, where the majority of interactions take place online. In this context, increasing cyber-security has become indispensable in order to avoid attacks and reduce risks.
- Balancing the work and private lives of employees: With the rapid introduction of remote work into our lives, the boundary between work and private life has blurred for employees. The decrease in the time spent in the office, on the one hand, pushed employees to establish order at home, on the other hand, caused the loss of the line of business and private life.

When we mention the benefits of performing from home from an employers' point of view, we must underline certain points. One among them is that the ability to hire staff both locally and globally. The second important factor is that employees who work on the offices get distracted more often than remote workers. Performing from home, helps employees to focus and dedicate themselves to certain tasks. And therefore the final factor, that impacts employers' decision-making is, the significantly lower costs compared to the traditional work (Bloomberg - Are you a robot?, 2021).

Employers are encouraged to create a dedicated technical support (help) or email address where employees can contact with questions regarding production tools, equipment and technology for assistance if needed. At the same time, it should be clearly indicated that the equipment and tools received from the company for working remotely should be used by the employee himself/herself and only to perform the work entrusted to him.

2.1. Monitoring employee activities

Employees have been under surveillance by their employer for a long time, but as the pandemic has forced many jobs to be remote, that surveillance has now followed employees home. Employee surveillance has boomed during the pandemic. and the software that goes along with it is flying off the virtual shelves and these tools do more than just watch and plays, they analyze, rank and report on their productivity. Monitoring the activities of employees in the workplace is quite simple, because employees are physically in the office. Even in the traditional form of work, many enterprises paid special attention to the measurement of time spent by employees in the workplace. Many organizations even use biometric scanners or data from employee computers. In the current situation, due to the need to work remotely, enterprises began to use alternative methods to monitor employees. Because employees work from home and office, their activities can only be checked through special tracking software. Once the software is installed on an employee's computer, administrators and managers have the opportunity to find out how many hours the employee works during the day, whether or not he or she completes tasks, check browser history, track emails from a corporate email, and view screenshots or videos. The features of this software help to eliminate any annoyances that may arise later by notifying employees in advance.

According to our survey, respondents who stated that, their organizations use special software to monitor employee activities, categorised the functions of that kind of software as follows:

- Time tracking
- Tracking your browser memory and tabs
- Record a screenshot / video of the screen at certain intervals
- Tracking programs used on your computer
- Recording of written emails / messages
- "Idle time" measurement
- Measuring employee productivity
- Upload and monitor downloaded files

Unlike the most commonly used employee monitoring programs, the applications used in Azerbaijan do not have a keylogger function and employee tracking with a webcam. The use of ICT in a remote mode of operation carries an increased risk of getting hacked and giving access to the unauthorized people, and also increases the risk of bullying via the Internet.

To counter this, most businesses have data protection, privacy and computer security, and disaster prevention policies (Обзор международной повестки, 2020):

- All telecommuters must read, understand and comply with applicable ICT guidelines to ensure data protection, privacy, and computer security.
- All teleworkers are required to complete remote training in the use of ICT, which is available to all employees.
- All remote managers and employees are required to take all measures to avoid damage to the enterprise when using communications for production purposes, including with the help of ICT technical means.

3. SURVEY QUESTIONS AND ITS RESULTS

An online survey was conducted to analyze the organization of remote work activities of employees during the pandemic.

The research questions that this survey raises and tries to answer are as follows:

- What software does your company use to track assignments during a pandemic (while working remotely)?
- Does your company use special software that monitors your work during the day?
- During your remote work, did you feel distrust and constant control from your supervisors towards you and your activities?
- Do you think you work more in remote work than in traditional work?
- How has your productivity changed during remote work compared to the period before COVID-19?
- On what basis do you want the organization of work at the enterprise where you work to be carried out after the end of the pandemic?
- If the company you work for after the pandemic has a hybrid work week, how many days per week would you like to work from office?

Non-probability sampling was used to gather the sample for this research. Non-probability sampling means that not all individuals have an equal chance to be represented in the sample. (Kothari, 2004). Voluntary sampling was used to choose the sample as the study used Google Form's online survey tool. People from different sectors that worked from home for certain period, due to the COVID-19 pandemic, were asked to take part in this survey. 105 people have volunteered to answer the questionnaire online. The survey data has been analyzed using descriptive statistics. The software that has been used for this analysis is IBM's Statistical Package for the Social Sciences version 23. The biggest limitation in conducting this survey is that the current pandemic situation in the country still persists, so it is not possible to organize a survey to cover a wider range of respondents in enterprises. Due to the pandemic, it was problematic to organize the face-to-face interviews required for a qualitative analysis. Thirty one of the participants belong to the age group of 18-25, thirty five of them are in age group of 26-35, thirty two are in age group of 36-45 and seven are in the age group of 46-55. It is clear from Table 1 that 39% of the survey participants' daily activities are monitored by the enterprise they work for through special software. 80% of the respondents whose work activities were daily monitored by the program, said that they did not feel mistrust and constant control over their activities by their supervisors, during the pandemic. In comparison, only 59% of the respondents whose daily activities were not monitored by any software, stated that, they did not feel constant control or distrust. 76% of the participants, who expressed insecurity and constant control during the remote work, said that the company where they currently work does not monitor their activities through any software. In organizations where monitoring is not conducted or where the monitoring process is impossible, managers face the problem of not believing that employees they do not see in the office every day, work with the same efficiency and duration during the pandemic.

Table following on the next page

Count		During your remote work, did you feel distrust and constant control from your supervisors towards you and your activities?		Total
		Yes	No	
Does your company use special software that monitors your work during the day?	Yes, it is used	8	33	41
	No, it is not used	26	38	64
Total		34	71	105

*Table 1: Does your company use special software that monitors your work during the day? * During your remote work, did you feel distrust and constant control from your supervisors towards you and your activities? Crosstabulation analysis*

When asked "How do you assess the role of the software you use in the transition from traditional to remote work?", 35 percent said, their existing software weakened the transition. 56 percent of respondents said that their software was fully ready for this transition. The percentage of respondents who said they gave up some of the software during the transition was 9. The most important part of organizing remote work was the creation of communication channels between employees. According to the survey, the software used as a means of communication in Azerbaijan during the pandemic were identified: Whatsapp groups (55 respondents), MS Teams (46 respondents), Slack (22 respondents), Telegram (8 respondents), Mail (2 respondents), Skype (5 respondents) and Zoom (3 respondents). Figure 1 shows the percentage of video conferencing platforms used by survey respondents.

Figure 1: Software used for video conferences during the pandemic

Following the establishment of communication channels between employees and management, task tracking plays an important role in the organization of remote work activities. Platforms for distributing tasks among employees and monitoring their performance and the overall work process were widely used by enterprises even before the pandemic. However, after the onset of the pandemic, when the traditional form of work was no longer possible and employees were forced to work from home, enterprises expanded the use of this software and began to apply it at all levels of the organizations.

Count		What software does your company use to track tasks/assignments during a pandemic (while working remotely)?					Total	
		No special software is used	Asana	Bitrix	Jira	Evernote		Trello
Sector	Bank or or non-bank financial institutions	9	7	5	13	0	2	36
	Construction	4	0	0	0	0	0	4
	Education	3	0	0	0	1	0	4
	International organization	0	0	1	0	3	0	4
	Oil and gas sector	5	3	0	0	0	0	8
	Public sector	11	3	0	0	0	0	14
	Retail sector	3	0	0	0	0	0	3
	Service sector	14	0	6	4	2	6	32
Total		49	13	12	17	6	8	105

*Table 2: Sector * What software does your company use to track assignments during a pandemic (while working remotely)? Crosstabulation analysis*

According to our survey, there is a difference in how organizations implement task monitoring programs depending on their area of activity, size and sector. It is clear from Table 2 that the pioneer sectors in the implementation of these programs in Azerbaijan are banks, nonbank financial institutions and service sectors. In other sectors, the application of this category of programs is not very widespread. However, in the post-pandemic period, the application of these platforms in other sectors will come to the fore. This is because these applications, regardless of the workplace and form, lead to increased productivity while maintaining transparency in the monitoring of tasks. All the software stated above, have the common concept of task tracking realized in different form of graphic user interfaces. Because these applications do not limit users to just desktop computers, their use is possible from all mobile devices. The mobility brought by these applications will, over time, lead to more widespread usage of these applications by users and businesses. In an online survey, 62 respondents said they would like to work in hybrid form after the end of the pandemic. 10 people preferred distance learning, and 33 people preferred the traditional form of work. 59% of respondents see hybrid as an alternative form of traditional work as a form of future work (Table 3).

Count		On what basis do you want the organization of work at the enterprise where you work to be carried out after the end of the pandemic?			Total
		Traditional	Hybrid	Distant	
Sector	Bank or or non-bank financial institutions	8	27	1	36
	Construction	1	3	0	4
	Education	3	1	0	4
	International organization	0	4	0	4
	Oil and gas sector	2	6	0	8
	Public sector	11	3	0	14
	Retail sector	0	0	3	3
	Service sector	8	18	6	32
Total		33	62	10	105

*Table 3: Sector * On what basis do you want the organization of work at the enterprise where you work to be carried out after the end of the pandemic? Crosstabulation analysis*

The main reason for the tendency of people to this new type of work is the information and communication technologies and the software used in the enterprise, which supports remote operation.

*Figure 2: How has your productivity changed during remote work compared to the period before COVID-19? * On what basis do you want the organization of work at the enterprise where you work to be carried out after the end of the pandemic? Crosstabulation*

In the post-pandemic period, businesses will also be interested in switching to hybrid work mode. Because during the pandemic, employees have shown that they can perform their tasks more efficiently when equipped with the necessary software and hardware. Thus, 54% of respondents stated that, their productivity increased during distance work (Figure 2).

4. CONCLUSION

It is expected that the experiments, methods and tools gained during the pandemic period will be used in the post-COVID period in the enterprises where the remote work was successful. To this end, enterprises will redesign their workflows to make their organizational structures more flexible and adaptable to the hybrid form of work. Businesses will review their structures and mechanisms to be prepared for such uncertain scenarios in the future. With the increasing impact of COVID-19, we have witnessed that many organizations have switched some or all of their employees to the remote working model. With the start of the normalization process, institutions need to adapt to the current situation in order to ensure operational sustainability. In this context, the real question is how will the return to work be in this period of many innovations. The new global study commissioned by Kaspersky of 8,000 SME employees from various industries revealed that almost three-quarters (82%) of employees reassess their pre-COVID-19 working methods. Employees now want to shape the future of the business world on their own terms, with opportunities such as spending more time with loved ones (53%), saving (39%) or working remotely (38%) instead of returning to work as they used to (Three-quarters of employees in Turkey do not want to return to traditional working models, 2021).

Home working led to a 13% performance increase, of which 9% was from working more minutes per shift (fewer breaks and sick days) and 4% from more calls per minute (Bloom, Liang, Roberts and Ying, 2014). "Remote" as an ad hoc option for all employees and a permanent work format for some will gain a foothold in the corporate practice of many companies after the pandemic, since the crisis made it possible to assess the advantages of this format for both employers and employees. The ICT sector will become a pioneer in the formation of the "new norm". Large tech companies turned out to be the best infrastructurally prepared for the "telecommuting" format, as they had practiced it before. However, in connection with the pandemic, "remote work" has become widespread: Google and Facebook have extended their work hours from home until mid-2021 (Facebook extends Coronavirus work-from-home policy, 2021). Twitter announced that if they wish (and if the specifics of work permit), employees can remain "remotely" indefinitely. (Twitter Will Allow Employees To Work At Home Forever, 2021) Companies see the benefits of telecommuting both for corporate costs and employee motivation, so over the next 10 years, Facebook CEO Mark Zuckerberg predicts that 50% of his company's employees will work remotely. (Disparate pay, 2021)

ACKNOWLEDGEMENT: *I would like to express my special gratitude and thanks to the survey respondents for giving me such attention and their valuable time and taking part in the survey that I have conducted.*

ABSTRACT

It is almost impossible to imagine a contemporary society without intensive communication processes. While overcoming obstacles related to public transportation system, it is difficult to evaluate social importance of them for all classes in society. It is essential to mention a role of public transport in developing cities and regions, improving environmental situation and increasing safety of passengers. In order for public transport system to work effectively, a regulatory base, an involvement of several public and government entities to development process actively and an increase of effectiveness of financing are required. One of the fundamental needs for people is to provide a mobility of themselves, which is one of the symbols of freedom and higher standards of living. According to experts worldwide, public transport changes economical development of cities and regions in a high scale. Public transport is a driver and a tool of increasing effectiveness of economy. Meanwhile, it is one of the fundamentals of ecological and road safety. It can be confidently said that there is no city or entity in world that can operate without public transport. In the article, the process of regulation of tariffs in public transportation system by government has been evaluated. At the same time, the ways of shaping and regulating public transport fees in Azerbaijan has been analyzed. Taking the interests of corporations operating in transportation field into consideration, the samples for calculation of minimum fees in carrying passenger process. The calculation has been made in a cost method which considers financing the value of a passenger's economically justified travel cost and profitability of a servicer company. Actuality and relevance of the topic is determined with requirement of methods in setting fees in public transportation system, of new approaches to prices which allow adjustment of government's tariff policy in a field of passenger carrying in a competitive market to contemporary economical and social environment. The purpose of the article is to determine the features of shaping and regulating public transport fees in Azerbaijan and the mechanism in order to improve effectiveness in the system of passenger carrying.

Keywords: *Public transport, Transport system, Tariff, Tallinn model, Tariff determination*

1. INTRODUCTION

The development of transport system is highly significant for Azerbaijan. Along with energy, communication, education and healthcare, transport plans a vital role in achieving social, economic, foreign policy and the other governmental priorities in order to meet the needs of the community. After regaining independence, Azerbaijan entered a new stage in the development of the transport systems. The process contributed to creation of a legal framework for transport in market economy and strong demand-centered activities that reflect the demands of a market economy. Dynamic development achieved recently in all fields of public life in Azerbaijan has increased the geopolitical importance of our country. Together with that, it is essential to actively participate in the ongoing socio-economic processes taking place in the global economic sphere, get effective access to foreign markets and have a competitive national industry. Globalization, rapid integration, and sustainable development which are at the core of the global agenda today are especially relevant for our country. Public transport plays a crucial role in meeting people's needs and it is a driving factor in a development of living conditions of people. The development of public transport contributes to economic development, decreases the intensity of traffic jams by reducing the use of private cars, affects the parking lot problem in central parts of the city and helps to reduce CO₂ emission. Transport companies should use forms of passenger service that will change the lifestyle of citizens and become a preferred form of public transport. One of the main tasks today is to assess the attitude of public transport passengers to innovations in the field of transport services in order to develop an integrated approach to the development of the urban transport system. The efficient functioning of the transport system of the area creates the necessary conditions for the development of the economy and the social sphere. The growth of the world's population has led to a significant increase in the number of private vehicles. The existence of sufficiently limited opportunities for the development of road infrastructure has led to a sharp decline in real traffic speeds in cities, ie, the deterioration of urban mobility. Due to the redistribution of traffic flows and the widening of the road, the opportunities for optimizing the road condition have been largely exhausted. Under these conditions, a qualitative improvement in road conditions and an increase in the mobility of citizens is possible, if and only if car owners abandon the use of their private cars in favor of public transport. In order to achieve it, public transport must attract new passengers and be able to meet the changing needs of existing passengers.

2. METHODOLOGY

In general, it was not possible to determine modern and high-quality public transport tariffs in the country due to factors such as non-compliance with the optimal tariff policy, lack of a competitive environment and subjective approaches, and incomplete fulfillment of obligations of regulatory entities. Currently there does not exist any effective mechanisms for setting such tariffs on public transport. Therefore, passenger tariffs are applied for social security and quality of service for different social groups without taking into account. This is considered one of the weakest links in social policy and prevents the formation of a suitable environment for more effective funding. The economic elements of the organizational and economic mechanism are the regulation of passenger transport tariffs, economic analysis of carrier costs and algorithmization of the process of tariff formation. Tariff regulation of passenger transport considers not only the calculation of an economically justified tariff, but also the calculation of a social tariff. Taking into account the social significance, the tariffs for transport services to the population are being improved. Algorithmization of the tariff formation process summarizes the economic analysis of tariff regulation and costs and consider the creation of a mechanism for the formation of passenger tariffs. Subsidization of public transport systems varies significantly around the world.

One of the main directions is to investigate the issues arising from application of the model, used to determine public transport tariffs in Tallinn, Estonia, to the post-Soviet countries, as well as to Azerbaijan.

3. RESEARCH MODEL

The choice of mechanisms for managing the mobility system depends on the target. Using the Tallinn model, we can consider those that help reduce traffic congestion and create sustainable consumption patterns. Certain tariff models are used in our country to determine public transport tariffs.

4. ANALYSIS

To solve the problem of tariff formation, it is proposed to use an optimal model taking into account the interests of participants in public transport service market. Optimization problems are an important mathematical problem class, because in any field of activity a person tries to choose the optimal solutions aimed at saving costs, time and resources. Choosing optimal, justified decisions is one of the important resources to increase quality and efficiency. A model is a simplified copy, an artificially created object on which certain features of a real object are reproduced. In order to study these images and transmit the results to real-world objects and events, a model is created by replacing real objects or events with clearly simplified images (models). The process is also known as modeling. Public transport in Azerbaijan consists of public and private sectors. Baku Metro is a natural monopoly in the field of subway passenger transportation. Public (Baku Bus LLC) and private sector operate in parallel in bus transport. Public transport tariffs in the country are regulated by the government (Tariff Council). Passenger transportation is an activity that requires a special permit (license). Despite the implementation of a number of state programs so far, it has not been possible to create a public transport system in the country that meets modern requirements. In 2015, the Baku Transport Agency was established under the Cabinet of Ministers of the Republic of Azerbaijan to implement state policy and control in the field of passenger transportation in Baku (<https://president.az/articles/17196>). Demand for public transport services has increased in recent years due to factors such as natural population growth, urbanization, development of the tourism sector, rising fuel prices and traffic jams in Baku. In 2017, the passenger turnover in the transport sector was 1,973.4 million people (the corresponding figure for 2007 was 1,148 million), of which 84.7% or 1,672.2 million people were carried on buses, 11.6% or 228.8 million people were carried on the subway. In general, 96.3% of passenger in the country was carried out by bus and subway. During 2007-2017 years, from bus transport 487.7 million manat, from metro transport 44.3 million manat was obtained, and as a result, the total income was 532 million manat. It should be noted that bus revenues have quadrupled since the last price change in 2007. After the price change in 2011, subway revenue increased by 54%. The increase in revenue is due to the increased transparency of the sector compared to previous years, rising prices for intercity passenger transport and increased passenger turnover.

Table following on the next page

	2014	2015	2016	2017	2018	2019
Total passenger turnover	26316	27125	27650	28289	28714	29533
Transport by land						
Passenger turnover	22992	23825	24429	24886	25276	25950
Share of transport by land on total passenger turnover, %	87.4	87.8	88.4	88.0	88.0	87.9
Private cars						
Passenger turnover	1296	1370	1413	1455	1494	1550
Share of private cars on transport by land, %	5.6	5.8	5.8	5.8	5.9	6.0
Public transport in cities						
Passenger turnover	15191	14214	14369	14628	14845	15241
Share of public transport in cities on transport by land, %	66.1	59.7	58.8	58.8	58.7	58.7
Intercities public transport in cities						
Passenger turnover	6505	8241	8647	8803	8937	9159
Share of intercities public transport in cities on transport by land, %	28.3	34.6	35.4	35.4	35.4	35.3
Mass Rapid Transit - MRT (metro)						
Passenger turnover	2378	2450	2400	2525	2549	2611
Share of MRT on total passenger transport, %	9.2	9.0	8.7	8.9	8.9	8.8
Passenger turnover per a person, km	2759.91	2811.08	2833.63	2870.80	2888.80	2981.80

Table 1: Passenger turnover in public transport field (mln. passenger-km)

Passenger turnover = the number of passengers carried * the distance the passengers were carried.

(Source: <https://www.stat.gov.az/source/transport>)

The flow of passengers is growing every year. In 2019, the passenger flow amounted to 29,533 million passenger-km, which is 2.7 times more than that in 2000. Urban and intercities public transport take a large proportion of passenger turnover (82.6% of passenger turnover through all transport vehicles) in the country (Figure 1).

Figure 1: Passenger turnover per a person (mln. passenger-km)

(Source: <https://www.stat.gov.az/source/transport/>)

Statistical analysis shows that there was a significant increase in passenger turnover costs between 2007 and 2017. However, no increase in tariffs was noted during this period. Factors driving the growth include rising financial costs as a result of rising fuel and electricity prices, upgrading used equipment, and rising wages in the sector (pros and cons of an increase in public transport tariffs, 2018). Statistical analysis shows that there was a significant increase in passenger traffic costs between 2007 and 2017. However, no increase in tariffs was registered during this period. Factors driving the growth include rising financial costs as a result of rising fuel and electricity prices, upgrading used equipment, and rising wages in the sector (pros and cons of public transport tariff increases, 2018). The dynamics of financial change in this direction in 2019 is described in more detail in the diagram below.

Figure 2: Cost incurred due to passenger carrying service, million manat
(Source: *Transport in Azerbaijan, Baku-2020, Statistical Journal, p.76*)

It should be noted that a new economic situation has emerged in Azerbaijan, especially in the last three years. Thus, in 2015-2017 years, due to the fall in oil prices, the national currency (Azerbaijani manat) depreciated by more than 54%, fuel prices increased by 63.6%, and electricity prices increased by 34%. In addition, the country's consumer price index was 4% in 2015, 12.4% in 2016 and 12.9% in 2017. Under these conditions, along with other industries, new problems have arisen for economic entities operating in the public transport segment. These problems have reduced the investment of businesses operating in the field of public transport. In 2012, 1,038 buses were brought to the country for passenger transportation, while in 2017, the corresponding figure was 6 times less or 187 units. As a result, the sector's profits have declined, the quality of public transport services has weakened, and the transport fleet, including the bus fleet, has become obsolete. In particular, the sharp devaluation of the local currency has significantly increased the cost of modernizing and repairing in terms of technical equipment for the import-dependent transport sector. Taking all these conditions into considerations, certain steps must be taken in the field of public transport services. The most reasonable step among all possible choices is to optimize existing tariffs in public transport. By the decision of the Tariff Council of the Republic of Azerbaijan dated July 30, 2018, the prices for passenger transportation by bus and subway were increased. It should not be considered rational saying that the increase in tariffs in public transport is unexpected. This is because when the subway fare was increased in 2011, officials emphasized that the increase was not enough. In the following years, the news about an increase in public transport tariffs became the subject of public opinion. In 2016, local media citing government sources reported that prices for passenger services will increase by 50%. The decision of raising the price of gasoline in June 2017 caused debates.

As a result, in October 2017, the Baku Transport Agency, as one of the departments implementing state control over passenger traffis, increased tariffs. After the decision of the Tariff Council in 2018, we can see how the prices for different categories of passenger services in Azerbaijan will change.

Type of transport	Previous tariffs	New tariffs	A change in percentage
Subway	0.20	0.30	50%
Bus (within a city)	0.20	0.30	50%
Bus (intercities), for every km	0.16	0.24	50%

Table 2: Changes in tariffs for passenger transportation, manat

(Source: <http://www.tariffcouncil.gov.az/?/az/content/184/>)

Despite of the necessity of optimization of tariffs, the Tariff Council's increase in public transport tariffs by 50%, and the statement issued by the agency in connection with this increase, in which it is noted that an increase in tariffs was implemented in order to develop transport infrastructure and to alleviate financial security, should not be considered a successful step. One of the main reasons for this claim is the increase in tariffs despite of the fact that quality does not increase, and a negative impact, which resulted from the discrepancy between quality and tariffs, on future positive changes in this area. The second reason may be the lack of price differentiation in terms of social distribution among the population when setting tariffs. Students, pensioners, mothers with many children and etc. are aimed when it is said social distribution. Meanwhile, non-existence of social distribution in public transport tariffs violated the principle of equal distribution of income. Another reason is the increase in tariffs before forming the relevant infrastructure and completing the cashless payment system. It should also be noted that since the current state of public transport in the country does not meet modern standards, the increase in existing prices will further slow down the development of this sector. In addition, it should be noted that the level of transparency in the activities of state-owned companies, especially in the field of passenger transport, is unsatisfactory. For example, the accounting of the Baku Metro, one of the 20 largest state-owned enterprises, is very poorly organized and not even organized in accordance with state standards. Despite the fact that the average annual turnover of this institution is about 100 million manat, only one individual was involved as an external auditor to assess the financial performance. At the same time, the annual financial statements of this institution are not informative. This undermines the ability to monitor high-quality financial performance (<http://metro.gov.az/en/about/metropoliten/fin>). Incomplete transition to the system of cashless payments for passenger transportation in the transport sector is one of the main factors ensuring the existence of clandestine traffic in this area. Although steps have been taken to introduce a cashless payment system in public transport in Baku since 2011, this process has not yet been completed. Finally, although the Baku Transport Agency announced that the full implementation of the cashless payment system will be completed in the first half of 2018, it became clear at the time that this was not possible. It should be noted that a large number of buses still continue to accept cash payments. According to statistics, currently 2021 buses serve 150 routes in Baku, of which only 500 buses on 25 routes have completed the transition to a cashless payment system. In other words, 75% of buses operating in Baku accept cash payment (<http://bna.az/en/ictimai-neqliyyat>). Even after the tariffs were renewed, the tariffs for public transport services in Azerbaijan remained lower than most of the existing tariffs in the CIS countries and regions (Hümbətova S., 2018). It should be noted that the current tariffs for subway passengers are 0.80-1.50 manat in Russia, 0.20-0.40 manat in Kazakhstan, 0.48-0.56 manat in Belarus, 0.35 manat in Georgia and 0.44-1.75 manat in Turkey. As for regular bus service tariffs within a city, it is 0.80-1.50 manat in Russia, 0.20-0.45 manat in Kazakhstan, 0.44-0.52 manat in Belarus, 0.35 manat in Georgia and

0.91 manat in Turkey. Tariffs for regular intercity bus routes are 5.2-9.2 manat/km in Russia, 4.2-7.5 manat /km in Georgia, 4.9-8.0 manat/km in Turkey. Tariffs for public transport for citizens registered in Tallinn, the capital of Estonia, where Azerbaijan was once compared, have been abolished since 2013. However, within the city, tourists use public transport by paying the relevant prices set for them. This project implemented in Tallinn is funded from the state budget. Even during the discussion of this decision, 40 out of 60 deputies of the Tallinn City Council voted in favor of this decision. According to average government estimates, this decision will help each family save an amount of 50 euros in their budget. In addition to Tallinn, in some countries public transport has begun to provide free services to its citizens under certain conditions as well. Luxembourg is an example. Since 2019, all public transport in the country has begun to provide free services. The application of this model by several countries and cities has already attracted the attention of other countries. Some countries have even begun researches in this area. In countries such as Belarus and the Russian Federation, fares are partially subsidized to keep the tariffs for passenger transportation below economic costs, and therefore the fare paid by citizens does not fully cover the cost of transportation by the state (Ryazanova, 2016). Subsidizing passenger transport is an integral part of its successful operation.

5. CONCLUSION

Determining and implementing the directions of development of the country's transport system is possible with the availability of extensive and high-quality statistics. For the successful integration of the country's transport into the international transport system, there must be concrete figures for the development of the transport sector of the country and forecasting development directions. It is necessary to create an extensive information network for the development of infrastructure, intensification and planning of transit traffic, development of intermodal and multimodal transport in the parts of international transport corridors passing through the territory of the country. At the same time, the needs of information users in this area must be met, as the reconstruction of transport infrastructure, the renewal of the transport fleet are the important stages in the development of the transport industry. Therefore, one of the main proposals is that creation of a single information system for the transport and road complex should be one of the main priorities, and that the system should be based on complete and reliable statistics. Subsidizing the state-controlled public transport sector (Baku Metro CJSC and Baku Bus LLC) has also created an unequal competitive environment in the sector. Thus, it has become difficult for private businesses to put cars that meet modern requirements into operation. This, in turn, has created a weak competitive environment, especially in Baku. It is proposed that if conditions in the country allow the implementation of the Tallinn model, instead of providing subsidies to a state-owned company and creating a non-competitive market, the state should become a natural monopolist in public transport and define routes for all buses. The decision to increase tariffs by 50% is believed to have placed a significant cost burden, especially on budgets of families with low-income, and has had a negative impact on social security. According to preliminary estimates, as a result of the increase in tariffs, the population will face additional costs of 260 million manat per year. It is proposed that instead of subsidizing a certain part of public transport costs, the government should fully subsidize these costs in order to apply the Tallinn model for public transport in Azerbaijan. If it is not possible to apply this model, then government should differentiate tariffs of passenger services for different passenger groups (e.g: lower fares for students, pensioners, and the other sensitive groups) and use the optimal mechanism for determining tariffs in general. As a result, the citizen is provided with the opportunity to make his own long-term budget planning by choosing between these packages. It is proposed that the accountability of state-owned companies operating in this area be prepared more professionally and in accordance with state standards

and be made more transparent. It is also proposed to complete the full implementation of the cashless payment system in public transport as soon as possible because this process will also contribute to the formation of the information system.

ABSTRACT

If earlier the traditional methods of market segmentation served as an effective method to match consumer needs with apparel companies' offerings, in the era of technological advancements with Big Data becoming a new type of sustainable capital and fashion market facing rapid changes, they no longer suffice. Hence, the use of non-conventional segmentation methods along with traditional can help companies to match with higher accuracy certain value propositions of their products with their customers' profiles, and by doing so eliminate the choice overload, that the customers are facing. Considering that that earlier studies discovered that music affects shopping behaviour and that apparels are hedonic products of high involvement, the following factors of non-conventional segmentation were analysed: psychographic dispositions, physiological factor, and musical choice. This article concerns the empirical evaluation of the effect that psychographic dispositions, physiological factors, and music choices have on consumer needs of women aged 18-35 in Azerbaijan. Once data was collected using convenience sampling method, the following statistical analysis were performed: PCA, EFA, frequency, reliability and convergent validity analysis, linear regression and bivariate correlation analysis. The results demonstrated that psychographic, physiological, and musical factors are substantial determinants of consumer needs. As results suggest, fashion-oriented consumer needs positively correlate with extraversion and rhythmic type of music and negatively - with neuroticism, complex and rebellious types of music, rectangle figure and weight; meanwhile emotion is positively associated with agreeableness, neuroticism, complex music; and negatively – with rebellious music. Appearance-oriented consumer needs have a positive correlation with extraversion and conventional type of music, whereas individuality positively associated with openness to experience, and negatively – with conventional music. The need for novelty positively correlates with neuroticism, and negatively – with conventional music. At last, the need for comfort positively correlates with neuroticism and weight, and negatively – with extraversion, conventional music, and hourglass figure.

Keywords: *fashion industry in Azerbaijan, music choices, non-conventional segmentation methods, physiological factor, psychographic dispositions*

1. INTRODUCTION

In the era of online shopping which constantly undergoes rapid changes due to technological advancements, conventional segmentation methods can no longer serve as an effective method of market positioning of companies and their products. Big Data revolution has prompted the use of non-traditional market segmentation methods by making data and analysis more accessible and easier to execute.

Data collected about customers can be utilized to offer them products tailored to their needs and save them from choice overload, which has become a permanent component of both online and in-store shopping. Although non-conventional methods of market segmentation have been widely researched by international academia and implemented in their marketing strategy by international corporations, companies in Azerbaijan still rely on traditional segmentation methods. Taking into account that non-conventional segmentation methods - in particular psychographic dispositions, physiological factor, and musical choice - are of higher importance for hedonistic products of high consumer involvement, this study focuses on how accurately non-conventional segmentation methods along with the traditional ones can determine consumer needs that are provided in certain clothing items.

2. LITERATURE REVIEW

Segmentation of the fashion market based on non-conventional methods is one of the widely studied subjects by the international researchers. Researchers, namely Rauschnabel P.A., Matzler K., Bidmon S., Grabner-Kräuter S., Guido G., Huy H.T., Gohary A., Hanzae KH, Choungourian A. in their studies of non-conventional segmentation methods based on the psychographic component found a connection between five main personality traits (Big Five) and customers' buying behaviour. In recent years, the relation between music and fashion has also become the centre of researchers' attention. Studies have shown that there is a correlation between people's musical preferences and their clothing choices: the more people are interested in music, the stronger they are involved in fashion. Researchers Na Y. and Agnhage T. studied effect of background music in stores on consumer behaviour. (Na & Agnhage, 2013). Knoferle K.M., North A.C., Sheridan L.P. and Areni C.S. have proven that the tempo and mode of music affect sales (Knoferle et al, 2012; North et al, 2015). According to a study by Pisut G. and Connell L.J, there is a close linear relation between the clothing choices of female consumers and the degree to which they are satisfied with their bodies (Pisut & Connell, 2007). Women with high self-esteem about their bodies (positive body image) opt for more fitting clothing to enhance their physical attractiveness. They also allocate more funds from their budget for clothing. This article reviewed the work of renowned consumer behaviour researchers like Weine Hoyer, Gunter Barry, and Philip Kotler. The reports of well-known consulting companies such as McKinsey & Company and articles of the international magazine «The Economist» were also used. Statistical data was retrieved from both national (public database of the State Statistics Committee of Azerbaijan: www.stat.gov.az) and international (Statista: www.statista.com) databases.

3. METHOD

3.1. Research model

The methodology of this study is based on a process of systematic integration of various elements of the research and consisted of four main parts. First specialized academic literature was reviewed and a conceptual model that links non-conventional segmentation to consumer needs was developed. To test the effectiveness of the developed conceptual model, an online survey was conducted among shoppers of the same age group and gender in Azerbaijan. At the third stage, the data collected from surveys were analysed using the IBM SPSS Statistics 22 software. At the end, based on the results of the study, recommendations on the use of non-conventional segmentation methods for the clothing market in Azerbaijan were made.

3.2. Working group

Online survey, aimed to determine main characteristics of fashion consumers in Azerbaijan based on the factors of non-conventional segmentation, was distributed via social media to persons of the same age group and gender (women aged 18 - 35 years).

332 respondents took part in this survey. The age of the respondents ranges from 18 to 35 years old. An average respondent is 25 years old, has hourglass body type, weights 61 kg and is 1.67 m tall. The respondents who took part in the survey, on average, demonstrated a high need for novelty ($M = 3.72$, $\sigma = 1,03$). When it comes to their current engagement, 36% of respondents are employed, 34% are studying, 17% are working and studying at the same time, 13% are recent graduates seeking employment. Social media was chosen as a distribution channel for the survey for several reasons: ease of distribution, convenience of filling it out, higher response rate, wider coverage, etc. In addition, the study focuses on online shopping, which assumes that its main audience are active online - users. The online questionnaire was sent out in the period of three days. Reminders were sent to the participants who did not complete the survey within three days.

3.3. Data collection tools

A standardized online self-completion survey was used for data collection. The survey was compiled using the publicly available online survey tool - Google Forms. Thirty questions of various types were included into the survey: five-point scale questions, single-answer questions, multiple-choice questions, and open-ended questions.

3.4. Collection and analysis of data

The online survey comprised the following six parts:

- 1) The first part of the survey covered questions about demographic data of the respondents: one open-ended question (age), two single-answer questions (gender and occupational status).
- 2) The second part included one multiple-choice question regarding music preferences of the respondents. Both in the questions about respondents' music choices and occupational statuses, option of an open answer, namely "Other option", was given for respondents to add their own answers to those already available.
- 3) The third part of the survey consisted of ten Likert scale questions that evaluated their psychographic dispositions based on Big Five taxonomy of personality traits: openness to experience (O), conscientiousness (C), extraversion (E), agreeableness (A) and neuroticism (N). The questions were based on Big Five Inventory (BFI-10) developed by Rammstedt & John (2007).
- 4) The model developed by Park & Sullivan (2009) was adopted in ten Likert scale questions aimed at determining main consumer needs. The consumer needs model differentiates between the main benefits that consumers are trying find in products that they are purchasing. For this study, the following consumer needs were developed based on the framework of Park & Sullivan (2009): fashion (F), appearance (A), individuality (I), emotion (E), comfort (C) and novelty (N).
- 5) The part of the survey that dealt with the physiological factor covered several types of questions: two Likert scale questions regarding consumers' body image (how satisfied are they with their body features), two open-ended questions about respondents' weight and, and one question regarding respondents' body shape. For the last question, a typology of body shapes by Pisut & Connell (2007) was employed. A graphic representation with a detailed description of each type of body shapes were added to the survey in order for the respondents who are not familiar with the typology of body shapes to have necessary information to correctly indicate their body type in the survey.
- 6) The part of the survey that focused on clothing products and the benefits they offer included multiple-choice question with a set of twenty-four T-shirt images to choose from. The images used in the survey were taken from online stores of Mango, Bershka, Stradivarius Azerbaijan for various reasons: availability of a large selection of T-shirts of various styles,

all items of clothing are presented in a unified form on a plain background, availability of shots from various camera angles with and without the model and availability of front and back views of clothing items.

Once data was collected using convenience sampling method, first data cleaning procedures were undertaken in order to remove corrupt data and then the following statistical analysis were performed: PCA, EFA, frequency, reliability and convergent validity analysis, linear regression, and bivariate correlation analysis.

3.5. Findings and interpretation

Data collected on personality traits (BFI-10) and consumer needs (CN-10) was first analysed in IBM SPSS Statistics 22 for underlying structural relations and internal consistency of factors using Exploratory Factor Analysis (EFA) and Principal Component Analysis (PCA). Five factors derived from BFI-10 showed factor loading value higher than 0.7 (lowest – 0.8), eigen value higher than 1 (lowest – 1.13) and accumulated variance of 76%. In case of CN-10, five derived factors displayed factor loading value higher than 0.7 (lowest – 0.9) and accumulated variance of 93%. Taking into the account aforementioned, both personality factors and consumer needs factors can be accepted as representative (Kent, 2015). Kaiser-Meyer-Olkin Test and Bartlett's Test of Sphericity were performed on the dataset to examine its sampling adequacy and test matrix of correlations against identity matrix. For both BFI-10 and CN-10 Kaiser-Meyer-Olkin Test demonstrated sampling adequacy values higher than 0.5, whereas Bartlett's Test of Sphericity showed the p-value of .000. Taking into account that the above-mentioned values of sampling adequacy and correlation indicator, the factor analysis is accepted as valid (Hair et al., 2014)

Kaiser-Meyer-Olkin Test of Sampling Adequacy		0.620
Bartlett's Test of Sphericity	Approxim. Chi-Square	537.913
	df	45
	Sig.	.000

Table 1: Kaiser-Meyer-Olkin Test of Sampling Adequacy and Bartlett's Test of Sphericity on BFI-10

(Source: IBM SPSS results table)

Kaiser-Meyer-Olkin Test of Sampling Adequacy		0.622
Bartlett's Test of Sphericity	Approxim. Chi-Square	1704.985
	Df	45
	Sig.	.000

Table 2: Kaiser-Meyer-Olkin Test of Sampling Adequacy and Bartlett's Test of Sphericity on CN-10

(Source: IBM SPSS results table)

To test internal consistency of BFI-10 and CN-10 Cronbach's Alpha test was employed. Each factor's Cronbach's Alpha value is higher than 0.5 and thus these tests are accepted as reliable (Nunnally, 1978).

Factors	Cronbach's Alpha	Cronbach's Alpha based on standardized items	Number of items
Neuroticism	0.755	0.756	2
Extraversion	0.625	0.627	2
Openness to experience	0.700	0.702	2
Agreeableness	0.548	0.549	2
Conscientiousness	0.570	0.572	2

*Table 3: Cronbach's Alpha test (BFI-10)
(Source: IBM SPSS results table)*

Factors	Cronbach's Alpha	Cronbach's Alpha based on standardized items	Number of items
Individuality	0.945	0.945	2
Fashion	0.901	0.903	2
Appearance	0.890	0.893	2
Emotion	0.878	0.878	2

*Table 4: Cronbach's Alpha test (CN-10)
(Source: IBM SPSS results table)*

Table 5 and 6 indicate Pearson's correlation coefficients that were computed to test convergent validity of BFI-10 and CN-10 tests. Correlation between respective questions is significant at the 0.01 level and thus these tests are accepted as valid (Kent, 2015).

Pearson's Correlation	N_Q2	E_Q2	O_Q2	A_Q2	C_Q2
N_Q1	r =.607 p =.000				
E_Q1		r =.541 p =.000			
O_Q1			r =.457 p =.000		
A_Q1				r =.378 p =.000	
C_Q1					r =.401 p =.000

*Table 5: Convergent Validity test (BFI-10)
(Source: IBM SPSS results table)*

Pearson's Correlation	F_Q2	A_Q2	I_Q2	E_Q2
F_Q1	r =.824 p =.000			
A_Q1		r =.806 p =.000		
I_Q1			r = .896 p =.000	
E_Q1				r = .783 p =.000

*Table 6: Convergent Validity test (CN-10)
(Source: IBM SPSS results table)*

After completing the exploratory factor analysis, existence of the relations between consumer needs and various dimensions of consumer profiles, such as psychographic factor, physical factor, and music choices were analyzed. To study the relations between consumer needs and personality dispositions and music taste multiple linear regression model was employed: Big Five personality dimensions, consumers music choices and consumers' body weight were defined as independent variables and consumer needs – as dependent variables. Correlation analysis was used to analyze the relations between consumer needs and the choice of T-shirts, as well as their body types. Table 7 presents the snapshot of all the correlations that were detected between consumer needs and personality traits, music preferences, body types and weight.

Table following on the next page

Consumer needs and factors of non-conventional segmentation	Psychographic factor	Music preferences	Physical factor (weight and body type)
Fashion	Extraversion ($\beta = .254, p = .000$) Neuroticism ($\beta = -.159, p = .004$)	Complex music ($\beta = -.104, p = .066$) Rebellious music ($\beta = -.221, p = .000$) Rhythmic music ($\beta = .233, p = .000$)	Weight ($\beta = -.153, p = .007$) Rectangle body type ($r = -.194, p = .001$) Positive body image ($r = .127, p = .029$)
Appearance	Extraversion ($\beta = .105, p = .072$)	Conventional music ($\beta = .112, p = .059$)	
Individuality	Openness to experience ($\beta = .170, p = .004$)	Conventional music ($\beta = -.102, p = .084$)	
Emotions	Neuroticism ($\beta = .186, p = .001$) Agreeableness ($\beta = .184, p = .001$)	Complex music ($\beta = -.151, p = .011$)	
Novelty	Neuroticism ($\beta = .165, p = .005$)	Conventional music ($\beta = -.112, p = .060$)	
Comfort	Extraversion ($\beta = -.159, p = .000$) Neuroticism ($\beta = .106, p = .065$)	Conventional music ($\beta = -.172, p = .004$)	Weight ($\beta = .107, p = .069$) Hourglass body type ($r = -.116, p = .046$)

*Table 7: Correlations detected between consumer needs and main factors of non-conventional segmentation
(Source: IBM SPSS results table)*

The consumer needs factor of fashion correlates positively with extraversion and negatively with neuroticism at 0.01 significance level. While complex (at 0.1 significance level) and rebellious (at 0.01 significance level) genres of music are negatively correlated with fashion, as consumer need factor, rhythmic music is positively correlated at 0.01 significance level. When purchasing apparel female consumers with a rectangular figure are not guided by their consumer need for fashion. They also showed greater satisfaction with their overall appearance (positive body image). When choosing T-shirts, they opt for fitting apparel with low body coverage. Women, for whom the factor of appearance plays a decisive role when choosing clothes, also have high rates of extraversion. As for extraverts to engage in social interactions they need to make a good impression first, they tend to focus on their appearance to a greater extent. When it comes to music preferences, they opt for conventional music. According to the results of the analysis, the CN factor appearance does not show any correlation with positive body image, which might be due to the fact that regardless of the degree to which appearance-oriented female consumers are satisfied with their figure, they tend to choose certain clothing items to highlight or conceal certain physical features. Female consumers who try to express their individuality through the clothes they are purchasing similar to the appearance-oriented consumers opt for conventional music. They also tend to score high on extraversion.

As in case of appearance-oriented consumers, no correlation between variables of physical factor and consumer need for individuality was detected. Women, who make their purchase decisions based on their emotions, scored high on two Big Five personality traits: agreeableness and neuroticism. Consumer need for emotion correlates negatively with complex music at 0.1 significance level. In their research, Gohari and Hanzai (2014) identified that there is a positive relation between neuroticism and impulsive buying. They make their purchase decisions impulsively based on the hedonic features of apparel. Female consumers, who focus on novelty do not prefer the genres of conventional music and show high rates of neuroticism (positive correlation at 0.1 significance level). The female consumers that prefer comfortable clothes scored high on neuroticism and low on extraversion and showed dislike conventional type of music. On average, they did not have an hourglass body type. In addition, consumer need for comfort positively correlates with weight. When choosing T-shirts, they opt for apparel of neutral colours with loose fit, high body coverage and plain texture. The approach of combining various non-conventional segmentation dimensions into one framework used in this study, provided evidence that considering consumers from different perspectives, namely psychographic dispositions, music taste and appearance-related physical features, can serve as a guidance and help to identify firstly consumer needs and, as the result – predict their clothing purchase decisions.

4. CONCLUSION AND DISCUSSION

While most of the previous research in this area has examined the relation between psychographic factor and brand image, this article emphasizes the importance of considering all relevant factors of consumer choice, particularly when dealing with hedonistic products of high consumer involvement, such as clothing items and accessories. Analysis of the data demonstrated that psychographic, physiological, and musical factors are correlated with different types of consumer needs and, as a result, influence consumers' choice of clothing. This information can serve as a guideline for fashion companies that can based on the data, they have on their customers, build recommendation systems that will offer a personalized selection of their products. Recommendation systems help customers overcome the choice overload, which often impedes purchase. Use of recommendation systems tailored to the needs of consumers is especially important in the era of Big Data, as it enables a throughout analysis of consumers' profiles. The current study focuses on the clothing benefits that consumers in Azerbaijan are seeking to satisfy by opting for certain apparel, as online retail industry of fashion products has received a little attention from the academia, despite the fact that it falls behind the international standards and requires development. Local consumers prefer purchasing from overseas online stores like Asos, Missguided, Ebay, Amazon Fashion and others. International online stores successfully utilize customer data, such customers' previous purchases, information about their preferences and their physical features, to improve the quality of recommendation systems. Using the framework developed by this study as guidance, Azerbaijani apparel companies will be able to build personalized recommendation systems that will perform analysis of their customer data and will ensure that their product offerings satisfy the needs of their customers on an individual level. This recommendation system tailored to the needs of consumers will improve customer experience and hence will lead to increased customer satisfaction. In the age of social media, when information about customer dissatisfaction is spreading at a high speed, personalized recommendation systems are gaining in importance. In addition to diversifying their product offerings, companies focus on providing customers with overall gratifying shopping experience.

INFLUENCE OF SPECIFIC FEATURES OF THE CONSTRUCTION SECTOR ON THE METHODOLOGY OF MANAGEMENT ACCOUNTING AND ANALYSIS

Sevinj Abbasova

*Associate Professor at Azerbaijan State Economic University (UNEC), Azerbaijan
sevinj.abbasova@yandex.ru; sevinj.abbasova@unec.edu.az*

ABSTRACT

The investment attractiveness of the construction business, to a very large extent, depends on providing investors with reliable and transparent financial statements that show the property status of construction organizations, their ability to increase capital, as well as possible threats and risks. Accounting and analytical information reflected in the financial statements allows stakeholders to make timely management decisions. This is necessary for managing the strategic and tactical management. The worldwide experience shows that science and practice have not yet created anything more effective than a management accounting system to generate reliable information. Research shows that the formation and development of management accounting in the construction industry is difficult due to a number of problems. One of the possible ways to solve them is the architectonics of the features of the construction sector of the economy developed by the author, which shows their impact on the organization of management accounting and management analysis in contract construction organizations. Knowing the nature of the impact of the features and factors identified in the course of the study makes it possible to assess the risks of misstatement of the financial statements. The methodological basis of the study is a systematic approach that represents management accounting as a synergistic system. The result of the study was the disclosure of the influence of structured features of the construction sector on the organization and development of management accounting in supplier construction companies. Using the recommendations put forward by the author in practice will give the opportunity to form a reliable information base and increase the efficiency of the business activities.

Keywords: *management accounting, management analysis, technical and economic, production and technological features of construction, management solutions*

1. INTRODUCTION

In today's accounting environment, there is a need for continuous research into the information requests from different user groups in different sectors of the economy. To ensure management with transparent and accessible information for decision-making at all levels of management, a comprehensive methodological approach is needed. At the same time, one should consider the peculiarities of the functioning of a particular sector of the economy, the main directions of its development, trends, long-term prospects, and features of the production structure. Such a mechanism is possible in the management accounting and analysis system. It is in the system of management accounting and analysis that reliable information is generated, which is necessary for making management decisions on-line. It should be noted that at this stage management accounting and analysis in housing companies is not enshrined in law. At the same time, the problematic issues of such accounting are widely covered in the works of foreign scientists. However, these works focus on theoretical aspects. There are very few studies of the industry features of housing companies that influence the organization of management accounting and analysis systems. There are controversial provisions, lack of systemicity, unexplored of certain areas and methods of management accounting and analysis in the construction sector.

The need for a comprehensive study, as well as the enormous practical need for management accounting and analysis in the construction sector, confirm the relevance of this study.

2. THE IMPACT OF TECHNICAL AND ECONOMIC FEATURES OF CONSTRUCTION ENTERPRISES ON THE ORGANIZATION OF MANAGEMENT ACCOUNTING AND ANALYSIS

Management accounting in a construction organization is an element of its accounting and analytical system. This system is based on the collection, analytical processing and generalization of information about business processes at all stages of construction and installation works (Abbasova S.A., 2015). It provides management with data regarding the costs and results of the enterprise, and its financial centers (responsibility centers, cost centers, revenue centers, etc.). Such information is necessary for cost management, its analysis and control in order to make managerial decisions. A review of the literature shows that most researchers only list the sectoral features of construction organizations. We did not limit ourselves to this and structured the sectoral features, which are influenced by factors of the internal and external macro- and microenvironment. This structuring will help to simplify the implementation of management accounting, in accordance with the needs of construction organizations. The architectonics of the features of the construction sector of the economy developed by us is given below:

- Technical and economic features
- Production and technological features
- Organizational and sectoral features
- Management features
- Legislative and legal features
- Behavioral features

Within the framework of this article, we will consider the impact of the first two groups of features on the organization of management accounting and analysis. Let's start with the technical and economic features of construction organizations (see Table 1).

Table following on the next page

Table 1: The impact of technical and economic features of construction enterprises on the organization of management accounting and analysis

№	<i>Features that characterize the specifics of the industry</i>	<i>Impact on the organization of management accounting and analysis in a construction organization</i>
1	2	3
1.	<p>Territorial isolation of construction objects; location in relation to sales markets, communications. The end product of the construction industry is not transportable.</p> <p>The mobility of the means of production (workers, machines, equipment, etc.) moving from object to object.</p>	<p>There may be: the wrong choice of the accounting object, the wrong capitalization of fixed assets, the erroneous accrual of depreciation, the accrual of depreciation on fixed assets that are not involved in construction, early unjustified write-off of fixed assets, the replacement of assets with less valuable assets.</p> <p>Significantly affects the pricing of an object under construction.</p>
2.	<p>Mandatory use of design and estimates documentation.</p>	<ul style="list-style-type: none"> • Inconsistency of the design and estimates documentation of the contractors with the design and estimates documentation of the customer, • Failure to perform certain hidden works approved by the design and estimates documentation, • Not for every type of construction and installation work there is an estimate. <p>It is necessary to organize an accounting and analytical system of design costs and deviations from the estimated standards, to apply various methods of calculating the cost of work.</p>
3.	<p>Close interconnection with other sectors of the economy.</p>	<p>Leads to dependence on the volume and stability of production of products (work performed, services rendered) in other fields and types activities.</p> <p>There may be an incorrect calculation of the cost of construction products (works, services).</p>
4.	<p>A large number of complex objects and structures being built.</p> <p>Significant dimensions of construction products. The scale of the warehouse.</p> <p>Lack of concluded agreements on material liability with responsible persons.</p>	<p>There may be an overestimation of the volume and cost of construction, an inconsistency between the actual volumes and accounting data, and erroneous accrual of depreciation of fixed assets.</p> <p>The use of cheaper technologies for the production of works than provided for by the project. Re-presentation for payment of previously paid volumes of work, leads to higher cost price.</p> <p>Untimely inventory of the object. Requires detailed accounting in the context of business processes</p>

Source: Table 1 was compiled by the author on the basis of generalization and structuring of the sources [1, 3, 4, 5]

The technical and economic features of construction require:

- accounting of supply on the construction projects market;
- systematic management analysis (marketing, strategic and competitive analysis),
- analysis of the near and distant environment,
- the need to prepare additional information on the costs of material and financial resources when transferring workers and construction equipment from one site to another

The territorial isolation of construction objects complicates the exchange of information, limits the possibilities of operational interaction and management. It is necessary to organize an accounting and analytical system of income and expenses for each business process of the construction object. In a contracting construction organization, management accounting should be positioned as an analytical accounting of such indicators as income and expenses for the main objects of construction work (Petukhov M. V., Petukhova Zh. G. 2016). The obligatory use of normative estimates is associated with the need to use various methods of calculating the cost of work, assessing the degree of implementation of estimates for individual works and the entire construction project. In the course of the study, it was revealed that there are often no technical and regulatory legal acts reflecting the quality of building materials, products and structures, the reliability of construction facilities, their fire safety, protection from natural and man-made damage. The influence of such a construction feature as a large number of complex objects and structures being built, the significant dimensions of construction products should be taken into account by:

- detailed accounting in the context of business processes associated with the construction of specific facilities;
- comparison of various options for technological and managerial solutions within the boundaries of the accounting and analytical system;
- creation of warehouses and assembly of structures and products

The long service life of construction objects requires the organization of work to ensure warranty service within a specified period. This affects the cost of the final product (Abbasova S.A., 2019).

3. THE INFLUENCE OF PRODUCTION AND TECHNOLOGICAL FEATURES ON THE ORGANIZATION OF ACCOUNTING AND ANALYSIS IN CONSTRUCTION ENTERPRISES

Consider the impact of production and technological features on the organization of accounting and analysis in construction enterprises (see Table 2).

Table following on the next page

Table 2: Influence of production and technological features of construction organizations on the organization of management accounting and analysis

N.	<i>Features characterizing industry specifics</i>	<i>Impact on the organization of management accounting and analysis in a construction organization</i>
1	2	2
1.	The duration of the production cycle, dividing it into separate stages (preparation of the zero cycle, erection of the foundation, the underground part of the building, finishing work, etc.). Large amount of construction in progress. Construction time can be several years.	It determines the specifics of the process of its implementation and reflection in accounting and reporting. The delivery of the object to the customer and payment for the work are usually carried out in several stages. This affects the specifics of the formation of revenue and cost. There may be: Excessive and unclaimed construction work. Registration in the accounting of the volume of sales for a smaller amount and the subsequent assignment of funds. Subscriptions in construction work orders. Non-compliance of the provisions of a company's construction accounting policies with regulatory requirements on accounting for the reporting period, including and in the assessment of the construction in progress.
2.	The need to carry out preparatory work before the start of construction (drainage work, construction of temporary living quarters for workers, etc.)	The accounting and analysis of financial, labor and material costs associated with such work is not organized. Unreasonable attribution of some expenses for the construction of facilities.
3.	The end product of construction is the creation of a new residential facility, while there is a high resource intensity of production (material consumption - bone, capital intensity, cost intensity, etc.).	Incorrect use of building materials and prices for them. Overestimation of the size of the write-off of building materials. Application of inflated norms of overhead costs, limited costs. Untimely inventory taking. The expenses reflected in the accounting and tax records of the construction company are not confirmed by primary accounting documents. E is a violation of the Law of Azerbaijan Republic "On Accounting"
4.	The production process consists of a mandatory list of related operations, in which the next process is not possible when the previous one is completed.	Violation of the sequence of operations leads to marriage, distortion of the cost of construction work and the financial result of the construction organization
5.	Long payback periods for capital investments, a relatively high risk factor and uncertainty, as well as changes in the economic situation in the country.	Write-off of expenses for the installation of equipment and the inclusion of their cost in the volume of capital investments for construction projects. Analytical accounting for long-term investments and capital investments is not kept. Manipulation of expenses in terms of write-off and partial write-off of the amount of expenses for construction projects.
6.	High share of overhead costs in the cost of construction products	Failure to comply with the estimate of overhead costs. Distortion of the structure of the cost of objects when accounting for costs for subcontractors. Inconsistency of the provisions of the accounting policy of a construction organization with the requirements of regulatory documents for accounting for the current reporting period.

Source: Table 2 was compiled by the author on the basis of summarizing and structuring sources [1, 6, 7, 8]

Due to the duration of the production cycle in construction, dividing it into separate stages, the formation of the financial result of a construction organization may occur unevenly.

The large volume of construction in progress and its significant share in the total volume of work performed requires the organization of analytical accounting of construction in progress. These features require the organization of an accounting and analytical system for each business process. It is necessary to determine the cost of construction for the entire construction period, conditionally distribute income and expenses to stages of work and specific business processes as they are completed. In order to determine the exact balances of construction in progress, you need to choose the optimal method for its assessment and approve it in your accounting policy.

Great importance should be attached to:

- conducting strategic planning and strategic management analysis,
- analysis of the reasons for deviations from the estimated costs and selected development strategies,
- maintaining internal (management) reporting.

Before construction begins, preparatory work, such as drainage, is usually carried out, and temporary living quarters are built for workers. This requires the organization of accounting for financial and material costs associated with such work. It is also important to conduct a management analysis of the resource potential of a construction organization. The construction of any construction facility is quite resource-intensive: there is a high material consumption, capital intensity, cost-intensiveness of the production process. Therefore, it is advisable to organize an accounting and analytical system for the nomenclature of material resources, budgeting, control over the consumption of materials. Such control should include the planning of material costs according to the norms, for the main groups of equipment, taking into account its design features and operating conditions, as well as the supply of materials - according to primary documents. In addition, the preparation of operational information on the current prices for building materials will help to calculate the economically feasible consignments of their supplies in time. Timely implementation of internal control and audit methods is of great importance. In construction, there is a clear technological sequence of construction work, in which the next process becomes impossible without completing the previous one. This feature requires the organization of operational accounting and analysis of expenses, income, financial results for business processes at each stage of construction work. The omission of defects in any of the processes creates a risk for the selection and distribution of building materials in the next stages. How can I avoid at seemed the situation? It is necessary to establish management control in the management accounting system and separate a separate type of work into an autonomous accounting object. With the help of architectural and technical supervision of construction, the quality of construction production is monitored - acts are drawn up on detected deviations from technology. This helps to quickly identify the costs of correcting marriage and the source of their funding. One of the production and technological features also includes a fairly long payback period for capital investments. This leads to risk factors and uncertainties. Therefore, the constant minimization of the costs incurred and the regular carrying out of their management analysis and audit are relevant. Today, the management accounting system of construction organizations should combine accounting, organizational, economic, managerial and other methods in a certain information space, that is, it is subject to digital transformation. Prospects for the digitalization of management accounting in the construction sector, in our opinion, are as follows. To organize an effective management accounting and analysis system at an enterprise, it is necessary, first of all, to outline the boundaries of its information support. Management accounting is positioned in the information and instrumental space of management of construction companies as a powerful driver of transformation processes. These processes are focused on the implementation of digital systems and technologies (Rojkova N. K., 2020).

The latest advances in technology, such as artificial intelligence, the development of an IT structure, big data, etc., cause structural changes and reboots in many areas of activity, including accounting. At the present stage, blockchain technology is a new tool that should be included in the toolbox of management accounting specialists. Blockchain can already be seen as a prerequisite for a revolution in accounting methods, for example, the accounting system. When using cloud blockchain technologies in the accounting process, a new reality of online accounting opportunities opens up for construction companies.

4. CONCLUSION

In this study, we have not limited ourselves to listing the currently insufficiently studied industry studies of organizations of organizations. We have structured the most important industry-specific features due to factors of the internal and external macro- and microenvironment. This structuring will help to simplify their use in accordance with the needs of construction organizations in the implementation of management accounting. It was found that their services to this area are methods of management and organization of construction work, a special production technology of the organization of management accounting, costs, and calculation of the cost of construction and installation work. Perhaps the considered features of the construction industry do not seem so significant to a non-attracted user of information. However, they lead to the complication of the activities of construction companies on the market, under the influence of numerous and varied factors. Therefore, it is necessary to search for specific approaches to the formation of various aspects of the accounting and analytical system for managing business processes. Risk management in the current activities of construction organizations is a prerequisite for their work. In this regard, the vital need for the organization of the system of management accounting and analysis is put forward at the forefront. Management accounting in the construction organization, as an element of its accounting and analytical system, provides management with data, first of all, on the costs and results of the enterprise, and its financial centers (responsibility centers, cost centers, income centers). This data is needed to manage, analyze, and control costs. In a construction organization, management accounting should be positioned as an analytical accounting of such indicators as revenues and expenses for major construction works. In addition to management accounting and management analysis, internal controls and internal audit are also essential elements of the accounting and analytical management system and it is able to perform large-scale tasks to evaluate internal control processes, risk management, corporate governance. The system of internal control and audit of construction companies, considering industry specifics, accumulates experience and necessary information about the types of risks and measures to eliminate or minimize them. Such a system can actively help risk management at every stage of risk management. In the context of the digitalization of the economy, management accounting is regularly replenished with new processes and competencies. Their introduction into accounting practice suggests a significant improvement in the quality of accounting work at all levels of management of the company. The study showed that the level of digitization of management accounting and analysis in construction organizations is low. It can be improved by improving the collection, processing, and preparation of information, as well as increasing its quality, speed and reliability. Blockchain technology is a new tool that should be included in a set of management accounting tools. Blockchain can already be a prerequisite for a revolution in accounting methods, such as the registration system. With the use of cloud-based blockchain technologies in the accounting process, a new reality of online accounting opportunities is opening for construction companies.

ABSTRACT

After 1993, the basis for using Azerbaijan's hydrocarbon resources in the interests of the people was laid thanks to the conclusion of the "Contract of the Century." Simultaneously, Azerbaijan started deliberate large-scale economic reforms. It was in those years that the foundation for our country's significant changes was laid. We note among them fundamental institutional changes aimed at replacing the old way of managing new free competition relationships. The purpose of these transformations was to implement political measures to create a market economic system, privatize state property, build new property relationships, and conduct land reforms. In addition, the opening of new production sites and the creation of new jobs in the non-oil sector made it possible to expand the infrastructure of production, transport and utilities and to create modern social infrastructure enterprises. Including increased building of new educational, health, and sports institutions. The foundations of our country's dynamic and sustainable progress as a whole were achieved during this period. It should be noted in particular that great progress has been made in solving social problems effectively over these years. For example, in accordance with advanced international standards, the population social protection system has been rebuilt. A new pension system began to operate and systems were developed and developed for targeted state social assistance and the provision of social benefits. The poverty rate dropped from 49.7% in 2000 to 5.2% in 2018 thanks to a successful social policy.

Keywords: *hydrocarbon resources, "Contract of the Century", economic reforms, fundamental institutional changes, competition relationships, economic system*

1. INTRODUCTION

After 1993, the basis for using Azerbaijan's hydrocarbon resources in the interests of the people was laid thanks to the conclusion of the "Contract of the Century." Simultaneously, Azerbaijan started deliberate large-scale economic reforms. It was in those years that the foundation for our country's significant changes was laid. We note among them fundamental institutional changes aimed at replacing the old way of managing new free competition relationships. The purpose of these transformations was to implement political measures to create a market economic system, privatize state property, build new property relationships, and conduct land reforms.

There was a further deepening of large-scale reforms in our country in the 2000s. These reforms created favorable opportunities for accelerated development, as well as conditions for a higher level of socio-economic progress in society. The country's investment environment has improved, the government has been rebuilt according to modern criteria [1]. Due to an increase in natural resource extraction and export, economic growth dynamics received a new impetus. In the context of the global economic crisis, this continued even in 2009. Therefore, we can confidently say that the Azerbaijani economy's growth is the result of the successful implementation of the strategic course chosen. Oil revenues have been channeled to the non-oil sector along with this. This has led to significant progress in this area's development and over the past ten years, the non-oil sector's average annual growth rate has been nearly 11 percent.

1.1. Problem Statement

In addition, the opening of new production sites and the creation of new jobs in the non-oil sector made it possible to expand the infrastructure of production, transport and utilities and to create modern social infrastructure enterprises. Including increased building of new educational, health, and sports institutions. The foundations of our country's dynamic and sustainable progress as a whole were achieved during this period. It should be noted in particular that great progress has been made in solving social problems effectively over these years. For example, in accordance with advanced international standards, the population social protection system has been rebuilt. A new pension system began to operate and systems were developed and developed for targeted state social assistance and the provision of social benefits. The poverty rate dropped from 49.7% in 2000 to 5.2% in 2018 thanks to a successful social policy. Wages and pensions in particular have been raised repeatedly.

1.2. Aim of the study

The country's successes in socio-economic spheres are also reflected in international rating agencies (Fitch Ratings, Moody's, Standard & Poor's) assessments of the Azerbaijani economy. Every year, these ratings have increased. In the Doing Business Report prepared by the World Bank and the International Finance Corporation, Azerbaijan improved its position, and in the World Economic Forum's Global Competition Report, it rose to a leading position among the Commonwealth of Independent States and the region [2]. As is known, total national income per capita is classified by the World Bank. According to this classification, Azerbaijan entered the category of "high average income" countries and, according to the 2010 UN Development Program for Human Development, left the group of "medium human development" countries and entered the group of "high human development" countries in 2018. Effective government regulation will be guiding principles to achieve these objectives. In a market economy, this regulation should ensure healthy competition, transforming it into an export-oriented economy. It will ensure the rational use of energy, create high added value and ensure the integrated development of socio-economic spheres. Within the concept, the goal is to transform the economy of the country into a productivity-based economy. To achieve this, it will be possible to increase the overall productivity of the factors of production [3]. When talking about improving the national economy's competitiveness, the following areas should be noted: protecting macroeconomic stability, strengthening monetary and fiscal policy coordination, improving the business environment and supporting private initiative, developing the financial services market, and improving foreign trade and investment policies. It is planned to maintain inflation at an acceptable level during this period, making a gradual transition to a more flexible free floating exchange rate of the national currency [4].

2. LITERATURE REVIEW

Measures will also be taken to improve the national economy's structure. This is done to ensure further economic diversification, that is, to create the economy's multi-vector sectors. Priority areas will be: modernization of the oil and gas sector and the petrochemical industry, diversification and development of the non-oil industry, expanding the possibilities of using alternative and renewable energy sources, developing the private sector and enhancing food security, expanding and developing trade and service activities, improving the structure of foreign trade and investment. The goal is set that during the implementation of the concept the average annual real growth rate of the gross domestic product (GDP) in the non-oil sector will be more than 7 percent. Accelerating economic diversification, maintaining high non-oil sector development rates in subsequent years, enhancing the economy's competitiveness and expanding the country's export opportunities are the main task at the current monetary policy stage. An economic model of export orientation is the basis of the development concept "Azerbaijan-2020: A Look into the Future." It is also planned to contribute to the growth of non-oil exports by improving competitiveness and improving the structure of the economy. Promoting and expanding innovation, as well as rapid non-oil industry development, will create a fertile ground for a knowledge-based economy in the country. At the same time, from the financial and credit needs point of view, the Central Bank's International Relations are primarily aimed at international financial institutions, developing the necessary cooperation with donor organizations, expanding the Central Bank's international relations, and strengthening the international image. The Central Bank and the provision of foreign technical assistance to the Central Bank's reforms. There are three main areas for this cooperation:

- Cooperation with financial and credit institutions around the world. This is done to attract financial and credit resources, including the central bank and the banking system as a whole, to the development of the state. Intensive cooperation with international financial and credit institutions is maintained by the country's central bank.
- Cooperation within the Poverty Reduction Program and the Credit Facility is undertaken with the International Monetary Fund (IMF). It is aimed at achieving economic development (PRGF). In addition, the IMF experts provided technical assistance to the Central Bank in setting up the Card Pressing Center, in preparing the State Program for the Development of the Central Payment System, as well as in other areas. Cooperation with the IMF was carried out to prepare the laws "On Banks" and "On the Central Bank of the Republic of Azerbaijan" in full compliance with international standards requirements.
- The European Bank for Reconstruction and Development (EBRD) is working to strengthen Azerbaijan's financial sector. His work in the financial sector is carried out in the following areas: securing credit lines for banks, participating in private banks' capital and the Microfinance Bank, and privatizing state-owned banks.
- The opening of the Asian Development Bank (ADB) Representative Office in Azerbaijan in 2004 created more favorable conditions for active cooperation with the ADB. ADB experts consulted and discussed the preparation of "Financing Residential Apartments" throughout 2004.
- Cooperation with foreign central banks. To familiarize with existing world best practices and new technologies, to achieve the implementation of these standards and technologies in Azerbaijan's banking system and to determine the Azerbaijan Central Bank's authoritative position among foreign central banks, cooperation has been established with central foreign banks of developed countries. Cooperation with the Bundesbank of Germany, the Polish Central Bank, the Swiss Central Bank, the Czech Republic's Central Bank, Turkey's Central Bank, Kazakhstan's Central Bank, France's Central Bank is being carried out in this direction.

- Cooperation with other organizations. The relations of the Central Bank with other international organizations are mainly aimed at providing technical support to the reforms that are held in the bank. For this purpose, close relations were established with the Swiss State Secretariat for Economic Affairs (SECO), the German Development Bank (KfW), the United States Agency for International Development (USAID) [5].

Thus, the Central Bank is a state-to-real economy intermediary bank. The remaining banks are carrying out this mediation. Indeed, the central bank is a regulatory body that combines the characteristics of a bank and a department of government. Nearly all central banks have some methods of influencing the economy. Traditionally they include: discount and collateral policies; minimum reserve policies; open market operations; deposit policies; monetary policies. However, a number of preconditions depend on the content of the standard set of methods and the combination of their use by banks in different countries. Attempts to bring modern central bank strategies of various countries to the traditional monetary policy concepts have shown that neither monetarism nor the theory of government regulation finds expression in the practice of influencing the economy of the country. We can expect an alternative approach to choosing a central bank strategy in the future. At the same time, market mechanisms are increasingly given priority over administrative regulatory methods [6]. An example of this is the liberalization of banking laws in the early 1990s (Austria, Italy, France, and others) in several European countries. The orientation towards regulating the rate of growth of money supply in the national economy or regulating the exchange rate of the national currency in relation to any stable foreign currency is one of the fundamental principles for determining the strategy of central banks. That is, we're talking about changing the discount rate value. The central bank's objective is to increase the cost of refinancing credit institutions to reduce their credit potential. So he has to raise the rate of discount. However, if there is a downward trend in the money market, this event will not bring the desired effect. The fact is that credit institutions are going to prefer interbank loans in this case [7]. The central bank needs to influence the money market by other methods to achieve this goal (by raising rates on minimum reserves, etc.). With other things being equal, refinancing for commercial banks will become more expensive in the event of an effective increase in the discount rate. And this ultimately leads to an increase in the country's loan costs. Note that the latest discount rate changes were made at a Central Bank Board meeting on 14 June 2018. The regulator then rejected abrupt changes and reduced the discount rate to 10 percent by one percentage point. And the corridor's upper limit was reduced from 14% to 12%. The corridor's lower limit remained eight percent. During the year, Azerbaijan's Central Bank reduced the discount rate three times: from 15% to 13% in February 2018, from 13% to 11% in April, from 11% to 10% in June. One of the new achievements in Azerbaijan's foreign economic relations is that a number of authoritative international economic organizations have admitted the country to membership. This is the first condition for the entry of Azerbaijan into international processes of integration. Azerbaijan has become a member of the International Bank for Reconstruction and Development (IBRD) and the International Monetary Fund (IMF), among other international organizations. These organizations were founded in Bretton Woods (USA) in 1945. These organizations' creators were the United Kingdom, China, the USSR, the United States, France. The purpose of creating these organizations was to create a monetary union between the countries in the post-World War II organization under conditions of economic and financial system destruction [8].

3. RESEARCH METHODOLOGY

In order to stabilize the financial and monetary system, the IMF determines the conditions of assignments for implementation in a specific country. It requires recommendations from the

IMF for its member countries. The IBRD and the IMF currently have over 170 members. In September 1992, Azerbaijan became a member of those organizations. The IMF's quota for Azerbaijan is set at \$106.86 million. Membership fee is equal to the quota for joining the IMF. 22.8% of the membership fee shall be paid in hard currency and the remaining fee shall be paid in national currency.

3.1. Considerations based on industry

The IMF is providing Azerbaijan with technical and financial assistance. The Fund's experts analyze Azerbaijan's economy, prepare predictions for its development. The Fund's stand-by loans already have a positive impact on our country's economy [9]. The foreign trade model is not an end in itself. As an integral part of Azerbaijan's overall economic strategy, it should serve as a powerful tool to implement plans to accelerate the transition to a market economy and raise the population's living standards. The Republic of Azerbaijan began to pay special attention to relations with international financial, credit and economic organizations after gaining state independence in its foreign policy. There has been a lot of work in this area over the past period. Azerbaijan can be said to have become a member of all prestigious international organizations. These include the International Monetary Fund, the World Bank, the Reconstruction and Development Bank of the European Union, the Islamic Development Bank and the Asian Development Bank since 1999 [10].

3.2. Model Specification

One of the priorities for the development of Azerbaijan's economy after restoring its political independence was the establishment of foreign economic relations in the right direction. Increased cooperation contributes to the country's economic potential, raw materials and mineral reserves, natural conditions and favorable economic and geographical position. These facts show structural and qualitative changes in recent years' foreign economic relations. This is an example of the integration of Azerbaijan into the global economy. Cooperation with foreign countries provides advantages to Azerbaijan for its national economy's diversified development. This is why the establishment and development of mutual economic ties with foreign countries is an important factor in the development of Azerbaijan's national economy. The customs tariff [11] is one of the important ways in which the country is involved in foreign trade. For its integration into international processes, the Republic of Azerbaijan is remembered. Thus, on the threshold of the XXI century, it contributed to its further development. In the new century, Azerbaijan has increased its development pace. Another economic success has been achieved by our country. Evidence of this is the adoption on January 25, 2001 of the Republic of Azerbaijan as the 43rd member of the Council of Europe Parliamentary Assembly. The Commonwealth of Independent States, established in the early 1990s, was predominantly of a political nature, aimed at establishing inter-state relations between the former USSR countries. Today, this community is more focused on defining a concrete economic integration framework between the community countries. With a number of CIS countries, Azerbaijan established a free trade regime, a legal framework for free investment was issued. If Azerbaijan only exported fish, caviar, oil and silk to neighboring countries at the beginning of the 20th century, Azerbaijan now has economic relations with many world countries. The Republic of Azerbaijan currently exports oil, petroleum products and equipment, cotton fiber, tobacco, alcoholic beverages (wine), non-ferrous metals and chemical products and exchanges food products (oil, flour, sugar, grain, citrus fruits), metal and forest materials for automobiles and industrial equipment, light industrial goods (clothing, clothing, shoes), mineral fertilizers and household materials.

	January	March	May	July	August
Export	2 130 231.14	957 364.78	665 495.61	1 444 986.20	748 834.80
Import	721 010.85	850 318.77	782 371.08	911 126.18	790 609.00
Balance	1 409 220.29	107 046.01	-116 875.47	533 860.02	-41 774.20
Circulation	2 851 241.99	1 807 683.56	1 447 866.68	2 356 112.39	1 539 443.79

Table 1: Foreign trade turnover (million US dollars) 2020

Figure 1: Data shows that exports are more important. And this, in turn, enables you to expand trade. Balance of Payments, 1000 USD

(Source: State Statistics Committee of the Republic of Azerbaijan, p. 401)

Thus, international relations were established in relations with a number of international financial and credit organizations following the restoration of the Republic of Azerbaijan's independence. Our country is a member of the World Bank (WB), the International Monetary Fund (IMF), the Islamic Development Bank (IDB), the European Bank for Reconstruction and Development (EBRD), the International Cooperation Bank of Japan and other international financial institutions. Because of this, Azerbaijan uses international credit facilities for its economic development. These funds support economic projects and finance our country's development-oriented investment projects [12]. At the same time, the Republic of Azerbaijan's trade balance and structure is found in international goods and services markets as well as in financial markets. Here they are closely intertwined, they directly affect the size of a country's national income, the state of employment, inflation rate, and other macroeconomic indicators. Each country's government can not fail to take into account the mechanism of interconnecting macroeconomic indicators in an open economy when formulating economic policy. At the same time, first of all, the main macroeconomic variables that characterize the participation of the country in the international exchange of goods, services and capital should be determined and

measured, and then a macroeconomic model that describes the interrelationships of these variables can be constructed. It is necessary to investigate (analyze) with this model how the economic policies pursued in a given country and in other countries affect the international flows of goods, services and capital. The basis of such a macroeconomic analysis is the balance of payments of the country [13]. As you can see, the figures in Table 2 show the development of the tourism sector (net income 219 378= 2713789-2494411). Net financial assets grew 3.4 times and Azerbaijan's direct investment 1.6 times respectively. Trade and economic relations dynamically developed in 2017. The Republic of Azerbaijan's trade balance has been positive- \$ 610.9 million. Bilateral trade and economic relations structure continues to be fairly diverse.

4. DATA ANALYSIS AND INTERPRETATION

At the same time, the use of differentiated excise rates by the Azerbaijani side is a common problem for exporters to the Republic of Azerbaijan of goods subject to excise tax. They are much higher than local production excise rates on similar goods. Accordingly, in accordance with the resolutions of the Cabinet of Ministers of the Republic of Azerbaijan dated 15 November 2005 No. 209 and dated 25 January 2007 No. 16 for a number of goods, including Russian (yachts, sports and recreation swimming facilities and alcoholic beverages), higher excise tax rates are applied. The application of this discriminatory measure, as defined in Article 2 of the Free Trade Agreement, violates the principle of national treatment in mutual trade. Furthermore, it limits the free competition of domestic and imported products set out in Article 7 of the same Agreement [14]. In terms of preparing Azerbaijan for accession to the World Trade Organization, a number of international standards have been adopted in the field of information technology, building materials, agriculture, tourism and some other areas.

Figure 2: Percentage of main goods in the export of non-oil products

Azerbaijan applied for membership in the World Trade Organization in 1997. In 2007, a bilateral protocol was signed with Turkey on the completion of bilateral negotiations. In May 2008, a similar agreement was signed with Oman and the United Arab Emirates, and in May 2010 with Georgia. In the near future it is planned to sign protocols on the completion of negotiations with Moldova and Kyrgyzstan. Since 2003, Azerbaijan has been represented in the International Organization for Standardization (ISO) as a full member, and since January 1, 2010, in the European Organization for Standardization (CEN) as an observer. From January 1, 2011, Azerbaijan began to implement the World Trade Organization Code of Practice for the development, preparation and approval of standards, technical regulations and standards. Azerbaijan could continue to increase the supply of fruit and vegetable, wine-brandy and other products of traditional exports. In 2020, exports of products amounted to 13,060,548.391 thousand \$, while imports were 9,685,515.80 thousand \$. (State Committee on Statistics, p. 648). Implementation in Azerbaijan of state programs for the development of regions, modernization of road and transport infrastructure, technical re-equipment of the fuel and energy and petrochemical complexes, the sphere of information and communication technologies and other industries, the creation of free economic zones will be accompanied by an increase in Azerbaijan's needs in importing automobile and construction and road construction. equipment, railway rolling stock, various machines, mechanisms and technological equipment, metal, metal building materials, etc. In addition, the implementation of the state program to ensure food security of Azerbaijan opens up additional opportunities for foreign suppliers of agricultural equipment, fertilizers, highly productive seed and livestock material [15]. From table 3 it is clear that Azerbaijan is actively developing its foreign economic relations with its main trading partners. This is primarily evident in the oil industry. There is also a growing export of oil and oil products. The country currently has many proposals for developing cooperation in this sector with Georgia, Turkey, Ukraine, Romania, Bulgaria, in particular for transiting and partly processing Azerbaijani oil through their territory. There are projects on Turkmen natural gas transit, Kazakh oil transit is being conducted. Therefore, in order for Azerbaijan to be more sustainable in the aftermath of the crisis, the country needs to overcome the very high dependence of exports and the balance of budgets on oil prices. Accelerating structural reforms, diversifying Azerbaijan's national economy, improving business conditions, expanding the tax base, attracting foreign investment in the non-oil sector, and strengthening the banking system continue to be priorities for the country's development [17]. Azerbaijan attracted loans from this structure not only for money sake, but also for technical assistance and for the purpose of receiving advice. Our country has accumulated great accomplishments over the past few years in building democratic institutions and a free market economy. Stability and sustainable economic development have provided a solid foundation for democratic reform and combating unresolved social and economic problems. As of 1 January 2018, Azerbaijan's total public debt was 17 billion 7 million manat. 93.9 %-15 billion 978 million manat (9 billion 398 million dollars) of total public debt is external debt, 6.1 %-1 billion 29 million manat (605 million dollars)-domestic debt. Overall, 22.8 percent of gross domestic product (GDP) is the share of external debt, and 1.5 percent of GDP is the share of domestic debt. The total government debt of the country amounted to 24.3 percent of GDP in 2017. The ratio of total government debt to foreign reserves was 23.8 %. "45.1% of external public debt should be repaid within 10 years of the reporting period, 51.2% -10 to 20 years, 3.7% -over 20 years. External public debt will grow in nominal terms in the existing portfolio in 2018, amounting to \$9.42 million.

5. CONCLUSION AND RECOMMENDATIONS

Azerbaijan's relations with international financial organizations are very important not only for the state's current state of development, but also for the possibilities of building a sustainable

economic development model in the long term. The way to integrate Azerbaijan into international economic and political relations is through cooperation with international financial organizations. The development of a market economic system and a model of relationships with foreign partners and creditors based on market fundamentals was central in this direction. The main requirement for implementing relevant programs in this case is the integration of the economy into the world economy [19]. Azerbaijan's relationship strategy with international financial organizations should be based on the national economy's current state. There is also a need for conceptual certainty, which is to include a model of cooperation with international financial organizations and private creditors in the general socio-economic development model. The forms of continued cooperation with such organizations need to be clearly defined in the strategy of relations between Azerbaijan and international financial organizations. It is possible to change the very principles of relations with international financial organizations, taking into account the practice of recent years and the irregularity of financial resources. A possible direction for further building relations between Azerbaijan and international financial organizations is the transition from directly receiving financial resources to obtaining political and advisory support from these institutions [20].

ACKNOWLEDGEMENT: *Clear distribution of functions and areas of activity between state organizational structures is important-the Ministry of Finance of the Republic of Azerbaijan, the Central Bank of the Republic of Azerbaijan, the Ministry of Economic Development of the Republic of Azerbaijan. Organizational structures should have a clear program of activities on which the development of cooperation with international financial organizations depends. In turn, this program requires constant coordination in line with clearly defined strategic priorities of the state. Modern development's transformative conditions require a general structural reform. This reform can open the way to exploit the state's potential. This task should be performed in accordance with the criteria used in world practice and in accordance with the country's current course of events [21]. In relations with international financial organizations, the principles of protecting Azerbaijan's state interests should be based on the priorities of long-term social, political and economic development goals. Many countries' experience of market transformation, including Azerbaijan's experience, shows that loans from international financial organizations can actively help solve financial and other problems [28].*

APPLICATION OF INNOVATIVE KNOWLEDGE AND SCIENTIFIC IDEAS TO TEACHING FOREIGN LANGUAGES

Firuz Karimova

Azerbaijan State University of Economics (UNEC)

Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan

k.firuz@mail.ru

ABSTRACT

Currently, one of the most relevant issues in Azerbaijan is the development of innovations. The knowledge – based innovation is even more important. The role of innovative methods in learning a foreign language is great. The rapid development of the world requires knowledge of more than one language. It plays an important role in bringing people closer together and communicating with each other. Originating in America for the first time, the term "innovation" has been widely used in all fields of developing science and technology. The innovation system is primarily based on scientific knowledge. It comes to life thanks to computers and the Internet. Innovative scientific knowledge is applied in learning foreign language. This article explores how and in what ways scientific ideas based on innovative knowledge are applied in foreign language teaching and attempts to describe the current scene.

Keywords: *science, knowledge, innovation, computer, foreign language*

1. INTRODUCTION

Nowadays, one of the relevant issues in Azerbaijan is the development of innovations, and the knowledge-based innovation is even more important. The role of innovative methods in learning a foreign language is great, moreover the rapid development of the world requires the knowledge of more than one language. It plays an important role in bringing people together and communicating with each other. People who know a foreign language benefit from it in many ways: they learn about the cultures of different nations, they gain career opportunities, they develop individual scientific and artistic creativity, increase their worldview, sharpen their thinking and intellect. Political, economic and cultural relations with the countries around the world, as well as the ties between nations and cultures open new doors in the communication process. This set forth the new theoretical and practical problems in teaching foreign language and requires finding solutions to these problems. “One of the most important aspects in the teaching process is to establish real communication conditions by creating natural situations and discussions in a foreign language” [1, 11]. The traditional method is gradually disappearing due to the development of science and technology, and as in any area the innovative knowledge and ideas are beginning to be applied. But what exactly is innovative and innovation?

2. EMERGENCE OF THE TERM INNOVATION

The term “innovation” first appeared in 1912 in the work “Theoretical Development Theory”, written by the American economist Joseph Schumpeter (1883-1950). The concept of innovation does not mean invention and discovery. Here, the common characteristics and sufficient differences are in the form of unity. If discovery and invention are things that already existed and were not known to the public, innovation is novelty. Innovation is a concept that is not based on the assertion of new fundamental truths through expressing cardinal and revolutionary mechanisms. “For the first time in the United States, the innovative methods have been used to teach this foreign language. In the early 1960s, computers began to be used in foreign language classes at other US universities, as well.” [1, 13]. In the 1970s, the information and communication technologies began to be used in foreign language classes in Western Europe, Japan, Russia, and Latin America. However, all this does not mean that at that time (1960-1970

years) the information and communication technologies were widely used in foreign language classes. This happened gradually in the countries of the world. Already in the XXI century, the scientific innovations have begun to be applied in Azerbaijan, as well. Of course, since gaining the independence, Azerbaijan's science and technology have entered a new stage of development. Thus, in turn, plays a role in activating the innovation. *“According to the Decree of the President of the Republic of Azerbaijan Ilham Aliyev No. 355 dated August 21, 2004, the preparation of the “Program for providing comprehensive secondary schools in the Republic of Azerbaijan with information and communication technologies (in 2005-2007 years) was of special importance” [4].* Within the framework of the implementation of the program, a lot of work has been done in the field of providing the comprehensive secondary schools of the country with computer equipment and the interactive learning methods with the application of ICT have been developed with increasing attention to the construction of education based on ICT. Based on this, it is possible to move towards development based on knowledge and the use of innovations by making fundamental changes, taking into account modern conditions. In particular, modern methods and techniques are used in the study of foreign languages. The traditional methods are already disappearing. It has already proven that learning using innovative methods in accordance with the requirements of the time is a more effective and affordable method. The methods such as increasing the level of communication, learning by having fun, learning based on hearing rather than reading are innovative methods in learning a foreign language. Because it is required by such elements as education, fundamental science, scientific and technical business, human capital in the broadest sense, knowledge and production of high technologies, which are already part of the infrastructure of the knowledge. The knowledgeable society, the development of innovation is already important in all areas. The goal of Azerbaijan as a state and society is to become a country that produces knowledge, as well. The main task facing the state is not to be left out of the development process of the world. Therefore, it is important to ensure substantial progress of innovation in all areas.” *The National Strategy for the Development of Science in the Republic of Azerbaijan for 2009-2015 years was adopted.” This document states that the development of science and technology, the creation and application of advanced innovation systems are among the strategic goals of state policy. The objectives of the strategy include increasing the efficiency of research and innovation policy, technological modernization of the country, the widespread use of innovations aimed at improving the efficiency of human activity in a particular area. One of the important sections of the strategy is devoted to the integration of science, education and production. This section emphasizes that the integration of science, education and industry as components of a perfect system in the Information Society must be based on knowledge. [5].*

3. INNOVATION AND TECHNOLOGY

The innovation is also closely connected to technology. Without technology, there can be no innovative education based on knowledge in science. *According to the Dictionary of Philosophy written by editing T.Frolov, “the technology presents an evolving complex artifact system, production operations and processes, resources, and subsystems of social outcomes that interact with information, management, financing, and other technologies” [20]. a large, explanatory sociological dictionary “Collins” explains the presented concept as follows: “Technology is the practical application of science and the methods of its application in the field of production use in the field of production” [19].* The changes and innovations that have taken place in the XXI century, the innovative approaches to the organization of teaching, improvement of the content and methods of teaching, the information and used communication technologies have created conditions for teaching a foreign language. The main work in the teaching process in this area is under the responsibility of trainers and foreign language teachers.

Such factors play a role in increasing their activity and strengthening their creative pursuits. Currently, active (interactive) teaching methods, which are now more widely used in comprehensive secondary schools and higher educational institutions, lessons based on new teaching methods organized with enthusiasm, and articles that reflect the elements of innovation are evaluated as the results of these searches. Students are highly motivated and interested in teaching based on innovative methods. They aspire to study more enthusiastically. If teaching in the traditional method is teacher-oriented, teaching in the interactive method is student-oriented. Here the teacher communicates directly with the student, and learning through entertainment and application of student-oriented methods of teaching creates the best conditions for students to acquire knowledge. Thus, Students can easily overcome language barriers in this area. Universities should play a leading role in the formation and development of the national innovation system, raising the innovative level of the society, and shaping an innovative culture. Knowledge and information are becoming a decisive factor in the development of the world education system. One of the important issues is the ability of many teachers who teach foreign languages to use information technologies correctly and purposefully, especially the ability of teaching foreign languages with innovative knowledge and skills. The formation of educational institutions, whether they are comprehensive secondary schools or universities, as competitive modern educational institutions should also cover all the directions of innovative activity. Innovations should play a leading role in the activities of all structural units of educational institutions. For this purpose, if necessary, it is expedient to create additional innovation-oriented infrastructure departments within the university. The main purpose of these infrastructure units should be to create and implement innovative products.

4. THE ROLE OF THE INTERNET AND COMPUTERS IN LEARNING FOREIGN LANGUAGE

There are many advantages of using information technology in the process of teaching foreign languages: the Internet network is a rich source of authentic material for learning foreign languages. Here, each of students can gain innovative knowledge in accordance with their area of interest. Pupils and students can enrich their worldviews by getting acquainted with the latest developments in the world through the Internet. The familiarity with authentic materials teaches everyone how to learn a language. Correspondence and conversations between students strengthen their language skills. Internet resources allow pupils and students to communicate with native speakers live. They understand that the foreign language used on the Internet is different from the teaching materials given in the textbooks. The process of learning language can take a different direction and their being motivated is important. Motivation helps students learn faster and more. Both in comprehensive secondary school and in high educational institutions, in the rooms equipped with Information and Communication Technologies the materials are taught through videos, picture dictionaries, audio exercises, listening dialogues, games that will add color and make the lesson more interesting. There are many online resources that we use to provide high-quality teaching of pronunciation, grammar, literature, phonetics, new synonymous antonyms, phrases and their explanations. There are 3 stages of computer-assisted language training. *“The first stage is called language learning with a structured computer covering the 1970s and 1980s. The main leading methods at this stage of computer based language teaching were grammar-translation method and audio-lingual methods. In this case, the main didactic purpose of using computers was to teach the structure of the language and thus perform tasks correctly, and the purpose of the lesson was to ensure the extreme accuracy and precision of the language. The second stage is called computer-communicative language learning, covering the 1980s and 1990s. At this stage, the main method of learning a language on a computer was communicative language learning. Thus, it required the language to be learned logically in the classroom.*

*At this stage, the communicative activities on the computers are used, and the main goal was to achieve fluency at the lesson. The third stage is called interactive computer language learning, and it covers the 21st century” [9, 21]. Mastering the foreign languages is extremely important in order to adequately respond to the integrative processes taking place in the XXI century, characterized by such concepts as "globalization and internationalization", "information and nanotechnology". Post-industrial societies and transnational corporations ”are also important in modern education. A project to apply modern teaching methods is already being implemented in Azerbaijan. In recent years, our country has accumulated basic experience that is important for the preparation, planning and implementation of active lessons, and teachers have developed basic knowledge, skills and habits. Although, the innovative education is combined with traditional education, textbooks should come in the first place. The textbook is rich in topical issues, focused on the development of oral speech, rich in audio and video materials to develop listening comprehension skills. “The provided materials serve the development of intercultural dialogue, and have taken from real life. Mostly the textbook consists of materials from the BBC, documentaries and fragments from feature films” [1,199]. The textbook contains grammatical and lexical exercises for different purposes, which form the foundation for mastering these competencies, in addition to instilling communicative competencies in the reading process. Due to the different approaches to the teaching of grammatical material in the teaching and learning of foreign languages for communicative purposes, the colorful grammar exercises reflected in the *Reading* lessons have served the effectiveness of the reading and comprehension process rather than instilling theoretical knowledge. “Effective work conducted on written comprehension texts has also created a favorable environment for easier mastering of the Intercultural values rubrica and in this lesson, it has also created the grounds for more purposeful acquisition of communicative skills.” [1, 89].*

5. APPLICATION OF INNOVATIVE KNOWLEDGE IN FOREIGN LANGUAGE TEACHING

Knowledge of foreign languages is also very important in terms of human formation and integration into secular scientific knowledge. The most important reason for failures in learning a foreign language is the applied traditional methods. Students who start learning a foreign language do not develop creativity and follow grammatical rules, which complicates the learning process. Innovations, i.e. the innovative methods are based on a student-oriented interactive learning style. New learning methods in language learning, such as psychodrama and sociodrama, are widespread around the world. Differences in the perception of individual learning have been expressed in recent years as an important point in terms of foreign language education. Everyone's learning ability may be different. However, there are different language learning methods that everyone can benefit from.

5.1. Motivation

As in the teaching of any subject, the student must be motivated at first. Motivation is very important in learning a foreign language. The research of Robert Gardner, Richard Clement and others related this issue began 60 years ago. The motivation covers the first 5-10 minutes of the lesson. In this case, the teacher is given the opportunity to attract the interest of students. The student can be encouraged by testing the assignments in a truthful way and for some specific achievement (even if it is small). It can be expressed in the form of "you have a lot of potential," "you seem to put in a lot of effort," and so on. This has to be in a reasonable format. *“In the first weeks of the school year, to create such motivation, using dating games (icebreakers, classbuilding activities), bellwork / do now) strategies, and so on. creates a positive atmosphere in the classroom and improves learning outcomes.*

In general, before applying any methodology, it is necessary to pay attention to three points: 1) the chosen method should be consistent with the purpose of training, 2) the chosen method must meet the requirements of visual, acoustic and kinesthetic abilities of students, 3) the differentiation should be used, if there are sharp differences in the language level of students” [15].

5.2. Working with texts

The main purpose of teaching written meaning in communicative learning is to teach language learners to read unfamiliar text for different purposes and to understand what they are reading. However, reading comprehension in foreign language teaching is closely related to the goals and objectives of each lesson, as well as the strategies for achieving these goals. The open ended and closed questions in the texts are designed to test the logical perception of students. Thus, the questions are designed to instill such skills as testing children's attention and to draw logical conclusions, to connect parts of the text. The designed questions also focused on students' ability to analyze and express their personal opinions. These types of questions are more likely to cover closed-ended test tasks. Text is also a source of information. And this creates interdisciplinary integration. The historical text written in English, the life story of any writer, the medical function of a plant, any scientific text written about the space, the texts on the field of sports (texts related to the history of tennis and badminton), the texts on the history of any sport, even if the texts are aimed at teaching a foreign language, they increase students' worldview by providing them with additional knowledge and information. Therefore, working with texts, instills such skills as vision, comprehension, thinking. The teaching of foreign languages is very different from the teaching of other subjects. The main feature of teaching the foreign languages is the fact that the lessons are based on previous knowledge, the inter-subject chain, which brings them closer to the exact subjects. The development of pronunciation, vocabulary and grammar, reading, writing, listening and speaking skills are in the spotlight when teaching the foreign language and the assessment is carried out according to these criteria. Reading, writing, listening refer to the language skills. In the teaching of Russian, English and any other languages, the attention should be paid, first of all, to the study of new words in context, and most importantly, the attention should be paid to the development of reading skills, on conditions that the correct pronunciation and correct usage are explained in the sentence. It develops both writing, and helps to feel the language, and makes the "repetition" of vocabulary and grammar more meaningful. Language is a means of communication, it consists of words, and pronunciation and grammatical rules come to life in words, it is impossible to speak and understand what you hear without knowing the words.

6. COMMUNICATION SKILLS

In addition to being the means of communication, the language is also a part of the social life. Naturally, the communication established on the live Internet is different from the teaching of a foreign language taught in the textbooks. *Therefore, the use of the communicative method in language teaching has been welcomed by scholars and methodologists. Communicative language training allows students to learn the language in the communicative language environment. [18, 59].* Since language is the means of communication, the main purpose of learning it is to acquire the ability to communicate in that language. The effective way to do this is to allow all the students, to create the conditions to speak in the foreign language as much as possible during class. The more communication progresses, the faster and quicker the conversation will take place. *“Ioannou Georgioun also states that computer-based communication serves originality, as well. He notes that the language used in computer-based communication activities is original, and that the communication itself is original and Ioannau Georgioun also says that the computer communication motivates the students and gives them*

the positive attitude towards language learning. This will be especially effective if it is organized as a part of a language program, rather than as an additional activity for students”. [10, 200] More effective teaching of foreign languages in educational institutions is carried out on the basis of communicative competence. The use of learning tools within the framework of communicative competence has the maximum effect when they are applied in a timely, purposeful and professional manner, and the features of computer programs and the Internet system are mastered in order to listen to the original language and listen to the linguistic features of the speech in audio and visual form, to gain the opportunities for independent distance learning, from audio and video recordings. In addition, the modern cell phones have various language learning programs in the "play store" application. By connecting to the network via the Internet, students can download various applications. One of the most popular applications of recent times is the “Cambly” application. Thus, by joining this program, it is possible to communicate with any foreign language teacher from anywhere in the world. The teachers from all over the world are joining to the application for this purpose. Live conversations and correspondence are available in this program.

6.1. Digital education

The rapid development of technology has resulted in an increase in the number of Internet users among students. The use of computer technology in education develops the teaching process. Recently, the development of digital network infrastructure, ensuring a certain level of coverage of educational institutions with the domestic Internet network and the provision of high-speed internet access is important in the teaching of innovative knowledge. Warschauer, Shetzer, and Meloni call the computer-based communication the asynchronous communication, whereas the synchronous communication with a computer is described as hypertext. [17, 49]. “In the 1970s and 1980s, computer-assisted language teaching attracted the attention of very few teachers. However, the rapid development of the computer and the popularity of the Internet in the 1990s increased the interest to this field. Initially, English learners can train 24 hours a day with native speakers and other students from around the world. Today, computer-based communication is very important in the society and in the classroom” [18, 31]. Although computer language learning materials share many common features with other language materials, there are also many different aspects of the computer. There are totally seven types of computer language learning activities. These are: writing, communication, multimedia, computer literacy, coordination and reference skills, tests and distance learning. *Jeremy Harmer notes that the use of the Internet in education, and especially in language laboratories, has grown at an extraordinary rate. He considers references, language teaching and testing programs, sharing e-mail information and word processors to be the basis of teaching language via computer.* [3, 145]

7. CONCLUSION

Educational reforms in each country must be based on innovation, forward-looking and should be preventive in nature. In view of all this, it can be said that the Internet is a rich source of authentic materials for learning foreign languages. The materials used in the lessons using Information and Communication Technology are more memorable, the lessons using Information and Communication Technology are more interesting and the lessons explained are clearer and more understandable. In language teaching based on modern technologies, the study of language through communication comes to the fore. In this sense, students can develop their language skills using synchronous and non-synchronous means of communication via the Internet. Using the ICT in a high level is the best way to learn and memorize a foreign language. However, the current level of application of modern information and communication technologies in foreign language teaching cannot be considered satisfactory in terms of

integration into the world educational space. The digital network infrastructure must not be weak. Despite all this, foreign language teaching is already based on scientifically innovative knowledge in many developed countries, including Azerbaijan. In this direction the motivation, working with texts, communication skills, digital education, internet and computer technology, and several innovative methods and techniques play an important role in learning a foreign language and are based on the innovative knowledge and scientific knowledge.

FINANCIAL PERFORMANCE EVALUATION AND BANKRUPTCY PREDICTION

Emil Gurbanzada

Azerbaijan State University of Economics (UNEC)

Baku, Istiqlaliyyat str.6, AZ1001, Azerbaijan

emil.zaur11@gmail.com

ABSTRACT

Research into financial failure and bankruptcy has been continuing by deepening for more than fifty years. The basis of this researches stands on the calculation of the bankruptcy rates, more precisely the bankruptcy risks, by examining the financial indicators of the companies. Calculating the bankruptcy risk of businesses as a result of models is extremely important in both micro and macro terms. Although the actuality of these issues increases even more after each crisis, so far it has not come to a single conclusion. There are multiple reasons why it cannot become a single result. Because bankruptcy can occur for many reasons. These reasons vary due to the place, time, and other factors. The main purpose of the subject is to investigate the causes of bankruptcy, to measure the applicability and linearity of the models as well as to test the predictability of bankruptcy in Azerbaijan banking with Altman Z-score and Springate models. As a result of the tests, the following findings have been reached. Z-score results can reflect real financial performance. So, the scores of the banks that have protected their sustainability are generally distributed between 1.8-3.0 at various times. For z-score, these scores are scores that can be considered normal. In addition, scores of less than 1.8 and above 3.0 are also observed. Unlike the Altman Z-score model of the Springate model, it has been revealed that the scores obtained as a result of applying it to Azerbaijan banking do not reflect the real financial performance. The main one of our scientific and practical conclusions is that bankruptcy models are not always the same in terms of linearity. In our research, we encountered banks that did not go bankrupt even though their z-score was below 1.8. The reason for this is the reasons we have just mentioned. They vary due to local and time factors. For this, before applying the model, the characteristics of the model in terms of the sector, the state of the economy and the region to be applied should be considered.

Keywords: *Bankruptcy prediction, Sustainability, Azerbaijan banking sector, Altman Z-score model, Springate model*

1. INTRODUCTION

For more than 50 years, modern researches have been conducted and tested at the international level, whether in terms of measuring financial performance or related to bankruptcy. Although much researches have been conducted on the bankruptcy models of businesses so far, no definite conclusion has been reached. Therefore, such sensitive issues should be used with modern data. One of the reasons that increase the actuality of the subject is that the concepts of financial performance and bankruptcy are not used only in limited areas and are valid for all businesses that provide production, trade, and service. Looking at the recent years, the 2008 international crisis and the local crisis in 2015 have fully demonstrated how important it is to regularly control financial performance figures in all areas. The purpose of forecasting bankruptcy is to evaluate a company's financial condition and expectations in its activities. Corporate bankruptcy forecast is a very important phenomenon in the economy. Not only owners but also other participants are concerned with the financial sustainability of the company. Participants and interested parties include the government, investors, banks, internal management and consumers, and the public.

Accurate estimation of the financial performance of companies is of great importance in making important decisions about various stakeholders, relationships, and participation with companies. Bankruptcy forecasting is a great tool at their disposal to avoid significant loss by lenders and investors, banks, and other persons. We can list our goals as follows:

- 1) Evaluating the applicability of the Altman Z-score and Springate models to our data set
- 2) Evaluating the consistency of the figures obtained as a result of the application with practical data.
- 3) Evaluating the applicability of modern modeling methods to the banking sector of our country.

By conducting quantitative research, the data were collected from publicly available sources, analyzed with Altman Z-score and Springate models. The reports of banks operating in the Republic of Azerbaijan, the reports of the Azerbaijan Banks Association, and the Central Bank of the Republic of Azerbaijan were used to conduct research and evidence the validity of the hypotheses.

2. LITERATURE REVIEW

There were no sophisticated statistical methods and computers for predicting bankruptcy in the first half of the 20th century. Financial ratios of successful and unsuccessful companies were compared. By recording low rates in companies that went bankrupt, it was begun using it to predict bankruptcy in the next years (Fitzpatrick 1932). The first methodological breakthrough came from Durand. Durand published a credit scoring model that works with univariate discriminant analysis. Durand's analysis was established only in terms of credit. Because Durand set up a model for measuring the bank's credit portfolio, saying that the bankruptcy of lending companies was due to "bad loans". What Durand called "bad loans" were overdue loans for more than 90 days. According to Durand, the better loan the company gives, the less risk of bankruptcy and the higher the probability of financial success. So The Author used a large sample of 7,200 consumer loans allocated by 37 financial institutions. These included age, gender, marital status, dependents in the household, salary, and other socio-demographic variables. In addition, loan features such as the borrower's assets and debts and the amount and number of installments were also available. Durand separated the unsuccessful loans and grouped the customers who received them according to the characteristics it is mentioned above. In this way, Durand built a group of customers and the company's credit portfolio began to be scored according to these characteristics (Durand, 1941). This method later became widespread around the world with Beaver's univariate discriminant analysis-based model. We can say that these studies are the last examples of univariate discriminant analyzes (Beaver, William H, 1966). This is because Myers and Forgy, realizing that classifying the observations made using a single variable, did not provide a reliable result, developed a credit rating system for banking customers. They applied multivariate regression analysis and discriminant analysis in their models. Multivariate discriminant analysis showed better results compared to previously applied models in the case of risky customers. Therefore, more attention was paid to the method of multivariate discriminant analysis (James & Edward W, 1963). New York University Professor Edward Altman developed a new model in 1967 called the Altman Z to score formula to develop a tool for predicting bankruptcy. Since Altman Z score and Springate models will be used in our application, they will be studied extensively. Gordon offered another view on corporate financial distress. According to Gordon, a company experiences financial distress is when its earnings fall and the value of its debt exceeds its asset value. In such a case, the bond yields fall below the risk-free interest rate in the market and the firm starts to struggle. (Gordon, 1971). According to Denis, if a company suffers losses for at least 3 years in a row, it is unavoidable that it will experience financial difficulties.

According to their research, when a company is in financial distress, its cash flows become negative and cannot pay dividends. Therefore, the decline in dividend payment, combined with negative net income, forces the company into financial problems (Denis 1995). Platt used the definition of operational to identify corporate financial distress. In his opinion, it is in danger if a company is experiencing one of the following situations: negative net activity for several years, major downsizing, pause in dividend payments, and financial restructuring (Platt, 2002). Purnanandam tried to explain the corporate financial distress in terms of solvency. When a company fails to pay interest or make claims on debt contracts, it falls into financial distress. According to Purnanandam, when the final value of a company's assets falls below the nominal value of its debt, it may fall into financial distress in paying its debts. That is why, in this definition, a company may experience difficulties even while still fulfilling its obligations (Purnanandam, 2005). Ling tried to identify a model that could predict bankruptcy in China. In this study, two groups of companies were tested in 1998 and 1999. A balanced group of financial and non-financial distressed companies has been selected. This study tested 15 financial ratios including profitability, solvency, and liquidity ratios. Using MDA, he reached the model named Z-China Score. On other hand, this score includes asset-liability, working capital, return on total assets, and undistributed earnings ratio (Ling, 2007). Bhumia created a predictive model. This study was conducted in India, it was tested on the data of private sector companies from 1996 to the end of 2005. Five-year reports of companies that failed were received. The selected companies are from the manufacturing sector and were matched between 32 successful companies and 32 unsuccessful companies. It was tested to be significant in the 7-rate discriminant function. The prediction power of the model established with this function was 88% and 94%. This study also proved that although there are more tools to use in predicting a company's failure, MDA can still predict bankruptcy with a high accuracy rate (Bhumia, 2011). A study by Laitinen and Suvas obtained 1,255,768 unsuccessful and 22,594 failed annual firm observations from 26 European countries to determine the impact of Hofstede's original cultural dimensions on financial distress forecast. A logistic regression model was used to predict a company's future financial condition in an international context. The rate of return on assets (ROA) and the equity ratio used to measure the success of the company, regardless of occasional deviations, play a vital role in bankruptcy prediction models. Therefore, according to this study, solvency, and profitability are mandatory predictors of bankruptcy in international financial modeling (Laitinen & Suvas.2016). We can show to the bankruptcy forecast surveys recently conducted with logit analysis, the "Institutional bankruptcy forecast for Kenya listed businesses" study published in 2020. In the research, there are 64 companies currently listed on stock exchanges in Kenya. The study used the ten-year financial statements of companies that existed in the stock exchange. Financial statements are taken from Nairobi Securities as well as the Capital Markets Board. While canonical correlations were used to establish relationships between variables, Logit analysis was used to create a model to estimate the financial distress of a company. As a result of logit analysis, the most common bankruptcy forecast predictor was found in the study as the return on assets (ROA) and return on equity (ROE) ratios. (Ogachi, Ndege & Gaturu, 2020). By analyzing the financial statements of "Thomas Cook Group" which declared bankruptcy for the years 2015-2018 by Akbulaev, Guliyeva, and Aslanova in 2019, with Altman "Z" score, the model was found to be valid (Akbulaev, Guliyeva, & Aslanova, 2020). However, it should not be forgotten that various models have been designed to measure the insolvency of companies around the world. Each model has several deficiencies during its implementation. One of the deficiencies faced by the models is that a model cannot be transferred and applied from one country to another due to the difference in economic conditions between countries. A well-developed model in one country may not work well in another. Therefore, it needs to develop a forecast model that takes into account the specific conditions of a particular economy, using real data on the financial situation.

3. EVALUATION WITH ALTMAN Z SCORE AND SPRINGATE MODEL

The Altman-s Z score model is regarded as one of the pioneers in financial stability and financial performance. We can almost say that most of the models made by discriminant analysis from that on have been made as an alternative to Altman. Although the Altman Z score model has been established fifty years from now, it has been observed that even in the modern economy it predicts bankruptcy two or three years in advance. In addition, after the financial managers tested the level of this indicator, they can prevent the risk of bankruptcy if they take proper steps. (Altman, E. I. 2000). According to Sanobar Anjun, Altman's Z-score model is one of the most influential multi-faceted analyzes researched in the last 40 years. (Anjun, 2012). According to the Altman model, when banks' scores are above 3, banks are financially strong. It was stated that the banks performed close to normal in the 1.8-3.0 intervals of the score. The model score below 1.8 indicates that the probability of the banks experiencing a crisis in the coming years will be high probability and they may go bankrupt.

The Altman Z score model is an analysis of the following variables:

- $Z=1.2*A+1.4*B+3.3*C+0.6*D+1.0*E$
- A (Working Capital) / (Total Assets)
- B (Retained earnings) / (Total Assets)
- C (Earnings Before Interest And Tax) / (Total Assets)
- D (Market Value Of Equity) / (Total Liabilities)
- E (Total Sales) / (Total Assets)

First of all, we will look at the ratio formed by dividing the earnings before interest and tax, which has the highest rate, by total assets. The fact that this ratio gives lower values for several years in a sequence may indicate that the results of core activities of the company have deteriorated. The higher the operating margin, the more added value is generated by the company, allowing this ratio to reach the big levels. According to the model the bankruptcy risk of businesses that reach these indicators is reduced. The second ratio we will describe is the ratio resulting from dividing retained earnings by total assets. This ratio reflects the company's reserves and investment strategy. Lower or decreasing values of the reported results may indicate the downtrend in profits, reserve erosion, or reduced dividend distribution due to the losses of recent years. Because of these reasons, this ratio is given as 1.4 which is considered as strong. The ratio of working capital to total assets reflects the company's liquidity. We know that liquidity often has an important share in bankruptcy, so this ratio is also within the ratios that seriously explain the model. If working capital is a very small part of total assets it can create funding problems for the company. According to Singhania and Mehta (2017). the more stocks the company holds, the higher the risk of market value fluctuation, short-term liquidity pressures. The ratio of total sales to total assets shows how effectively the company uses its assets to make sales. To find out whether this value is more or less, the industry average of the business can be taken as a reference value. Low levels can indicate that too much capital is locked in assets. High values may indicate that the company has too little assets for its potential sales level. The ratio of the market value of equity to total assets is the ratio that affects the model with the lowest proportion. According to our researches, the low ratio of this ratio is not at all because it is less insignificant than the others. This indicator shows the financial structure of the company and its ability to finance itself. Lower values indicate high reliance on external financing and reduced prospects of additional financing. However, if the company becomes over-indebted, this will increase the financial burden, jeopardize business partnerships with suppliers or customers, and increase the risk of bankruptcy. (Turner, j. 2016). For this reason, this ratio is normalized and given with a small proportion, not because it is of little importance. The Springate model was developed in 1978 by Gordon I.v.springate.

It is a multi-stage and multi-variable model like the Altman model. When the model was calculated for the first time, an *s* value was calculated to calculate the successful and unsuccessful distinction of companies. Reliability was calculated as 92.5% in a study conducted on 40 Canadian companies (Springate 1971). The Springate model is also used frequently in studies on financial performance and financial stability. The fact that it resembles the Altman model, most of the data that is successful in the Altman *z* score model causes this model to be successful as well. For the Springate model, the validity indicator for the sustainability of the bank is above 0.86.

Springate *s* model consists of the following variables:

- $S = 1.03 * A + 3.07 * B + 0.66 * C + 0.4 * D$
- A (Working Capital) / (Total Assets)
- B (Earnings Before Interest And Tax) / (Total Assets)
- C (Earnings Before Interest And Tax) / (Current Liabilities)
- D (Total Sales) / (Total Assets)

As it seems, three of the four ratios contain the same ratios as the Altman model. However, since the proportions are different, I think we should touch on a few important points. As in the Altman model, in the Springate model, the ratio with the highest ratio is the ratio of earnings before interest and tax divided by total assets. Unlike the Altman model, the ratio value is 3.07. This ratio, which is considered to be one of the profitability ratios of the company, has been included in both models at a large proportion because it indicates what the company obtains with its assets. This also means that the low ratio in both models means that the business is closer to bankruptcy. That is to say, the main problem of many companies that go bankrupt in the modern business world is that they cannot earn by their assets. By dividing working capital into total assets part of the model, Springate incorporates liquidity too. If we look at the ratio in the model, we can say that Altman gives a ratio of the same weight compared to the ratio.

4. APPLICATION OF BANKRUPTCY FORECASTING MODELS TO AZERBAIJAN BANKING SECTOR

Data of 24 banks were used in the application. 4 of these banks are bankrupt. Bankrupt banks had to be more represented in the data set to measure the predictability of bankruptcy models. But data are severely deficient for many of the bankrupt banks, Therefore, their data couldn't be in the data set. Most of the data of the users are taken from the official websites of the banks and the other data are from the sources of the Azerbaijan Banks Association and the Central Bank. The hypotheses for which we are seeking answers as a result of application are as follows:

- H1a: The results of the Altman Z-score model give results reflecting the financial performance of banks traded in the Azerbaijani banking sector.
- H1b: The results of the Altman Z score model do not yield results that reflect the financial performance of banks traded in the Azerbaijani banking sector.
- H2a: The results of the Springate model give impressive results reflecting the financial performance of banks traded in the Azerbaijani banking sector.
- H2b: The results of the Springate model do not yield results that reflect the financial performance of banks traded in the Azerbaijani banking sector.

Models 8 years of 180-line data have also been exclusively tested and the results recorded. We can describe the years between 2016-2020 as the years in which the banks went towards development in terms of both assets and profits. However, as we know, this situation started to pause as a result of the pandemic that started in 2020. Even though a shocking recession did not begin as in 2015, it is felt from financial demonstrators that development has stalled.

As for Z scores, the lowest Z score is 2.14. If we compare the years when such crises occurred, it is a very good Z-score indicator. However, if we consider the year 2015, we also remember that in 2015, the impact of bankruptcy on financial demonstrators showed itself in the following year, not in the same year. Therefore, to measure the impact of the pandemic crisis on the Azerbaijani banking sector, we should wait and analyze the financial indicators for the years 2021-2022.

Banks	Assets	Credit Portfolio	Liabilities	EBIT	Retained Earnings	Working Capital	Z score	S score
ABB	8187.6	2474.3	4590.5	178.3	297.1	359.7	2.62	0.26
PAŞA Bank	4869	2045.3	3616.2	79.7	132.8	125.3	2.16	0.26
Kapital Bank	5040.6	2210.3	3724.5	323.4	539.1	131.6	2.46	0.46
Xalq Bank	2295.2	1537.6	1539.5	34.1	56.9	75.6	2.58	0.36
ASB	935.2	345.2	662.3	6.8	11.3	27.3	2.14	0.21
Access Bank	902.1	533.7	606.3	4	6.7	29.6	2.44	0.29
Rabitəbank	862	394.8	582.3	5.1	8.4	28	2.31	0.24
Bank Respublika	1070	458	723.7	7.7	12.8	34.6	2.28	0.23
Unibank KB	752.8	556.7	474.1	14.8	24.7	27.9	2.80	0.41
AFB Bank	548.5	434.4	364.8	2.3	3.9	18.4	2.66	0.37
Muğanbank	548.3	334.3	234.5	-1.9	-3.2	94.1	3.60	0.40
TuranBank	551.5	342.8	286.3	1.9	3.1	26.5	3.01	0.31
Yelo Bank	442.2	319.6	286.8	-23.3	-38.9	46.6	2.40	0.18
Bank of Baku	394.2	366.5	180.8	11.3	18.9	21.3	3.77	0.56
Azər Türk Bank	351	167.7	164.6	0.1	0.2	18.6	3.10	0.25
Expressbank	304.4	221.1	112.8	9.8	16.3	19.2	4.22	0.51
Bank BTB	355.8	214.2	127	0.6	1	22.9	4.05	0.32
Günay Bank	231.8	179.5	85.2	0.3	0.5	14.7	4.12	0.38
Bank Avrasiya	153.8	109.6	38.2	0.3	0.4	11.6	5.64	0.37

Table 1: Financial indicators of banks for 2020 (mln)

(Source: Annual reports of banks, reports of Association of Azerbaijan Banks and author's calculations based on research data)

If we consider the general results of the models, we can say that the Altman Z score model predicts bankruptcy correctly at 75% rate. However, the fact that the results of the Springate model is much lower (10% -15%) makes it impossible to apply the model to the market without any changes in the current situation of the model. Therefore, as a result of the tests of the model, for the first H1 hypothesis, the hypothesis that the results of the Altman Z-score model gives reliable results reflecting the financial performance of banks traded in the Azerbaijani banking sector is confirmed. However, the H1 hypothesis will not be correct. The results of the second hypothesis, the Springate model can't give absolute results reflecting the financial performance of banks traded in the Azerbaijani banking sector - that is why the hypothesis has proven to be false. The Springate model tests whether banks will go bankrupt or not with their own score being up or down from 0.86. For almost all banks in our data set, the Springate model has not been able to make absolutely correct predictions.

Now let's have a visual look at how Altman Z score and Springate models have changed over the years and how much they can explain the situation.

*Chart 1: Comparison of Altman and Springate models (2010-2020)
(Source: Author's calculations based on research data)*

As we have said, the 0.86-scale qualification indicator of the Springate model is not valid for Azerbaijani banking. However, this situation does not give the conclusion that the Springate model cannot absolutely describe the banking sector of Azerbaijan. When we look at the chart, although the absolute value of the Springate model does not describe the bankruptcy of banks, it can seriously explain the change in the financial situation annually. That is, when we look at the graph, we notice that the middle pointer of the model between the years 2010-2014 increased and decreased significantly in the years 2014-2016. In fact, when we look at Altman and Springate models in the same graph, we notice that the Springate model explains the situation relatively better than the Altman model. That is why we can say that the Springate model can make relatively accurate predictions.

5. CONCLUSION

The following results were obtained in our study. Bankruptcy models are not always the same probability in terms of accuracy, they change due to local and time factors; In some cases, bankruptcy models make estimates that reflect the real situation in terms of numbers based on financial performance, but estimates are not realized due to other factors. There are several reasons for this to happen. In some cases, the state supports large financial characters in order not to change financial balances. In some cases, the shareholders take over and compensate the losses themselves to cover the debts. Since the model does not take such reasons into account, the predictions of the model can differ from reality. The fact that the number of banks whose transactions have been suspended so far in the data set is very low compared to the number of banks currently being traded makes it difficult to determine the accuracy of the models. Although the prediction results of the Altman Z score model can explain the situation of the Azerbaijani banking sector according to various times, the accuracy of the predictions of the Springate model is very low. Although it is not possible to apply the Springate model to the Azerbaijani banking sector by considering the absolute value, it describes the situation in the financial years relatively well. The instability of the financial sector strongly reduces the predictive power of models. At points where existing bankruptcy models do not make accurate predictions, it is necessary to establish a unique model for the sector through machine learning, deep learning, and neural network analysis, which are the leading solutions in today's data processing world.

However, we must take into the important thing here, that to implement almost all of these learning paths, the following must be provided:

- 1) 1 Large amount of data;
- 2) 2 It is needed financial stability over the years for machine can learn the data
- 3) 3 There should be bankrupt banks in the number of banks working in the data set.

When we make the above assumptions, the accuracy amount of the models will increase with significant measure. It will lead to development in financial markets either from a micro or macro perspective.

ABSTRACT

At the present Russian economy goes through the stage of transformation and global changes in economic and technological patterns. The situation in the labor market causes the need to change the content of education as it applies to modern requirements. The role of man has changed, because he has become the main resource of modernization. The sector of digital transformation is clearing up: the balance of the strategy and tactics of business and society development, the issues of involving human capital and society in managing the modernization of the economy in the context of globalization are becoming important. The necessity of forming a multi-component information and educational environment based on the unity of education and human resources policy, which can be considered part of the digital economy, is shown. Human capital is one of the key factors in the development of regions and countries digital transformation situation. Man as the main productive force of economic growth and the main consumer of the results of this growth becomes the highest goal and the main criterion of the quality of economic growth in modern conditions. However, the distribution of population, and, as a consequence, human capital, across territories, on the one hand, is extremely heterogeneous and, on the other hand, is subject to constant change. Studies by various authors have shown that it is possible to make plans for the preservation and development of human capital, to restore state control over this process by using digital transformation technologies for the development of the labor market and education management system, having forecast results of the development of enterprises, regions and the country, as well as to evaluate the performance of the human training system. A person should freely dispose of his main capital - qualification. And for this purpose it is necessary to give him such professional training which will allow to easily master professions in the future, to realize possibility of own development on the basis of digital technologies. The aim of the study is to generalize and develop theoretical provisions in the development of methodological recommendations for managing the development of human capital in the regions under the conditions of digitalization of the economy. The first part of the study presents the dominant characteristics and transformation factors of human capital evolution under conditions of digital transformation; the second part of the article describes the methods for assessing the level of human capital development in the regions in Russia and other developed countries.

Keywords: *human capital, human resources, human capital assessment methodology, digital transformation, digital competences, digital technologies, digital economy*

1. INTRODUCTION

Modern trends in the development of the economy, the new format of economic relations in the context of digitalization cover all spheres of society, including the process of activating the human factor. The human factor, directly, is an important component of all spheres of activity. Based on this, the trends in the development of human capital become particularly relevant. If we consider the management of a digital enterprise, then it is human capital that is the priority for its further development, regardless of the type of services provided and the region. Nevertheless, it is necessary to study in detail the impact of digitalization on the formation of human capital and its impact on its further evolution, since it is human capital that is the core around which various changes occur that affect the socio – economic development of regions.

2. DOMINANT CHARACTERISTICS AND FACTORS OF TRANSFORMATION OF THE EVOLUTION OF HUMAN CAPITAL IN THE CONTEXT OF DIGITAL TRANSFORMATION

According to the researchers, in the current conditions of digital transformation, it is necessary to study the development of human capital, its formation and reproduction from the point of view of innovative approaches. Digital transformation focuses on increasing the flexibility of data centers, a process that requires moving away from existing (outdated) technologies to new, improved ones, where a clear digital process will be traced. It should be noted that the evolution of human capital is characterized, on the one hand, by the potential of each person, on the other hand, by the methods that are characteristic of the new economic order. The stages of the evolution of human capital date back to the middle of the twentieth century, during the historical period of economic development, when the differences in the rates of economic growth between individual industrialized and backward states sharply increased. From the end of the 18th to the beginning of the 20th century, scientists such as L. Walras, J. M. Clark, F. List, J. McCulloch, G. D. McLeod, A. Marshall, J. S. Mill, S. Say, I. F. Tyunen, T. Winstein, J. S. Walsh, I. Fisher, and W. Farrah definitely played a significant role in the evolutionary development of human capital. We should also note that such scientists as L. Walras, J. McCulloch, I. F. Tyunen, T. Winstein, W. Farr, and I. Fischer believed that it is the individual who acts as human capital, and not its competence. Later, the same position was held by A. Marshall. He introduced the concept of "personal capital", meaning a person who is physically strong, contributes to the growth of labor productivity. Other economists, such as: F. List, J. S. Walsh, J. S. Mill, defined precisely the ability to carry out work, qualification qualities by the concept of "human capital". In their opinion, some types of abilities are natural, others are acquired by a person in the course of their life activity. Researchers such as L. Dublin, F. Cram, I. Fischer, S. H. Forsyth, who deal with the formation and reproduction of human capital, began to make attempts to assess its effectiveness in the economic process. Their assessment began with the use of economic, mathematical and statistical tools in the study of such issues as:

- cost per person;
- assessment of the impact of the national education system on the economic growth of the regions;
- the costs of the family, which are associated with the growth of the economic value of a person;
- the formation and use of public expenditures necessary for the upbringing and education of the population.

Certain provisions of the economic views of these major scientists-economists were used later in the formation of the modern theory of human capital.

In the second half of the 20th century, the theory of human capital acts as an independent scientific direction, which was influenced by foreign researchers. This was facilitated by a special list of socio-economic conditions:

- 1) High scientific and technical achievements provoked the transition to innovative production.
- 2) Since the content of the production process in every area of public life began to be subject to profound transformations, the share of labor costs of employees in the intellectual and highly professional orientation began to grow.
- 3) Creating conditions for the sustainability and credibility of the concept of "human value" at all management levels.
- 4) The accumulated theoretical and methodological potential of the concepts of human capital in the world economic thought. It made it possible to critically assess the state of scientific thought in the field of concepts of human capital and create on the basis of them, taking into account the new socio – economic conditions in society, a new independent scientific direction – the theory of human capital.

G. Becker made the greatest contribution to the development of the scientific direction of the theory of human capital. This scientist is a recognized creator of the scientific school within the framework of the concept of human capital. In 1962, Harry Becker published his work "Investing in Human Capital". In his opinion, the formation of human capital is due to the investment in the individual. The most important areas of investment, in his opinion, are education and training in the workplace, health care costs, migration, and the search for information about prices and incomes. The Russian researcher A. Tkachenko believes that the theory of human capital is interrelated with the new terminology "information society". The information society requires competent employees with scientific potential and skills to constantly adapt to modern market changes. The development of human capital should allow us to create a basis for improving the efficiency of the organization's activities in any industry, any business process. The competence approach, together with digital competencies, is the key to the development of human capital. At the same time, it should be taken into account that the development of digital competencies of personnel is not enough, it is also necessary to develop digital competencies of the organization (or business competencies), i.e. these are management technologies that allow the company to increase the level of competitiveness and build further promising strategic objectives.

3. METHODOLOGY FOR ASSESSING THE LEVEL OF REGIONAL HUMAN CAPITAL DEVELOPMENT IN RUSSIA AND OTHER DEVELOPED COUNTRIES

In the near future, the enterprises of the Russian Federation are seriously approaching the stages of human capital development, taking into account the impact of digital technologies. It should be noted that the effective use of human capital in the era of digitalization is possible only in workplaces that have high productivity. Today, one of the most priority areas of development of the Russian Federation is the creation of high-performance jobs. For example, the strategy-2020 of Sberbank provides for the following adjustments in the processes of human resource management (Figure 1).

Figure following on the next page

Figure 1: Changes in HR processes

In 2018, the World Bank proposed a "Human Capital Development Project". This project provides a methodology for calculating the index, which is based on measuring the contribution of children's education and health to their future productivity (Figure 19). The norm is the performance value of an adult who has received a full education and has excellent health. This performance is assigned a score of 1, and the final Index values are defined as a fraction of it. The components of the human capital index according to the World Bank methodology are such indicators as:

- the percentage of children who were born in a certain year, whose life expectancy is up to 5 years.
- the percentage of children in the age structure up to 5 years, whose growth is not lower than the average for their age;
- the expected duration of children's education in school;
- test results in the framework of international and regional programs for assessing students' educational achievements;
- the percentage of persons of the age structure under 15 years, whose life expectancy is planned to be up to 60 years.

Russia is ranked 34th out of 157 countries, and the human capital position is considered high. It is planned that the labor productivity indicator of a person born in 2018 in our country, upon reaching the age of 18, will be 73% of the maximum possible level that can be achieved in the case of obtaining a full education and a full state of health. As for cross-country comparisons, the indicator of the Russian Federation exceeds the values of such countries as China, Brazil and India. However, these results are significantly lower than, for example, in Japan, Singapore and South Korea, which have shown steady economic growth over the past decades, due to the focus of public policy on education and science (Figure 2). If we compare the Russian Federation with other countries, the indicator of the human capital index exceeds the values in such countries as India, Brazil, and China. However, the values of the human capital index in countries such as Singapore, Japan, and South Korea are characterized by sustainable economic development due to their impact on science and education.

Figure 2: Indicators of the United Nations human capital index for selected countries, grouped by income level (2018)

Based on the results of the World Bank study, the relationship between the country's income level and the values of the Human Capital Index was shown. The developers believe that the value of this indicator can be used by countries to determine the share of income that is not received due to a lack of human capital. The World Economic Forum presented its position on the Human Capital Index in the "Global Human Capital Report" in 2017. The indicator was calculated for 130 countries by different age groups based on the four groups of indicators shown in figure 3.

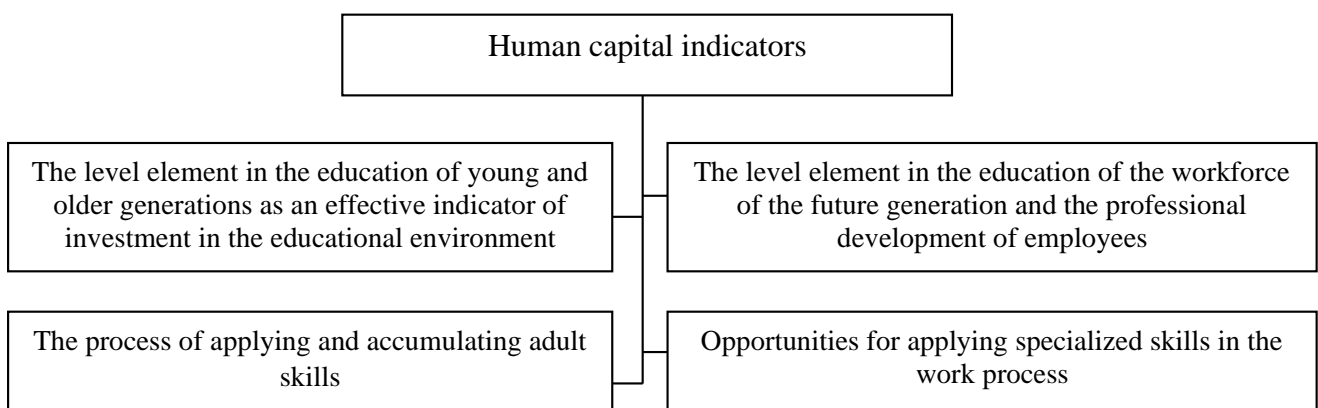

Figure 3: Indicators of human capital assessment (according to the methodology of the World Economic Forum)

Russia is in the ranking among other countries on the 16th place. At the same time, within the framework of this approach, Russia is ahead of the countries that were in higher positions in previous studies.

Figure 4: Values of the human capital index indicator according to the World Economic Forum methodology in 2017 (selected countries)

This study is based on the study of the potential of digital technologies that contribute to socio-economic development, taking into account factors in state regulation, human capital, a favorable business climate, an effective scientific and innovative system and a competitive digital sector of the economy. However, due to the differences in the availability of digital infrastructure, the low investment attractiveness of the regions, the disparity in population density, and the economic activity of the population, the problem of the digital divide can be traced. The new infrastructure requires a fundamentally different system of education and training of specialists. The education system is conservative in nature, and in this case it is very difficult to restructure. Therefore, only the discussion about the contours of the new system works today. The main problem is that most Russians almost stop their education after the age of 25. Businesses are trying to solve this problem. It should be noted that colleges and technical schools are trying to adapt their curricula to the requirements of the time and update the equipment. Consequently, the advanced achievements of science and technology in the field of digitalization and Industry 4.0 contribute to the formation of human capital of a fundamentally new quality. Due to the fact that there is progress in the advanced achievements of science and technology, Industry 4.0 allows you to create a new format of human capital. Until now, special human capital was considered the most valuable, and the general was assigned a secondary value. However, modern research in this area suggests that these roles are changing today. It is the general skills and competencies that come to the fore, such as system thinking, emotional intelligence, flexibility, creativity, adaptability, the ability to work in conditions of uncertainty, the ability to continuous learning, etc. The requirements for specific human capital are also changing.

4. METHODOLOGICAL RECOMMENDATIONS FOR MANAGING THE DEVELOPMENT OF HUMAN CAPITAL IN THE DIGITAL ECONOMY

In our opinion, the development of the concept of a new generation of human capital can be based on the digital technology "smart" card. The Smart card is the main methodological recommendation for human capital management. Its purpose is the process of identifying the conditions and mechanisms for the formation of the concept of human capital development of a new format, which will ensure the integration of educational resources of the digital economy

as a component of the concept of "smart" specialization of the region; it will act as a digital platform for interaction between the scientific and educational, administrative and business communities. Its main tasks:

- to determine the conditions for the creation and stages of the development of a "smart" map of the region in order to develop and effectively use human capital;
- make a forecast of the development of human capital;
- to form a system of integral indicators that characterize the assessment of the effectiveness of the use of human capital in the new format, taking into account the peculiarities of the development of the "smart" region and its scientific potential.

The development of digital competencies contributes to the implementation of tasks in the media and the digital environment, media literacy expands opportunities for communication, communication, cooperation, and joint search for solutions to problems. The ability to effectively, systematically accumulate knowledge, as well as critical, creative, autonomous and flexible thinking is important. Digital competencies extend to the creation of digital content, including programming, information security, including digital well-being, and competencies related to cybersecurity, intellectual property protection. An important role is assigned to digital competencies in order to form creative and critical thinking, increase adaptability to changing external conditions. In the context of modern trends, human capital is acquiring a new format. Digital competence of human capital is manifested in the accumulation of additional skills that ensure life activity and professional development in the digital environment. Therefore, such competence can be user-defined and professional. Within the framework of user competence, the skills necessary for the effective use of ICTs for personal purposes (study, self-development, communication, etc.) are developed. Professional digital competence is based on the skills required in the work, as well as in the field for the development, operation and maintenance of ICTs themselves. The change in the format of human capital is based on a system of objective factors that can be classified into personal and environmental factors (Figure 5).

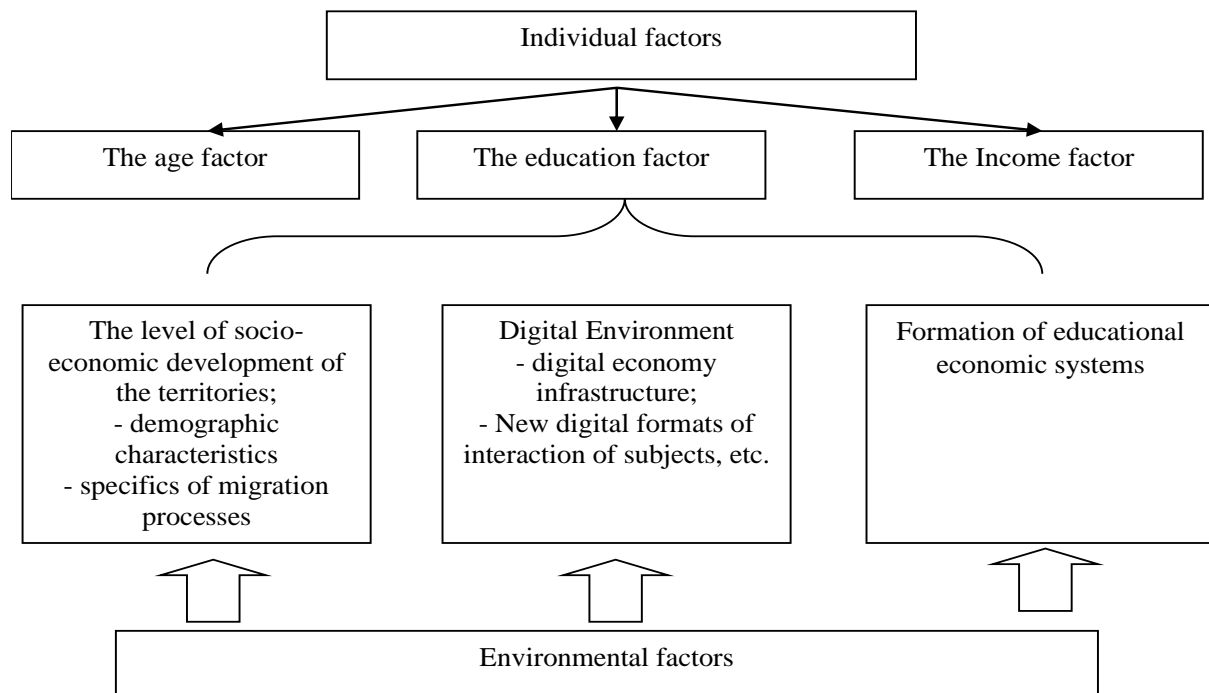

Figure 5: Factors of formation of digital competence of human capital

Personal factors include the age composition of the population, level of education, and income. As a rule, people with higher education have a similar level of development of digital competence skills. A similar trend continues with respect to the level of income that is associated with education. In general, the scheme of the influence of factors on the "smart" map as a digital technology for the development of human capital is presented in the following figure 6.

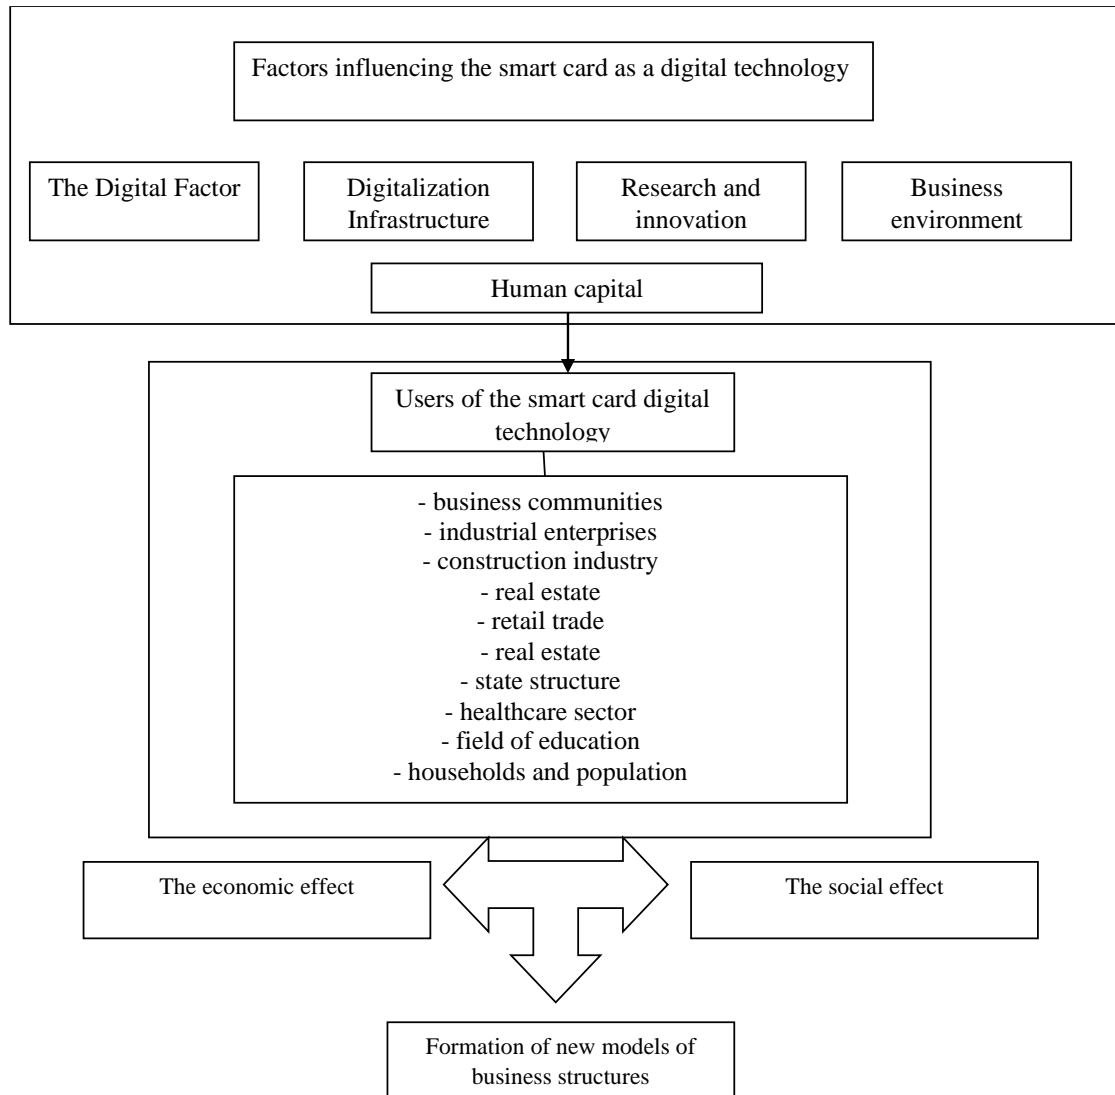

Figure 6: Factors influencing the "smart" map as a digital technology for the development of human capital

5. CONCLUSION

In conclusion, it should be noted that due to the influence of various factors on the development of a new generation of human capital, it is necessary to apply such a digital tool as the "smart" map, which will act as a digital personnel platform for the region in the aspect of human capital development through the interaction of scientific, educational, administrative and business communities. The results will be the stages of developing a "smart" map of the region for the development and effective use of human capital; the forecast of human capital development; a system of integral indicators that characterize the assessment of the effectiveness of the use of human capital in a new format, taking into account the peculiarities of the development of a "smart" region and its scientific potential.

ABSTRACT

Karabakh is one of the oldest historical regions and an integral part of Azerbaijan. Every nation keeps a record of the painful and happy years of its history. In 2020, a new phase of our history has begun. This is the victory stage. In the past years, the strengthening of the country's economy, the creation of foreign currency reserves, the provision of the army with modern equipment, the successes in the field of diplomacy have created conditions for the Azerbaijani Army to start its victory march. The counterattack, which started on September 27 in response to the Armenian provocation in 2020, resulted in victory in 44 days. The Azerbaijani Army, which is among the 50 strongest armies in the world, wrote a new page in the world military history with its courage in the Second Karabakh War. As a result of the victory won in the military conflict in autumn 2020, Azerbaijan has started to rebuild infrastructure and develop these regions in Karabakh. Currently, the process of clearing the released areas from mines and other explosive devices has begun. Shusha was once again declared the capital of our culture. President Ilham Aliyev has determined the framework for post-conflict reconstruction. The development of Azerbaijan's liberated territories, reconstruction, construction and humanitarian activities with the participation of international development partners and investors, cooperation between the state and the private sector, the return of internally displaced persons and the development of social capital can be implemented by applying a special state programs approach. The aim of this study is to examine the mining industry, metallurgy, food industry, processing industry, tourism and recreation, creative industry, medicine, grain growing, vegetable growing, viticulture, cotton growing, fruit growing and animal development potentials in the lands liberated from the occupation. In addition, investment in these areas makes it important to work in terms of both the growth of non-oil exports and import substitution and participation in value chains.

Keywords: *Karabakh, Azerbaijan, victory, reconstruction, investment, public, private*

1. INTRODUCTION

Karabakh is one of the oldest historical regions of Azerbaijan. The name of Karabakh, which is an integral part of Azerbaijan, derives from the Azerbaijani words "Qara" and "Bağ". The word "Qara" and "Bağ" has a history as old as the Azerbaijani people. It is an undeniable fact that this statement is applied to certain territories of Azerbaijan all over the world. The word "Garabagh" given by the Azerbaijani people to some of their lands was first developed 1300 years ago in the sources. Karabakh was defined first as a historical geographical concept and then as a large geographical area of Azerbaijan. The formation history of "Karabakh" as the name of a particular region of Azerbaijan allows a more scientific explanation of its etymology. Because in Azerbaijani language (as in other Turkic languages) "black" has the meanings of "dense", "thick", "big", "dark" and others in addition to color. From this point of view, the term "Karabakh" means "black garden", that is "big garden", "thick garden", etc. It means. Therefore, the word "Garabagh" belongs to the Azerbaijani people just like Karabakh. As a political-geographical place, in history it has always been not "Nagorno-Karabakh" but a general concept of "Garabagh" that covers the entire Karabakh lands - mountains and plains.

Hundreds of examples of the oldest and most precious folklore and music pearls of the Azerbaijani people were created in Karabakh and are connected with Karabakh. In addition to the historical and cultural value of Upper Karabakh, it is rich in its fascinating nature, underground and aboveground resources, rich economic potential and extensive tourism opportunities. If we pay attention to the main parameters of the economic potential of these regions, as a result of the plundering of Armenia, the infrastructure of the region has decreased to zero.

2. OVERVIEW OF KARABAK'S HISTORY

On the way to Karabakh victory, the history of Karabakh is illuminated in the following subsections.

2.1. Stage One

This stage can be called the stage of creating a "new homeland" for Armenians. The first period of exile of Azerbaijani Turks from West Azerbaijan began in 1801 with the annexation of Eastern Georgia by Russia and then the capture of Shamsədil and Loru-Pambak regions by the Russians. According to the Gulustan agreement signed between Russia and Iran on October 12, 13, all khanates of Northern Azerbaijan, except Nakhichevan and Yerevan khanates, joined Russia. Russian troops captured Nakhchivan city on 26 June 1827, Sardarabad fortress on 20 September and Yerevan fortress on 1 October. According to the Treaty of Turkmenchay signed on February 10, 1828, the last Northern Azerbaijani khanates, Yerevan and Nakhichevan, joined Russia. On March 20, Nikolai signed a decree on the establishment of an "Armenian province".

2.2. Second Stage

This can be called the "silent genocide" stage. As a result of the Armenian uprisings in Turkey in the 1990s, approximately 300,000 Armenians migrated to the Caucasus and the region turned into a bloodbath. Taking advantage of the pro-Armenian position of the ruling circles of Tsarist Russia, Armenians began to pursue a policy of ethnic cleansing by force of arms to establish a new Armenian state in the lands where Azerbaijanis lived in 1905-1906.

2.3. Third Stage

The crimes committed by Armenians against Azerbaijanis in the years 1918-1920, which were referred to as "national massacres" in the history at that time, are defined as genocide. Because these massacres were the result of the aggression and ethnic cleansing policy of the independent Armenian state. According to the Mudros agreement signed on 30 October 1918, after the withdrawal of Turkish troops from the South Caucasus, the second phase of the massacre of Armenians against Azerbaijanis began in the territory of Yerevan province. The President of the Azerbaijan Republic signed a decree "On the Genocide of Azerbaijanis" on March 26, 1998 to commemorate all the tragedies of the genocide in order to give a legal and political assessment of the genocide acts committed by the Armenians against the Azerbaijanis in the XIX-XX centuries and declared the Day of Genocide of the Azerbaijanis on March 31.

2.4. Fourth Stage

Although it is written as the deportation of Azerbaijanis in 1948-1953 in history, it is actually exile in the true sense of the word. In Soviet Armenia, more than 50,000 Azerbaijanis were persecuted in the 1930s, most of whom were deported to Kazakhstan and Central Asia. The Armenian leaders, who did not encounter any resistance during this action, managed to carry out another action in the late 1940s and early 1950s - the deportation of the Azerbaijanis.

The USSR government's resettlement decisions allowed the Armenian government to wipe out most of the existing Azerbaijani settlements around the city of Yerevan and on the Armenian border with Iran and Turkey.

2.5. Fifth Stage

This stage can be called the completion of the ethnic cleansing of Azerbaijanis from Armenia. In the mid-1960s, anti-Turkish and anti-Muslim propaganda was resumed in Armenia. The decision to commemorate the 50th anniversary of the so-called "Armenian genocide" further inflamed Armenian chauvinism. On February 20, 1988, the extraordinary session of the Council of People's Deputies of Nagorno-Karabakh with the participation of only Armenian deputies decided to remove the region from Azerbaijan and include it in the administrative-regional part of Armenia. Until 1988, the area where Azerbaijanis lived in Armenia was 25 percent of the country's territory, or about 7.5 square kilometers. In general, in the last 200 years, more than 2,000 Azerbaijani settlements in the territory of Armenia have been removed from the list in various ways, and a single-ethnic Armenian state has been established in the historical territory of Azerbaijan.

2.6. Sixth Stage

This stage covers the years 1991-1994 (Khojaly, genocide history, 1992). Understanding the impossibility of annexing Nagorno-Karabakh to Armenia, Armenia began to make territorial claims through armed groups formed in the territory of the autonomous region. The enemy used weapons of the USSR armed forces in Nagorno-Karabakh territory. As a result of the Armenian military attack, 20 percent of the territory of the Republic of Azerbaijan - Khankendi city, Khojaly, Shusha, Lachin, Khojavend, Kelbajar, Aghdam, Fuzuli, Jabrayil, Qubadli, Zangilan regions and 13 villages Tatar region, 7 villages of the Gazah region and Nakhchivan One village of Sadarak district was occupied by the army (Mammadov, 1992). After the national leader Heydar Aliyev came to power, the chaos in the country ended, a regular army was established and a ceasefire agreement was reached on May 12, 1994. Oil contracts were signed to strengthen the Azerbaijani economy. Azerbaijan's position in the international arena has strengthened. However, the OSCE Minsk Group, which was established to resolve the conflict, has not taken any concrete steps to date.

2.7. Seventh Stage

This stage is the triumphal stage of our history. The end of the 220 painful year has come. In the past 17 years, the strengthening of the country's economy, the establishment of foreign currency reserves, the provision of the army with modern equipment, the successes achieved in the field of diplomacy have created the conditions for the Azerbaijani Army to start its victory march. The counterattack, which started on September 27 as a reaction to another Armenian provocation, ended with victory in 44 days. The Azerbaijani Army, which is among the 50 most powerful armies in the world, wrote a new page in the world military history with its courage in the Second Karabakh War. It implemented UN Security Council resolutions that had not been implemented since 1993. Azerbaijan Army once again showed the world that we are a heroic, invincible and proud nation by restoring our territorial integrity. In 44 days, 5 cities, 4 settlements, about 300 settlements, many strategic heights were saved from the occupation. The liberation of Shusha on 8 November determined the fate of the war. On November 10, the Armenian Prime Minister signed a surrender decision. Armenia surrendered, raised the white flag and fell on her knees. Armenian Prime Minister Nikol Pashinyan, who put forward 7 conditions against Azerbaijan and said "Karabakh is Armenia", signed an unconditional surrender action. The territorial integrity of the state was restored. On December 10, Victory Parade was held with the participation of Turkish President Recep Tayyip Erdogan, who made

an exceptional contribution to our victory. The process of clearing our liberated areas from mines and other explosive devices has begun. Shusha was once again declared the capital of our culture. International organizations see the consequences of Armenian vandalism with their own eyes (Armenia - Azərbaycan münaqişəsi, 2005).

3. THE STATE OF KARABAKH AFTER VICTORY

As a result of the plundering of Armenia, the infrastructure of the region was reduced to zero. According to the statistics given by Deputy Minister of Economy Niyazi Safarov, 7 regional centers, 6 cities, 12 settlements, 830 villages, 700 hospitals and health institutions, 6 state theaters, 368 clubs, 85 music schools, 600 industrial and agricultural enterprises were destroyed in the occupied territories. has been. More than 1 million hectares of agricultural land were destroyed and withdrawn from circulation, including about 128,000 irrigated lands, about 35,000 hectares of vineyards and orchards. Before the occupation, these regions accounted for 24% of GDP, 41% of grape production, 46% of potato production, 18% of meat production and 34% of milk production. The occupation seriously damaged the country's water resources.

3.1. Reconstruction of the Karabakh Region

The statistics given above give an idea about the scale of the work to be done in the region. As a result of victories in military conflict in the autumn of 2020. Azerbaijan re-controlled a number of regions previously under Armenian control, as in the former Nagorno-Karabakh Autonomous Region. The question then arises, first of all, of the restoration of infrastructure and the development of these areas. Agriculture should be the main sector of the economy in the returned lands, this sector can make the main contribution to the economy of the whole of Azerbaijan. However, this is hampered by the fact that important areas in the region are mined. Several service areas in already rescued areas The recovery process continues. Within the framework of Azerishig project in Karabakh, OJSC built strategic facilities of special importance in the rescued areas. Azercell Telecom LLC is establishing the first mobile infrastructure and fourth generation LTE radio base stations in the liberated regions. Other mobile operators - Nar and Bakcell - also complete their interior design work and implement the action plan. The economic potential of the liberated lands is multifaceted and covers a variety of agricultural, industrial and tourism areas. The saved lands have great potential for the development of viticulture, tobacco cultivation, cotton growing, Cocoons, fruits and vegetables, melons and livestock. It is corn, pea and grape native to the region. During the pre-occupation period, Fizuli and Aghdam regions were among the leading regions of the country in cotton, grain and grape production. Cabrayil, Gubadli, Zangilan neighborhoods also differed in viticulture. Animal husbandry is highly developed in Lachin, Kelbecer, Kubadli and Zangilan. We can evaluate the industrial potential of the region in 4 areas: rich water supply, electricity, industrial recreation opportunities and processing of rich minerals. The region is also suitable for the development of the processing and food industries. Our lands are also rich in mineral and thermal water resources. These resources will be used for drinking water, land reclamation and electricity generation. Azerbaijan will put an end to the hydro war of the enemy waged against our country by effectively managing its water resources. Speaking of the industrial and recreational opportunities of the region, it should be noted that the main electricity generation and water storage gave grounds to say that the regional economy will grow rapidly.

3.2. Investing in Karabakh Region

Various financial resources can be used in the restructuring of the Karabakh region, including the state budget, SOFAZ, funds from foreign credit institutions, grants and donations, private investment and other sources not prohibited by law. Representatives of international organizations, foreign countries, large and medium-sized enterprises are interested in

participating in post-conflict building. Every international organization seems to be ready to invest in liberated lands, according to its jurisdiction and profile, to suit every business. As in Israel, the diaspora investment model can be widely used in Azerbaijan. In the post-conflict period, technology investments in the regions can be increased by venture capital, crowdfunding and crowdfunding. Investments in many areas can be attracted through public-private partnerships. The implementation of infrastructure projects through public-private partnerships leads to a revival of the private sector, an increase in productivity and a decrease in the burden on the state budget. The government is ready to invest in the development of the region. Minister Mikayil Cabbarov said that while the Azerbaijani side is open to foreign investments, it does not mean that it cannot do without them, and that attractive conditions will be created for investors. Baku plans to spend about \$ 1.5 billion in the form of state investment for the restoration of the region (<https://www.vedomosti.ru/politics/articles/2021/02/19/858725-azerbaidzhan-razrabativaet>).

4. CONCLUSION

Finally, the Liberated areas have potential for mining, metallurgy, food industry, processing industry, tourism and recreation, creative industry, medicine, grain growing, vegetable growing, viticulture, cotton growing, fruit growing, animal husbandry, poultry farming, beekeeping and building development. Investments in these areas will be important both in terms of increasing non-oil exports and import substitution, and for merging value chains. Post-conflict construction will play an important role in the economic security of our country, including food security. Various mechanisms can be implemented to encourage investment in these areas, including industrial parks and neighborhoods, agro-industrial parks, and other investment incentive mechanisms. Karabakh has the resources, strategic assets, activities and markets that can attract investors' attention. The new economic value to be created in the liberated lands will exceed the financial cost of the Azerbaijani state. Restoration of these areas will create many new jobs. Thus, the realization of new infrastructure projects will have a positive impact on the employment of our citizens. Economic development will create new jobs. Moreover, it will accelerate the growth of the non-oil sector and further prosperity of the Azerbaijani economy. Another important issue is the reconstruction of the Nakhchivan transport corridor. The reconstruction of the Nakhchivan transport corridor and the restoration of the railway from Azerbaijan to Turkey through Armenia and Nakhchivan will positively affect the economy of the region. Reestablishing communication with Nakhichevan will be beneficial for all countries in the region. Access to Armenia via Nakhichevan opens a second railway exit to Turkey. For this, Baku-Tbilisi-Kars highway was used before, but Nakhchivan road is much shorter. This is especially important for Russia due to strained relations with Georgia. In general, the Karabakh region will be a new geographical driver of economic development in Azerbaijan, the center of growth. Investment and construction activities in the region will accelerate GDP growth in Azerbaijan (http://www.iqtisadiislahat.org/news/vusal_qasimli_qarabag_azerbaycanda_iqtisadi_artimin_yeni_dravyeri_olacaq-1079).

ABSTRACT

In modern times the transition of human society from industry to post-industry is evaluated as one of the characteristic features of development trends. This is mainly related with the large-scale nature of the growing impact of science and technology on each aspect of society, as well as scientific and technological development aimed at more comprehensive socio-economic and historical changes. Due to this, the main trends of economic growth and the set of sources are also changing. Among them, natural resources and capital, which have the ability to affect the level of development of the economy, as well as scientific knowledge, which can be turned into an integrated resource, are considered as more important advantages. Experience shows that a new product of knowledge also necessitates an innovation process that ensures the transformation into technological innovations. The innovation process in itself changes the type of reproduction, the quality of socio-economic relations, and begins to play a key role in the functioning of the entire economic system, creating a progressive innovation-oriented economy with its own form of savings, special evaluation criteria for savings efficiency. From a theoretical point of view, the intellectualization of production as economic growth is considered to be the basis, ie GDP growth is achieved mainly through the production and sale of science-based products and services. One of the important rules for Azerbaijan's accession to the global economy is its activity in the field of science, technology and innovation, the restructuring of the economy based on the development of high-tech science-based production, and the transition to a more high-tech stage. As society progressed, science had moved to an independent field of individual activity with its own laws and at the same time growth trends, working methods, technologies and techniques, basic laws and systems of labor organization, and specially trained personnel. This is constantly developing area. At the same time, the labor, financial and material resources allocated to science are limited in a sense. Limited resources lead to the development of strategies and tactics aimed at the targeted involvement of limited resources in certain priorities, scientific and technical activities.

1. INTRODUCTION

The level of attention paid to research, education, culture, and technical growth in these countries from the past to the present is one of the features of developed countries under the current conditions of modern civilization. The degree of efficiency with which a state uses its intellectual capacity, as well as technological and cultural growth, are considered crucial aspects that have a considerable impact on the state's economic difficulties. Also, in the current environment, STP, culture, education, and research can only grow as a result of strong legal protection and a fair appraisal of intellectual property. In modern society, property is regarded as a socio-economic relationship. Property relations cannot exist and function if people do not treat a given person's property as "someone else's" and the owner of that property as "his own." Property is defined as the appropriation of means of production as well as material items by individuals, as well as the development of economic connections between members of society regarding the use and disposal of property, from an economic standpoint. When these relationships are legally protected in their broadest sense, the right of property emerges, and the right of property, with its specific form and regulations, safeguards the property, or more accurately, the existing economic relationships between people. The transition of human civilization from industry to post-industry is one of the defining characteristics of current development patterns. This is attributed to the large-scale nature of science and technology's rising impact on every area of society, as well as scientific and technological advancements targeted toward more extensive socioeconomic and historical transformations. As a result, the main patterns in economic growth and the sources of growth are shifting. Natural resources and money, which have the power to influence the economy's level of development, as well as scientific knowledge, which may be transformed into an integrated resource, are considered to be the most crucial advantages. Experience has shown that a new knowledge product requires an innovation process to ensure that it is transformed into technological innovations [1]. The process of innovation alters the type of reproduction, the quality of socio-economic connections, and begins to play a vital role in the operation of the entire economic system, resulting in a progressive innovation-oriented economy with its own form of savings and unique savings efficiency evaluation criteria. The intellectualization of production as economic growth is believed to be the foundation from a theoretical standpoint, for example GDP growth is primarily achieved through the creation and sale of science-based products and services. The transition to the new millennium at the conclusion of the previous century coincided with the process of replacing a specific phase in society's cyclical growth, or more accurately, with a new, more sophisticated stage of civilization. There is a global industrial society crisis at the turn of the century, which affects every level of civilization, including the level of demand dictated by the individual, his aptitude, ability, and degree of knowledge; socio-economic relations; ownership, exchange, national, moral, political, and legal issues as well as ideology, including science, education, culture, and religion. In society, new elements are coming together and building strength in a flexible way. It is thought that the following are the primary indicators:

- the development of an individual with greater knowledge, as well as the adaptation of that knowledge to new beliefs about natural laws and societal progress;
- production development, fundamental reconstruction of the reproductive structure, prioritization of human needs, transfer to a more advanced technological structure;
- the social-market economy's diversity, which relates other types of ownership and the level of concentration of production in a significant way;
- sharply competitive market economy with favorable regulatory features and developed social protection;
- state structure with democratic rights;

- the start of a time of national awakening associated with the formation of voluntary associations of equal peoples;
- a resurgence of high cultural legacy; increased scientific creation, demand for intellectual items, and a rapid rise in the proportion of people who spend time thinking.

As a result, it is critical to include the aforementioned worldwide trends when developing forecasts for the state's future development, its regions, and sectors of activity as a whole, particularly in the sphere of science, technology, and innovation. [2, p.428]

2. DEVELOPMENT WAYS FOR INNOVATION INFRASTRUCTURE

One of the most essential criteria for Azerbaijan's entry into the global economy is its scientific, technological, and innovative activity, as well as the reorganization of the economy based on the development of high-tech science-based production and the transition to a more high-tech stage. Science evolved as an independent field of individual activity with its own laws, growth trends, working methods, technologies and techniques, basic laws and labor organization systems, and specifically qualified employees as society progressed. This is a field that is always changing. At the same time, science's labor, financial, and material resources are constrained in some ways. Limited resources necessitate the creation of strategies and tactics aimed at directing limited resources toward specific priorities, scientific and technical activity. Scientific activity is defined as any activity that aims to gain and utilize scientific information. Basic scientific research is defined as an experimental or theoretical effort aiming at gaining new understanding about the development and basic qualities of individuals, societies, and the natural environment in which they live. Scientific and technical activity (STA) is an activity that aims to acquire and apply new knowledge in order to solve technological, economic, social, humanitarian, and other problems, as well as to ensure that science, technology, and production work together as a unified system. STAs are divided into many types. The boundaries between these species are conventional and it is difficult to distinguish them from each other. Individuals that participate in STA on a regular basis are also not restricted to a single type of STA. That is, every form of "science-production-consumption" cycle can involve a scientist or an inventor. Expansion of scientific capacity in the production of products is considered as a theoretical basis for the creation and development of science-based economic zones. The above-mentioned theoretical basis must be considered in the development of scientific and technical, as well as innovation policy at certain levels of government. Concepts, theories, and models that, in and of themselves, manifest new information in the form of a scientific output and enable professionals to understand and master it. In addition, science's product becomes a commodity and manifests as an innovation. The intellectual or scientific product can be employed in two ways: through market realization and non-market realization. In other words, once an intellectual product is commercialized, it moves from the stage of invention to the stage of new application - innovation. In the last 15-20 years, the term "newly applied" - "innovation" has become commonly employed in scientific literature and practical operations. The format can be used to codify innovation in the form of one of the forms of intellectual products, such as an invention, scientific approach, standard, recommendation, methodology, documentation for an enhanced product, patent, effective proposal, invention, "know-how," marketing outcomes, and so on. When innovation is applied to a production and management system, it is changed into a marketable product, and its application leads to economically, socially, and other beneficial forms, or, to put it another way, it transforms into a new stage - innovation [3, p.30]. The following are the key characteristics that influence the competitiveness of items supplied and traded in today's intellectual property market:

- The level of legal protection of goods sold in trade enterprises or markets;
- The criteria meets modern technical standards;

- Ability to meet the requirements of buyers;
- Price level when comparing the goods sold with similar ones;
- Sharp changes in the number of consumers;
- The degree of access of intellectual goods to the market, etc.

Initially, the intellectual property market was thought to be a market for technological raw materials, but in its current form, existing market agreements are codified as the acknowledgment of exclusive intellectual property or trade secrets rights, as well as legal protection of IP in the form of a service, more specifically, the findings of market research, software provision, technical solution availability, technological documentation, and so on. It functions as a product, and as a result of intellectual work, these products acquire specific attributes and are appreciated. It's worth noting that an intellectual product's introduction into the economic cycle can be facilitated by the acquisition of property rights for the owner. The adoption of a substantial level of monopoly is one of the fundamental elements of the intellectual property market. This market is considered a seller's market and differs from other consumer goods markets in that it has a high level of income as one of its key characteristics. The appropriated profit is defined by the existing difference between the cost of the intellectual product and the licensing price, with the license price based on the part of the income that the buyer can earn in the right to use the intellectual product. The intellectual property market is classified into the following types based on the characteristics of the products on the market:

- According to the type of market structure: monopoly, oligopoly, and monopoly competition;
- According to the type of products purchased and sold: inventions, utility models, know-how, and so on;
- According to the subjects of the intellectual property market: consumers, inventors, buyers, sellers, authors, (in some cases, the state can be included);
- Patent market, copyright market, related rights market, etc. according to the range of intellectual goods;
- According to the development section: research, sales, production, etc. IP market in sectors;
- According to the degree of coverage: regional, global, local and national.

Thus, there are six major elements that have a positive or negative impact on the development of the intellectual property market and should be examined by a particular country in the context of global integration:

- 1) By field of formation: socio-economic, institutional and cultural factors;
- 2) According to the scope of impact: macroeconomic and microeconomic factors;
- 3) In the direction of impact: direct and indirect factors;
- 4) Due to changes in market competition, supply and demand: price and non-price factors;
- 5) On the characteristics of the impact of supply and demand in the market: special and general factors;
- 6) According to the general characteristics of influence: external and internal factors. [4, p.3]

3. THE ROLE AND PLACE OF INTELLECTUAL PROPERTY EVALUATION IN THE ECONOMIC DEVELOPMENT

The application of intellectual property in economic operations, in the form of knowledge-based legal structures, is intimately linked to the development of the contemporary modern economy. In many nations with a higher intellectual level, the intellectual property market is gradually becoming one of the most important sectors of the national economy. Intellectual property is an essential resource that influences people's material well-being.

As a result, the proportion of intangible assets based on intellectual property in the property complexes of major national corporations is increasing. Intellectual property has grown in importance as a valuable resource in the realm of material production.

- 1) If intellectual property is valued as a legal system, it is intangible and, under certain conditions, can be used by multiple legal entities at the same time. They are stored in the research of existing knowledge during the transfer of knowledge. The nature of information protection legislation, as well as the protection of commercial secrets, patents, and copyrights, are all tied to intellectual property. The intellectual property market entails the utilization of knowledge as intellectual property objects, as well as the protection of human rights, as part of innovation and scientific and technical activities. The intellectual property market's operation as part of innovation and scientific and technological activities can be separated into two parts:
- 2) Inclusion of intellectual property in the economic turnover;
- 3) Second, the economic turnover in these facilities.

In today's world, the intellectual property market is regarded as a place where supply and demand for intellectual property are formed. Property, in this case, functions as a commodity in the context of free choice and exchange. Simultaneously, the state must behave as one of the market's subjects, mediators, right holders, or partners. The intellectual property market is largely valued as a market for technological raw resources, and such transactions are formalized in the current market as the transfer of intellectual property rights and the provision of legal protection in the form of service or trade secrets. The intellectual property market is often seen as the culmination of product research and development, original technical judgments, design and technology documentation kits, and software. Intellectual property is considered the consequence of intellectual property when it develops appropriate features as a product. The sale of property rights, licenses, the search for new investors, licenses, the placement of orders in the company, or, to be more accurate, the maximum income from intellectual property in various forms comprise the outcome of intellectual work in modern society, including formation of motivation and stimulus in the employees of the enterprise in the field of creation, legal protection and use of intellectual property. The success of a company's development does not depend on the company's financial resources, but on the people and their collective activity. Therefore, it is expedient to develop stimulus and motivation tactics of employees working in the field of intellectual activity and direct them to the creation of a new product of the company. The pace of change of economic processes around the world, the further dissemination of inventive ideas, and their application in the sphere of production is accelerating in the period of globalization, with the development of innovation activities to a qualitatively new level. This is a "positively charged" result of globalization since it allows more countries to benefit from their innovations, increased technical standards, and innovative management approaches. This component, according to projections, will drive global economic growth in the near and distant future [5]. Intellectual property is now regarded as a fundamental reform in the competition, rather than a by-product of the development of new items. The research has always been chosen on the basis of its intellectual quality. As a result, Azerbaijani producers should not miss out on current chances by legally monopolizing key product markets. The establishment of a positive intellectual property management system in businesses creates the circumstances for a significant improvement in the profitability of intellectual activity. To develop circumstances for the generation of intellectual property, new economic, legal, and organizational management methods are required. The aim of management science and practice is also to find mechanisms that will allow innovation to become a true productive force and a market subject. The significance and relevance of intellectual property management organization may be explained by the fact that the corporate entity's source of income is believed to be effective

decisions - management, technical, and economic judgments. It is impossible to examine the current economic strategy without taking into account intellectual property. That is, its usage in manufacturing generates a significant amount of additional revenue. The application of intellectual activity's results to civil, legal, and economic circulation is critical for raising the technical level and competitiveness of manufactured items. Production facility and equipment management is unquestionably legal for a third-millennium business, but it must be linked with excellent intangible asset management to obtain a competitive advantage. According to research, the intellectual property management system does not match modern standards. The state has not yet formed a favorable system of regulation of intellectual property relations. Many companies do not fully use their scientific capabilities and companies do not fully use their scientific potential and patent-protected research. In addition, practice demonstrates that intellectual property is the most important factor in improving the innovation economy's competitiveness, and that its usage necessitates managerial influence over processes. Taking all of this into account, it is deemed necessary to adopt the following actions in Azerbaijan to improve intellectual property management:

- first of all, to direct the intellectual property potential of individuals to obtain modern purposeful directions for innovative development;
- to incorporate retail infrastructure into the unified system for innovative activities by establishing infrastructure improvement ministries at the state and regional levels;
- Improving the quality of domestic regulation of the intellectual property and innovation market

As a result, the list of measures to be implemented includes the following:

- the selection of state-supported strategic priorities in science and education, as well as assuring the training of a new generation of employees;
- development of national and regional development programs of the intellectual property market;
- participation of the country in the creation of the infrastructure of innovation activity as a result of the cooperation between private and state sectors;
- the execution of economic and social benefits that can have a significant impact on the development of economic entities' innovative activities;
- to effectively use state assistance mechanisms for the purchase and sale of intellectual property in a way that safeguards both the state's and businesses' interests.

These include:

- Subsidies for intellectual property researchers;
- Quotas for the export of effective intellectual commodities;
- State protection of the rights of intellectual property authors;
- Increase export customs tariffs to prevent inefficient export of technology and licenses;
- Investment of intellectual capital in the charter funds of local and foreign businesses;
- Intellectual property copyright sales.

Services based on science. According to the findings of the study, scientific services are classified as follows in European Statistics by forms of economic activity:

- a) high-tech services with a high level of science:
 - computer related activities;
 - communication;
 - research and development.

b) medium-level science and high-tech services:

- health and social services;
- other commercial activities;
- financial intermediation;
- types of activities related to the organization of culture, recreation and sports.

The systematization of high-tech services is further developed according to the technological level in the practice of existing statistics observations. It is necessary to assess the expenses of producing more advanced knowledge in order to analyze employment in fields of intellectual activity. As a result, they rely on a variety of sources of data, including one-time observations. Investments in science-intensive products are provided in the form of tax breaks and, above all, "investment tax credit". Companies that devote the majority of their resources to the creation and development of inventions are frequently granted such privileges. This is deducted from the amount of tax as part of the increased income, as well as the tax benefits provided in the traditional form. In general, the preferable form becomes significant only after the installation and operation of new machinery. In the presence of a regulatory system that complies with the law, a company's right to a tax credit is automatically included. Tax benefits are determined as a percentage of the cost of modern equipment, such as 5.3 percent in Japan (for equipment and electronics), 50 percent in the UK (for the first year of development of modern equipment, materials, technology, and so on), 10-15 percent in Japan (firm depending on the appropriation of the territory, geographical position), and 100 percent in Ireland. Tax advantages are only available in the United States for innovation investments in energy-related sectors.[12] As a result, tax advantages for the production and development of inventions are offered as deductions from a company's expenditure for proper purposes in industrialized countries.

3.1. Development innovation activity in Azerbaijan

The continuance of care in the field of research and education, the conservation of scientific and technical advantages, the training of highly skilled employees in science and education, personnel care, and the approval of numerous key laws in the field of science are all priority of Azerbaijan's innovation strategy. The majority of the country's scientific institutions are funded by the government. The amount of dollars provided for scientific finance in 2008 increased dramatically due to an improvement in the quality of research and technology. In this regard, expenditures on science in the state budget in 2017 grew from 30.8 million manat to 65.0 million manat, up from 30.8 million manat in 2014. In recent years, appropriate steps have been taken to advance science and strengthen the management system. In recent years, the invention and enhancement of innovations in the framework of the growth of a knowledge-based economy has evolved into a process of replication facilitated by a better national innovation system, and intelligence is now regarded as a priority as a result of the state's demand for innovative knowledge. Human capital is a carrier of mental resources that is always evolving. As a result, premier universities, which not only make a large contribution as a result of modern training, but also serve as a foundation for regional innovation clusters, hold a prominent place in national innovation systems as a display of successful foreign experience (cluster - a set of objects). They create the conditions for the formulation of ideas, the enhancement of science-based product manufacturing, and the demonstration of high-tech services. Let's have a look at how changes in the labor market will benefit the science-based economy:

- 1) In general, hiring specialists with the necessary information and knowledge, such as programmers, analysts, scientists, and engineers, is required to promote science-based manufacturing. As a result, as the "intellectual share" of the product obtained grows, so does the demand for research employees.
- 2) Professors and teachers are required for professional and scientific education.

- 3) The industrialized countries' strategy was to find geniuses who could create new knowledge, and as a result, the worldwide competition will heat up. Those who excel in schooling in the United States, for example, now confront significant hurdles. There are certain bad tendencies in science and education staffing:
- aging of engineering and scientific personnel;
 - a drop in the number of scientists and graduate students in nations that are already undergoing rapid scientific and technological development (South Korea, China, India, and so on);
 - decreased interest in studying technical and natural sciences among young people;
 - higher cost of higher education compared to other countries;
 - limited number of teachers of scientific and technical subjects in many universities;
 - secondary education still lags behind world standards.

The assignment of exclusive rights to the results of intellectual creation is crucial in the development of any legal interactions between civil law subjects for the use of intellectual property results. The phrase "intellectual property" is often used in laws in various nations to express these rights.[6] In the cases and in the manner prescribed by law, intellectual property is recognized as the exclusive right to a legal or natural person's results of intellectual creation, or to similar products, types of work, and services (firm name, trademark, service mark, etc.). The transfer of intellectual property rights and the forms of their integration into the economy are gradually evolving as computer technology and the Internet advance. The following is an analysis of forecasts for the development of science in the country:

- Improving the quality of basic research carried out at ANAS, other scientific research institutions and universities;
- Protection and development of Azerbaijan's scientific and technical potential, more effective application of this potential in environmental and public health protection, expansion of the country's information resources, and acceleration of innovative processes;
- Strengthening the functioning of scientific institutes and universities in terms of guiding and organizing scientific research;
- Effective use of more open, expedient methods of competition and competition, which eliminates the prospect of monopolies in research, and the establishment of conditions for the discovery of the country's scientists' creative potential;
- Competition-based development of general programs in scientific institutions and implementation of their funding;
- Training of highly qualified personnel with education and internship abroad.

The following can be considered as measures to be implemented in the fields of science:

- Realization of changes in management of scientific institutions according to important scientific directions of ANAS;
- Prioritization of scientific interests in the management mechanism of ANAS;
- Creation and sale of knowledge-based products, as well as their adaptation to the market economy through information, marketing and service;
- Determine the process for evaluating the quality and degree of scientific works, with a focus on research characteristics, civilized traditions of creative research, the establishment of governmental priorities in this direction, and the scientific community's viewpoint;
- The development of a new system for realizing scientific research outcomes by merging ANAS, technopark (technopolis), and scientific exchange (scientific and information technology interchange);

- Providing high salaries to researchers, as in developed countries, as well as increasing the attention to scientific work in society;
- Establishment of various funds to support the research of young scientists;
- Establishment of a system for training scientific professionals in conformity with the scientific and technical field's demands and preferences;
- Development of some creative foreign company initiatives by scientists and specialists from the National Academy of Sciences, as well as the formation of joint ventures in the Republic of Azerbaijan to speed up access to the global market;
- With the assistance of foreign corporations, transforming the scientific products of the National Academy of Sciences' enterprises into competitive samples and introducing these items to the global market.

The Law on Patents of the Republic of Azerbaijan (established in 1997) governs inventions, utility models, and industrial designs, among other things, that are the outcome of human mental activity and are regarded objects of industrial property. It is a security document issued by the relevant governmental authority. Industrial property rights are patented and safeguarded by the government. A patent is a legal document that verifies the authorship and originality of a work and grants the owner the exclusive right to use it. Patents cannot be used to protect inventions, utility models, or industrial designs that violate humanism and morality values, as well as social norms. The relevant executive authority in the field of industrial property in Azerbaijan carries out attestation and registration of patent attorneys, accepts claims on legal property from legal entities and individuals, performs research and inspection, registers industrial property in the State Register, grants patents, and implements the state policy on industrial property protection. Improving transnational education and transnational science based on innovative technology is the answer to universal problems. The formation of a unified scientific and educational space in Europe based on the Bologna system, in particular, is linked to scientific development ideals. Many countries' development strategies are based on concepts for innovative societal improvement (the idea of innovative development is the basis of the development strategy of the EU, China and other countries of the Russian Federation). If a country adopts an innovative development plan as its foundation, the transition from an industrial to a knowledge-based economy must be assured. Currently, it is not the countries who produce the most scientific information that are developing, but the ones that utilise such information in a higher quality and put it into practice. Of course, the relevance of information and new knowledge for industry varies by region or location; the important thing is that these ideas can be implemented swiftly and successfully. In and of itself, innovation entails gaining money from new information, scientific breakthroughs, and discoveries, as well as the ability to sell these products profitably on the market. Innovation is an important sort of intellectual entrepreneurship that is predicted to become a large-scale sphere of activity (as a result of the usage of the Internet for intellectual product e-commerce). Economic progress in developing nations is dependent on the development of a high-quality national innovation system. The Czech Republic, for example, has a fascinating history with innovation: On the basis of licensing, 98 percent of technology utilized as new ideas are purchased from other nations, and local enterprises are given 10-year loans at a rate of 5% per year to implement such unique ideas. Since 2016, the Czech Republic, together with a prominent country like the United States, has been a world leader in high-tech exports. Another example is Japan, whose rapid development began in the middle of the last century with the licensing of leading technologies to build innovative industries in the country. In Russia, the subject of creative development has been one of the government's strategic goals in recent years, although problems with administrative management, corruption, bureaucracy, and monopoly in the country present temporary barriers to creative development [9].

In recent years, significant emphasis has been paid to the development of human capital, education, and information technology, which has opened up favorable potential for innovative development prospects in Azerbaijan. Recently, Azerbaijan's higher education system has improved, and it has been integrated into the European education system through the creation of Regional Innovation Zones (RIZ), "Electronic Azerbaijan," and other initiatives. The establishment of state programs in these areas should be regarded as a positive move. The country's innovative development outlook necessitates the training of modern-thinking employees, which in turn necessitates the country's educational system's inventive development.. Innovative educational ideas should be employed more broadly in education to achieve this goal. Additional new knowledge is learned as a result of the implementation of innovative educational programs based on the application of students' acquired capabilities. The low degree of scientific and industrial interactions, as well as the relatively weak competitive environment in educational institutions, necessitate the creation of new higher education institutions. The teaching of the educational process itself, including the integration of science and industry, in the process of gaining new knowledge, is provided by the innovative education system, and innovative education can, of course, be applied in innovative institutions. Innovative institutions should create an educational system that is accessible to new scientific research. These universities' curricula equip students and masters with practical skills for developing and managing various projects, as well as training on current concerns and internship possibilities in production and research institutes. In order to ensure innovative development in the educational process, it is important to consistently implement the following processes:

- a) prepare real projects for students' future professional activities (in various sectors of the economy);
- b) conducting and applying fundamental research;
- c) creating opportunities and conditions for students to choose courses as a result of the application of educational technologies.

Because the information economy's creation of information, information goods, and services is highly scientific, their quality and market competitiveness are heavily influenced by a country's level of technological development, as well as the level of development and adoption of new information technologies. The widespread use of cutting-edge technologies opens up prospects for operational change in the manufacturing organization to ensure high mobility and the introduction of new product models.[10 The information economy allows for the development of a variety of tools for maximizing the efficiency of production and knowledge. Its growth develops and distributes new sorts of products and services, as well as creating and stimulating the creation of new forms of labor. This alters people's living environments, providing new opportunities for personal growth, the construction of a new information culture, and the construction of moral ideals. As a result, the country's social production system must undergo successful structural reforms, achieve rapid development of the ICT sector, and construct modern production and service sectors with extensive application of innovative technologies in order to become an active participant in the modern global economy and a subject of the information society.

4. CONCLUSION

In summary, these processes highlight the significance of Azerbaijan developing a comprehensive innovation system. Simultaneously, new approaches to improve science and research-based production are being investigated. The formation and development of technoparks is one response to such processes. Simultaneously, taking these elements into account, it is necessary to build a concept of technopark networks, which serve as the

development infrastructure for innovation processes. The building of an innovative economy is one of the Republic of Azerbaijan's top priorities for development. Our country, which is richly endowed with natural resources, aspires to diversify its economy beyond oil. This necessitates the development of Azerbaijan's scientific-educational complex and industry. The country's chances of developing a new knowledge-based innovative enterprise should be enhanced. The purpose of diversifying the country's economy is to boost GDP by producing different kinds of goods and services. Furthermore, enhancing production efficiency, developing new technologies, and implementing advanced technologies to improve the competitiveness of high-tech goods in local and global markets, as well as expanding science-intensive businesses, should be considered a top priority for the country's economy.

ABSTRACT

It is clear that the export has important effects on country economic development. There are lot of various strategies have used in some countries to increase the export of services. According to the international statistics, we can see that the share of services exports in global trade is increasing, and every country is trying to improve its capacity in the export of services by making some progress in this direction. After the successfully implementing oil strategy in the Republic of Azerbaijan, the volume of country exports has increased. At the moment, developing non-oil sector and achieving in diversifications of production and exports are main priorities of the country. Many strategies and policies have been pursued in this direction. However, the share of crude oil and oil products in total exports is still high and expanding export diversification is very important. We consider that one of the ways of expanding total exports is to increase exports of services. In this regard, some progress has been made in tourism and transport services in recent years, and according to statistics, the number of tourists visiting to the country is growing every year. Considering to the geographical and climate environment of our country, it is possible to achieve more progress in the export of tourism and the other types of services exports. Considering experiences of the countries that have succeeded in exporting services, it is clear that the main important factors of services exports development are improving the quality of services, creating the necessary infrastructure, having professional staff or increasing their professionalism, developing sectors that interact with exported services. For this regard, with the direct and indirect support of the government, it is possible to achieve the expanding services exports in our country by eliminating those problems.

Keywords: *export of services, export diversification, government support*

1. INTRODUCTION

It is an undeniable fact that the export of services plays an important role in the economic development of the country. Most countries in the world pay special attention to the promoting exports of services in order to achieve economic development, export diversification, increase revenues, employment and other important goals. For this reason, the share of services exports in the world economy is constantly growing. The development of technology has given a great impetus to the expansion of services. Thus, as a result of the technological development, the opportunities for trade in services have increased, and the export of services has created new opportunities for the diversification of the economies in many developing countries. For this reason, it is important to make some recommendations for the development of this sector by studying the experience of countries that have succeeded in exporting services and studying existing theories.

2. THE ROLE OF SERVICES IN THE ECONOMIC DEVELOPMENT

According to many researchers, services affect the country's economic development in four ways (Adlung 2007, Mattoo and Payton 2007):

- By influencing national income and employment. It is clear that the development of services leads to an increase in national income and employment in the country;
- By affecting the quality of some services. Thus, the expansion of services exports in the country results in an increase in the quality of some services;
- By influencing the investment climate. Promoting commercial services in the country is leading to an improvement in the investment climate in order to strengthen the infrastructure in a number of related services, including transport systems, communications and energy services.
- By diversifying the economy. The role of services in achieving inclusive growth in the country is great. Although the agricultural sector has a more effective impact on poverty reduction in the country than any other sectors, the service sector is considered to be more effective. The service sector allows more low-income people to find higher-paying jobs, strengthens economic infrastructure, and helps the country become more competitive globally.

3. THE MODES OF INTERNATIONAL TRADE IN SERVICES

It is very useful to study the aspects of trade in services. Service trades differ from commodity trades in that they are face-to-face between the consumer and the service provider. The international trade of services is implemented through the following models:

- Mode 1. Cross-border supply; this model is similar to commodities. For example, sending software from one country to another.
- Mode 2. Consumption abroad. Consumers (for example, tourists or students) travel across the border and benefit from certain services.
- Mode 3. Commercial presence. Establishment of a manufacturer's department in the consumer's country.
- Mode 4. Presence of natural persons. Manufacturer (engineer, doctor and teacher) operating in another country across the border.

Before studying the factors of development of international trade in services, it would be more expedient to identify the existing barriers in this area. Barriers to international trade in services are more complicated than barriers to international trade in goods.

4. BARRIERS IN INTERNATIONAL TRADE OF SERVICES

According to the experiences of some countries around the world, the main obstacles to the export of services are:

- Lack of human resources: As the service sector is labor-intensive, the development of this sector depends directly on skilled and professional staff. The level of education in the country plays a special role in this direction. In addition, a number of low-income countries face challenges, such as having highly professional staff working outside the country, which in some countries leads to restrictions, such as reduced access to the necessary staff in the service sector.
- Poor infrastructure: In countries with relatively low incomes, infrastructure is underdeveloped. Lack of necessary infrastructure for the development of services reduces the tendency to invest in this area. Lack of necessary infrastructure and reduced investment in services is a major obstacle to the development of this sector.

- Small size of the domestic market: One of the obstacles to the development of services is the small size of the domestic market in some countries. Thus, small countries face certain difficulties if they do not take advantage of the scale effect in the field of services.
- Lack of necessary information: In some developing countries, service exporters have difficulty obtaining the necessary information about the markets due to their small size. At the same time, these companies are unable to inform customers about the services they offer. Since the sale of products in foreign trade is formed mainly on the basis of international reliability and trust, the services offered by such enterprises are not attractive to customers.
- Low use of modern technologies: For the most part, most companies operating in developing countries are not able to use modern technologies. As we know, the lack of high-level technologies leads to a low level of competitiveness of these enterprises.
- Lack of financial resources: Many small and new enterprises face certain difficulties in obtaining the necessary financial resources. This is one of the factors preventing their development.

5. INTERNATIONAL TRADE OF SERVICES AND SERVICES EXPORTS OF AZERBAIJAN

5.1. International trade in services worldwide

According to the statistics, it is clear that the total exports of goods and services in the world in 2019 amounted to 25033 billion US dollars, of which 19468 billion US dollars accounted for exports of goods and 6144 billion US dollars for exports of services. Share of services in total exports was 24.5% (UNWTO - World Tourism Barometer, 2020). Looking at the last decade, we see a steady increase in the share of services exports. According to other statistics, the share of services in the export of all goods and services in developed countries is 20.9%, while in developing countries this figure is 29.3% higher (UNWTO - World Tourism Barometer, 2020). It is clear that the share of developing countries in total exports of services is growing steadily.

5.2. International trade in services in Azerbaijan

First of all, it should be noted that after gaining independence, our republic has attached great importance to foreign trade and considered the development of this sector as the basis of economic development of the country. For this reason, foreign trade relations with many countries of the world have been started from the very beginning and certain successes have been achieved in this direction. As a result of the successful oil strategy implemented in our country, the volume of foreign trade exchanges and our country's foreign exchange earnings have been steadily increasing in a short period of time. Recently, special attention has been paid to the diversification of the economy in our country, and many strategies, policies and measures have been implemented to increase the number of the country's exports. As a result, many products in addition to oil and oil products are already exported to the world. In addition, special attention was paid to the international trade in services, which has become one of the most important sectors in the world, as a result of which great achievements have been made in the export of some services. However, looking at the potential of our country, it seems that we are still not in the right position in the export of services. According to statistics, until 2019, there was an increase in the export of services in our country.

Table following on the next page

	2017	2018	2019
Total exports of services	4 688 439	4 690 704	3 761 480
Commercial services	4 660 773	4 661 131	3 726 578
Travel	3 011 781	2 634 163	1 791 514
Transport	971 396	1 223 822	1 107 970
Other business services	404 966	528 309	666 527
Telecommunications, computer and information services	66 296	78 995	58 438
Government services	27 666	29 573	34 902
Construction	65 181	54 307	31 589
Insurance and pension services	23 464	12 462	26 639
Personal, cultural, and recreational services	12 529	17 222	22 523
Financial services	6 125	12 521	7 298

*Table 1: Services exports of Azerbaijan, 2017-2019, by thousand USD
(Source: <https://www.trademap.org/tradestat/index.aspx>)*

It is clear that in 2019, Azerbaijan's exports of services amounted to 3761 million US dollars, which is less than last year. However, in 2018 there was an increase in exports of services. The decline in the last year is due to events in the world. Among the commercial services of our country, tourism and transport services have the largest share. However, it should be noted that in the last two years, there has been a decline in exports of tourism services, but in 2018 there is an increase in transport services.

	2017	2018	2019
Total imports of services	8 067 752	6 752 758	6 377 143
Commercial services	8 004 015	6 678 845	6 302 990
Travel	1 453 655	1 164 989	1 723 533
Transport	2 658 369	2 284 361	1 702 493
Other business services	1 048 362	1 520 870	1 458 446
Telecommunications, computer and information services	2 482 167	1 331 496	1 034 176
Government services	112 864	161 412	159 345
Construction	90 387	99 484	97 940
Insurance and pension services	63 737	73 913	74 153
Personal, cultural, and recreational services	49 880	42 198	46 734
Financial services	14 425	16 781	16 026

*Table 2: Services imports of Azerbaijan, 2017-2019, by thousand USD
(Source: <https://www.trademap.org/tradestat/index.aspx>)*

There has been a decrease in the import of services in our country over the past two years. Thus, in 2017, the country's import of services amounted to 8067 million US dollars, while in 2019 it was 6377 million US dollars.

	2017	2018	2019
Total exports of services	4 688 439	4 690 704	3 761 480
Travel	3 011 781	2 634 163	1 791 514
Personal travel	2 286 894	2 036 827	1 435 377
Business travel	724 887	597 336	356 137

*Table 3: Travel services exports of Azerbaijan, 2017-2019, by thousand USD
(Source: <https://www.trademap.org/tradestat/index.aspx>)*

As we have noted, tourism and transport services have the highest share in the export of services of our country. Individual travel weighs more in the export of tourism services. However, if we look at many countries around the world, we can see that business travel accounts for 40-45%. For this reason, first of all, it is expedient to take the necessary measures for the development of business travel in our country.

	2017	2018	2019
Total exports of services	4 688 439	4 690 704	3 761 480
Transport services	971 396	1 223 822	1 107 970
Air transport	439 559	782 668	680 039
Sea transport	175 227	146 379	129 684
Other transport	350 689	288 095	294 484
Postal and courier services	5 921	6 680	3 763

*Table 4: Transport services exports of Azerbaijan, 2017-2019, by thousand USD
(Source: <https://www.trademap.org/tradestat/index.aspx>)*

In the field of export of transport services, air transport had a higher weight. However, for some reason, there was a decline in 2019. Exports of maritime transport services declined every two years. As we have noted, despite the great opportunities in the field of export of services in our country, the existing potential is used at a low level.

6. DEVELOPMENT FACTORS OF INTERNATIONAL TRADE IN SERVICES

Examining the strategies implemented in the field of export of services on a global scale, we can see that the following important factors have a greater impact on the development of this sector:

- The existence of "fundamentals" in the country. Fundamentals refers to the country's factor endowments, particularly entrepreneurial skills, natural resources and human capital, relevant infrastructure and telecommunications networks, the institutional environment related to services, and so on.
- Trade in services, investment climate and policies affecting the mobility of staff working in this field. These include transport and financial services, health and education services, foreign investment in this area, telecommunications and business process outsourcing, construction and information technology, and more.
- Policies for the development of services. This section includes policies to increase exports of services and investment in services, as well as special incentives for technology and raw material imports, subsidies or tax incentives for those operating in the sector, trade fairs abroad and the dissemination of relevant information to assist exporters.

7. CONCLUSION

The role of the services exports in the non-oil sector development in our country, the diversification of exports, the growth of foreign exchange earnings, the creation of new jobs and the stimulation of economic development in general is great. For this reason, the development of this sector is important. Given the existence of strong global competitors, the need for large investments, as well as the direct or indirect involvement of the state, as it covers not only one sector, but many sectors of the economy, we consider it appropriate to use tax incentives and subsidies. Thus, the quality of the environment, the strengthening of infrastructure, the protection of the environment, the expansion of relations between the services sector and related sectors, the high quality services that are created are not only important for the local community. The state, companies and public organizations have common interests in this work. For this reason, clustering of stakeholders has the advantage of being more effective in achieving these goals, benefiting from the scale effect (allocation of costs for road construction and maintenance) and benefiting public organizations. This has the ability to strengthen the competitive environment within the cluster. Of course, the creation of such clusters can be more effective due to government incentives. At the same time, strengthening the economic infrastructure of the state, increasing domestic capacity, improving the professionalism of staff in this area, as well as investments in the export of services, special discounts on technology and raw material imports, the introduction of necessary subsidies and other incentive policies can be useful in services exports.

ABSTRACT

As in all other countries gender issue in Azerbaijan still remains actual. Gender equality plays a major role not only in the development of any country's economy and in improving its social welfare. Although the legal equality of population in the country is regulated by relevant laws and other legal acts, the distribution of women and men by occupation and sector, the improper distribution of unpaid domestic work, gender discrimination in the workplace and other obstacles equality still exist. In the labour market, the employment rate of men is higher than that of women, which leads to social inequality. The article analyzes the level of employment of men and women in Azerbaijan, as well as the gender characteristics of the age and level of citizens' education, the unemployment rate and the short-term employment rate and the existing gender pay gap were also statistically assessed. The aim of the research is to estimate statistics of gender characteristics of employment in Azerbaijan, as well as to identify reasons of gender inequality based on the data provided by State Statistical Committee of the Republic of Azerbaijan, World Bank and World Economic Forum. The methodological basis of the research consists of analyzing statistical data of gender characteristics of employment in the Republic of Azerbaijan with the help of special graphs, tables, time series analysis, forecast and others. The results of the research take into consideration the levels of employment in Azerbaijan. The results can be used as an analytical and statistical data while making decisions to overcome the existing gender issue in the job market.

Keywords: *employment, gender inequality, labor market, statistics, unemployment*

1. INTRODUCTION

Gender equality allows all women and men, regardless of their gender, to participate equally in social, economic, political and other areas of life, as well as to ensure their equal access to economic resources. Ensuring social justice, human security, and men's and women's rights and freedoms in modern conditions is only possible with the real establishment of gender equality in all spheres of society, and the solution of this problem is one of the main goals of the Republic of Azerbaijan since the first years of its independence. Equality and freedom of men and women before the law in Azerbaijan are guaranteed in accordance with the Constitution of the Republic of Azerbaijan (Article 25) adopted by nationwide referendum in 1995. In addition, a number of important steps have been taken for gender equality by means of state support. "The Law on Guarantees of Gender (men and women) Equality" signed by Azerbaijani President in 2006, "Republican Comprehensive Program on Fight against Daily Violence in a Democratic Society" adopted by the Cabinet of Ministers in 2007, and "The Law on Prevention of Domestic Violence" adopted by National Assembly in 2010 is among those important steps taken to eliminate gender discrimination (<http://www.e-qanun.az>).

Since Azerbaijan ratified conventions such as “The Convention on the Political Rights of Women” (1992) and “The Convention on the Elimination of All Forms of Discrimination against Women (CEDAW)” (1995), as well as agreed with the international agreements such as “The Beijing Declaration and Platform for Action (1995), the Millennium Development Goals (MDGs) set forth in the Millennium Declaration (2000), and the Sustainable Development Goals (2015), it has made great achievements in issues related to the protection of human rights and freedoms, the protection of women’s rights, and the elimination of gender discrimination (<http://www.undp.org>). Although gender inequality has been partially eliminated as a result of these measures, the country’s indicators in international gender equality indices have not yet reached the desired level. Pursuant to the Global Gender Gap Index calculated by the World Economic Forum experts for 156 countries, Azerbaijan ranked 100th in 2021 (94th in 2020, 97th in 2019). In the index, which is rated between 0-1, Azerbaijan’s score was 0.688 for countries, 0.996 for educational attainment, 0.748 for economic participation and opportunity, 0.939 for health and survival, and 0.069 for political empowerment. Thus, although the country’s performance in reducing gender inequality in education and health is acceptable, we can still observe gender inequality in political empowerment. The level of gender inequality in economic participation and opportunity is relatively moderate. The labor force participation rate was 69.5% for women and 74.6% for men. In Azerbaijan, 35.8% of legislators, senior officials, and managers were female, 64.2% were male, and 58.0% of professional and technical workers were female, 42.0% were male (World Economic Forum, 2021). As reported by the World Bank’s “Women, Business and the Law 2020” survey published in 2020, Azerbaijan ranked 92nd (78.8 score) among 190 countries in the gender equality ranking (World Bank, 2020). Taking into account the gender factor, the Human Development Index was 0.934, the Women’s Empowerment Index was 0.427, and the Gender Inequality Index was 0.264 in Azerbaijan in 2019 (<http://www.stat.gov.az>). All this proves once again that there is gender inequality in Azerbaijan, which leads to unfavorable socio-economic consequences, and the statistical analysis of gender differences in unemployment and employment remains as a particularly significant and relevant subject. Gender issues has been studied by foreign and local scholars such as Eliseeva I.I., Dekina M.P., Tagarov B.Zh., Persteneva N.P., Panov A.M., Barchenkova E.Y., Muradov S.M., Abasov A.S., Mirzazade R.S., Mehtiyev A.S..

2. STATISTICAL ANALYSIS OF THE GENDER DISTRIBUTION OF THE ECONOMICALLY ACTIVE POPULATION

One of the most essential statistical indicators used to characterize gender equality in the labor market is the distribution of men and women in the economically active population. Conforming to this indicator, experts from the World Economic Forum assess women’s access to the labor market (Panov, 2014). Let’s analyze the general situation of economic activity of men and women in the labor market in Azerbaijan, using the data of the official statistical service of the Republic of Azerbaijan (Table1):

	2005	2010	2015	2016	2017	2018	2019
Economically active population (in thousands)	4380.1	4587.4	4915.3	5012.7	5073.8	5133.1	5190.1
Women	2111.3	2257.7	2404.5	2439.5	2464.8	2495.7	2526.0
Men	2268.8	2329.7	2510.8	2573.2	2609.0	2637.4	2664.1

*Table 1: Dynamics of economic activity of men and women in Azerbaijan in 2005-2019
(Source: <http://www.stat.gov.az>)*

As can be seen from Table 1, the number of economically active population in 2019 increased by 810 thousand people (18.5%) compared to 2005 and amounted to 5190.1 thousand people, of whom 251.6 thousand people were unemployed and 4938.5 thousand were employed. According to official state statistics, the share of women in the economically active population in Azerbaijan increased to 48.2% in 2005, 49.2% in 2010, 48.9% in 2015, 48.7% in 2016, 48.6% in 2017, 48.6% in 2018, and 48.7% in 2019. The gender distribution of the economically active population has not changed significantly during the years studied. In 2005-2019, more than 50% of the economically active population was men, and this indicator was almost the same with slight differences in all years. The highest share of men in the economically active population was registered in 2005 (51.8%) and the lowest in 2010 (50.8%). Compared to 2005, the number of economically active women increased by 6.9% in 2010, 13.9% in 2015, 15.5% in 2016, 16.7% in 2017, 18.2% in 2018, and 19.6% in 2019. On the other hand, the number of economically active men increased by 2.7% in 2010, 10.7% in 2015, 13.4% in 2016, 15.0% in 2017, 16.2% in 2018, and 17.4% in 2019 compared to 2005. The increase in the economically active population in 2005-2019 was due to the strong impact of the development of the oil and gas sector in the country on other economic fields (mainly service and construction), as well as the self-employment of small landowners and their families. The results of the selective statistical survey “On economic activity of the population” conducted by the State Statistics Committee of the Republic of Azerbaijan in 2019 in all regions of the country showed that the share of economic activity of working-age women was lower than men. This proves that women in the country are mainly involved in family care, cleaning and other unpaid work. The share of economic activity in the country was 72.4% for women (68.7% in urban areas, 76.6% in rural areas), 75.1% (72.3% in urban areas, 78.3% in rural areas) for men. In 2019, the level of economic activity of women was 11.3% for those aged 15-24, 78.6% for those aged 25-54, and 10.1% for those aged 55 and over. The level of economic activity of men was 12.3% for those aged 15-24, 75.5% for those aged 25-54, and 12.2% for those aged 55 and over. Thus, in 2019, the level of economic activity of women and men aged 25-54 was higher than in other age groups. Given that the majority of young boys and young girls aged 15-24 in Azerbaijan are involved in education, the figures showing a low level of economic activity in this age group are quite natural. The share of economically active women aged 15 and over is 6.4% lower than that of men of the same age throughout the country, 6.7% lower in urban areas, and 5.8% lower in rural areas. The economic activity of working-age women living in rural areas was 8.0% higher than that of urban women, and the economic activity of working-age men living in rural areas was 6.0% higher than that of urban men. In 2010-2019, the share of the unemployed in the economically active population in Azerbaijan decreased 5.6%-4.8%, while the share of the employed population increased 94.4%-95.2%.

3. STATISTICAL ANALYSIS OF GENDER DIFFERENCES OF EMPLOYMENT AND UNEMPLOYMENT IN AZERBAIJAN

Ensuring gender equality in the labor market results with an increase in employment, a decrease in unemployment and, consequently, an increase in income, which all these in turn reduce social tension and poverty, and improve living standards. The dynamics of gender distribution of the employed and unemployed population in Azerbaijan in 1999-2019 was as follows (Table2):

Table following on the next page

Year	Employed (in thousands)		Unemployed (in thousands)	
	Men	Women	Men	Women
1999	1978,5	1978,5	263,6	289,0
2000	2016,5	2016,5	246,5	268,2
2001	2032,6	2032,6	234,5	242,2
2002	2049,2	2049,2	220,6	220,6
2003	2066,7	2066,7	206,2	194,7
2004	2085,3	2085,3	179,8	168,9
2005	2104,7	2104,7	164,1	153,7
2006	2126,4	2126,4	157,0	134,2
2007	2149,2	2149,2	163,9	117,2
2008	2173,4	2173,4	142,4	119,8
2009	2199,8	2199,8	114,2	146,0
2010	2227,4	2227,4	102,3	156,0
2011	2250,0	2250,0	104,7	146,2
2012	2291,8	2291,8	103,5	139,6
2013	2337,5	2337,5	98,5	138,1
2014	2376,1	2376,1	99,6	138,2
2015	2408,2	2408,2	102,6	141,1
2016	2465,7	2465,7	107,5	145,3
2017	2502,8	2502,8	106,2	145,5
2018	2529,4	2529,4	108,0	145,8
2019	2556,8	2556,8	107,3	144,3

Table 2: Dynamics of gender distribution of the employed and unemployed population in Azerbaijan in 1999-2019

(Source: <http://www.stat.gov.az>)

As can be seen from Table 2, as a result of measures and reforms implemented in Azerbaijan since the first years of its independence, the number of unemployed of both females and males in the labor market in the country decreased in 1999-2019, while the number of employed population increased. Gender equality in employment allows establishing equal opportunities for both women and men to work with different levels of professionalism in various economic activities and jobs, receiving adequate and comparative rewards for work, equal provision of appropriate working conditions, social protection, as well as equal access to the labor market. Although the dynamics of the employed population for both women and men increased steadily between 1999 and 2019, the number of employed men exceeded the number of employed women in all years. In 1999, the share of women in the employed population was 47.7%; in 2019 it was 48.2%. In comparison with 1999, the number of employed men in 2019 increased by 29.2% and amounted to 2556.8 thousand people, and the number of employed women increased by 32% and amounted to 2381.7 thousand people. Compared to 2018, the number of employed men in 2019 increased by 27.4 thousand (1.1%), and the number of employed women increased by 31.8 thousand (1.4%). According to the results of the selective statistical survey “On economic activity of the population” conducted by the State Statistics Committee of the Republic of Azerbaijan in 2019 in all regions of the country, the employment rate for the population aged 15 and over was 59.7% for women (55.5% in urban areas, 64.7% in rural areas) and 66.9% for men (63.0% in urban areas, 71.4% in rural areas).

Figure 1: Gender distribution of the employed population in Azerbaijan in 1999-2019, in thousands

(Source: <http://www.stat.gov.az>)

In 2019, 10.3% of the total number of employed 2381.7 thousand women aged 15-24, 79.3% aged 25-54, and 10.4% aged 55 and over. 11.4% of the employed men (2556.8 thousand people) aged 15-24, 76.1% aged 25-54, and 12.5% aged 55 and over. This means that men start working at an earlier age than women and continue working until later in life. Women start working later than men and retire earlier. As can be seen from Figure 2, in 2019, the share of men in all age groups (except for 45-49 and 50-54 age groups) was higher in the employed population in Azerbaijan. Only 43.7% of the employed population in the 15-19 age groups was women. The high number of men in this age group is due to the fact that, unlike girls, young boys enter the labor market earlier without finishing school. Due to the fact that many young girls have graduated from higher and secondary schools and entered the labor market, the number of employed women in the 20-24 age groups increased slightly to 45.9%. Although the number of employed women in the 25-29 age groups was close to the number of men, the number of employed women and men in the labor market was equal in the 30-34 age groups. The fact that more than half of the employed population in the 45-49 and 50-54 age groups is women is due to the fact that women in these age groups, regardless of salary level, do not leave their permanent jobs and the number of men looking for work decreases. The increase in the proportion of men was due to the fact that women retired earlier.

Figure following on the next page

Figure 2: Gender and age distribution of the employed population in Azerbaijan in 2019, in percentage

(Source: <http://www.stat.gov.az>)

As in other countries, women and men are unequally represented in economic activities in Azerbaijan. In 2019, 41.8% of all employed women were involved in agriculture, forestry and fishing, 18.8% in trade, vehicle repair, 12% in education, and 6.1% in health and social care, and 21.3% in other areas. 30.6% of men worked in agriculture, forestry and fishing, 13.0% in construction, 10.1% in industry, 9.1% in public administration, defense and social security, 7.3% in transport and warehousing, 3.8% in education, 2.4% in real estate operations and 23.7% in other areas. According to the State Statistics Committee of Azerbaijan, while in 2018 only the number of women working in 3 types of economic activities (education, health and social services and recreation, entertainment, art) was higher than the number of men, in 2019, the number of women working in agriculture, trade, vehicle repairing, information and communication, healthcare, social services, education, recreation, entertainment and art, and other services exceeded the number of men (<http://www.stat.gov.az>). Studies show that in the labor market in Azerbaijan, as in developed countries, there is a problem of gender differentiation of income and wages. Although the principle of equal payment for equal work is provided by law in the Republic of Azerbaijan, the salaries of men and women working in the same field in the labor market differ. While the average monthly nominal salary in 2018 was 360.8 manats for women and 670.2 manats for men, as a result of the increase in the minimum wage, the level of this indicator in 2019 was 443.4 manats for women and 764.8 manats for men. That is, the average monthly salary of women was 58% in 2019, compared to 53.8% of the average monthly salary of men in 2018. The average monthly salary of women in the areas dominated by women in the labor market in Azerbaijan is considerably less than the average monthly salary of women. For example, although at the beginning of the 2019/2020 academic year, 81% of secondary school teachers, 79% of secondary special education teachers, and 55% of higher education teachers were women, the average monthly nominal salary of women in the education sector (409.7 manats) was 78.6% of the average monthly nominal salary of men (521.0 manats). This was due to the fact that the number of men working in management positions in the education sector and receiving high salaries was higher than the number of women. 48.8% of full-time general education principals and their deputies were women and 51.2% were men. In 2019, the share of women in the total number of civil servants in Azerbaijan was 29.0%.

The number of women holding civil service positions increased by 232 people (2.8%) in 2019 compared to 2018 and amounted to 8520 people, of which 465 people held administrative positions according to the 3rd higher classifications, 5076 people were in administrative positions according to the 4th-7th classifications, and 2979 people worked in auxiliary positions. In 2019, the average monthly nominal salary of women (325.1 manats) in the field of healthcare and social care services, which are dominated by women, was 72.4% of the average monthly nominal salary of men (449.2 manats). As of the end of 2019, the number of doctors was 31,829, of which 65.9% were women. In other areas, the high average monthly salary of men is explained by the large number of men in these areas. In the Azerbaijan labor market, women work more informally and in low-paid jobs than men, which lead to a significant difference in the salaries of men and women. In general, the difference between men's and women's wages is formed as a result of the influence of employment conditions such as the level of education of employees, individual characteristics like work experience, the sector of the economy, the type of employment contract, the size of the enterprise, and so on. The highest level of employment was observed in both women and men with full secondary education, and the lowest level was observed in those with primary education. In 2019, 40.5% of the employed population with higher education was women, 59.5% was men, 60.4% of the employed population with secondary special education was women, 39.6% was men, 29.7% of the employed population with vocational education was women, 70.3% was men, 48.8% of the employed population with full secondary education was women, 51.2% was men, 56.0% of the employed population with general secondary education was women, 44.0% was men, and 73.5% of the employed population with primary education was women, 26.5% was men. According to the data obtained by the State Statistics Committee of Azerbaijan applying International Labor Organization's (ILO) methodology (including the unemployed), the number of unemployed men in 2002-2008 exceeded the number of unemployed women, while in 2009-2019 the number of unemployed women exceeded the number of unemployed men. 49.7% of all unemployed in 2002, 48.6% in 2003, 48.4% in 2004, 48.4% in 2005, 2006 46.1%, 41.7% in 2007, 45.7% in 2008, 60.4% in 2010, 58.3% in 2011, 57.4% in 2012, 58.4% in 2013, 58.1% in 2014, 57.9% in 2015, 57 in 2016, 8%, 57.8% in 2017, 57.4% in 2018, and 57.4% in 2019 were women. These data indicate that the unemployment in the Republic of Azerbaijan is more specific to women. The unemployment rate for women was equal to 6.9% in 2010, 5.9% in 2015, 6.0% in 2016, 6.0% in 2017, 5.9% in 2018 and 5.8% in 2018. In 2019, the unemployment rate in the whole country was 5.7% for women (6.7% in urban areas, 4.7% in rural areas), 4.0% for men (4.9% in urban areas, 3.1% in rural areas). In 2019, the number of unemployed reached 81.3 thousand people (30.7 thousand for women, 50.6 thousand for men), and the number of those receiving unemployment benefits was 540 (283 for women, 257 for men). Despite the high share of men among those who received unemployment status in 2010-2019, the share of men in the number of those receiving unemployment benefits in 2012 and 2019 was small. In 2019, 0.51% of men and 0.92% of women with unemployment status were given the unemployment benefits.

Figure following on the next page

Figure 3: Gender distribution of the unemployed population in Azerbaijan in 1999-2019, in thousands
(Source: <http://www.stat.gov.az>)

The highest unemployment rates are noticed in the 15-19 and 20-24 age groups. The high unemployment rate for young boys and girls in the composition of unemployment remains a serious problem in Azerbaijan, as in most other countries. Unemployment rates for these age groups are higher in urban areas than rural areas for both females and males. There is a difference between the unemployment rates for boys and girls in the 15-29 age groups (27.9% for young boys and 36% for young girls). The high unemployment rate in this age group is explained by the reluctance of employers to hire inexperienced workers.

Figure 4: Gender and age distribution of the unemployed in Azerbaijan in 2019, in percentage
(Source: <http://www.stat.gov.az>)

Gender differences of unemployment are also reflected in education. The highest unemployment level is observed in the population with full secondary education, as in employment. More than half of the unemployed women – 55.9%, and 47.3% of the men have full secondary education. 46.4% of the unemployed population with higher education is women and 53.6% is men. 54.1% of the unemployed population with secondary special education is women and 45.9% is men. 62.1% of the unemployed population with vocational education is women and 37.9% are men. 61.4% of the unemployed population with full secondary education is women and 38.6% is men. 53.0% of the unemployed population with general secondary education is women and 47.0% is men. Finally, 66.7% of the unemployed population with primary education is women and 33.3% is men. One of the fundamental issues in the statistical analysis of gender differences in unemployment and employment is to determine its general development trend and forecast the level of unemployment and employment for men and women by analyzing the dynamics of the gender distribution of the unemployed and employed population. As a result of analytical smoothing of the dynamics series (Table 2) characterizing the distribution of the unemployed and employed population in Azerbaijan, the trend model $\hat{y}_t = 149,2 + (-8,1)t$ for unemployed men, the trend model $\hat{y}_t = 2234,7 + 28,9t$ for employed men was determined. The trend model was $\hat{y}_t = 166,4 + (-5,6)t$ for unemployed women and $\hat{y}_t = 2080,5 + 28,9t$ for employed women. According to the forecast on the basis of these models, a decrease in the level of unemployment and an increase in the level of employment for both men and women were expected to occur in a short term in Azerbaijan. However, since March 2020, the spread of coronavirus COVID-19 in Azerbaijan has had a direct impact on the country's labor market as a negative factor. In order to prevent a pandemic in Azerbaijan, the closure of enterprises, including small and medium enterprises, has increased the unemployment rates and decreased the number of employed population. In conformity with the preliminary data provided by the State Statistics Committee of Azerbaijan, despite the creation of more than 129,000 new workplaces in Azerbaijan, in 2020, the number of unemployed was 375.9 thousand people, which were 124.3 thousand people or 49.4% more than in 2019. The number of employed population decreased by 1.25% and amounted to 4876.6 thousand people (APA-Economics, 2021). Finally, due to the lack of official data on the gender distribution of unemployment and employment in 2020, it was not possible to conduct a statistical analysis of gender differences of unemployment and employment in Azerbaijan caused by the spread of coronavirus infection COVID-19.

4. CONCLUSION

Ensuring gender equality in unemployment and employment in the labor market is of crucial importance in the socio-economic development of any country and is a key mechanism in the struggle with poverty. A statistical analysis of the gender differences of employment and unemployment in Azerbaijan using data from the official statistics service found that despite the high proportion of women in the total population, more than half of the economically active population was men. Although women have the same legal status as men in the labor market in Azerbaijan, women's mainly engagement in family care, cleaning, and other unpaid work because of national customs and traditions, social problems (violence, economic and political oppression), difficulties in reconciling personal life with work, gender discrimination in employment, etc. all these prove that women do not have the same opportunities as men do. These reasons prevent many women from using their potential in the labor market and result with an increase in the number of employed men and in the number of unemployed women. At the same time, men start working at an earlier age than women and continue their work until a later age. Women start working later than men and retire earlier. Compared to the number of employed men, the number of employed women was higher in agriculture, trade, vehicle repair, information and communication, healthcare, social services, education, recreation,

entertainment, art, and other fields. Men worked mostly in industry, construction, transport and warehousing, tourist accommodation and catering, financial and insurance activities, real estate operations, professional, scientific and technical activities, administrative and support services, public administration and defense, and social security. However, there is a variation between the salaries of men and women working in the same job in the labor market. This variation was primarily due to the vertical (greater number of men in leadership positions than women) and horizontal gender segregation (male dominance in the labor force) in the country's labor market.

IMPACT OF COVID-19 ON THE TOURISM SECTOR IN AZERBAIJAN: PROBLEMS AND DEVELOPMENT PROSPECTS IN THE POST-COVID PERIOD

Leyla Hajiyeva

Azerbaijan State University of Economics, Azerbaijan

Leyla_Hajiyeva@unec.edu.az

ABSTRACT

The pandemic of the new coronavirus and the strict anti-epidemic measures imposed by various countries have accelerated the transformation of world tourism. The industry is losing hundreds of billions of dollars and millions of jobs. However, at the same time, the digital travel tech startups are entering the market, the new opportunities for individual tours and the international cooperation formats are emerging. The article investigates the impact of the pandemic on the economy and the tourism sector of Azerbaijan, discusses the problems that have arisen in the field of tourism. It is noted that the current crisis has revealed the existing structural weaknesses in the tourism economy (this is a fragmented sector, represented mainly by small and medium-sized businesses, overly dependent on seasonality), as well as gaps in the readiness of governments and businesses to respond quickly to the new challenges and changes. The socio-economic consequences of the pandemic and the possibilities transformation of tourism are analyzed. By conducting a comparative analysis of statistical data, the main changes in inbound and outbound tourism are identified, an analysis of various scenarios for the development of tourism in the post-covid period is carried out. The results of the study make it possible to put forward a number of proposals for the restructuring of the industry and the further development of tourism in Azerbaijan.

Keywords: *COVID-19, pandemic, tourism restructuring, tourism sector*

1. INTRODUCTION

In the 21st century, humankind faced a number of global crises that had a negative impact on the growth of the entire world economy. Having survived the economic crises of 2001 and 2008, the world faced an even more unpredictable and destructive situation in 2020. Given the cyclical nature of economic growth, we can state the beginning of a new global financial crisis in the short run. To the global economic problems, such as trade and customs wars, the global GDP slowdown, energy resources sales and prices slowdown, was added a new threat of global scale-the coronavirus infection, which within a year has brought down futures quotes for oil to negative values and questioned the viability of globalization in the current conditions. The upcoming global financial crisis, complicated by a global pandemic, might be the most crucial test for the global economy of the 21st century (Kostin K.B.& Khomchenko E.A., 2020). In recent years, the global economy has grown more slowly than at the beginning of the 21st century: developed countries - at an annual average of 2% against 2.4%, developing countries - at an annual average of 5% instead of 7%. The world was struggling to overcome the effects of the crisis of 2009, and the coronavirus not only cancelled out the achieved, but also accelerated a number of processes that pose even more complex challenges to humankind. As per the International Labour Organization, the "coronacrisis" jeopardized more than 500 million work places in the world, and 100 million of them will be lost permanently. As a result, about 120 million people in developing countries will end up in extreme poverty. Tourism has become one of the areas of the global economy that has felt the full negative impact of the pandemic. The closure of the airspace of many countries, the imposition of many restrictions, the strengthening of sanitary and hygienic requirements, the need to observe social distance, the increasing concern of the population for their safety and psychological fear of a new virus led

to a complete crisis of tourism and a number of related industries (hotel business, air transportation of passengers, entertainment, etc.). The article examines the impact of the pandemic on the tourism sector of Azerbaijan, analyses the existing problems in the industry and offers a number of recommendations for the development of tourism in the post-crisis period.

2. IMPACT OF THE PANDEMIC ON WORLD TOURISM

Tourism is an important area of socio-economic activity and makes a significant contribution to the state budget revenues of many countries. According to the World Travel & Tourism Council (WTTC) data, which represents the international tourism industry, the contribution of tourism to the global economy in 2019 amounted to \$ 9.1 trillion, or 10.4% of world GDP (<https://wttc.org/Research/Economic-Impact>). Council estimates the travel and tourism industry accounts for 330 million work places worldwide (1 in every 10 work places worldwide). In early 2020, all countries were covered by a pandemic of a new type of coronavirus, COVID-19, announced by the World Health Organization. Tourism is one of the global industries most affected by the economic impact of the pandemic (Aburumman, 2020). Traditionally, the tourism and recreation industry is affected by external shocks – for example, events occurring in specific host countries can lead to a large-scale redistribution of trips to other resort regions. However, such powerful shocks as COVID-19 pandemic can paralyze the world tourism market for an indefinite period. Along with the epidemics of viral and infectious diseases, exogenous factors that depress the global hospitality industry can also include military conflicts and terrorist threats, climate change and natural disasters, abrupt price changes of the oil and oil products, currency fluctuations, financial and economic crises, etc. (Bayeva M. A. & Knobel A. Y., 2020). Today, tourism and related industries are experiencing an unprecedented decline due to the coronavirus pandemic. Many experts in tourism state that the current crisis associated with the new virus is the worst for the industry since 1950. Thus, according to the UNWTO, the annual figures for tourism in 2020 had declined by 73% on the average compared to 2019. The slowdown was observed in almost all regions of the world (Fig. 1).

Figure 1: YTD changes by region, 2020 (%)

(Source: <https://www.unwto.org/international-tourism-and-covid-19>)

As it follows from the above graph, Asia and the Pacific suffered the most, with an annualized slowdown in tourism of -84%, followed by the Middle East (-75%), Europe (-70%), Africa (-69%) and Americas (-69%). The Asian region was the first to feel the impact of the new virus, accompanied by travel restrictions, and sometimes a complete lockdown, in addition, this region was the most active in terms of tourist flows. We consider the change in tourism indicators in 2020 by months (Fig. 2).

Figure 2: YTD changes by month, 2020 (%)

(Source: <https://www.unwto.org/international-tourism-and-covid-19>)

As it follows from the graph, the maximum slowdown in tourist figures was observed in April-June 2020, which is due to the imposition of strict restrictions by a number of countries and the air spaces shut-down. We will notice that along with tourism, passenger air transportation also faced global revenue losses. So, according to the site (<https://www.statista.com/statistics/1106679/coronavirus-airlines-passenger-revenue-region/>), total revenue losses of passenger air transportation in 2020 amounted to \$370 billion, including revenue losses for individual regions were as follows: Asia-Pacific region - \$120 billion, Europe - \$ 100 billion, North America - \$88 billion, Latin America - \$26 billion, the Middle East - \$ 22 billion, Africa - \$ 14 billion. In assessing the loss of tourism due to COVID-19, the WTTC notes that the sector has lost 4.5 trillion US dollars, while the contribution of tourism to Total GDP was 5.5% (4,671 billion US dollars), that is 4.9% less than in 2019.

3. IMPACT OF COVID-19 ON THE TOURISM SECTOR OF AZERBAIJAN

As elsewhere in the world, the pandemic has caused great damage to the tourism sector of Azerbaijan. The first case of infection in the country was registered in February 2020. The first infected with the virus were citizens of the country who arrived from Iran, and after confirming cases of infection, it was agreed the country's border with Iran should be closed for two weeks. Naturally, at the time, it was not yet clear how dangerous and contagious the virus was, and no one could predict how long this situation would last. In early March has been a ban on imports of Iranian products into the country, and in all educational institutions located in the country, a week vacation was announced to ensure the safety of the population and prevent the spread of the virus, and later the period was extended until March 27. On March 12, in our country the first case of death from a new coronavirus was confirmed. On March 14, social isolation measures began to take effect in our country, mass events were banned, appeals to people with the slogan "Stay at home" were made, the land and air borders of the country were temporarily closed (Hajiyeva L., 2021). The number of people infected with the COVID-19 virus in our country is reflected in Table 1. Also note that the first information about the number of infected people in Azerbaijan was published on the website of the World Health Organization (WHO) (<https://www.worldometers.info/coronavirus/country/azerbaijan/>) on March 24 of 2020 (15 people).

Date	30/ 03 2020	30/ 04 2020	31/ 05 2020	30/ 06 2020	31/ 07 2020	31/ 08 2020	30/ 09 2020	31/ 10 2020	30/ 11 2020	31/ 12 2020	31/ 01 2021	28/ 02 2021	31/ 03 2021	30/ 04 2021
Number	64	38	248	556	318	126	110	1022	2981	1052	153	270	2237	1196

Table 1: Daily New Cases in Azerbaijan (by selected dates)

(Source: <https://www.worldometers.info/coronavirus/country/azerbaijan/>)

As it shown in the Table, the number of infected people began to grow from October and reached its peak in December (on December 13, the highest daily number of infections so far was recorded – 4451 people). At present, with the number of 328.159 people infected (12 may 2021), Azerbaijan ranks 53 among 221 countries (the number of deaths was 4726, the number of survivors was 309771, the number of active cases was 13662). In general, if we look at the graph of the daily number of infections in our country, we can observe that the process is of wavy (cyclic) nature (<https://www.worldometers.info/coronavirus/country/>). The graph shows three waves, the smallest of which is observed in May-August 2020, the largest wave-in October 2020-January 2021, and a relatively average wave - in March-May 2021. Tourism plays a key role in the economy of Azerbaijan and has significant potential for development (Hajiyeva&Teymurova, 2019). The COVID-19 pandemic has significantly affected the tourism sector and, since March 2020, has led to a serious decline in this area. According to statistics, 686.3 thousand people from 155 countries visited Azerbaijan in January-September 2020 (3.5 times less than in the same period last year). In order to prevent the spread of coronavirus infection, the imposition of a restrictive regime at the state border between the Republic of Azerbaijan and neighbouring states, as well as temporary restrictions on the travel of citizens in most countries of the world, led to a sharp decline in the number of arrivals to our country from April to September 2020, and trips were carried out mainly for non-tourist purposes. Unfortunately, currently, full statistical indicators for 2020 have not been published, so the analysis covers January to September. For the analysis, we will consider the data provided by the State Agency for Tourism of the Republic of Azerbaijan for 2020 (Figure 3). January 2020 was successful for tourism, compared to the corresponding indicator of 2019, the number of tourists arriving in Azerbaijan increased by 18.1% and amounted to 226,200 people, and the most tourists came to our country from Russia (+20.5%), Georgia (+14.6%), the Middle East (+20.8%), Turkey (+12.1%) and Iran (+26.5%). The increase in the flow of tourists, also, continued in February, which is not very suitable for travel. The number of tourists coming to the country in this month, increased by 15.8%, the majority of them came from Georgia -59,000 people (+11.4%) and Russia -55,000 people (+23.3%). The number of tourists coming from Turkey was 23,600 (+5.9%), from the Middle East – 16,900 people (+11.2%), from Iran - 13400 people (+22.9%). The highest growth is observed in the number of tourists from Russia and Iran.

Figure following on the next page

Figure 3: Number of tourists visiting Azerbaijan in the first half (January-June) of 2019 and 2020, in thousands

(Source: https://tourism.gov.az/uploads/documents/statistic/_report)

According to the State Tourism Agency of the Republic of Azerbaijan, a sharp decline of tourism indicators starts in March. It should be noted that March is the most favourable time for tourism in Azerbaijan, and many tourists come to our country to observe the celebration of Novruz Bayram. In March, 93,000 people visited Azerbaijan, which is 153,000 people (62.2%) less than the corresponding figure for 2019. 35,000 people (-47%) from Russia, 24,600 people (-60%) from Georgia, 13,200 people (-47%) from Turkey and 4,100 people (-88.5%) from Iran visited our country. In April, the crisis in tourism continued and deepened, as only 20,000 tourists visited our country this month, which is 218,000, or 91.7% less than in 2019. The number of tourists from Russia declined by 90.3%, from Turkey - by 79%, from Georgia - by 94.6%, from Iran - by 78.5%. Negative trends in tourism continued in May, when 25,000 foreign tourists visited our country, which is 89.9% less than last year. The tourists were from Turkey (-69%), Russia (-91.9%), Iran (-70.7%) and Georgia (-93.7%). In June, 26,000 tourists visited our country, which is 91.7% less than in 2019, while the number of tourists from Turkey declined by 59.9%, Russia - by 94.8%, Iran – by 82.7% and Georgia – by 93.7%. According to the information on the website of the State Statistics Committee of the Republic of Azerbaijan (stat.gov.az) in January-September of 2020, the majority of those tourists arrived in our country were from Russia (28.1%), Georgia (24.9%), Turkey (18.1%) and Iran (8.3%). The majority (78.7%) of people traveling to our country were men, and 21.3% were women. According to statistical information there have been changes in the use of vehicles by tourists arriving in Azerbaijan, if in 2019 52.9% of tourists chose the road and railway transport, then in 2020 this indicator increased by 16.1% and reached 69%, and the number of people using air transport declined by 11.8% (from 40.5% to 28.7%). Since sea transport in our country is not developed, this indicator is very low, in 2019, it increased by 0.8%, and in 2020 the number of people traveling by sea increased by 1.5% and amounted to 2.3%. Compared to the corresponding period of 2019, the number of citizens of the Republic of Azerbaijan traveling abroad declined by 3.9 times and amounted to 1073.4 thousand. 69.9% of those who left were men and 30.1% are women. The number of Azerbaijani citizens traveling to Iran during this period declined by 4.6 times, to Turkey by 3.5 times, to Georgia by 4.1 times, and to the Russian Federation by 3.5 times. Let's analyse the use of vehicles by tourists traveling abroad from Azerbaijan: in 2019, 75.9% of our passengers chose road and railway transport, in 2020 this figure increased by the

factor of 0.7% and reached 76.7%, while the number of air transport users increased by 4.1%. Since sea transport in our country is not developed, this figure is very low, in 2019 it increased by 0.8%, and in 2020 the number of people traveling by sea increased by 1.8% and amounted to 2.5%. If you look at the statistics of domestic tourism, the number of people who made tourist trips in 2020 declined by 3.4 times compared to 2019 (4352.9 thousand people, including 56.5% men, 43.5% women) by 1268.7 thousand people (57.6% men, 42.4% women). If we overview the statistics of domestic tourism, the number of tourists who made tourist trips in 2020 declined by 3.4 times (57.6% men, 42.4% women) compared to 2019 (4352.9 thousand people, 56.5% of which were men, 43.5% were women) and amounted to 1268.7 thousand people. The purpose of most of the trips was related to visiting relatives, friends, and vacation-related trips. As for the vehicles used, intercity buses and cars were used more. In terms of the vehicles used, intercity buses and cars were preferred. Thus, our analysis shows that the COVID-19 pandemic has negatively affected the development of tourism in Azerbaijan, the indicators of inbound and outbound tourism have declined by 3.5-4 times, and domestic tourism indicators have declined by 3.4 times compared to 2019.

4. MAIN SCENARIOS AND PROSPECTS FOR THE DEVELOPMENT OF TOURISM IN THE POST-COVID PERIOD

UNWTO considered three scenarios for the decline and recovery of international tourism after the coronavirus pandemic, according to which by 2020 the number of international tourist arrivals could decline from 58 to 80%. The first scenario assumed a decline in international tourist flows by 58% if the gradual opening of borders and the easing of restrictions on travel begin in early July; the second scenario envisaged a decline in world tourism indicators to 70% provided that the recovery process begins in September; the third, worst possible scenario envisaged a decline in indicators to 78% if international tourism does not begin to recover before December. Unfortunately, the results of 2020 (-73%) showed that the development will follow the third scenario. Researches of a number of authors are dedicated to impact of the coronavirus pandemic on the hospitality and tourism sector. Several experts note that the recovery of the industry and the achievement of the results of 2019 can be expected no earlier than 2023 (Takudzwa, 2020). Others (Gössling et al, 2020) draw parallels between the impacts of previous crises on the tourism sector and state that the Severe Acute Respiratory Syndrome (SARS) outbreak in 2003 or the global financial crisis of 2008-2009 had a short-term impact on tourism. Bakar and Rosbi (2020) studies analyses the impact of Covid-19 on the hospitality sector based on a supply and demand analysis. The authors note that the pandemic has a high psychological impact on tourists and caused panic, which led to a sharp decline in demand for the services of the hospitality and tourism sector. D'Orazio et al, (2020) investigates the dynamics of infected people in tourist centres using an agent –based model and analyses social restrictions aimed at reducing the number of infected people with the virus. Takudzwa. C. Maradze et al, (2020) note the socio-economic impact of the pandemic on tourism, expressed in a decline in demand for tourist services; fall in income; job losses and rising unemployment; the need for social support for sector workers and, as a result, increase in social expenditure; increased requirements for public safety and health. Hao et al (2020) studies the impact of Covid-19 on the hotel sector and identifies six stages of anti-crisis management of pandemic: the pre-crisis stage; the warning factor monitoring stage; the interim stage; the recovery stage; and the stage of making specific decisions. Anton Pak et al, (2020) studies the economic consequences of the pandemic associated with a decline in economic activity, the breakdown of communications, the reduction of productivity of many enterprises, the closure or partial operation of a number of companies, which led to an increase in unemployment and a decrease in household incomes. The authors note that the pandemic has caused fear and panic among the population, which has led to a change in the structure of its spending.

Passenger air travel, tourism, restaurant and hotel business, and entertainment have been the most impacted sectors. Consolidation of all countries is proposed to solve the problems; the need for mutual economic assistance to less developed countries that are not able to meet the pandemic independently; increased investment in the development of a better vaccine; and the adoption of protective measures in the field of sanitary and hygienic conditions. T. Ibn-Mohammed, et al. (2021) studies the impact of the coronavirus pandemic at the macro level (the impact of global production and trade, as well as export and import) and at the micro level (changes in consumer behaviour patterns) on the example of a number of countries. The authors point out that the unprecedented impact of Covid-19 on the aviation sector and tourism, emphasizing that according to the modelling of various development scenarios, depending on the period of restrictions and the closure of air borders, the arrival of international tourists will fall from 58% to 78%, while the prospects for further development of the industry remain extremely uncertain. Abhimanyu Awasthi et al, (2020) points out that in the context of a global pandemic that has affected all areas of economic development, it is necessary to develop socially responsible tourism-the tourism aimed at sustainable development, that is, economic growth, environmental integrity and social justice. Nana Kvirvelia and Mariam Tsitsagi (2021) analysing the impact of Covid-19 on the tourism sector in Georgia, note the need to adapt to the real situation and develop new strategies for hotels. Adapted strategies should focus on the development of domestic tourism, the use of a more stimulating price mechanism, as well as focus on improving the quality of tourist services provided and strengthening protective measures. Hajiyeva L.A. (2021), analysing the impact of the pandemic on the tourism sector of Azerbaijan, talks about the necessary changes in national tourism companies, including the development of domestic tourism at the initial stages and, in particular, ecological tourism; the introduction of digital technologies (the preparation of virtual excursions to cities and museums, the launching of new online platforms); introduction of new rules of movement (vaccinations, mandatory wearing of a mask, observance of physical distance, changes in visa rules), etc. The World Travel and Tourism Council (WTTC) provided its recommendations for the recovery of the tourism industry:

- 1) Overturn of travel recommendations and bans on non-essential international trips that prevent traveller insurance.
- 2) Adoption of global health and safety protocols, provision of travel safety guarantees to travellers.
- 3) Adoption of a rapid test and tracking strategy, which helps to contain the spread of the virus.
- 4) Closer collaboration between the public and the private sector to ensure a standardized and global approach to the crisis.
- 5) Continued government support for the sector in terms of tax incentives and liquidity incentives, as well as measures to protect employees

5. CONCLUSION

The assessment of the current situation shows that all future trips need a new scenario and the introduction of new requirements. Many European countries already require travellers to have a certificate of vaccination (as well as vaccines accepted in Europe such as BioNTech produced by a German company or the American vaccine Pfizer). Compliance with the new rules will be the focus of countries around the world to minimize risks to the health and prevent any future infections. Developing new "ethics rules" and compliance with them (for tourists, residents, and companies) can be a prerequisite for ensuring "responsible behaviour" and accountability for businesses, communities, and tourists. Travel companies today must regulate their activities in accordance with changes in the environment and pursue a flexible policy of adaptation to new conditions. It should be taken into account that as a result of today's restrictions on the market there is a deferred demand, and the volume of this demand is quite large.

In such circumstances, travel companies that apply a more flexible policy may benefit. It is necessary to use the situation to develop more profitable proposals, to create a better infrastructure. In order to compete, companies in this sector need to quickly adapt to changing requirements, as well as develop technological projects and digitalization in the tourism sector. The demand for online platforms is growing day by day; the digitalization has a strong impact on the tourism sector. Summarizing our research, we propose the following to help the tourism sector overcome the crisis caused by the pandemic:

- Implementation of a number of measures to reduce socio-economic consequences (preservation of work places, strengthening confidence and security, introducing new sanitary rules);
- First of all, the development of the strategy for the development of the domestic tourism market;
- Strengthening the competitiveness and sustainability (development of tourism infrastructure, improving the quality of services, diversification of offers and markets, focus on the development of domestic tourism);
- Application of digitization (use of QR codes, mobile applications, new technologies, organization of online excursions in social networks, etc.);
- Development of socially responsible tourism (creation of necessary products and infrastructure for the development of green tourism);
- Transition from mass tourism to the organization of individual and small tours;
- Coordination and cooperation of all parties to achieve the goals of sustainable development and transformation of the tourism sector.

THE PROBLEMS OF INTERNATIONAL TOURISM DEVELOPMENT DURING COVID 19 PANDEMIC

Saida Babayeva

*Azerbaijan State University of Economics (UNEC), Azerbaijan
saida.baba@unec.edu.az*

ABSTRACT

In recent decades, international tourism has become one of the fastest growing industries. This is due to the fact, that international tourism is an important source of foreign exchange earnings in the economy, affects GDP increase, provides an increase of employment in service sector and development of industries related to serving foreign tourists. Azerbaijan, regained its independence in 1991 and since then tourism has become one of the promising industries with wide range of opportunities and untapped potential. International tourism development will contribute to overall economic growth, increase employment opportunities and growth rate of foreign exchange earnings. Considering this, Azerbaijan government declared tourism one of the priority areas of the non-oil sector. As a result, the development of tourism in Azerbaijan has become one of the fastest growing sector of the economy. This article examines trends of tourism development in the Republic of Azerbaijan for 2013-2019. In 2020 COVID-19 pandemic caused significant damage to almost all sectors and especially tourism. Being still emerging industry in Azerbaijan, tourism faces a number of challenges due to the pandemic. The article considers the ways of mitigating impacts of lockdowns on tourism, alternative ways of tourism development, the opportunities of digitalization in tourism sector as well as the issues of the development of this industry in the period after the pandemic.

Keywords: *tourism, international tourism*

1. INTRODUCTION

Tourism is one of the youngest industries and economic studies devoted to its development began to appear since 50s of the twentieth century. The economic aspects of tourism are described in the works of K.Cooper, R.Sharply, D.Telfer. Then there were studies devoted to the problem of supply and demand in tourism, tourism statistics which were presented in the works of Witt.S, Rithie.B, Burns.P, Palmer.K and others. By the 90s of twentieth century new directions in the study of tourism appeared, revealing the impact of tourism on economic development. The relationship between tourism and economic growth is reflected in the work of Sinclar M. The impact of tourism on the welfare is reflected in the work of Copeland B. In Azerbaijan, the problems of tourism were studied by R. Kasumov, A. Alirzayev, L. Allahverdiyev, I. Akhmedova and others. Within the framework of the development of the non-oil sector in Azerbaijan tourism is one of the important. This choice is explained by the fact that tourism is a highly profitable and dynamically developing sector of the economy. The development of tourism and especially international tourism is a source of foreign exchange earnings in national economy, increases GDP. provides an increases in employment in the service sector and the development of industries associated with tourism. Thus the development of international tourism contributes to the overall growth of economy, employment and foreign exchange earnings in the country. The development of international tourism has a direct and indirect impact on the development of various economic entities. The international tourism directly affects tourism enterprises (tour operators and travel agencies), hotels, health resorts, restaurants, cafes, museums, excursions and entertainment centers. The development of international tourism affects also shopping centers and production of souvenirs.

In addition, the development of international tourism affects the work of embassies and consulates, the transport sectors (airways, railways stations, bus stations), insurance companies, communication services, etc.

2. ANALYSIS OF THE MAIN INDICATORS OF THE TOURISM INDUSTRY IN AZERBAIJAN

The law “On Tourism” adopted on 04.06.1999 No. 674 IQ regulates the tourism sector in Azerbaijan. The adoption of this law determined the principles of state policy in the area of tourism development. The Law of the Republic of Azerbaijan “On Tourism” is aimed at establishing the legal basis for the development of tourism in the country. It contributes to the creation of a single tourism market in the Republic of Azerbaijan, regulates relations arising in the area when realizing the rights of citizens and stateless persons to rest, travel and freedom of movement. The law also defines the procedure of using the tourism resources of the Azerbaijan Republic. In 2002 the country adopted a state program for the development of tourism in Azerbaijan. Then the Ministry of Tourism prepared a program “Development of tourism in AR for 2008-2016”. Taking into attention the prospects of the industry, 2011 year was declared as year of tourism in Azerbaijan. Then the government adopted a Strategic Roadmap for the development of the specialized tourism industry in Azerbaijan. The main goals in the tourism sector of the Republic of Azerbaijan until 2025 were selected in this strategy. These goals are the next:

- 1) Full implementation of the tourism potential of Baku providing the attraction of a large number of foreign tourists to the city;
- 2) Formation of favorable environment in Azerbaijan for the development of the tourism sector in the country;
- 3) Development of regional types of tourism for both local and regional tourists;
- 4) Establishing a national tourism quality system to improve tourist satisfaction; (Strategic roadmap for the development of specialized tourism industry in the Republic of Azerbaijan pp.2-3)

Table following on the next page

Table 1: The main indicators of tourism for 2013-2019 years

	2013	2014	2015	2016	2017	2018	2019	Dynamics for 2013-2019 (%)
Number of tour operators and travel agencies	197	218	243	272	339	374	432	219.3
Annual growth rate(%)		110.7	111.5	111.9	124.6	110.3	115.5	
The number of people employed	1729	1794	1586	1838	1891	2074	2205	127.5
Annual growth rate (%)		103.8	88.4	115.9	102.9	109.7	106.3	
Profit of tour operators and travel agencies (mln.azn)	29.6	27.0	30.8	29.1	36.7	46.1	50.4	170.3
Annual growth rate (%)		105.1	117.3	100.8	111.6	137.5	112.3	
Number of tours sold	65448	66233	44615	36978	44066	49992	63885	97.6
Annual growth rate (%)		101	67	83	119	113	128	
Including citizens of Azerbaijan	7078	6990	4695	5842	5850	7390	7501	106.0
Annual growth rate(%)		99	67	124	100	126	102	
For Azerbaijani citizens abroad	53771	54900	38002	24368	31612	36463	44915	83.5
Annual growth rate (%)		102	69	64	130	115	123	
Foreigners and stateless persons	4599	4343	1918	6768	6604	6139	11469	249.4
Annual growth rate (%)		94	44	353	98	93	187	

Source: Tourism in Azerbaijan 2020, p. 12

As can be seen from Table 1, in 2013-2019 in Azerbaijan the number of tour operators and travel agencies increased by 2.2 times, the income of tour operators and travel agencies increased by 70.2%. During this period the number of tours sold to tourists decreased by 2.4%. If consider the annual growth rates, a significant decrease by 33.0 % took place in 2015 and by 17.0 % in 2016 .In subsequent years, there has been an increase of annual growth rate. The same trade can be traced in the number of tours sold to Azerbaijani citizens within the country. The number of them increased by 6.0% over the entire period, and the largest decrease was observed in 2015. The tours sold to Azerbaijani citizens traveling abroad in 2013-2019 decreased by 17.5 %.The largest decline took place in 2015 and 2016.The decrease was associated with a fall in in oil price, a depreciation of manat and a decrease in real incomes of the population. During the study period, the number of tours sold to foreigners and stateless persons has significantly increased by 2.5 times. It should be noted that in 2013 only 7.0% of tours were sold to foreigners and stateless persons. By 2019, their share increased to 18.0%. In 2013, the tours sold to the citizens of Azerbaijan accounted for 93%. 10.8 % from them were tours within the country and 82.2 % were foreign trips.

In 2019, the share of tours sold to Azerbaijani citizens decreased compared to 2013 to 82.2 %, 11.7% of which were tours within the country, and 70.3 % were foreign trips. Thus, the analysis showed that in Azerbaijan in 2013-2019 there was a trend in favor of international tourism growth.

Table 2: Dynamics of foreign tourists arriving in Azerbaijan in 2015-2019.

	2015	2016	2017	2018	2019
Total	2009	8949	13455	12777	30950
USA	12	28	161	40	61
Germany	45	83	49	115	247
UAE	55	1262	5009	3964	1899
Great Britain	35	61	131	7	16
China	9	352	91	25	133
France	94	133	36	37	141

Russia	1052	4321	1985	2225	3637
Turkey	129	50	444	229	1211
Other countries	578	2659	5549	6135	9079

Source: Tourism in Azerbaijan 2020, p.17-18

As it can be seen from table 2 in 2015-2019 the number of tourists visiting the country increased by 10.7 times. This significant growth is because the number of foreign tourists in the country in 2015 was very small – only 2009 people. Table 2 shows that the greatest growth by 34.0 times was observed among tourists from the UAE. In descending order the next are tourists from China with growth by 14.8 times; Turkey with growth by 9.4 times; Germany with growth by 5.5 times; Russia with growth by 3.5 times. The number of tourists from India and Israel has significantly increased, but because of absence of information, it is impossible to demonstrate their growth correctly. In 2015 more than half of foreign tourists (52.4%) were Russian tourists. The proportion of tourists arriving in Azerbaijan from various countries did not exceed 10 % level and amounted to 6.4 % for tourists from Turkey, 4.7% for tourists from France, 2.7 % for tourists from the UAE and 2.2% for tourist from Germany. The share of tourists from other countries was very small and totaled 28.8%. By 2019 the geography of tourists arriving to the country changed. Thus the tourists arriving from Israel accounted for 29.7 %. Then in descending order follows India for 16.9%, Russia for 11.8%, UAE for 6.1% and Turkey for 3.9%. Other countries accounted for 29.3 % and the share of each country in this group does not exceed one percent level. The small proportion of tourists per country indicates that there is not enough information about the opportunities for recreation and leisure in Azerbaijan there. In 2015, 93% of tours was sold to the citizens of Azerbaijan Republic and 7 % was sold to foreigners and stateless persons. 13.2% of tours to the citizens of Azerbaijan were domestic the rest ones were foreign. By 2019 the share of tours sold to the citizens of Azerbaijan Republic decreased to 82.0 % while the share of tours sold to foreign citizens increased to 18.0% respectively. 6.9 % of tours sold to the citizens of the AR are travel within the country and 93.1% are foreign travels. Such distribution of tours indicates that the citizens of Azerbaijan prefer to rest outside the country. One of the reason is the high cost recreation within the country. During the study period the cost of tours increased by 55.3 %. This indicator increased 2.5 times for the citizens of AR and it increased 3.9 times for foreigners and stateless persons. (Tourism in Azerbaijan pp.15-19).

However, COVID 19 has adjusted the development of tourism around the world including Azerbaijan. The tourism industry losses multimillion of dollars and people employed in this industry lose their jobs and income. All of this negatively affects the tourism industry. At the same time, the existing problems stimulate the search for new opportunities for tourism and the growth of digitalization of tourism.

3. PROSPECTS FOR THE DEVELOPMENT OF TOURISM IN AZERBAIJAN

Azerbaijan is located at the junction of Europe and Asia there all conditions for development of international tourism here including historical monuments, excellent climatic conditions and picturesque landscapes. However, Baku is the main attractive center for tourists. Natural and climatic conditions of Azerbaijan, its geographical location on the trajectory of the Great Silk Road creates conditions for diversifying the directions of tourism. First, it is cultural tourism. It includes acquaintance with history, art, architecture and way of life of the population of the country. Secondary it is health tourism. This potential is represented by a large number of mineral springs in various regions of the country. Then, Naftalan can be considered as a unique health resource. Third, there are summer and winter types of mountain tourism here. The country has such favorable conditions for this as picturesque ridges Greater and Lesser Caucasus. At present time, the Tufandag and Shahdag operates as summer-winter recreation center. In the future, it will be possible to organize summer-winter recreation complexes on the liberated territories of Karabakh and Kalbyadzar-Lachin regions. Fourth, the organization of beach tourism has good perspective for the country. The long sea line of the Caspian Sea from north to south is a favorable condition for beach tourism, the potential of which is not sufficiently used. The lack of infrastructure meeting standards does not allow beach tourism to compete with Turkey, Egypt, the United Arab Emirates, etc. In addition to infrastructure, the organization of leisure is also important for the development of tourism. It includes the creation of entertainment centers, various attractions, the organization of concerts, etc. Fifth direction is business tourism. For development this direction in Azerbaijan there are hotels, conference rooms, as well as experience in organizing such events here. In addition, the country has conditions for the development of sport tourism, ecological and hunting tourism. For this purpose, the necessary infrastructure has been created, including Olympic complexes etc. In Azerbaijan, the opportunities for extensive growth of the tourism sector has not been still exhausted - many territories that could be used for the development of tourism are still waiting for its investors. It should be noted that tourism was chosen as a priority area for the development of the non-oil sector of the economy and it is supported by the state. As a result of government support in the country infrastructure for the development of tourism was created, including conference rooms, hotels, concert halls, etc. Geographical position of Azerbaijan, natural and climatic condition of the country, monuments of history and culture, rich cuisine – all of them are favorable conditions for the development of tourism. The main problem of tourism development in Azerbaijan is the facts that travel agencies are concentrated in the capital. This fact does not allow to use the existing tourism potential of the country's region. Another problem is the lack of appropriate personnel, including the lack of persons speaking foreign languages in rural areas. In addition, the lack of sufficient information about the country and the high cost of tourism services in comparison with Turkey and Georgia are factors that hinder the development of tourism in the country. To solve the existing problems, it is necessary to strengthen the work on advertising the regions of Azerbaijan, regularly monitor the tourism markets of neighboring countries, use their positive experience and increase the competitiveness of tourism services in Azerbaijan.

4. CONCLUSION

Pandemic COVID-19 requires taking care of the health of tourists which contributes to the growth requirements for sanitary and hygienic standards in tourism. The requirements of sustainable development are promoted by an orientation towards rational consumption and respect for nature, organization of production with minimization of damage to the environment. During pandemic it is possible to use immersive technologies that allow to combine real and virtual effects for a more immersive space. The pandemic has significantly reduced travel opportunities. Thus, the huge deferred demand was formed. The direction of this demand depends on the country, tour operators and tour agencies which are prepared for this. Travel companies need to prepare well for the post-pandemic period and be competitive in new conditions. Digitalization of the tourism industry may be one of the important areas. To a certain extent this process was underway and such services as Skyscanner, Booking.com, Airbnb made it possible for tourists to choose and plan their trips. The share of tourists requests to these services grew annually. The pandemic will contribute to an increase in tourists use of various digital services. Thus, tour operators must create digital services and digital products to meet modern requirements and be competitive. It considers also creation of online platforms for booking tickets, hotel rooms, as well as organizing leisure activities for example, purchasing tickets to museums, concerts, etc. The creation of such services to organize individual routes from buying plane tickets to various excursions. Another important direction of tourism is the organization of virtual excursions to cities and museums around the world. The opportunity to visit famous sights without leaving apartment allows people to see the world, visit new places in different countries. If a person liked the virtual tour, then he or she will want to visit this place after the pandemic. Thus, virtual excursions influence deferred demand shaping it for the future. In addition, it is important to develop international cooperation in the field of tourism. Conducting teleconferences with foreign partners provides an opportunity to discuss problems and opportunities, exchange experience and solutions to emerging problems. Summarizing all of the above, it should be noted that it is important for the tourism industry of Azerbaijan to use the existing potential and diversify tourism services. is important to prepare for the post-pandemic period in order to attract deffered demand, expand the geography of tourists, use non-standard technologies in tourism and opportunities of digitalization. All of the above will help to increase the competitiveness of the tourism industry in Azerbaijan.

ABSTRACT

It is known that the first immigrants came from the western part of the present-day United States. Probably many of them settled in the area before moving. More than half of the North American language families spoke English on the Pacific coast, especially in California. People later settled in the northern and eastern regions of the United States, where very few families lived. Thus, the spread of the true Native American population throughout the region was a reflection of the spread of the Europeans a few hundred years later. Most of the native languages were spoken in the southern United States: Quechua - 7 million, Maya - over 1 million, Aztec - over 1 million. Today, one in 250 Americans speaks Indian. In 1962, the last reliable number of American speakers was announced. The influence of Native American Indian words on the English language has a deeper meaning than the derivations that are included in the vocabulary of the language individually. With this technique, the English language enriched its vocabulary. European languages are rich in nouns, but weak in verbs. Therefore, they received many names from the Native American Indian languages. However, Native American nouns are also used as verbs and do not differ in sentence. Therefore, English speakers began to use compound nouns to form verbs from nouns or to combine them to capture the essence of Native American Indian terms. Phrases and regular expressions used by many Native American Indians are included in the English dictionary, for example: going on the warpath, scalp hunting, paleface man, burying the hatchet, smoking the peace pipe.

Keywords: *immigrants, Linguistic and archaeological information, Vikings*

1. INTRODUCTION

Except the recipients as the Indian American and Native Alaskan themselves (people being more than 5 years old), the people more than 70 % report that they speak only English at home. Approximately, the Native Northern American Indian language is spoken at 15 % of homes. Approximately, according to two-thirds of the homes where native language is spoken there are located in New Mexico, Arizona and Alaska, being the language of Navajo of the most spoken native language doesn't surprise. Coming from west part of the current USA of the first immigrants is known. Probably, most of them have settled in that territory before migration. More than half of the Northern American language families are spoken in English on the coast of the Pacific Ocean, especially in California. The peoples have migrated to the North and East regions of USA later and less families have lived there. Thus, the spreading of the real Native American nation along the region as if it was the mirror of the spreading of Europeans after many years: *The languages of California (Hokan, Penutian-Mayan); Siouan tribes (Lakota, Dakota); Southern America (Mascots and Isolation); Iroquois and Cherokee (Chalagi); Algonquian in California (Lenni-Lenape, Delaware, Walam Olum); Beothuk, Yuchi; Na-Dene (Navajo, Apache, Athabaskan); Eskimos-Aleut (Inuit).* The Southern American languages – the greatest difference – the field of shelter for the grandchildren of the first immigrants: *Quechua, Aymara, Guarani, Chibchan; Language isolate – in Amazon; Carib, Arawak, Taino.* What is the reason of the existing of language diversity of the Native Americans in such great degree? There were tens of language families belonging to each of the Indo-European family.

On the contrary, the map simplifies this language diversity. In California, the languages are different as the speaking of the English and Chinese with each other. Most of the linguists doubt that, the root of some of these spread families is associated with the immigrants being from the various tribes of Asia, speaking in the languages not relating to each other. The linguistic and archeologic information indicate the existing of more immigration from Asia to America by Alaska. Those immigrations have started 14 thousand years ago at least. The settlement of the people engaged with the hunting-gathering in all dwellings of America from Arctic to the extreme points of the Southern America until 9000 BC is known. According to the legends of Walam Olum, there is no evidence related to the existing of communication of these languages with the Siberian languages. Until 1492, the arguments related to the main communication haven't been met in the other sources, either. Vikings have travelled to the coast of the Northern Atlantic from the X century to the XIV century, but they haven't influenced any durable effects linguistically or demographically.

2. THE NATIVE AMERICAN LANGUAGES AFTER THE OPPOSITE RELATIONS

Before the Europeans, the Aztecs and Incas had the strong Empires consisting of thousands of people. The capital of Aztecs called Tenochtitlan was greater than London in 1492 and only the Chinese Empire was greater and stronger than the Inca Empire. The main part of the world languages was the Native American Indian languages in 1492. It was estimated that, one of each five people around the Earth had spoken in the Native American Indian language in that time. It is clear that, this situation doesn't apply for today. Most of the Native American Indian languages have been spread; and less people speak in these languages preserving the existence till today. None of the Native American Indian languages is used for addressing to the United Nations Organization. Native American Indians have been moved by the Europeans completely and at the beginning of this century many of the people thought that, the root of Hindus has been eradicated and their languages have been doomed to exhaustion completely. Most of the Native languages have been spoken in the south of the United States of America: Quechua – 7 million, Mayan language – over 1 million, Aztec – over 1 million. Today, one of each 250 American citizens speaks in the Native American language. The last true number of the carriers of the Native American languages has been announced in 1962.

3. THE INFLUENCE OF THE NATIVE AMERICAN LANGUAGES TO THE ENGLISH LANGUAGE

Now let's look through the influence of the Native American Indian languages to the English language. Despite the native languages have been forgotten as being the method of communication or have mixed with the other languages at the best situation, these languages have influenced more to the language of the invaders. The main influence is belonged to the names of place taken from the Native American Indian languages. The names of the states more than half of the United States of America are related to the Native American Indian names; only fewer names of the states come from the European languages. The Native American languages: *Michigan (Alg) large water or large lake (Great Lake), Minnesota (Siouan) clear blue water or cloudy water, Missouri (Siouan) water flowing forward, Ohio (Ir) good river (great river), Texas (Caddoan) Friends or Allies, the State of Nebraska (Omaha) flat water, the State of Kentucky (Ir) Dark and bloody (cursed) ground.* Most of the states have been called with the names of the tribes once lived there: Mass, Conn, Illinois, Dakota. The cities and the Counties too: Punxsutawney (Town of the sandflies), Skagit, Snowhomish, Okanogan and etc. The Native American Indian names are found more for rivers, sea and mountains: Potomac, Allegheny, Monongahela, Okeechobee Lake, Okefenokee Swamp, Skagit, Samish, Wabash, Wasatch and etc. Though it is strange, the Native Americans usually didn't give the separate single name to the river or mountain completely.

Instead, they were inclined to give special names to the individual features as any of the turning (flowing) of the river or the source of the river. Instead of giving the name to the whole mountain, they called each of the peaks or height of them with separate different names. The Europeans often misunderstood this method and they applied one native name to the whole geographical unites: the State of Tennessee (in the tribe of Cherokee) – has chosen from the name of Village, Appalachian Mountains – (in the Northern Florida, Appalachian) – has chosen from the name of the village. Canada (Ir) – Is in honor of the name of small village by Jacques Cartier to whole land (ground). Coinciding to the practice of naming of the places in honor of the individual people, the Europeans often called the places in honor of them after the famous Indians: Tammany, Pochatello (the chief of Bannock), Sacagawea (Shoshone woman bird), Ueatcom (Seattle). It is strange that, after the name of people, the Indians occasionally called any of the names of things or places in honour of that person. Almost, the practices of Europeans giving the name have also changed later: they accepted the tradition of the Native American Indians by giving preference to call the places with the names of animals more than giving the names of individual people: Buffalo, New-York; Turkey Island (near Jamestown); Turtle Lake, Michigan, Reindeer River. The Ancient Europe didn't use this practice after the accepting of Christianity; as a rule, only the European toponyms before Christianity are the names of animals: for example; Berlin, Bern. In last years, the ancient Native American Indian names as Denali, Kalaallit Nunaat, Kulshan, and Tahoma have been pushed for using again by discovered. Thousands of Native American Indian words included to the general dictionary of the English language. It wasn't surprised, because since the belonging of the greatest series of the names given to many new plants, animals, things and environments to the Native American Indians and keeping themselves, the Europeans had to find the way for expressing them: bayou (in the language of Choctaw associawith the southeastern part of the United States, meaning is a slow-moving creek or a swampy section of a river or a lake); savanna (field being forest and grassland, Taino, in the language of Arawakan tribe); pampas (the name of grass and country in the South America); jerky (derives from the Quechua word ch'arki which means "dried, salted meat"); potato (it is the hybridized form of the word of Taino tribe "batata" with the word of Quechua tribe "papa"); hurricane (comes from the Taino Native American word, meaning is evil spirit of the wind); tomato and chocolate (Aztec); blizzard, shark – perhaps, it is in the language of Native American Indian and some sources say it came from the Mayans. Many Native American Indian words have passed to the English language. The colonies of Massachusetts Bay and Jamestown are the places being the first witness of Indian-English large communications, the word "squash" derives from the word "asquatasquash" meaning is "eaten raw", the word "succotash" meaning is "broken corn kernels". The other Algonquin words: skank – a woman of low or sleazy character (yüngül qadın), chipmunk – small, striped rodents of the family Sciuridae (dələ), racoon – medium-sized mammal (yenot), moose – elk is a member of the New World deer in North America (Amerika sığını), opossum – marsupial (siçan növü), persimmon – edible fruit (xurma), sassafras – genus of three extant and one extinct species of deciduous trees by its aromatic properties, the Native Americans have used from this as tea (ətirli yarpaqları olan ağac, yerli amerikalılar çay kimi bundan istifadə ediblər), hickory – it is a shortening of pockerchicory, pocohicora, or a similar word, which may be a milky drink made from such nuts (qoz ağacı və bu qoz, fındıqlardan hazırlanan südlü bir içki olan pockerchicory pocohicora sözünün qısaldılmasıdır), wampum – white strings of shell beads by the Native American nations (yerli amerika xalqları tərəfindən pul və zərgərlik kimi istifadə edilən cilalanmış balıqçulağından xüsusən ağ qabıqlarından hazırlanmış, sapa düzölmüş munçuqlar), toboggan – a simple sled (xizək), wigwam – semi-permanent domed dwelling (yaşayış yeri, kiçik ev), tomahawk – is a type of single-handed axe (yerli amerika tayfalarının istifadə etdikləri bu söz bizimdə işlətdiyimiz toxmaq kəlməsinin eynisidir), papoose – meaning "child", is used in the context of the child's mother (uşaq və ya valideynə deyilən söz), squaw

– the woman, but in some tribes this word is used as the meaning of humiliation (qadın, ancaq bəzi qəbilələrdə təhqir mənasında da işlənir), Squaw and Papoose – woman with a baby in a sling on her back seated on a large rock outside a wooden fence (ana uşağını arxasına bağlayaraq görüntüsü anlamında ana və uşaq deməkdir), powwow – a celebration of American Indian culture in which people from diverse indigenous nations gather for the purpose of dancing, singing, and honouring the traditions of their ancestors (qısa içlas, görüş, parad mənasından savayı həm də, sağaltmaq üçün keçirilən sehirli ritual və onu aparan müqəddəs insan anlamında verir), caucus – a meeting at which local members of a political party (qapalı bir siyasi toplantı anlamına gəlir). The word Yankee passed to the English language derives from the word “eankee” in the tribe of Cherokee and its meaning is “coward”. Podunk – swampy place and a small, unimportant and isolated town (bataqlıq və ərazinin təcrid olunmuş lazımsız hissəsi), “muckamuck” – it is jargon in Chinook language and its meaning is “plenty to eat, plenty of food (Chinook dilində jarqon yemək yemək və yeməyi bol olan adam mənasındadır), Honk – a noise made by a goose or a car horn (vəhşi qazların səsi, sonra avtomobilin signal səsi), honky-tonk – it is the name of the place as being the musical bar (musiqili bar olaraq yer adıdır). The influence of the Native American Indian words to the English language expresses deeper meaning than the borrowings including to the lexicology of language individually. The English language has enriched its own lexicology by this technology. The European languages are rich with the nouns, but are poor with the verbs. According to this, they got more nouns from the Native American Indian languages. But the Native American nouns can be used as the verb and don't differ in the sentence. For this, the English speakers have started to make the verbs from the nouns or to use the compound nouns combining them to each other for keeping the essence of terms in the Native American Indian language. It causes to the appearing of hundreds of new noun combinations: rattlesnake – venomous snake (zingrovlu ilan), june bug – green June beetle (iyun böcəyi), red cedar- red cedar (qırmızı sidr), bloodroot – is a perennial, herbaceous, antiseptical flowering plant called by Native American Indians in Eastern (America Şərqi Amerikada yerli amerika hinduların adlandırdıqları bu bitki, antiseptic, sidikqovucu, qusma, iltihab, qızdırma, ösürək əleyhinə və rak xəstəliyi nə qarşı bi dərman bitkisidir), chokecherry – species of bird cherry (quş albalı), sugar maple – sweet maple (şəkər ağcaqayın), peanut – groundnut (fıstıq), firewater – whisky, strong alcoholic drink (viski), icki növü, bullfrog – species of frog (gurbağa), catfish – a person giving fake information (yalan məlumat verən adam). Such kind of combinations surrounding the elements of strange or opposite meaning was rare to the period of colony in the English language. The polysynthetic structure of the Native American Indian languages influenced to the modern English language and after the first influence of the Native American languages, such kind of unusual semantic combinations were continued to emerge: wore off – to gradually disappear (tədricən yoxa çıxmaq, köhnəlmək), bootleg – in the meaning of alcoholic drink sold illegally, the whites smuggled illicit items, specially the alcoholic drinks in the legs of tall boots during selling the illicit alcohol to the Native American Indians (gizli satılan içki mənasındadır, ağ dərililər yerli amerika hindularına qeyri qanuni alkoqol ickilər satan zaman ickiləri kolbalarda uzunboğaz cəkmələrinin yuxarı hissəsində gizlədirmişlər). Most of expressions and stable word combinations used by the Native American Indians include to the lexicology of the English language. For example: going on the warpath -angry and ready to fight with (acıqlı, əsəbi, qisas hissi ilə döyüşə getmək), scalp hunting – is the act of cutting or tearing a part of the human scalp, with hair attached (baş dərisini soyub çıxartmaq), paleface – a white person (ağ irq və ya ağ dərili adam), burying the hatchet – end a quarrel or conflict and become friendly (küsüşməni, konflikti bitirmək və dostlaşmaq), smoking the peace pipe – to resolve a dispute or stop fighting with someone (mübahisəni və vuruşmanı dayandırmaq), Great Spirit – is the concept of a life force, a Supreme Being or God (Böyük Ruh), Happy Hunting Ground – the paradise of some American Indian tribes to which the souls of warriors and hunters pass after

death to spend a happy hereafter in hunting and feasting (yerli amerika hindularının inancında, onların döyüşçüləri və ovcuları öləndən sonra ruhlarının cənnətdə xoşbəxt ovçuluq etdikləri məkan).

4. CONCLUSION

As Native American Indians lived with each other, it is obvious that their language can influence each other's language. The words, expressions, sayings of the Native American Indian languages have passed to the English language and both have enriched the lexicology of the language, and have left deep traces by influencing basically to the European, English life and culture. In this regard the main influence is belonged to the names of place taken from the Native American Indian languages.

ABSTRACT

To ensure socio-economic development in the world, it is necessary to achieve positive changes in certain territories. Regional development is a complex process and should be considered using a multidimensional approach and assessing the impact of factors on the level and quality of life of the population, the dynamics of economic growth. The digitalization of the economic sphere currently has a significant impact on the development of territories. Digital transformations form new conditions for the functioning of regional socio-economic systems, the unique features of which in different territories require study. The digital economy is based on the deep penetration of digital technologies, that is, the use of hardware and software for collecting, processing and transmitting digital information, in all spheres of economic activity and social relations. The digitalization of society creates new opportunities for business entities, which can be realized through the creation and implementation of innovations in the business sector and public administration. Innovations in management, production or in the goods and services themselves are the main conductors of digital achievements in the activities of business entities and the mechanism for their transition to the digital economy. Innovation, like other types of economic activity, undergoes significant transformations in the context of digitalization, consisting in the expansion of the types of innovative resources and subjects. The digital economy expands the development potential of the region, makes it possible to overcome resource constraints. It is advisable to explore aspects of regional development through the functioning of digital platforms that integrate economic, social and technological processes that form digital service ecosystems. The phenomenon of the digital economy requires scientific understanding and assessment to be used as a factor in the development of the economy of the territories.

Keywords: *Regional development, Digital economy, Regional development management, Digital transformation, Digital platform*

1. INTRODUCTION

Digital technologies are now so widespread that it is already difficult to separate them from the spheres of management and life. The digital transformation trajectory has penetrated economic and production processes. The digital economy and management can no longer be considered a phenomenon, it is rather a consequence of the objective processes of the evolution of modern

society (Chehabeddine, Tvaronavičienė, 2020, P. 434; Shenoy, 2018, P. 175). In this regard, the modern policy of influencing the parameters of territorial socio-economic systems should provide for integration with promising technologies. Activities on the regulation of regional development are aimed at strengthening the level of economic security and socio-economic transformations through the implementation of programs and measures that activate the resources of the territory. Regional development implies a systematic positive change in the living conditions of citizens and is reflected in an increase in regional product indicators, per capita regional income, expansion of production opportunities and industries, product competitiveness, export of manufactured goods (Barca, McCann, Rodríguez-Pose, 2012, P. 140; Stryabkova, Lyshchikova, Chistnikova, Glotova, Kochergin 2019). Digitalization conditions contribute to regional development, create additional opportunities for the business community and consumer services. At the same time, the penetration of digital technologies and devices into all spheres of life poses a certain threat of excessive dissemination of personal information, loss of confidential data, unauthorized access to closed public and private sources. Therefore, modern measures of regulation of development on the part of government structures should provide directions for ensuring information security.

2. OPPORTUNITIES AND CHALLENGES OF USING DIGITAL TECHNOLOGIES FOR REGIONAL DEVELOPMENT

Despite the fact that the legislation of different countries is responsible for the organization of information protection activities to a large extent on its owner, who must conduct checks of the level of protection of sources and bases, the facts of intrusion into information systems, in our opinion, it is the authorities that should carry out comprehensive work on implementation of the observance of the rights of the owners of information resources. The creation of the correct legal framework for the functioning of digital means of storing, using and applying information will lead to the empowerment of entrepreneurs and an increase in citizens' satisfaction. Since information becomes a factor of production and a certain condition for the formation of competitive advantages, it is advisable at the government level to regulate the issues of establishing property rights, as well as regulating the aspects of determining the value and value of digital content. While establishing the proper level of security and regulation in the digital economy, government bodies are faced with the task of creating conditions for the unhindered development of new technologies and free access to them (Dyatlov, Lobanov, Zhou, 2018, P. 1194; Mazelis, Lavrenyuk, and Krasko, 2020, P. 1140). It is these conditions that trigger economic growth. One of the advantages that arises in the digital economy is the release of time (Litvinenko, 2020, P. 1525; Novikova, Strogonova, 2020). Accordingly, the economic policy for the development of territories can use the resources of free time that have appeared for representatives of business structures and the population. Both of them can feel the effect of the release of time and interpret it as an indicator of social development, as well as direct the resulting time resource into the production sphere, which will entail the emergence of economic growth. Another effect that requires analysis and assessment in regional socio-economic systems is the network effect. Its action causes an increase in the value of services, goods, products for all consumers with an increase in their market. Within the framework of regional development regulation, it is necessary to study the reserves for expanding the action of network effects. Along with this, an obstacle to regional industrial and social development in the digital environment may become too much information available in the public domain, an opportunity for everyone to disseminate and post any information (Novikova, Strogonova, 2020). That is, the "digital noise" arising in the current situation makes it difficult to access high-quality, objective, correct sources. Scientists note that there is a threat of the emergence of a "digital crisis", as a result of which "a significant part of the data corresponding to the information need will not be used, instead of valuable information, the attention of specialists will be diverted to

the processing of" information noise "(Sturgeon, 2021, 42). To increase the level of development of regional territories and enhance their influence on the country's economy, it is advisable to expand the use of blockchain technologies in various spheres and industries of the territory. For a socio-economic system, distributed ledger technologies can give impetus to the development of existing companies, the expansion of interregional cooperation and the emergence of startups in different industries, innovative products and business models. Blockchain can be applied not only in financial markets, it is the potential of the industry application of such technologies that should be revealed in regional socio-economic systems. And blockchain technologies can enter business practice alongside traditional business models. Blockchain technology attracts not only individual companies, but entire business sectors as well. For example, the benefit of blockchain for regional insurance organizations is the automation of workflows. Regardless of the context of using smart contracts, in conjunction with the blockchain, they offer a number of advantages: they allow you to automate the satisfaction of claims for insurance payments, offer a reliable and transparent mechanism for organizing payments for all parties, and can be used to individually and fine-tune the terms of each individual agreement. For example, in the case of a car accident, a smart contract can guarantee that a payment is made only if the car is repaired at a service station pre-selected by the insurer or more convenient for it. Despite the possibility of implementing such programs without the use of blockchain, a smart contract platform based on the new technology can provide unique advantages. Not only does it guarantee increased transparency and customer trust through decentralization and automation of data reconciliation and validation, but it also provides a tangible network effect not available with centralized platforms. Technological innovation is not intended to change the essence of products, although it can sometimes do so. A very breakthrough consequence of the development of digital technologies can be considered the emergence of a means of completely leveling corruption in any area. Such an opportunity is provided by the use of the blockchain network due to the transparency of the entered records, the impossibility of deleting them by one or several persons, protection against falsification and deliberate distortion of data, since the entered information is recorded simultaneously on multiple devices, controlled by a significant number of users. Blockchain in public administration has already found application in different countries of the world, their comprehensive application and distribution is being investigated by specialists from various organizations. Blockchain has shown the greatest efficiency in construction and in organizing and holding elections. The use of blockchain technologies in the construction sector reduces the degree of uncertainty or incompleteness of data on the progress of work, the level of conflict disputes during the execution of the contract. The experience of holding elections in Sierra Leone will make it possible to state the high efficiency of blockchain elections with insignificant monetary costs for the organization (Avazov, Abduraxmonov, 2020). In Russia, distributed ledger technologies were tested during the voting on amendments to the Constitution of the Russian Federation; residents of the Moscow and Nizhny Novgorod regions were able to apply them. Convenience, relative simplicity and citizens' confidence in the results of such elections are the undoubted advantages of digitalization of voting. Blockchain as a digital transformation technology is of strategic interest to players in the regional insurance market. The biggest barriers to widespread adoption of technology in the insurance industry are the need to foster collaboration between market participants and technology leaders, the need for successful operational transformations, and the creation of a supportive regulatory environment. Laying the foundations to address these challenges today will enable insurance companies to implement full-scale scenarios for their own practical application of the technology and capitalize on its benefits over the next five years. The new technology has the potential to help many industry players cope with competitive challenges, including weak customer interest in insurance products, limited growth in developed markets, and the trend

towards digitalization. Representatives of the banking industry are currently attempting to practically implement several scenarios for using the blockchain at once: from the development of technology for direct interaction of customers with the payment system to the launch of trading systems on the stock exchange and currency exchange. Startups like Tradle are working on blockchain solutions to implement a customer data verification process for authenticity and reliability. This procedure requires the client to agree to all the necessary checks of his data to close the contract. Once a customer's profile has been verified, they are able to send verified identities to other companies to sign new contracts using the same tool, avoiding the need to go through the entire verification process again. This speeds up and increases the efficiency of the new customer acquisition process.

3. REGIONAL NETWORK STRUCTURES

One of the most important trajectories for the development of the regional economy is the development of network spatial structures. The network economy is defined in the European Commission report as an environment in which any company or individual, located anywhere in the economic system, can contact easily and at minimal cost with any other company or individual for collaboration, for trade, for the exchange of ideas and know-how or just for fun. Proceeding from this, the network economy is a qualitatively new form of economic order, which is beginning to oust hierarchical and market forms from servicing economic relations in society. Networked cooperation is an extended group of people with similar interests interacting with each other and maintaining informal contact for the purpose of mutual support and assistance (Chepurko, 2011, P. 56; Delgado, Porter, Stern, 2016, P. 37). Networking is one of the forms that allow you to save on the scale of production, an intermediate form between the market and the hierarchy (Leonov, Barabash, 2015, P. 82). Interfirm cooperation helps to reduce transaction costs associated with obtaining information and exercising control. The network structure is a stable and structured collection of semi-independent firms or non-profit organizations) involved in mutual relations and united by a common goal. Relationships in the network are designed to streamline the exchange relationships between participants and facilitate their adaptation to the conditions of a changing environment. Both formal and informal contracts serve as the basis for networking (Delgado, Porter, Stern, 2014, P. 1788). The network structure can take the form of temporary cooperation of enterprises (organizations, individual teams and people) with key competencies for the best fulfillment of a market order, based on a unified information system (Panke, 2020, P. 481; Börze, Risse, 2019, p. 1235; Adner, Kapoor, 2010, p. 310). In our opinion, the economic development of the regional economy can be carried out by increasing entrepreneurial networks in the form of a system of long-term cooperative interactions of independent enterprises based on the joint use of resources, a special system of values, and having a specific set of organizational and managerial interactions. In the regions, it is advisable to promote the emergence of network structures when a group of persons united by some organizational framework carries out their interactions on the basis of Internet technologies. Such a technical basis allows a group of persons engaged in joint activities to create a more flexible and effective organizational structure, compared to traditional forms of organizations (Schiff, Winters, 2002; Kostrov, 2010, P. 117). In addition, it will be effective to introduce a network form of management (coordination) of the regional economy, which can be used both in network organizations and in the network economy to coordinate joint activities. The main difference between this form and the market and command form is the direct and equal participation of all members in the process of coordinating their activities." Network presence is beneficial if it helps the local firm to do its job better. if the customer benefits from their service provider's membership in the network. The entry of a local firm into the network presupposes an increase in its "local" value, due to an increase in its status and the expected growth of professionalism and quality of services provided (Granstrand,

Holgersson, 2020, P. 91). Behind this claim is serious work at the network level to provide local benefits from network participation that are valuable to customers. The best opportunity to grow the network is to provide a system of support and interaction that will help all local members become more useful to their own customers. Network participation can be valuable for serving geographically dispersed customers.

4. CONCLUSION

In the regions, it is advisable to promote the emergence of network structures when a group of persons united by some organizational framework carries out their interactions on the basis of Internet technologies. Such a technical basis allows a group of persons engaged in joint activities to create a more flexible and effective organizational structure, compared to traditional forms of organizations. In addition, it will be effective to introduce a network form of management (coordination) of the regional economy, which can be used both in network organizations and in the network economy to coordinate joint activities. The main difference between this form and the market and command form is the direct and equal participation of all members in the process of coordinating their activities." Network presence is beneficial if it helps the local firm to do its job better. if the customer benefits from their service provider's membership in the network. The entry of a local firm into the network presupposes an increase in its "local" value, due to an increase in its status and the expected growth of professionalism and quality of services provided (Granstrand, Holgersson, 2020, P. 91). Behind this claim is serious work at the network level to provide local benefits from network participation that are valuable to customers. PRIORITY DIRECTIONS OF PUBLIC SECTOR DEVELOPMENT AT THE POSTNEFT STAGE

Mahmudova Ilhama Mahammadnabi

*Associate Professor at Azerbaijan State Economic University (UNEC), Azerbaijan
a_murad97@mail.ru*

ABSTRACT

All the successes achieved in the field of socio-economic development in our country during the years of independence, the created economic, social, scientific-technical, financial potential, human capital, infrastructure, improvement of social welfare of the population are connected with the personality of National Leader Heydar Aliyev. From this point of view, the general and characteristic features of the economic development strategy of Azerbaijan, the stages of its formation, the main factors, conditions and means ensuring its success, systematically analyzed and evaluated by President Ilham Aliyev, defined by the Great Leader, are being systematically analyzed and evaluated. It is of exceptional importance in the study of the economic heritage of the great leader and in the selection and realization of the priorities, main goals and objectives of the future development of our country. The main features of the economic policy pursued in the Republic in recent years are its high level of implementation of state programs, decrees and orders for these periods, successfully ensuring the acceleration of economic development in the country, leading to non-oil sustainable development of all processes. After the economic independence of the Republic of Azerbaijan, significant changes took place in the political and economic life of the country. Thus, the choice of the path to a market economy, in turn, has created the basis for the privatization of property, the development of new organizational and legal forms of entrepreneurship based on individual and joint private property, including commercial. Since then, enterprises have been studying market demand, establishing economic ties, concluding contracts with foreign partners, seeking sources of financing, and producing products in order to achieve full economic independence. Thus, effective independent economic entities also operate in competition with public sector enterprises. Looking at the experience of countries that have undergone significant development in the world practice, the Public-Private Sector Partnership has always been of special importance as a broad parametric topic. Public-private relations are a priority topic and reflect economic, social, legal, cultural, political and other nuances. President Ilham Aliyev is successfully continuing the work on the adoption and implementation of various programs in the field of state structure in our country. Targeted measures will significantly increase the economic power of the state by ensuring the development of all sectors of the economy.

Keywords: *fiscal policy, government, finance, entrepreneurship*

1. INTRODUCTION

At the end of the last century, despite a difficult historical period, Azerbaijan was recognized in the world as a country that confidently went through a great evolution in its socio-economic and cultural life and ensured a stable, secure and modern standard of living. The country's international prestige has increased significantly, the traditions of statehood have been strengthened in society, and the construction of modern socio-economic infrastructure has been successfully implemented. One of the main problems in modern times is to determine the role of the state in the economic system. This problem also determines the importance of studying the functionality of the public sector of the economy, the impact of the public sector in Azerbaijan on market processes. Therefore, the efficiency of public sector development can be considered as one of the main factors in increasing the synergistic impact of government

intervention on the spheres of economic activity, especially in the economic sphere. In a sense, this is even more relevant in the context of the global financial crisis and the inability of private capital to meet the needs of the population. Along with ensuring the efficient operation of the public sector and improving its structure, work is underway to expand the scope of the private sector through the privatization of state property. In modern times, the most important priorities for the development of the national economy are the implementation of economic policies that comprehensively develop the country's economy, the formation of export-oriented national economy, production of competitive products on the world market, minimizing dependence on oil and diversification of the non-oil sector [3]. Improving the structure of public capital investment, strengthening control over the efficient use of these funds, ensuring the strengthening of relations between public investment policy and relevant development programs, achieving common principles and priorities in the areas of state-guaranteed funds and public investment expenditures in the state budget is [5].

2. RELATIONSHIP BETWEEN THE PUBLIC DEPARTMENT AND THE PRIVATE SECTOR

Recent processes in the world economy, the complex external economic environment of the country, the deterioration of the macroeconomic and financial situation, the decline in oil revenues due to falling oil prices have had a serious impact on the economy of the Republic of Azerbaijan. Such serious circumstances have made it necessary to adapt to the global economic crisis and form a new model of economic development. Azerbaijan's modern economic policy is aimed at diversifying the economy, developing the non-oil sector, and creating a sustainable and competitive national economy [4]. The methods of the article include observation, collection and selection of facts, analysis of E-views 10 program, autocorrelation test, Breusch-Pagan tests, methods of normal distribution. In general, the reason why the public sector is active in all types of entrepreneurship in the industry is the intention to increase its brand. It should not be overlooked that the minimum number of medium-sized enterprises is concentrated in the agricultural sector, as their number is many times lower than 50. This is due to the lack of attention to agriculture. There are other unnamed areas in state ownership where the largest share of micro-entrepreneurship has fallen. Looking at the tourism sector, at least micro-enterprises are in this sector. I would like to clarify that the smallest number of state-owned small businesses is concentrated in education, and the largest number in industry. The reason for this is as mentioned above.

Figure 1: Total civil servant in the Republic (2014-2018) [9]

The number of civil servants working in state-owned enterprises, ie in the public sector, varies from year to year. These indicators can both decrease and increase relative to each other. For example, if we analyze the indicators for 2014 and 2018, we can easily see that the total number of civil servants in the country in 2015 increased slightly compared to 2014. But when we compare this figure with 2018, we see that on the contrary, in 2014, this figure is 3% higher. So, in 2018, the number of civil servants in the country did not increase, but decreased. In general, the year with the highest total in the country was 2015, and the year with the weakest was 2018. From this it can be concluded that this figure is declining in the country every year [9].

Figure 2: Specific weight of the private sector in the economy (2019) [9]

The development of the private sector corresponds to the industrial sector, as we are an oil country. If we look at Azerbaijan, we will see a large number of enterprises and organizations engaged in oil production. Of course, due to the rich gold deposits in our country, some private companies are trying to increase the number of enterprises in this category by investing in our homeland. This shows the role of the private sector in our economy. The share of the private sector in the economy is 62% of the mining industry. In general, as a result of consistent measures taken within the framework of industrialization, growth rates have been observed in various industries. As can be seen from the graph, the processing industry has the smallest share in the private sector. Apart from mining and processing industry, the remaining 30% falls on other industries. However, such factors are somewhat different in the public sector than in the private sector. In general, the state should try to make the public sector more dominant in the economy than the private sector. The reason for this is that the state, unlike the private sector, serves only citizens. The diagram below is an indication of these factors. is purely to serve the citizens. The diagram below is an indication of these factors. is purely to serve the citizens. The diagram below is an indication of these factors.

Figure 3: The share of the public sector in the economy [9]

If we look at the assets of enterprises and organizations across the country, we see that the private sector accounts for 62% of total assets. This means that the state plays a supporting role not only in itself, but also in the private sector. It is no coincidence that in 2016, by decree of President Ilham Aliyev, more than 300 new state-owned enterprises were declared open for privatization on the instructions of the Cabinet of Ministers. These include oil engineering, agriculture (including fishing), health, culture, tourism, and other areas [1].

2.1. Ecometric analysis of the public sector: Eviews analysis

The development of the public sector means an increase in GDP. Thus, as the number of companies producing products in the country grows, it plays an important role in the components of the common assets of this country. Thus, the development of the public sector leads to an increase in the country's gross income and an increase in the level of quality for the welfare of the population in its own sector. It should be noted that because our country is based on the oil industry, most private companies invest in industry, but not only private enterprises and organizations, the public sector is trying to use this advantage to invest more in industry and equalize its share with the private sector. Of course, the reason for this is the economic function performed by the state.

Variables	Coefficient	Standard error	T value	P > t
Revenues of public sector enterprises	0.7330	0.3346	2.1906	0.0361
GDP	0.1217	0.1417	0.8586	0.3971

Table 1: Income and GDP of public sector enterprises

Let's see if there is a connection between the assets of the public sector and GDP. To do this, we used the Eviews 10 program to determine the relationship between the total revenues of state-owned enterprises and GDP on the website of the Statistics Committee. As we have seen, there is a link between the revenues of state-owned enterprises and GDP, with a probability of less than 5%. That is, the revenues of state-owned enterprises operating in our country have a positive impact on GDP growth. In other words, according to the model, a 73% increase in the income of local enterprises means a 12% increase in GDP, or vice versa.

Variables	Coefficient	Standard error	T value	P > t
Assets of public sector enterprises	0.742453	0.278844	2.662614	0.0106
GDP growth rate	0.49568	0.175209	2.829078	0.0069

Table 2: Assets of public sector enterprises and GDP growth rate

Variable	Coefficient	90% Confidence interval		95% Confidence interval		99% Confidence interval	
		Down	Top	Down	Top	Down	Top
C	0.121738	-0.118648	0.362124	-0.167419	0.410894	-0.267305	0.510781
Public sector	0.733027	-1.300381	-0.165674	-1.415488	-0.050566	-1.651237	0.185182
By assets:							
Variable	Coefficient	90% Confidence interval		95% Confidence interval		99% Confidence interval	
		Down	Top	Down	Top	Down	Top
Public sector	0.742453	0.274369	1.210537	0.181170	1.303737	-0.006804	1.491710
C	0.495680	-0.789796	-0.201564	-0.848357	-0.143003	-0.966469	-0.024891

Table 2: Profitability analysis

At the same time, if we analyze whether the assets of public sector enterprises are related to the GDP growth rate, we will see that there is a positive relationship. In other words, according to the model, a GDP growth rate of 49% with a probability of 6% means an increase of 74% in the number of enterprises operating in the public sector.

Figure 4: Analysis of the impact of the economic crisis on the performance of public sector enterprises

As can be seen from the diagram above, the economic crisis of 2015 had a serious impact on the performance of public sector enterprises. Since these econometric analyzes are analyzed with pooled panel data, random or fixed impact methods are not so important to us. Because both the period and the cross effect were taken as "None".

Figure 5: The impact of the economic crisis of 2015 on the assets of public sector enterprises

We can see from the diagram above that the effects of the economic crisis of 2015 had a greater impact on the assets of public sector institutions in Azerbaijan. Even the fact that this schedule, the public sector, is more volatile than the schedule is a clear proof of this. Due to the short period of the autocorrelation test, there is a dependence between the sectors, as we can see from the following tests.

Tests	Statistical coefficient	Probably
Breusch-Pagan LM	95.61711	0.0006
Pesaran scaled LM	2.823880	0.0047
Pesaran CD	1.330631	0.1833

Table 3: Autocorrelation test

Tests	Statistical coefficient	Probably
Breusch-Pagan LM	87.80635	0.0377
Pesaran scaled LM	0.853533	0.3934
Pesaran CD	0.671516	0.5019

Table 4: Breusch-Pagan test

The Breusch-Pagan test is a test of variable variants. Indicates whether the variant is variable or fixed. In both models, we see that this statistical test is important for our model because the significance rate is less than 5%. The Pesaran scaled LM test measures autocorrelation between sectors in our analysis, although it is not a widely used test, its probability is significant for assets and insignificant for enterprises. The Pesaran CD test measures cross-sectional dependence, and as we have seen, this ratio is not significant in either companies or banks, ie there is a dependency between the observed variables. That is, we cannot reject the null hypothesis based on the above result, because according to the results of the autocorrelation test, there is no cross-dependence in errors, but there is this dependence in the alternative hypothesis. The high probability of the Pesaran CD test, which confirms the connection between the cross-sectional data, suggests this. This is an ideal situation for the regression equation. That is, the value of the variables does not differ much from the value we want.

2.1.1. Factors determining the efficiency of the public sector

Thus, if we compare the impact of public sector revenues or assets on GDP, we find that all dependent variables, which have a statistically significant effect on both groups, are more affected by GDP. Therefore, if economic crises are not observed in the country soon, we can say that the assessment of the public sector has a great role in the development of the country's economy.

Figure 6: Analysis of the normal distribution of state-owned enterprises

Figure 7: Analysis of normal distribution by banks

If we analyze the normalization test for errors, there should be more than 30 observations for each variable according to the normal distribution. In the models studied, the total number of observations does not correspond to the normal distribution of assets and income of public sector enterprises. The analysis shows that in 2019, the number of employees in the country's economy increased by 5.6% compared to the same period last year and amounted to 1639.1 thousand people, of which 909.5 thousand people in the public sector of the economy, 729.6 thousand people and operated in the private sector. 20.2% of employees are in education, 17.8% in trade; repair of vehicles, 13.3% industry, 8.2% health and social services, 7.6% construction, 6.9% public administration and defense; social security, 4.6% transport and warehousing, 3.4% professional, scientific and technical activities, 3.3% agriculture, forestry and fisheries, 1.7% financial and insurance activities, 13.0% of the economy engaged in other fields. The country's macroeconomic forecasts and expected economic trends for 2019-2022, prepared by the Ministry of Economy of the Republic of Azerbaijan, including real GDP growth of 3.6% in 2019 and 3.9% in the non-oil sector. The selling price of a barrel of crude oil was set at \$ 60 in the calculation of the state budget and the revenues of the State Oil Fund. In general, the prevention of the negative impact of the ongoing processes in the world economy on the economy of Azerbaijan is on the agenda as one of the main priorities of monetary and fiscal policy in 2020.

As a result of comprehensive social reforms implemented by the relevant decrees of the President of the Republic of Azerbaijan, the minimum monthly wage in the country will be increased by 250 manat from September 1, civil servants, employees of a number of state-funded departments, enterprises and organizations, state oil companies. As a result of the increase in salaries of employees in the private sector and the acceleration of transparency in this area, in September 2019, the average monthly nominal wage in the country reached 723.4 manat, which is 35.8% compared to September last year. compared to 21.6% more [1].

3. PRIORITIES TO INCREASE PUBLIC SECTOR EFFICIENCY

In order to use new resources for economic growth, to diversify the economy and to attract more investment in the non-oil sector, important measures are being taken in our country to increase the share of the private sector in the economy. In addition, programs are being developed to increase the management experience and efficiency of local organizations in order to enable them to compete more successfully in the world market. To strengthen economic activity in the republic, to support private initiative, to carry out important structural changes in the economy in accordance with the will of the time, Intensification of privatization of state property in order to create a healthy competitive world and increase the efficiency of the national economy is considered one of the important aspects of economic policy [2]. The experience of many countries proves that the increase in the share of the private sector in the economy leads to significant progress in the asset and financial operations sector, as well as the normalization of capital outflows for investment. Three global trends in the world make it necessary to reduce the share of public sector property in the economy over time: first, a more global sector and more intensive technological progress make it necessary for management to respond quickly and adapt to new requirements; second, increasing attention to management and ownership policies makes this aspect one of the main driving forces of the value-setting procedure; third, Strengthening public control over the financing of the public sector increases the participation of the state enterprise (hereinafter - DM) in the valuation procedure. All of these areas provide an opportunity to achieve the goals set for each sector and, ultimately, the macroeconomic indicator by increasing the participation of the private sector in economic procedures.

Figure 8: Progress in operating and financial areas after privatization, in%. [10]

Programs related to the privatization of state property in our country have enabled the growth of economic opportunities in our country, the establishment of an independent sphere of competition, the re-creation of many state enterprises, the use of modern equipment and technology, as well as modern management methods. Using the experience of DDCs around the world, it continues to serve the country to promote the liberation of state property and the development of the private sector. The state is preparing a new bill aimed at increasing the efficiency of the use of state property, the development and management of its management [7].

4. RESULT

After the economic independence of the Republic of Azerbaijan, significant changes took place in the political and economic life of the country. Thus, the choice of the path to a market economy, in turn, has created the basis for the privatization of property, the development of new organizational and legal forms of entrepreneurship based on individual and joint private property, including commercial activities. Since then, enterprises have been studying market demand, establishing economic ties, concluding contracts with foreign partners, seeking sources of financing and producing products in order to achieve full economic independence. Thus, effective independent economic entities also operate in competition with public sector enterprises. As a result of the consistent and well-thought-out economic policy pursued in Azerbaijan, many elements of the state's economic policy have been formed and have now become significant mechanisms of influence. In this regard, the current increase in the share of private property in market economic relations requires the study of ways to increase the efficiency of public sector development [6].

4.1. Offers

- 1) Accelerate the process of privatization and reconstruction in various sectors of the economy;
- 2) Improving the mechanism for developing and implementing measures for the re-establishment of industrial enterprises engaged in the production of high-demand products and the renewal of long-term fixed capital;
- 3) Ensuring full transition to the application of international standards on the organization of production and product quality in industrial enterprises equipped with modern technical means;
- 4) Rapid adoption of the Competition Code in order to ensure an efficient business environment in the country and improve the consumer characteristics of products;
- 5) Development and implementation of appropriate measures for the implementation of institutional measures that can play an important role in the economic development of the country;
- 6) Increasing the role of the state in promoting investment to accelerate the investment process at the expense of domestic and foreign financial sources;
- 7) Improving the material and technical base of scientific research institutes and centers for the creation and development of high-tech fields;

The formation of an effective macroeconomic policy framework that serves sustainable macroeconomic stability, the strengthening of the medium and long-term "driving forces" of economic development, requires the full provision of economic sovereignty.

Five National Priorities for the socio-economic development of the country should be implemented:

- 1) steadily growing competitive economy;
- 2) a society based on dynamic, inclusive and social justice;

- 3) Competitive human capital and space for modern innovations;
- 4) Great return to the liberated territories;
- 5) Clean environment and "green growth" country [8].

Modern economic policy of the Republic of Azerbaijan is aimed at diversification (diversification) of the economy, development of non-oil sectors, formation of a stable, competitive national economy [2]. The successful connection of the trio of society, business and the state will be strengthened for the long-term sustainable and rapid development of our country.

ABSTRACT

The study examines the impact of R&D indicators on economic growth in the case of Azerbaijan. GDP was used as a dependent variable, while as independent variables R&D capital stock, R&D employment, R&D expenditure (% of GDP), scientific papers and patent application indicators were used. The statistical indicators used in the article covering the years 2005-2019. Based on these indicators ARDL and EC models were constructed in both the short-term and long-term. Among the indicators for the R&D sector, five models was established to prevent multicollinearity. According to results, the impact of R&D indicators on economic growth is basically significant in the long run. The impact of R&D employment, R&D expenditure is negative, while the impact of scientific papers, patent applications and R&D capital stock is positive on GDP. In the short run the impact of most indicators on economic growth is insignificant. The effects of the scientific papers, R&D expenditure and R&D employment are negative and significant. As can be seen, there are some inconsistencies between the theory and the results obtained. The reason is that the structure of the R&D sector in Azerbaijan does not meet modern requirements.

Keywords: *Azerbaijan economy, Economic growth, Paper, Patent applications, R&D sector*

1. INTRODUCTION

As in the production function, productivity growth depends on the efficient organization of capital and labor. As a result, the role of technology in maintaining a competitive advantage, from an ordinary enterprise to the national level, is undeniable. And to meet the growing and changing needs, technology must be constantly changed and updated. That's why the R&D area needs to be kept in focus. Technological changes make a positive contribution to the economic development of each country. The main purpose of this study in the case of Azerbaijan is to study the impact of indicators in the R&D sector on economic growth. Insufficient statistics for the study and incorrect classification are the main limitations of our study. In the research, we selected the number of scientific papers, patent applications, R&D expenditure, R&D employment, R&D capital stock indicators in R&D sector.

ARDL and EC models were built to study the long-term and short-term impact of these indicators on GDP, covering the years 2005-2019. Among the indicators for the R&D sector, five models were established to prevent multicollinearity. This article assumes that the indicators of the R&D sector in Azerbaijan have a positive and significant impact on economic growth.

2. LITERATURE REVIEW

There is a lot of research on the impact of the R&D sector on economic growth, and the results vary. In his article, Inekwe (2014) examines the impact of R&D spending on economic growth on the example of developed and developing countries. GMM models were used in the study and covered 2000-2009. As a result, the impact of R&D spending on economic growth is positive for upper-middle income economies and insignificant for lower income economies. Bayerçelik and Taşel (2012) studied the impact of the R&D sector on economic growth in the case of Turkey. To do this, they created a panel regression model using R&D departments, R&D expenditures, and patent applications as innovation indicators. As a result, a positive and significant impact on GDP was identified. Another study in Turkey examined the relationship among high-tech exports, patent applications and economic growth. Tests (VAR and VEC Granger Causality, Johansen Cointegration tests) found a long-term relationship among the indicators for the period 1990-2015 (Dereli, 2019). Recep and Alabaş (2017) studied the impact of R&D expenditures on economic growth in Turkey using indicators for 1990-2014. The study used the ARDL model based on annual data and found that R&D costs had a positive effect on real GDP in both the short and long term. Takalo and Kannianen (2000) argue the opposite of the theory that "patenting accelerates technical progress". Thus, their research concluded that those who did not patent their product used the innovations for a shorter period of time than those who received a patent. Also, patenting delays the introduction of a new product because it requires a lot of paperwork costs in their opinion. Crosby (2000) explored the impact of Australian patent applications on economic growth and productivity. Performed VAR analysis using indicators covered 1901-1997. According to the results, a 1 percent increase in patent applications leads to a 0.14 percent increase in GDP. Koutroumpis et al. (2019) surveyed R&D firms across Europe by sector. The study found that firms in the ICT sector which invest R&D capital brings in more revenue than firms in other sectors. Another article examines the impact of R&D expenditure on economic growth in the EU countries. The study covered 1995-2013 found that the impact was positive and statistically significant (Szarowská, 2017). Using a panel of data, Xiong et al. (2020) examined the relationship between R&D investment and economic growth on China. Research shows that the impact of the number of patent applications on economic growth varies by region. Also, patent applications cannot ensure growth in the public sector. The authors point out that the reason for this is that the patent owner is less motivated by the state, and there are large differences by region. As a proposal, they noted the implementation of a more comprehensive policy in this direction. Another study on China examined the impact of government public expenditure, government R&D expenditure and taxation on economic growth. As a result, it was noted that most government spending is financed by taxation, which reduces economic growth. Therefore, it was concluded that public spending will decrease and economic growth will increase as the choice of technological innovation increases (Zhou et al., 2020). In their study on OECD countries, Nair et al. (2020) researched to examine the relationship between R&D, ICT and economic growth in the short and long term. The results of the VECM analysis show that there is a relationship between the indicators for both periods. Another study for OECD countries found a positive effect of R&D expenditures and employment of researchers on economic growth for 1996-2015 (Bayraktutan and Kethudaoğlu, 2017). The study of ASEAN countries examined the impact of R&D indicators (high-technology exports, R&D expenditures, patent applications) on economic growth over 26 years.

Panel unit root and panel cointegration, FMOLS, DOLS tests were performed in the study. As a result, a significant impact of these indicators on economic growth was identified (Charutawephonnukoon et al., 2021). The study of EEA countries examined the impact of patent applications (residents, nonresidents, total) on economic growth for the period 1989-2014. Based on the results of the Granger causality test, it was noted that innovation has unidirectional and bidirectional effects on GDP per capita, and these effects vary from country to country (Maradana et al., 2019). Using as patent, trademark and industrial design application indicators Benny (2020) explored the impact of economic growth on India. The impact of these indicators covered 2009-2019 on economic growth model is positive and significant. Law et al. (2020) examined the impact of innovation on economic growth on the basis of ARDL, using indicators covered 1985-2016 (patent applications, patent grant for innovation) on Malaysia. The empirical results show that patent applications (local or foreign) are statistically insignificant but patent grant has significant impact on economic growth. From this point of view, it was emphasized that qualitative innovations are more effective than quantitative ones.

3. THE SOURCE OF THE DATA

In the model were used monthly statistics for 2005-2019 in Azerbaijan. We used GDP indicator from the Central Bank of the Republic of Azerbaijan's (2021), capital stock for professional, scientific and technical activities (as R&D capital stock), employment professional, scientific and technical activities (as R&D employment) indicators from the State Statistical Committee of the Republic of Azerbaijan's (2021), research and development expenditure, patent applications indicators from World Bank's (2021), scientific papers (Scopus database (Elsevier BV)) from Scimago Institutions Rankings' (2021) official websites.

4. METHODOLOGY

There are five R&D models in the article. In the all models were used the Cobb-Douglas production function based on the Solow model (see Ismayilov et al. (2020) for details). All variables were seasonal adjusted. In the models as dependent variable - GDP, as explanatory variables – R&D capital stock, R&D employment, scientific papers, R&D expenditure, patent application indicators were used on a monthly basis. Due to the lack of monthly data for the R&D sector (as well as insufficient annual data), these indicators were calculated using the EViews program. Among the indicators for the R&D sector, various combinations was established to prevent multicollinearity. The Augmented Dickey-Fuller (ADF) test is used to test for unit root. Different models were tested on the indicators and the Auto-Regressive Distributed Lag (ARDL) model was selected as the optimal model in the case of Azerbaijan. Also, one of the advantages of this model is that it is OLS based. In the case of Azerbaijan, the impact of R&D indicators on economic growth was examined in both the short-term and long-term. As a dependent variable in the long run LOGGDP_SA, in the short run D(LOGGDP_SA) was used. Based on Akaike Information Criteria, optimal lag lengths were selected. ARDL Bounds test was performed on each model. This test provides information on the existence of a long-term relationship among indicators. In the short run, the impact of R&D indicators is based on the Error Correction Model (ECM). Finally, CUSUM (Cumulative Sum Control Chart) and CUSUMSQ (CUSUM of square) tests were performed to test the stability of each model.

5. MODEL AND DISCUSSION

The results of the Unit Root test with trend and intercept term is shown in Table 1. All the variables are stationary. Because their absolute ADF values are higher than any of the absolute Mackinnon values.

Table 1: The results of Unit Root test

	LOGRDCAPESTOCK_SA (1st difference)		LOGGDP_SA (2nd difference)		LOGRDEMPLOY_SA (1st difference)

5.1. Long term

In the long term the results of ARDL model are shown in Table 2. According to the Table 2 in model 1 all variables are significant. And the impacts of patent and R&D capital stock on economic growth are positive, while R&D expenditure and R&D employment have negative impact. In model 2 all variables also are statistically significant. In this model R&D expenditure and R&D employment affect to the GDP negatively. In model 3 only R&D employment has insignificant and negative impact. But the other variables are statistically significant. As we can see in model 4 all variables are statistically significant and only the coefficient of R&D employment is negative. In model 5 none of variables are significant. The numbers of scientific papers effect are positive and significant in both models. This shows that research contributes to economic growth. Patent applications are significant in both models too. So that, a 1 percent increase in the number of patent applications causes to approximately 0.8-1 percent increase on GDP. Although the impact of patent applications in Azerbaijan on economic growth is positive, there are shortcomings in this area in our country. Thus, there is a need to increase the number of patent applications, not only in terms of quantity, but also in terms of quality. This, in turn, can contribute more to economic growth. R&D expenditure is significant in model 1 and 2. A 1 percent increase in the R&D expenditure causes to approximately 0.8-1.5 percent decrease on economic growth. Given that the bulk of R&D expenditure belongs to the public sector (private sector participation is almost non-existent), this effect is expected to be negative. The R&D employment is significant in model 1, 2, 4 and has a negative impact on economic growth. Thus, this effect varies approximately between 1.4-3.4 percent. This can be explained by the fact that the salaries of R&D workers are many times lower than the average monthly salary and lack of motivation. The impact of R&D capital stock on GDP is positive and significant. This is consistent with the theory.

Table following on the next page

Table 2: The results of ARDL model

	Model 1	Model 2	Model 3	Model 4	Model 5

(Source: Compiled based on data from the EViews program)

The results of the ARDL Bounds test on the each model are given in Table 3. The test results show that there is a long-term relationship among the indicators only in model 1. However, model 3 doesn't have this relationship. In model 2, 4 and 5 the coordination among the indicators cannot be explained because the F-statistic value is between the lower bound and the upper bound.

Table 3: ARDL Bounds test

	Model 1	Model 2	Model 3	Model 4	Model 5
F-statistic	5.55* (k=4)	2.86*** (k=4)	2.72** (k=3)	3.08*** (k=3)	4.10*** (k=3)

* there is a long-term relationship, ** there is not a long-term relationship, *** the existence of coordination cannot be judged

(Source: Compiled based on data from the EViews program)

5.2. Short term

The results of the short-term impact of R&D indicators on economic growth in the case of Azerbaijan are given in Table 4. The results show that in these models, the impact of most indicators on economic growth is insignificant. The significant variables are the number of scientific papers, R&D expenditure and R&D employment. Thus, an increase in the number of scientific papers, R&D expenditure, R&D employment by 1 percent causes to a decrease on economic growth by 0.24, 0.26 and 0.37 percentage points, respectively.

The insignificant effect of patent applications on economic growth can be explained by the fact that its application takes some time.

Table 4: Short run analysis and ECM

	Model 1	Model 2	Model 3	Model 4	Model 5
D(LOGGDP_SA(-1))	-0.06	0.02	0.02	0.03	-0.07

6. CONCLUSION

This article examines the impact of selected indicators in the R&D sector on economic growth in the case of Azerbaijan for short and long term. ARDL and EC models were selected to study this effect. Various combinations of models were built to prevent multicollinearity. In the long run, the impact of R&D indicators on economic growth is basically significant. The impact of R&D employment, R&D expenditure is negative, while the impact of scientific papers, patent applications and R&D capital stock are positive on GDP.

In the short run the impact of most indicators on economic growth is insignificant. The effects of the scientific papers, R&D expenditure and R&D employment are negative and significant. As can be seen, there are some inconsistencies between the theory and the results obtained. The reason is that the structure of the R&D sector in Azerbaijan does not meet modern requirements. Thus, first of all, it should be noted that the classification of statistical indicators in this sector is inconsistent with international classifications and is insufficient. Other problems include the low number of articles published in "impact factor journals", the low quality of patent applications, the low salaries of R&D sector employees and the low share of private organizations in the R&D expenditures, the small number of research centers and the inefficient organization of their activities, and the weak role of universities in the R&D sector. In order to prevent these problems, as in developed countries, it would be expedient to establish individual research centers and transfer these powers to universities.

ABSTRACT

This research was selected to examine the impact of the epidemic crises faced by each country on financial markets at a certain interval. This issue has been chosen to present, interpret and value from a scientific point of view the views put forward on epidemic crises and the precautionary practices for protection. The main purpose of the research is to analyze the impact of epidemic crises in the late 20th century and early 21st century on financial markets and to investigate the measures taken. Analysis of the Problem: Crises defined as unforeseen events cause many financial market participants to face great losses. As in financial and economic crises, there are different reasons for the emergence of the epidemic crisis. One of these reasons is epidemics. In the crisis situation caused by the epidemic, all institutions in the countries where the outbreak occurs have to fight many problems. In this study, the effect of health crises due to epidemics on money and capital markets will be examined. Sars, EBOLA and COVID-19 outbreaks will be discussed in the study. In order to determine the impact of epidemic crises on money and capital markets, an evaluation will be made by analyzing them with econometric modes. In this context, econometric models will be used to reveal the relations between the epidemic crisis periods and indicators determined in accordance with the theoretical infrastructure. Research Method: In this research, it is considered within the framework of scientific studies and writing methods; it will be processed in accordance with principles such as openness, provenance, objectivity, originality, integrity. In this study, it will be searched for which econometric model or which models can be most accurately determined by the effect of epidemic crises on financial markets using the following methods. Econometrically, the effects of epidemic crises on financial markets in the case of Singapore and the United Kingdom will be analyzed with the help of co-integration and causality tests using daily data (number of tests, number of daily transmissions, number of recovering and deaths) in the years when SARS, EBOLA and COVID19 appeared.

Keywords: SARS, EBOLA, COVID-19, Financial Market, Epidemic crisis

1. INTRODUCTION

Crises defined as unforeseen events cause many financial market participants to face great losses. As in financial and economic crises, there are different reasons for the emergence of the epidemic crisis. One of these reasons is epidemics. In the crisis situation caused by the epidemic, all institutions in the countries where the outbreak occurs have to fight many problems. In this study, the effect of health crises due to epidemic diseases on money and capital markets will be examined. Sars, EBOLA and COVID-19 outbreaks will be discussed in the study. An assessment will be made by analyzing the impact of epidemic crises on money and capital markets with econometric modes. In this context, econometric models will be used to reveal the relations between the epidemic crisis periods and indicators determined in accordance with the theoretical infrastructure. With the globalization of capital markets, both investors and academics have discussed the advantages of investing in capital markets. Due to globalization, the concept expressed as the integration or integration of financial markets in the market world is closely related and becomes interdependent.

As a matter of fact, companies operating on an international scale, investors in all areas of the financial sector, brokerages and actors have taken into account the relationship between other markets. At this point, the expectation of high returns in international portfolio diversification is possible, but with the low correlation between returns in different markets. In other words, we promise possible gains that can be achieved by diversifying on different national exchanges. This research consists of two parts. In the first part of the study, a short comparison of SARS, Ebola and COVID-19 epidemic disease was made. In the second part following this section, daily outbreak and financial market indicators related to Singapore and the United Kingdom were collected and their stasis was tested with the help of econometric expanded Dickey-Fuller (ADF) and Phillips-Perron (PP) unit root tests.

2. THE COMPARISON OF SARS, EBOLA, COVID-19 VIRUSES

When looking at viruses that affect the masses, SARS is first found in Hong Kong; Ebola was first seen in West Africa, while the new type of coronavirus was first seen in China. The number of patients affected by Ebola on the first day was 86, compared to 14 in SARS and 27 in coronavirus. On the first day of the disease, 86 people died of Ebola. SARS continued to grow rapidly, with the number of patients affected by the virus rising to 133 by the time the disease reached its first week, while the death toll was 3. Ebola killed 77 people in the first week. While there were no deaths in the first week of the coronavirus, the coronavirus began to spread rapidly and affect other countries (www.haberturk.com,2020). COVID-19 and SARS are similar in many ways. For example, both have the following characteristics (www.aysetolga.com,2020):

- Respiratory diseases caused by coronaviruses
- it is thought that they came out of bats and passed to humans with intermediate host.
- they are transmitted by touching dirty objects as well as coughing and sneezing droplets of the infected person.
- has similar survival rates in the air and on surfaces
- sometimes they can cause serious diseases that require oxygen or mechanical ventilation.
- symptoms may worsen as the disease progresses
- have similar risk groups such as elderly individuals and those with health problems
- no special treatment or vaccine.

Although studies show that Covid-19 is particularly similar to SARS, there are also points where the virus differs. On March 3, 2020, the World Health Organization announced the death rate of Covid-19 at 3.4 percent. Covid-19 is less deadly than SARS, which causes the death of about 10 percent of the people it infects. (www.hurriyet.com.tr,2020). Although the transferability of severe acute respiratory syndrome (SARS) is lower than COVID-19, the case mortality rate is much higher for SARS than for COVID-19. However, the number of COVID-19 cases is significantly higher than the number of SARS cases. Although the clinical manifestations of the two recently mentioned infections are usually limited to the respiratory tract, it is noteworthy that there is a wide range of heterogeneous clinical findings in COVID-19 cases, although they have higher levels of disease severity. From a pathophysiological point of view, this phenomenon is explained by the ubiquitous presence of ACE2 receptors in multiple organs and blood vessels. At the clinical level, among some typical COVID-19 symptoms described during the pandemic is "silent anoxia", a discrepancy between an extremely low oxygen level measured by the pulse oximeter and simultaneous dyspnea deficiency; symptoms of cardiac involvement, including myocarditis, myocardial ischemia and myocardial infarction; hepatitis; reddish discoloration of malar areas imitating cold bite or chilblains; intravascular coagulation, including pulmonary embolism; encephalitis; and acute renal failure.

3. ANALYSIS OF THE IMPACT OF SARS, EBOLA AND COVID-19 ON FINANCIAL MARKETS

3.1. Econometric Method and Data Set

In the analysis to be carried out, it was chosen to present the opinions put forward on epidemic crises and the precautionary practices for protection, to interpret and value them from a scientific point of view. Daily outbreak and financial market indicators related to the UNITED States, Singapore, Turkey, the United Kingdom and China will be collected. These indicators will be tested for stasis with the help of econometric expanded Dickey-Fuller (ADF) and Phillips-Perron (PP) unit root tests. In order to provide information about the relationship between the variables, the direction and severity of this relationship, correlation test and the classification of the data obtained, frequency distributions, and identification of these distributions by measures such as averages, quarters and percentages, standard deviation, etc. will be performed.

3.2. Relationship Tests between Countries' Daily Corona Data and Exchanges

In this section, correlation between the daily corona data and the stock exchanges of the countries, descriptive statistics and the Phillips-Perron, the Augmented Dickey-Fuller (ADF) tests were performed.

Table 1: Correlation test between UK daily data and Price FTSE 100

	Number of infection	Death	Price FTSE 100	Volume
Number of infection	1			
Death	0.192467052	1		
Price FTSE 100	0.033555777	0.036650134	1	
Volume	-0.06972173	0.182477398	0.043426217	1

As shown from Table 1, there is a very weak positive relationship between variables from the correlation coefficient between the price of ftse 100 and the number of cases in the United Kingdom (0.033555777). There is also a very weak positive relationship between variables from the correlation coefficient between the price of the FTSE 100 and the deceased (0.036650134). The descriptive statistical test volatility (Standard Deviation) between the UK daily data and the Price FTSE 100 was 0.019542189 for the FTSE 100.

Table 2: Price FTSE 100 with UK daily data the Phillips-Perron, the Augmented Dickey-Fuller (ADF) tests

Variables	PP Unit root test		ADF Unit root test	
	Fixed	Fixed and Trendy	Fixed	Fixed and Trendy
Price FTSE 100 (level)	t-statistics - 15.1919	t-statistics - 15.2730	t-statistics - 7.5908	t-statistics - 7.4838
	Prob. 0.0000	Prob. 0.0000	Prob. 0.0000	Prob. 0.0000

As shown from Table 2, the price is higher than the fixed value fixed and trendy value in the PP unit root test for the FTSE 100, but the ADF unit root test shows that the fixed and trendy value is greater than the fixed value. Since the probability value is less than 0.05, it is concluded that the level value is stable.

Table 3: Singapore daily data vs. Price FTSE Singapore

	Number of infection	Healed	Death	Price FTSE
Number of infection	1			
Healed	0.03777862	1		
Death	-0.01060676	0.032274412	1	
Price FTSE Singapore	0.05455919	-0.025059853	-0.001799994	1

As shown from Table 3, there was a very weak positive relationship between the variables from the correlation coefficient between FTSE Singapore and the number of cases (0.05455919). From the correlation coefficient between FTSE Singapore and the number of cases recovering, it was determined that there was a very weak negative relationship between the variables (-0.025059853). When we look at the correlation coefficient between death and FTSE Singapore price, it is determined that there is a very weak negative relationship between the variables (-0.001799994). According to the descriptive statistical test between Singapore daily data and Price FTSE Singapore, the volatility (Standard Deviation) was 0.01617834 for PRICE FTSE Singapore.

Table 4: Price FTSE Singapore with Singapore daily data the Phillips-Perron, the Augmented Dickey-Fuller (ADF) tests

Variables	PP Unit root test		ADF Unit root test	
	Fixed	Fixed and Trendy	Fixed	Fixed and Trendy
Price FTSE Singapore (level)	t-statistics - 15.1407	t-statistics - 15.3028	t-statistics 15.0600	t-statistics - 15.2711
	Prob. 0.0000	Prob. 0.0000	Prob. 0.0000	Prob. 0.0000

As shown from Table 4, the price is higher than the fixed value constant and trendy value for FTSE Singapore in both the PP unit root test and the ADF unit root test. Since the probability value is less than 0.05, it is concluded that the level value is stable.

3.3. Relationship Tests between World Daily Ebola Data for 2015 and Countries' Exchanges

In this section, correlation between daily Ebola data and exchanges around the world, descriptive statistics and tests of the Phillips-Perron, the Augmented Dickey-Fuller (ADF) were performed.

Table 5: 2015 World Daily Ebola Data and price FTSE Singapore correlation test

	Number of infection	Death	Price FTSE Singapore
Number of infection	1		
Death	0.99717037	1	
Price FTSE Singapore	0.060972176	0.059714121	1

As shown from Table 5, there was a very weak negative relationship between the variables from the correlation coefficient between FTSE Singapore and the number of cases. (0.060972176).

When we look at the correlation coefficient between the deceased and the PRICE of FTSE Singapore, it is determined that there is a very weak positive relationship between the variables (0.059714121). According to the 2015 world daily ebola data and the descriptive statistical test between PRICE FTSE Singapore, the volatility (Standard Deviation) was 0.037829458 for FTSE Singapore.

Table 6: 2015 world daily Ebola data and price between FTSE Singapore the Phillips-Perron, the Augmented Dickey-Fuller (ADF) tests

Variables	PP Unit root test		ADF Unit root test	
	Fixed	Fixed and Trendy	Fixed	Fixed and Trendy
Price FTSE Singapore (level)	t-statistics -5.5298 Prob. 0.0001	t-statistics -6.6179 Prob. 0.0001	t-statistics -5.5581 Prob. 0.0001	t-statistics -6.6179 Prob. 0.0001

As shown from Table 6, the price is higher than the fixed value constant and trendy value for FTSE Singapore in both the PP unit root test and the ADF unit root test. Since the probability value is less than 0.05, it is concluded that the level value is stable.

3.4. Relationship Tests between World Daily Sars Data and Countries' Stock Exchanges

In this section, correlation between daily SARS data and exchanges around the world, descriptive statistics and tests of the Phillips-Perron, the Augmented Dickey-Fuller (ADF) were performed.

Table 7: World daily Sars Data and Price FTSE Singapore Correlation Test

	Number of infection	Death	Price FTSE Singapore
Number of infection	1		
Death	0.000834891	1	
Price FTSE Singapore	-0.15434211	-0.0518	1

As shown from Table 7, the correlation coefficient between FTSE Singapore and the number of cases in which there is a very weak negative relationship between the variables (-0.15434211). When we look at the correlation coefficient between the deceased and the price of FTSE Singapore, it was determined that there was a very weak negative relationship between the variables (-0.0518). According to the world daily Sars data and the descriptive statistical test between Price FTSE Singapore, the volatility (Standard Deviation) was 0.013894565 for FTSE Singapore.

Table 8: Price FTSE Singapore with world daily Sars data the Phillips-Perron, the Augmented Dickey-Fuller (ADF) tests

Variables	PP Unit root test		ADF Unit root test	
	Fixed	Fixed and Trendy	Fixed	Fixed and Trendy
Price FTSE Singapore (level)	t-statistics -7.4462 Prob. 0.0000	t-statistics -7.5781 Prob. 0.0001	t-statistics -7.4462 Prob. 0.0000	t-statistics -7.5183 Prob. 0.0000

As shown from Table 8, the price is higher than the fixed value constant and trendy value for FTSE Singapore in both the PP unit root test and the ADF unit root test. Since the probability value is less than 0.05, it is concluded that the level value is stable.

4. CONCLUSION

Both its rapid spreading power and its global effectiveness have been effective in causing not only health problems, but also some economic problems. These unexpected outbreaks have inherently different consequences from previous global economic crises due to the breadth of measures taken and the fact that they are directly related to health. Although the measures taken are very important for health, it is also known that there will be some economic consequences. The epidemic has caused some sectors to slow down and others to come to a standstill. This has put pressure on the real sector and increased demand for precautionary liquidity in the economy. The study aimed to determine the impact of the coronavirus, which has caused widespread and significant shockwaves in global financial markets, on financial markets, given the negative effects on economic activity in the United Kingdom and Singapore. In addition, in this study, the model created differs from other studies in terms of estimation and tests used. From here; The magnitude of the relationship between the daily epidemic and financial market indicators related to Singapore and the United Kingdom and the stock and stock indexes of companies in these countries was measured. With the help of Dickey-Fuller (ADF) and Phillips-Perron (PP) unit root tests applied to the level levels of variables, the stasis level was tested to the level of 5% and 10% signifiability. This feature is important for VAR analysis. In addition, correlation tests were performed between the world and countries' own case, death and recovering data and country indices. According to the results of this study, it may also be useful to present a few evaluations and recommendations for investors. Sector indices are generally influenced by sector dynamics and the overall macroeconomic framework. It has been seen from these studies that there is also an industry index that is positively affected by negative developments due to the epidemic. Therefore, if investors integrate their portfolios in accordance with the conditions, the possible losses are reduced and allow for profit.

FEATURES AND PROSPECTS OF DEVELOPMENT OF TOURISM IN KARABAKH

Saadat Gandilova

*Associate Professor at Azerbaijan State University of Economics (UNEC), Azerbaijan
s.gandilova@unec.edu.az*

ABSTRACT

Tourism in the modern world is considered as a socio-economic phenomenon that has a direct and indirect impact on the development of all related infrastructure. Modern tourism is based on a high level of development of transport, social and service sectors, which ultimately turns it into a highly profitable sector of the economy. The main purpose of the study is to analyze the prospects for the development of tourism in Karabakh. The article discusses the main prospects for the development of the tourism industry in the Karabakh region. The main ways of sustainable development of tourism in the region are proposed. The development of tourism in the Karabakh region will be of great interest to foreign tourists. Meanwhile, in Nagorno-Karabakh, the development of tourism is given priority, Karabakh will become an ecotourism center of regional importance, and in the future it can acquire the status of a world-class tourist zone. Nagorno-Karabakh has a huge tourism potential, and with the restoration of lost infrastructure communications in the liberated territories, favorable conditions for business, including for the development of tourism, are expected to be formed.

Keywords: *Tourism, hotel, development, prospects, restoration, Karabakh*

1. INTRODUCTION

1.1. Relevance of the topic

Tourism in the modern world is considered as a socio-economic phenomenon that has a direct and indirect impact on the development of all related infrastructure. Modern tourism is based on a high level of development of transport, social and service sectors, which ultimately turns it into a highly profitable sector of the economy. According to the World Tourism Organization (WTO), tourism is today one of the most profitable and most dynamic sectors of the world economy. In terms of profitability, it is second only to oil production and refining. Tourism accounts for about 6% of the world's gross national product, 7% of global investment, every 16th job, 11% of global consumer spending and 5% of all tax revenues. In this regard, in many countries, the tourism sector is actively developing with government support. The main purpose of the study is to analyze the prospects for the development of tourism in Karabakh.

1.2. Significance of the study

Nagorno-Karabakh has a huge tourism potential, and with the restoration of lost infrastructure communications in the liberated territories, favorable conditions for business, including for the development of tourism, are expected to be formed. The article discusses the features of tourism in Karabakh, the concept of tourism development prospects, as well as its problems.

2. FEATURES OF TOURISM IN KARABAKH

Karabakh, with its many magnificent landscapes, stunning mountains, lakes, plains and valleys, as well as ancient history and cultural heritage, has a rich tourism potential. The city of Shusha, located on a picturesque hilltop, is the cultural capital of the region. Shusha is the cradle of mugham, the center of carpet weaving and breeding of the world famous Karabakh horses - all this is included in the UNESCO Intangible Heritage List. The process of including the historical center of Shusha city in the UNESCO World Cultural Heritage List has already begun - Shusha has been included in the preliminary list since 2001.

Preliminary studies are underway on the use of the tourism potential of the territories of Azerbaijan, liberated from occupation. Also, large-scale work on the construction of a new road to Shusha and the implementation of all the necessary infrastructure in Karabakh for the return of Azerbaijanis home to their historical lands are in full swing. Of course, the full restoration of the liberated territories will take time, since the occupation has continued since the early 90s, which led to the destruction or damage of many cultural and historical monuments. However, we are developing various tourist routes and projects, and we are confident that hiking, outdoor activities, visits to cultural and religious heritage sites, wineries, parks and museums, as well as many other tourist destinations will soon become popular here, and we Let us introduce Karabakh to the world as a new tourist destination. When traveling to Azerbaijan, you should definitely visit Nagorno-Karabakh. The incredible nature of the local regions is due to the presence of mountainous reliefs, lakes, caves, grottoes, alpine meadows, gorges and deep canyons, which are located on the local plateau. Azerbaijan has always been famous for its mesmerizing, fantastic and captivating mountains. And visiting the area on vacation in the near year 's, will personally experience the truthfulness of these words. Most tourists will visit the floor and the area and finding wonderful holiday filled with equestrian and hiking, backpacking and exciting fishing. In addition to the creatures acce many excursion routes, which are based on the huge potential and cultural heritage of the ancient region. You can budet visit countless attractions such as the historical and archaeological, and architectural character. The heavily indented mountainous terrain predetermines the unique and amazing nature of the local edges: sheer wooded mountain ranges alternating with deep canyons and gorges with raging mountain streams, alpine meadows, mysterious grottoes and caves, picturesque lakes. And the mountains are unique, fantastic, mesmerizing, captivating with endless variety and versatility. In addition, there are excellent opportunities for excursion routes in Karabakh - this is an ancient region with a rich cultural heritage, where a huge number of attractions are concentrated - architectural, archaeological, historical.

3. RESTORATION AND DEVELOPMENT OF TOURISM IN KARABAKH

In accordance with the agreements specified in the joint statement of the President of the Russian Federation, the President of the Republic of Azerbaijan and the Prime Minister of the Republic of Armenia, from 00:00 Moscow time on November 10 of this year. a complete ceasefire and all hostilities in Nagorno-Karabakh have been declared. The Azerbaijani authorities plan to allocate 2.2 billion manats (1.3 billion dollars) for the reconstruction of the territories of Nagorno-Karabakh, which came under the control of Baku during the armed conflict in the fall of 2020. Funding is included in the bill on the state budget for 2021, submitted to the country's parliament. The money will be spent on "restoring cities and villages" and creating modern infrastructure, including roads, communications, housing, and social facilities. This was stated by the chairman of the board of the Association of Hotels and Restaurants of Azerbaijan (DAIR) Samir Dubendi, Trend.az. According to him, Nagorno-Karabakh has a huge tourism potential, and with the restoration of lost infrastructure communications in the liberated territories, it is expected that favorable conditions will be formed for business, including for the development of tourism. At the same time, ecotourism activities in Karabakh will rapidly develop, since these lands are rich in natural resources. Taking into account the mountainous terrain, it is possible to develop various types of extreme tourism, agritourism, rural and "green" tourism, hiking, mushroom tours, birdwatching (bird watching) and other areas, says Dubandi. Directly referring to the development of extreme tourism, the head of the association indicated that the development of rafting, rock climbing, mountaineering and so on will be considered. The Association of Hotels and Restaurants was founded in 2009 and is a non-profit organization that supports and promotes the interests of the hotel and restaurant business in Azerbaijan.

In the post-war period, tourism is one of the priority areas in the economy. Thousands of historical, cultural and natural attractions, infrastructure rehabilitation, attraction of investments, participation in the economic and tourism fairs and forums budet Contributing acce development of the industry. Every year the number of tourists visiting to age five, because of the attraction of this direction and prospects. The Kelbajar and Lachin regions, the Karabakh region as a whole have great tourism potential. Significant work needs to be done to realize this potential. The Kelbajar region is located mainly in mountainous areas, the highest peaks are Jamyshdag (3 724 m) and Delidag (3 616 m). Broad-leaved forests (oak, beech, elm), forest-steppe vegetation in the highlands are widespread here. subalpine meadows, and from the fauna - mountain goat, roe deer, brown bear, wild boar, squirrel, snowcock, bearded vulture, eagle. Kelbajar is also one of the habitats of primitive man. This is evidenced by numerous caves, rock paintings, various hunting and household tools, found here during excavations, the history of which spans the IV-III millennia BC. At the same time, Kelbajar is the cradle of the ancient Turkic culture. Samples of the Kur-Araz culture dating back to the Bronze Age were also discovered in this area. Kelbajar is also rich in thermal water sources... On the territory of the Lachin region, bordering in the north with Kelbajar, there are more than 3 thousand historical architectural monuments. Among them, you can list mounds, monuments, fortresses, gravestones, figures of horses, rams, plot stones and much more. The highest peak of Lachin is Mount Gizilbogaz (3,594 m). The region has a relief rich in subalpine and alpine meadows and forests. Lachin (as well as Kelbajar) has a rich and ancient carpet weaving tradition. I would like to mention the world-famous Gasimushagi carpet weaving school in Lachin. Lachin also has rich water springs, thermal springs. Monuments of Albanian culture existed on the territory of both regions. Many of them were falsified by the Armenians who tried to ascribe their fake history to them. With this in mind, it is safe to say that these areas have a wide tourism potential. These areas are rich in natural and man-made resources. Referring to the above, we can say with confidence that in the near future such activities as ecotourism, including rock climbing and mountaineering, green tourism, educational tourism, archaeological tour, medical tourism, recreation will be developed on the territory of these regions. Demining is currently underway. Infrastructure work must be carried out. Today it is too early to talk about organizing any tour to that region. This work must be done first. Most importantly, the state of historical architectural monuments should be studied. They must be reviewed anew. A number of scientists have studied historical monuments located in Karabakh, but 30 years have passed. Naturally, they need to be revised. What monuments should be taken under state protection? It is necessary to restore them. It is necessary to build hiking trails, lay and mark hiking trails. Preparation of tourist maps and other work should be done. We will be able to deal with this in the coming years. This work should be performed by a number of departments, ministries and institutions. There are issues that need to be addressed by various institutions and institutional structures. In general, Karabakh will become a new tourist destination for us. Not only two regions, but the entire territory of Karabakh will become a new tourist destination. It is necessary to ensure the safety of these areas. For a tourist, the trip there must be safe. I hope that all scientists will jointly analyze the territory of Karabakh, create new tourist routes, tourist products. After the crisis in the tourism sector is overcome, by selling these products, we will attract many tourists. Special new types of tourism will appear. I am sure that Karabakh will become a territory of ecological tourism and will be recognized as a regional territory for ecological tourism. The time will come when we will create more beautiful places in Karabakh and adjacent regions than resorts in the Swiss Alps, resorts in France, Italy and Germany.

4. RESULTS AND DISCUSSION

The tourism potential of Karabakh is very rich, there are all opportunities for the development of many types of tourism - ecological, mountain, winter, hunting, health. This region, which has an ancient history, has unique flora and fauna, cuisine, historical, cultural and religious monuments, springs, dense forests and other attractions and benefits that attract tourists. Shusha, pearl culture, located at 1,400 meters above sea level, you can create new tourist routes, "In Susa the mild climate and mineral waters have medicinal properties here have grown famous composers, masters of mugham and artists of all this will allow.. I is we create interesting routes for tourists ". To begin with, civilians must return to the liberated territories, it is necessary to carry out work to restore housing and infrastructure, to ensure security. Only then can entertaining trips to Karabakh be organized. The trilateral statement on Karabakh by the leaders of Azerbaijan, Russia and Armenia was signed on November 10, 2020. President of the Republic of Azerbaijan Ilham Aliyev and President of the Russian Federation Vladimir Putin announced a complete ceasefire and all hostilities in the zone of the Nagorno-Karabakh conflict from 00:00 Moscow time (01:00 Baku time) on November 10, 2020. By this agreement, the Aghdam region is returned to the Republic of Azerbaijan until November 20, 2020. Until November 15, 2020, the Kelbajar region will be returned to Azerbaijan, and by December 1, 2020 - the Lachin region. At the same time, a peacekeeping contingent of the Russian Federation will be deployed along the line of contact and the Lachin corridor. Parallel to the occupied territories of the former yli withdrawn by Armenian Armed Forces. Unblocking of economic and transport links is expected. Transport links will be provided between the western regions of Azerbaijan and the Nakhchivan Autonomous Republic.

5. CONCLUSION

Forest, water and land resources in the territories liberated by Azerbaijan create great opportunities for the development of agriculture, processing industry and tourism. Most importantly, the economy of the liberated territories will be restored, and new technologies will be introduced, which will affect the increase in the productivity of the economy. P od occupation find L Xia Sarsang reservoir - the highest reservoir Azerbaijan (125 m) with a total capacity of 560 million cubic meters. In the past, the Sarsang reservoir provided irrigation water to the Terter, Agdara, Barda, Goranboy, Yevlakh and Agjabad districts. By creating artificial floods, the Armenian side dumped water in the spring and autumn months to damage the lands of Azerbaijan. In the hands of Armenian Sarsang Reservoir Presenting To a threat to the region's environment and national security. Up to 40 percent of Azerbaijan's mineral water reserves are located in the occupied territories. This water can be sold as bottled water, as well as create resort and recreational areas around the springs. 2 nature reserves, 4 reserves and historical monuments located in the occupied territories have great potential in terms of tourism development. The Azikh cave, which is one of the oldest settlements in the world, also has a tourist potential. Meanwhile, in Nagorno-Karabakh, the development of tourism is given priority, Karabakh will become an ecotourism center of regional importance, and in the future it can acquire the status of a world-class tourist zone. Nagorno-Karabakh has a huge tourism potential, and with the restoration of lost infrastructure communications in the liberated territories, it is expected that favorable conditions will be created for business, including for the development of tourism. At the same time, ecotourism activities in Karabakh will rapidly develop, since these lands are rich in natural resources. Taking into account the mountainous terrain, here you can develop various types of extreme tourism, agritourism, rural and "green" tourism, hiking, mushroom tours, birdwatching (bird watching) and other areas.

ABSTRACT

As the pandemic process covers all stages of the world economy and social life, there arises a great need to study this process. Taking into consideration that pandemic processes have weakened economic development many times, it is important to focus on investigating and eliminating shortcomings in other areas that have been damaged by this. Statistical study of demographic processes, which is another economic indicator, is one of the priorities of statistics. In addition, we would like to note that as the current problem affects the entire world economy, it will reduce the chances of countries to help each other. For this reason, the problem of unemployment has emerged as a key element in the current situation as a major shortcoming. The pandemic has had a profound effect on the unemployment problem along with the economy, which in itself has led to a greater need for new areas. The great damage caused by the COVID-19 pandemic to employment will, of course, be eliminated in parallel with the recovery of the economy. However, the positive developments created by the pandemic in some areas of employment should also be noted. These developments are expected to continue in the postpandemic period. COVID-19 will make digitalization necessary in many areas of employment. New specialties are expected to emerge, particularly in the IT sector, and the trend of people working remotely online will continue in the post-pandemic period. If we look at what is happening from a more positive angle, it can be noted that the sharp declines usually caused by sudden events such as the coronavirus pandemic are then replaced by rapid recovery and rise. The full transition to digitalization, which has long been delayed under the pretext of lack of funding and time, is already one of the main topics of discussion in the business world. We see that the unexpected COVID-19 pandemic in the world plays a big role in this issue. The current situation will accelerate and make digitalization necessary in many areas of the labor market. At present, we see that countries that are more advanced in terms of digitalization will be able to cope with the losses of this pandemic more easily. Millions of people are working from home as workplaces are temporarily closed and remote working system is switched to prevent the spread of the virus. Joint teleconferences, video meetings are organized. Many companies, which see these new digital rules as saving time and other resources and more convenient, are expected to continue to work in this way in the post-pandemic era. In general, digitalization of work, automation of production technologies, integration of new generation of software and equipment, organization of teleconferences are expected to be at the forefront of the business world in the post-pandemic period. The results of the analysis show the level of unemployment in the pandemic and what methods can be used to make the solution for this process more innovative.

Keywords: *pandemic, human potential, demographic processes, unemployment, correlation-regression, econometric analysis*

1. INTRODUCTION

The pandemic, one of the new economic problems of our time, is having a negative and positive impact on almost the entire world economy. The world economy with a monotonous standard

of development has stopped all economic processes, creating a shock effect from the almost sudden pandemic process. Implementation of the social isolation of many of the area itself has pushed at least temporarily, to suspend its activities[1. AA Ismayilzade, S Guliyeva]. But over time, have countries in the world continued to seek ways out of this situation. For today, vaccination has almost helped to reverse the economic process, albeit in small amounts. In addition, it should be noted that the problem of unemployment in accordance with the processes of social isolation brought on even more pronounced. According to the demographic challenges as well as the problem of unemployment during the pandemic began to manifest it more vividly. In view of the above, it was stressed that the problem of unemployment should be kept in mind, and there is a need for a more active analysis of the problems that have arisen in the current period. The realization of these requirements is possible on the basis of the use of a developed market economy mechanism together with state regulation. First of all, it is necessary to improve the territorial structure of production, ie: eliminate unequal development of production capacity in the regions, over-specialization of regions, more complete use of local resources and opportunities, taking into account personal labor potential, eliminate backwardness of regional social infrastructure; . This requires territorial flexibility of the workforce, which requires some regulation, as there is a risk of increasing disparities in the supply of labor to the regions, including an increase in staff shortages in regions with difficult living standards. Moreover, the desire to appeal to the modern era, content reveals new areas and professions[8. Trade and Development Report 2020]. For example, social media manager, marketing manager, digital manager, CEO Officer and others is one of the new areas of this kind. Of course, in order to acquire both the required and high-paying professions in the globalized world, it is necessary to be sufficiently familiar with the world labor market and conduct research. It is everyone's dream to find a good job, to work with enthusiasm, to gradually rise in the field where you work. Another issue is that when choosing a profession, it is important to take into account not only the level of wages, but also the demand for specialization in the labor market. Unfortunately, these two indicators do not always coincide. Therefore, a successful career and young professionals looking for success in the profession are sometimes disappointed [3. The Human Capital Report 2015.]. It should be noted that the coronavirus pandemic has also caused many changes and difficulties in the labor market. During the pandemic, the activity of both employers and job seekers decreased. For more than a year, the whole world is fighting with COVID-19. During this period, small and medium enterprises, especially around the world, have suffered greatly[2. Andreas Savvides and Thanasis Stengos]. During pandemic period, both developed and developing countries as well as the companies, institutions faced serious problems. The statements of the International Labor Organization were not heartening. According to a report released by the ILO, 305 million people lost their permanent jobs during the period in question. It is quite a large number. However, during the coronavirus pandemic, the need for health care workers doubled. Demand for caregivers without chronic disease has increased worldwide. Due to the increase in demand, the salaries of employees in this sector have also increased. The Bureau of Labor Statistics in the United States ranked the highest paid professions, noting that the salaries of health workers in one of America's most prestigious and competitive professions reached \$ 260,000 a year. Tightening quarantine rules, minimizing live communication between people accelerates digitalization in many areas of the labor market. We now see that the digitally advanced countries are more comfortable coping with the effects of the pandemic. Therefore, in the post-pandemic period, it is predicted that physical exchange will be replaced by digital exchange. Experience has shown that digitalization is necessary in many areas of employment. In particular, the information technology sector will create new specialties, in addition, people working in remote online trend is expected to continue during the post-pandemic period. The rapidly changing world order, of course, also affects specialties. Professions go beyond their own, that is, different specialties emerge.

The rapid development of e-services, in particular, has made this area even more important[7. World Employment and Social Outlook.]. The World Industry Index DOW JONES and the Nasdaq Index have led to a sharp rise in the share of innovative companies in world industry. If the countries of the world are considering integration into the modern world market and want to eliminate the problem of unemployment in the labor market, they should expand their activities in the areas covered by these indices. Their implementation will create a basis for the development of the country's economic processes and expand its geolocation in the world economy. In addition, along with the labor market, there is a need to implement a policy to constantly improve the economic situation in the country. Azerbaijan's labor market, as in a number of leading countries, continues to close both legal and illegal jobs during the crisis caused by the Covid 19 pandemic.

2. REAL SITUATION IN AZERBAIJAN

The number of economically active population in the labor market has increased by 70,800 over the past year. As of March 1, 2020, the official unemployment rate in Azerbaijan was 4.8%. Since then, as a result of closures in the country, the service sector has minimized its activities. In this case, those who worked illegally were fired, and those who worked legally continued their activities with the help of the government and the reduction of wages. However, in some cases, the contract was terminated. There was also an increase in dismissals at the end of the agreement. As of March 1, 2021, the official unemployment rate in Azerbaijan is 7%[4. V Teymurova, M Abdalova,]. This was due to the growing number of economically active population, as well as a decrease in the number of employees. The 2.2% increase in unemployment in the country over the past year is 40% of dismissals or contract expirations. The other part is based on the growth of the economically active population. At present, 376,000 economically active people are unemployed in the country. In order to ensure the livelihood of the population during the fight against coronavirus last year, in Azerbaijan, along with the unemployed, informal workers and temporary workers, temporary workers, as well as economically inactive population were paid 190 manat 4 times in 2020. This means a total of 450 million manat. In addition, it should be noted that in 2021, those who lost their jobs were always given the same amount of state support. In addition, it should be noted that financial assistance in connection with social isolation measures has always been provided to businesses suffering from the pandemic as a state support[5. В.Т. Смирнов, И.В. Сошников]. The main purpose here is to provide state support to individual economic entities. In this case, the development of the private sector in the field of economic activity will be unsatisfactory. After the post-pandemic, the loss of economic activity will in itself form a large army of unemployment[9. Handbook of Statistics 2020].

Infected with the virus	331883
Healed	319271
Death case	4839
Tested	3435192

Table 1: Current situation with coronavirus in the country (according to the number of people)

(Source:[14. <https://koronavirusinfo.az/az/>])

As we know, knowing that the country's population will reach 10 million in 2020, and as shown in the table, the economic damage of this process is not so great, as it is a very small part of the proportion of infection during a pandemic.

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020
Economically active population	4587.4	4626.1	4688.4	4757.8	4840.7	4915.3	5012.7	5073.8	5133.1	5190.1	5252.6
Employed population	4329.1	4375.2	4445.3	4521.2	4602.9	4671.6	4759.9	4822.1	4879.3	4938.5	4876.6
Unemployed population	258.3	250.9	243.1	236.6	237.8	243.7	252.8	251.7	253.8	251.6	376.0

Table 2: Labor market indicators of the country for 2010 – 2020 (in thousands of people)
(Source: [12. <https://www.stat.gov.az/source/labour/>])

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020
Product release in the main sectors of the economy in the country	45.7	56.3	60.0	61.8	61.3	57.4	66.2	78.2	86.5	89.1	79.3

Table 3: Product release in the main sectors of the economy in the country in 2010 – 2020.
(in billion manats)

(Source: [13. https://www.stat.gov.az/source/system_nat_accounts/])

The table presented above we can see clearly that the unemployed population in 2020, compared to the 49.4 per cent increase over the previous year 11.1 percent decline in total output in the country has led to the next round. Hence it is clear that 2020 is the reduction in total output for the year as a result of the increase in the unemployed population has a direct impact. Given all this, the problem of unemployment will always need to be explored in the future.

3. EVALUATION OF EFFECTS OF EMPLOYMENT ON PRODUCT RELEASE

The main areas of research in the country, the number of employed people have tried to evaluate the effects of the product release. The database of the State Statistics Committee, covering the period of 2010 – 2020 based on annual performance. The evaluation of the econometric regression equation was chosen as the methodological approach. The model was empirically implemented in the EViews 9 statistical software package.

	Product release	EMPLOYMENT
Product release	1.00	0.92
EMPLOYMENT	0.92	1.00

Table 4: Correlation coefficient

The results show that there is a strong linear relationship between employment and product release (0.92). This gives us a basis for constructing the regression equation in a linear form.

Table following on the next page

Log likelihood	13.38864	Hannan-Quinn criter.		-1.798232
F-statistic	15.47232	Durbin-Watson stat		1.408137
Prob(F-statistic)	0.001797			
Inverted AR Roots	.41			

Table 5: Evaluation of effects of employment on total product release

Thus,

$$\text{PRODUCT RELEASE} = -17.71 + 4.23 * \text{EMPLOYMENT}$$

According to the model results, the explanatory variable explains the dependent variable by 86.9% (R-squared = 0.869). The coefficients of the regression equation are statistically significant at the 1% significance level. The ratio suggests that a 1% increase in employment leads to a 4.2% increase in product release and the Durbin Watson coefficients (1.41) suggest that the model is adequate.

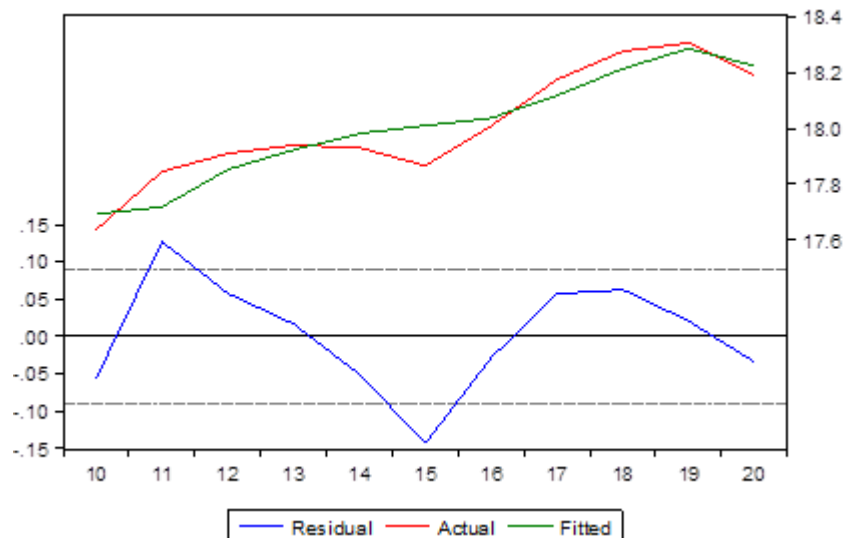

Figure 1: A graphical description of the remains is given below

During the pandemic, there have always been negative effects on the demographic situation. Thus, the reduction in the number of marriages during the process of social isolation, the reduction in the migration process of people has an artificially negative impact on demographic processes.

4. CONCLUSION

Studies show that migration indicators have a positive and direct impact on the number of economically active population. In the process of econometric research, a multivariate linear regression equation of dependence of the employed population of the Republic of Azerbaijan on output in key areas and demographic and social factors was constructed and the model was transformed into a mechanism adequate to real conditions. Given the satisfactory quality of the established econometric model, it should be noted that the model obtained to express the dependence of the employed population is indeed sufficiently adequate to real conditions and suitable for forecasting.

ABOUT THE STRUCTURE AND VOLUME OF GLOBAL FINANCIAL MARKET

Elshad Samedzade Ziyad

*Azerbaijan State University of Economics, Azerbaijan
selshad@yahoo.com*

ABSTRACT

The financial market is the economic plane in which financial resources are bought and sold. I propose a new structure:

- 1) Credit market - The credit market is an economic plane that allows money to be transferred from a lender to a borrower. The annual volume of the global credit market is more than 40 trillion US dollars.*
- 2) Currency market is the economic plane in which the purchase and sale of foreign currency takes place. The global currency market is more than \$ 2 quadrillion.*
- 3) Classical securities market - is the economic plane in which the circulation of securities is organized. The global securities market is over \$ 95 trillion (without DFI).*
- 4) Derivative financial instruments - a derivative is a written certificate confirming that the buyer undertakes to buy goods, currency, securities at a pre-agreed price and the seller undertakes to sell. The global derivatives market is said to be worth more than \$ 1 quadrillion.*
- 5) Precious metals market is an economic plane in which the purchase and sale of gold, platinum group metals, silver is organized. According to our calculations based on LBMA data, the annual trade of the London gold market alone is \$ 7 trillion.*
- 6) Precious stones include natural diamonds, emeralds, rubies, sapphires, alexandrites. The volume of only global diamonds markets is \$ 87,31 billion.*
- 7) The insurance market is the economic plane in which the sale of insurance certificates is organized. The global insurance market is worth \$ 6.3 trillion (2019).*
- 8) Leasing, forfeiting, factoring market-is the economic plane that organizes to conclude leasing, forfeiting, factoring deals. The volume of only global leasing market is \$ 1.2 trillion.*

Keywords: *global financial market, structure, volume*

1. INTRODUCTION

“There is no second tool in the world that unites people and nations as much as the market.” John Maynard Keynes proposed to divide the economy into financial and real sectors. According to the data of World Bank, our planet's GDP is \$ 87.7 trillion in 2019 and \$ 83.8 trillion in 2020, which is severely affected by the pandemic.¹ The volume of labor market is \$ 4.4 trillion.² At present, the commodity and labor markets together form for about 3-4% of the total global market, 96-97% falls on the financial market. Thus, a significant part of finance created to ensure the turnover of goods has moved away from its original functions and turned into finance for finance. Because classically, finance is a system that serves the purchase, sale and turnover of goods.

2. THE ROLE OF FINANCIAL MARKET IN ECONOMY

Former Italian Prime Minister Matteo Renzi said before referendum in 2016: “Let the financial markets know that we will continue to work to improve the structure of the economy.” Why did the government official apply to the financial markets? Because the situation in the financial markets has the potential to have both strategic and immediate impact on national economies. The efficiency of the economy as a whole depends on the efficiency of the financial system.

J. Schumpeter wrote about this in 1912, Gurley- E. Shaw in 1955, R. Goldsmith in 1969, and R. McKinnon in 1973. Richard Sylla, a professor at New York University, proves according to the data of Netherland and England in the XVII century, USA in the XVIII century, Germany, Japan, Russia in the XIX century that financial revolution, or more precisely, the strengthening of the banking system was a prerequisite for the industrial revolution and subsequent economic growth. However, the impact of financial markets on the economy can also be negative. In this case, the process of remanufacturing is disrupted. Borrowing becomes difficult, communication between economic entities is cut off, investment and employment are reduced. As a result, a crisis occurs. The rapid exit of up to \$ 400 billion from Southeast Asia during the 1997-1998 Global Financial Crisis, 5 times depreciation of the South Korean currency-won urge not to forget the effect of the global financial winds.

3. "THE SYSTEM IS LARGER THAN THE SUM OF ITS ELEMENTS" - PLATO

Experts have different views on the structure of the financial market. Taking advantage of their ideas, I propose a new structure:

- 1) Credit market
- 2) Currency market
- 3) Securities market
- 4) Precious metals market
- 5) Precious stones market
- 6) Insurance market
- 7) Leasing, forfeiting, factoring market

Each segment of the structure deals with the transfer of funds from a thrifty economy to a deficit economy by offering financial instruments. Let's talk briefly about the volume of segments.

- 1) Credit market. Here we are talking about the type of bank loan. The credit market is an economic plane in which money is transferred from a lender to a borrower. Lenders include international financial institutions, regional banks, the central bank, banks (working based on profit), and non-bank credit institutions. The global credit market is worth more than \$ 40 trillion. The main role in the world interbank market belongs to LIBOR. LIBOR is the weighted average interest rate in the interbank market. Thomson Reuters, a commissioner of the British Banking Association, determines it every banking day based on a survey of 16 first-tier banks that are considered market makers in the London money market. Thus, LIBOR is defined in 10 currencies: US dollar, Canadian dollar, Australian dollar, New Zealand dollar, euro, British pound, Swiss franc, Japanese yen, Danish krone, Swedish krona. Interest rates on a \$ 360 trillion financial instrument worldwide is based on LIBOR.³ There are also EURIBOR, PIBOR (Paris Interbank Supply Rate) in the global financial market.
- 2) Currency market is the economic plane in which foreign exchange is traded. The global currency market is more than \$ 2 quadrillion in a year, surpassing other parts of the financial market. The total market value of cryptocurrencies is \$ 2.48 trillion.⁴
- 3) Securities market is the economic plane in which the turnover of securities is organized. This market is divided into small parts: share and debt, state and corporate, primary and secondary market, stock and over-the-counter market etc. The global securities market is worth more than \$ 95 trillion (excluding derivative financial instruments). Derivative financial instruments, (in latin derivare – derivative from water), a derivative is a written certificate confirming that the buyer undertakes to buy goods, currency, securities at a pre-agreed price and the seller undertakes to sell. The purpose of this operation is to protect against price increases and decreases.

Of course, one of the parties can gain money and the other can lose. Some experts say that the volume of global derivatives market is \$ 1 quadrillion. The reason for the growth of this market is global uncertainty and the desire to protect against it. This part of the financial market is often difficult to account for because it is outside the control of national states. Therefore, some researchers consider this figure exaggerated.

- 4) Precious metals market is an economic area where the purchase and sale of gold, platinum, silver and platinum group metals (ruthenium, rhodium, palladium, osmium, iridium) is organized. Let's remember the history that in the past there were metal coins in turnover. Then turnover of paper money which is based on metal became. After the Jamaica Agreement of 1976-1978, a turnover based on a non-metallic emerged. As a result, gold-the brightest representative of precious metals lost its role as the basis of the monetary system. However, despite the exclusion of gold from official turnover, this precious metal and others remain in the interest of investors as a reliable financial instrument. These stainless, high-conductivity and rare metals are opportunity to protect and increase resources in times of uncertainty. They are sold in London Metal Exchange, New York Stock Exchange. The biggest gold market is in London. According to our calculations based on LBMA- (London Bullion Market Association) data, the annual trade of the London gold market alone is \$ 7 trillion. Switzerland buys 40 % gold which is sold in the world. The IMF, which has the world's largest gold reserves, holds 90.5 million ounces of gold worth \$ 168.6 billion.⁵

Table 1: Prices of precious metals

Name of precious metals	Price in 2019	Price in 2020
1. Gold ⁶	\$ 1,393.34	\$ 1,773.73
2. Silver ⁷	\$ 16.22	\$ 20.69
3. Platinum ⁸	\$ 868.04	\$ 893.39
4. Palladium ⁹	\$ 1,518.99	\$ 2,178.96
5. Rhodium(per ounce) ¹⁰	\$ 6,050	\$ 17,000

Banks accept metal deposits. The metal itself is not participated here. It is simply used as a unit of measurement. For example, if 100 grams metals are deposited, 3 grams metals per year will be added to it, regardless of the increase or decrease in the price of the metal.

- 5) Precious stones include processed and unprocessed natural diamonds, emeralds, rubies, sapphires, alexandrites. The volume of only global diamonds markets is \$ 87,31 billion. According to the idea that diamonds are eternal, financiers diversify their assets by investing in precious stones.
- 6) The insurance market is the economic plane in which the sale of insurance certificates is organized. Payments collected by insurance companies act as investment resource. The global insurance market is worth \$ 6.3 trillion in 2019.
- 7) Leasing, forfeiting, factoring market-is the economic plane that organizes to conclude leasing, forfeiting, factoring deals. Leasing is the sale of property (mainly equipment) by a

leasing company from the seller to the consumer on a long-term lease or in installments. Factoring (Latin factor - intermediary, sales agent) and Forfeiting (French à forfait - whole, full amount) are buying loan claims from the seller at a discounted price and then to ensure that the money is paid by the borrower. In factoring, the seller is initially paid part of the amount, and after receiving it from the buyer, the rest is paid with discount. In forfeiting, the risk remains in the forfeiter so after deducting a certain discount to the seller, the rest of the amount is paid immediately. Discount means the profit of a factor or a forfeiter. Leasing equipment alone in the world is \$ 1.2 trillion.

4. ALTERNATIVE DIVISION

The financial market is also divided differently: money market and equity market. The money market is the economic plane in which deals of up to 1 year are concluded. It includes transactions in loans, securities and other financial instruments. The equity market is the economic plane in which deals are concluded for more than a year. In some literatures, both money and equity markets are referred to as larger equity market. Such a division is interesting for a financial market participant because he applies to the money market for short-term trading and to the equity market for long-term trading.

5. CONCLUSION

In my opinion, the division I present more accurately reflects the reality of the financial market and does not allow recalculation of funds. According to my calculations, the annual volume of the world financial market exceeds 3 quadrillion US dollars. The market is sharply dynamic and statistics are changing rapidly.

COUNTRY BRAND RANKINGS DURING THE COVID-19 PANDEMIC: "ONE THING IS IMPORTANT: TO BE GOOD NOW"

Arpad Ferenc Papp-Vary

Budapest Metropolitan University, Hungary,

John von Neumann University, Urban Marketing and Geostrategy Center, Hungary

apappvary@metropolitan.hu

ABSTRACT

Brand rankings have long been common in the world of products and services: rankings of the top 100 global brands are released by Interbrand and BrandZ-Kantar-WPP among others. For example, the top five brands of the Interbrand 2020 list are Apple, Amazon, Microsoft, Google and Samsung, followed by the first non-technological brand, Coca-Cola. The situation is similar in the case of the BrandZ-Kantar-WPP 2020 ranking, with the order of the top five being Amazon, Apple, Google, Microsoft and Visa. Like classic brand rankings, country brand rankings are also available. Moreover, there is a new one almost every year, such as the Anholt Nation Brands Index, the FutureBrand Country Brand Index, the Anholt Good Country Index, the Bloom Consulting Country Brand Ranking (Tourism Edition and Trade Edition), the Young&Rubicam Best Countries, the Reputation Institute Country RepTrak and the Global Soft Power Index. It is impossible to discuss all of these in a single article, and not all of them have published a fresh country brand ranking that was created during the COVID-19 pandemic, therefore we only scrutinize the first three of them. One of the aims of the publication is to present their methodology, dimensions and attributes, as well as the results of the individual rankings, with special regard to how they changed in 2020. The other purpose of this writing is to highlight that the basis of a good country brand and a good country image is in fact nothing more than the good country itself – similar to a classic brand, where the starting point is a good product and service.

Keywords: *Country branding, Country brand indexes, Country brand rankings, Nation branding, Covid-19*

1. THE COMPETITION OF COUNTRIES IN OUR MINDS

Let us face it, we tend to compare our own country with other countries. There are nations that stand on a lower rung of the imaginary ladder, and there are countries above us. Maybe this is also related to our superiority or inferiority complexes, but we can also find a marketing-based explanation in the background – namely, the position of a country or a country brand on that ladder basically depends on the value or values we associate it with, and the thoughts and emotions that emerge in us when we hear the name of the country. As Kotler and Keller point out (2012), brands exist in consumers' minds. The strength of a brand depends on what the customer has seen, read, heard, learned, thought and felt about the brand over time. In other words, the strength of a brand exists in the minds of existing or potential customers and the direct or indirect experiences they have had with the brand. The question is, of course, whether the value of all this can be calculated and scientifically proven. This is not so simple in the case of traditional products and services either, but brand rankings such as Interbrand Best Global Brands or BrandZ-Kantar-WPP The Most Valuable Global Brands attempt to do so. Similar lists of countries are published from time to time as well – some of them can be disputed, but there are also lists that have become accepted in recent years, insomuch that foreign ministers and prime ministers of governments draw conclusions according to the results. These lists include examples that are not specifically brand rankings, but are still worth mentioning because of their frequency of being cited. Such rankings include the IMD competitiveness report and the World Economic Forum global competitiveness report As Péter Ákos Bod points out in his

article on the topic (2009, 32.), "In a professional sense, we can consider these lists as beauty contest rankings that we do not have to agree with, and – as it often happens in beauty contests – a high ranking on the list does not always reflect real values. However, a significant step backwards on these lists has a negative effect on the global perception of the country." Similar rankings are also regularly published by renowned journals such as *The Economist*, *Forbes* or *Euromoney*. Country lists by credit rating agencies such as Moody's Investors Service, Standard&Poor's, Fitch-IBCA or Japan Credit Rating Agency can be considered some kind of thematic rankings. However though, this article aims to stay true to the theme and specifically discuss country brand rankings, not the abovementioned lists. It is worth considering that almost every year at least one new ranking is published, which is then re-released each year. These include the Anholt Nation Brands Index, FutureBrand Country Brand Index, Anholt Good Country Index, Bloom Consulting Country Brand Ranking (Tourism Edition and Trade Edition), Young&Rubicam Best Countries, Reputation Institute Country RepTrak and Global Soft Power Index. It is impossible to cover all of these in a single article, and not all of them have recent country brand rankings created during the Covid-19 pandemic, therefore the study only looks at the first three. The article describes the methodology, dimensions and factors of the Anholt Nation Brands Index, the FutureBrand Country Brand Index and the Anholt Good Country Index, and then analyses the countries' shifts in the rankings during the Covid-19 pandemic. Before going into detail, however, it is worth discussing the usefulness of these rankings. First of all, publicly available rankings are important for the public opinion: everyone may be interested in where their own country ranks, how they compare with their neighbours, or which countries are rated the best or worst in the world, according to different criteria. It is no coincidence that the media are also happy to receive new rankings and report on them, as the subject is sure to be of interest to readers, viewers and listeners. The results of the rankings are useful for one more thing besides a comparison with other countries: to show how a country's ranking has changed compared to previous years or even earlier years. As country image (or country brand, if you like) changes slowly, it is worth paying attention to any significant shifts in the overall ranking or in any of its dimensions. The importance that some governments attach to this is illustrated, for example, by Finland's annual publication *Building the image of Finland – Review of the country image*. One of the main chapters of the review is about where Finland ranks in the various country brand surveys. On the basis of these, the document explains the country's main strengths and weaknesses and, more specifically, what the public thinks of them worldwide, i.e. how they perceive the Finland brand (Finland.fi Toolbox, 2017). But rankings also have another significance: they provide PR value for those compiling the lists, and can therefore result in paid government contracts. This may include consultancy, but many rankings are produced in such a way that detailed country analyses are only available for a fee, as the researchers have to be paid. The Scottish Government, for example, does this every year in the case of the Anholt Nation Brands Index and then publishes the detailed results, ensuring that people in Scotland can see how their country is perceived. This also helps to better inform the government (especially organs of state responsible for foreign affairs) of all the actions that need to be taken to further improve the country, and, consequently, the country brand (Gov.scot 2021). Last but not least, rankings can be particularly important in a situation where the whole world is affected by a topical issue – in this case, a pandemic. A change in the perception of a country can be an indicator of how well or badly it has managed the pandemic, and more specifically how this management has been reported in the international media. After all, our judgement of a country is greatly affected by the most important information pieces we have about it, that is, what news we have received about it, if any. The above information may well summarise the practical relevance and usefulness of each of these rankings.

If the analysis of rankings is done systematically by a country's government, it will certainly be more aware of what the country is perceived to be by the broad international public – whether before, during or after the pandemic.

2. THE ANHOLT NATION BRANDS INDEX

This index was the first attempt to set up a ranking of countries as brands. It was launched in 2005, and it has now grown into one of the world's largest social science research projects. It has had various complicated names: first it was called Simon Anholt's Nation Brands Index, then it was mentioned as Anholt-GMI Nation Brands Index and from 2008 as Anholt-GfK Roper Nation Brands Index, then in 2017 it was renamed Anholt Nation Brands Index powered by Ipsos, its current name. It can be seen that these names all include the word Anholt, referring to Simon Anholt, the creator of the concepts of country brand and country branding, and at the same time the best-known international authority in the field, the author of several books on the subject. In terms of research methodology, it must be pointed out that the research is conducted in 20 countries, and uses a representative sample to monitor the influence and attractiveness of 50 countries. This is also the most common reason for criticism regarding the ranking: on the one hand, only 50 countries are included (although, for example, Hungary is on the list), and on the other hand, the survey itself only takes place in 20 countries. However, as they say, if a research makes exactly the same mistake from time to time, the changes can be interpreted in the very same way, and that is the point. In addition, the sample itself is relatively large, with a total of 20,000 people being interviewed – and the last time it was conducted between 7 and 30 July 2020, when the COVID-19 pandemic had been tangible for more than four months (Ipsos 2020). The measurement is based on six dimensions, that is, competence fields, alongside 23 attributes in total. These are summarised in Table 1. According to the above criteria and the results of the survey, Germany had the best country brand in 2020, which means it is now in the lead for the sixth year in a row. The Top 10 is dominated by European countries (Germany, United Kingdom, France, Italy, Switzerland, Sweden), but Canada, Japan, Australia and the United States are also included. It is also true that the latter country finished in 1st place a few years ago, and now it is only 10th, which shows that the public perception of the US is deteriorating globally (or at least among the respondents in the 20 countries surveyed) (Ipsos 2020). In the context of the latter, it may be interesting to note that when we examine each dimension (see Table 2), the United States does best in the dimensions Exports and Culture. The former is no particular surprise, as the vast majority of global brands are American, be it technology companies, food, fast food chains or financial service providers, and the list goes on. In the field of culture, however, the United States' 5th place out of 50 countries may seem overly upscale at first. But if we consider that this includes not only cultural heritage (in which the country, having been founded in 1776, has limited opportunities), but also modern culture such as movies, pop music or sports, we may easily understand the result.

Table following on the next page

Dimension	Attributes of the specific dimension
Tourism	Visit if Money was No Object; Natural Beauty; Historical Buildings; Vibrant City
Exports	Science and Technology; Buy Products; Creative Place
Governance	Competent & Honest; Rights & Fairness; Peace & Security; Environment; Poverty.
Investment and immigration	Work & Live; Quality of Life; Educational Qualifications; Invest in Business; Equality in Society
Culture	Sports; Cultural Heritage; Contemporary Culture
People	Welcoming; Close Friend; Employability

Table 1: The dimensions and attributes of the Anholt Nation Brands Index (Source: Papp-Váry, Árpád (2019): Országmarkázás – Versenyképes identitás és imázs teremtése ("Country Branding – Creating competitive identity and image"). Budapest, Akadémiai Kiadó.)

Ranking	Total of all dimensions	Tourism	Exports	Governance	Immigration and investment	Culture	People
1	Germany	Italy	Japan	Canada	Canada	Italy	Canada
2	United Kingdom	France	United States of America	Switzerland	Germany	France	Australia
3	Canada	United Kingdom	Germany	Sweden	Switzerland	United Kingdom	Italy
4	Japan	Spain	United Kingdom	Germany	United Kingdom	Germany	United Kingdom
5	France	Greece	Canada	Australia	Sweden	United Kingdom	New Zealand

Table 2: The top 5 countries in the overall ranking and 6 dimensions of the Anholt Nation Brands Index

(Source: Ipsos (2020): Germany Retains Top "Nation Brand" Ranking, the UK and Canada Round Out the Top Three (<https://www.ipsos.com/en-ca/news-polls/Germany-Retains-Top-Nation-Brand-Ranking-the-United-Kingdom-emerges-ahead-of-Canada-to-Round-Out-the-Top-Three-US-and-China-Experience-Significant-Drop>), published: 27 October 2020, retrieved: 2 April 2021.)

Table 2 also highlights another interesting fact: if we are seeking to find the most ideal country brand, it is probably nothing but a combination of Italy and Germany. This is because one of the countries is weak in aspects that the other is strong in, and vice versa.

While Italy's tourism and culture are highly valued, as are the people who live there, the investment and immigration dimension receives significantly lower scores, not to mention governance. In contrast, people, landscapes, culture, food, and even fashion are weaker in Germany, while governance, the economy, and "engineering" brands are generally highly valued. Thus, in fact, if Italy and Germany were united, it would create the best country – or at least the best country brand – in the world. Of course, if we recall that there were aspirations for this in the 20th century, we may quickly realize that this is not a good idea after all.

3. THE FUTUREBRAND COUNTRY BRAND INDEX

The second best-known ranking following Anholt Nation Brands Index is related to FutureBrand, a global consultancy, and evaluates 75 countries – those that belong to the top 75 countries based on World Bank data regarding their GDP (gross domestic product). The dimensions under assessment are shown in Table 3.

Dimension	Factors of the specific dimension
Value system	Political freedom; Environmental friendliness; Tolerance
Quality of life	Education; Health; Standard of living; Safety and security; Would like to live/study there
Business potential	Good infrastructure; Advanced technology; Good for business
Tourism	Value for money; Attractions; People's desire to visit for a holiday; Resorts/Lodging; Gastronomy
Heritage and culture	Heritage; Historical points of interest; Art and culture; Natural beauty
Made in	Authentic products Quality products Unique products People's desire to buy products made here

Table 3: The dimensions and factors of the FutureBrand Country Brand Index (Source: FutureBrand (2020): The FutureBrand Country Brand Index 2020 – A unique country perception study. (<https://www.futurebrand.com/futurebrand-country-index-2020>, Published: November 2020. Retrieved: 4 December 2020))

While the first three associations (value system, quality of life, business environment) define the country's so-called status, the other three (tourism, heritage and culture, made-in) define the (country) experience. As a result, a separate ranking can be set up for each of the six dimensions, and a summary list can also be created based on them. According to the latter, the Future Brand Index 2020 summary list is headed by Japan, followed by Switzerland, Norway, Germany, Canada, Denmark, Finland, Sweden, the United Arab Emirates, and finally New

Zealand. It is worth highlighting the dominance of Scandinavian countries, because all 4 made it to the Top 10. It is also interesting that Hungary ranked 56th out of 75 countries, which is a significant decline as the country ranked 38th in the 2019 ranking. The data for the research was collected between 2 and 11 September 2020, when the COVID-19 pandemic had already been raging for six months. Thus, the experts involved in the survey were also interviewed about this, asking how their countries had dealt with the pandemic. Based on the experts' opinions, according to the citizens, the most typical activities and measures that contributed to the crisis management of the given countries were: Acting swiftly and rapidly; Preventative measures put in place; Clear and actionable guidance; Consistent guidelines; Strict rules and regulations; Borders shut down; Equipment provided; National unity/togetherness; Everyone's responsibility; Financial support given; Calm and level headed approach. According to the opinion of the 2,000 experts interviewed in September 2020, the countries that had handled the pandemic the best by the time of the survey were Thailand, Taiwan, Japan, USA, Sweden, South Korea, Germany, China and New Zealand. The Future Brand report also highlighted that country brands are more important than ever during the COVID-19 pandemic – and although we cannot control events, we may control how resistant the country is to them. In this context, Future Brand also surveyed when people view a country as successful from the outside and when they do not. This is summarised in Table 4.

For a country to be viewed successfully as a country brand it is seen as:	For a country to be viewed unsuccessfully as a country brand it is seen as:
Confident	Untrustworthy
Influential	Unreliable
Politically stable	Weak
Economically progressive	Outdated
Innovative	Corrupt
Trustworthy	Economically and politically unstable
Respected	Unsafe
Tolerant	Aggressive
Reliable	Bad for business
Safe	Slow
Honest	Unfriendly/intolerant and lacking respect
Well developed	
A leader	
Good for business	
Independent	
Authentic and with a good quality of life	

Table 4: What makes us think that a country is successful and what makes us believe it is not (Source: FutureBrand (2020): The FutureBrand Country Brand Index 2020 – A unique country perception study. (<https://www.futurebrand.com/futurebrand-country-index-2020>, Published: 1 November 2020. Retrieved: 4 December 2020))

4. THE ANHOLT GOOD COUNTRY INDEX

The table that can be linked to FutureBrand's name already shows, in part, that a good country brand depends on a good country – just like a classic product, where the starting point is good product and good service. It is no coincidence that in 2014, the most prestigious international authority on the subject, Simon Anholt, came up with a new ranking that no longer lists countries according to their attractiveness and brand image, but according to how much good they do for the world. It was a big philosophical shift, as Anholt has been talking and writing about the importance of brand image for almost fifteen years since the early 2000s: according

to his country brand hexagon model, when we judge countries, we think of them on the basis of six dimensions, that is, tourism, exports, governance, immigration-investment, culture and people. The best possible image of these must be displayed outwards, which of course is also related to what a country does in each area, that is, what the reality is regarding that image. The previously described Anholt Nation Brands Index was created in 2005 on the basis of the image of each country assessed according to the above six dimensions, as well as their overall image, which became decisive indicators in the assessment of brand building as an activity for many years. It is also true that Anholt was already trying to avoid the term 'country branding', using the term 'competitive identity' instead (Anholt 2007). He also pointed out how ineffective country brand campaigns are in many cases. "Since I started working in this field, I have never seen a whit of evidence or properly substantiated study proving that marketing communications programmes, slogans or logos have ever successfully changed or could change the international perception of various places." (...) "Governments that spend taxpayers' money on showing the world how cool, fantastic, wonderful or attractive the country is are not only unworthy of power, but should go to jail because that activity is pointless", he said, adding that "The annoying thing about this lie called country branding is that it encourages many countries to spend crazy amounts on futile propaganda programmes that they could not actually afford, and in the end only those vile PR agencies make a profit" (Anholt 2016). "I don't believe in the existence of this method, but if it does exist, it certainly has nothing to do with communications, logos or slogans; or it is only related to governmental measures", he stated emphatically. Starting out along this line, his focus shifted to deciphering what could be good governmental measures and what could be bad – not primarily for the country in question, but for the whole world. The problems that individual nations need to solve are, in fact, global problems such as climate change, migration, terrorism, deep poverty, inequality, war conflicts and enforcement of human rights. In addition, Anholt highlighted another aspect, pandemic and biosafety, when he gave his first big speech on the topic in 2014. He emphasized that this global problem can only be tackled by countries jointly, and it cannot be solved with inward thinking. According to him, "we've got to start collaborating a bit more and competing a bit less" (TEDx Talks 2014). So it is not enough for countries to be beautiful, it is also important to be good. Anholt's latest book, published in 2020, is therefore titled 'The Good Country Equation: How We Can Repair the World in One Generation'. It is quite funny that a good few years before that, British comedian Danny Wallace (who most of us know in connection with his book and film titled Yes Man) came to the same conclusion. In 2005, Wallace made a six-episode documentary comedy for the BBC about how to start our own country ("How to start your own country?"). In the series, he did a lot of research, interviewed various EU officials and mini-state leaders, then established his country in his own apartment, designed a flag for it, recorded its anthem, and recruited citizens. The name of the country was announced at an event in London that attracted thousands of people: the micronation was named "Kingdom of Lovely". However, there is a point that is even more relevant to our topic – he summarised the country's constitution in just two words: "Be good". Well, even if Anholt did not know Wallace's series "How to start your own country" for some reason, the Good Country Index was actually based on the principle of "Be good" – it shows what each country does on its own for others, for the well-being of the global community. Simon Anholt explained the essence of the Good Country Index in his TED presentation in 2014, which has since been viewed on Youtube by nearly five million people – he stated that the idea of the Good Country Index is quite simple: you just have to measure how the countries of the Earth contribute to common good at the level of humanity and what they take away from it. A wide range of data from the UN and other international organizations are used for this purpose, and for every country, we take stock so that it is immediately visible whether a country is the net creditor of humanity, or vice versa, that is, a burden to the planet, or somewhere in between.

Thus, there is no country image dimension in the Good Country Index, and there is no opinion poll to assess the image of each country, as in the case of the Nation Brands Index, which can also be linked to Anholt. Instead, there are ‘hard numbers’: complex statistics of 35 data points, many of which are provided by the UN – however, it is also worth noting that when the Good Country Index for a specific year is published, the statistics available for the analysis are in fact already a few years old. The 35 data points can be divided into 7 categories as shown in Table 5.

Category	Indicators (divided by GDP)
Science & Technology	The number of international students The export of scientific journals The number of international publications The number of Nobel Prizes (cumulated value) The number of patents
Culture	Creative goods exports Creative services exports UNESCO dues in arrears as % of contribution (negative indicator) Freedom of movement, i.e. visa restrictions Freedom of the press (based on mean score for Reporters without Borders and Freedom House index as a negative indicator)
International Peace & Security	Number of peacekeeping troops sent overseas for UN missions Dues in arrears to financial contribution to UN peacekeeping missions as percentage of contribution (negative indicator) International violent conflicts: Attributed number of casualties of international organised violence (negative indicator) Exports of weapons and ammunition (negative indicator) Internet security: Global Cybersecurity Index score
World Order	Percentage of population that gives to charity Number of refugees hosted Number of refugees overseas (negative indicator) Population birth rate (negative indicator) Number of UN treaties signed
Planet & Climate	National ecological footprint (negative indicator) Environmental agreements compliance Hazardous pesticides exports (negative indicator) Renewable energy share in total energy consumption Ozone: consumption of ozone-depleting substances (negative indicator)
Prosperity & Equality	Open trading: The situation of trading across borders UN volunteers abroad Remittance cost (negative indicator) Foreign direct investment (FDI outflow) Development assistance: Development cooperation contributions
Health & Wellbeing	Food aid Pharmaceutical exports Voluntary excess donations to the WHO Humanitarian aid donations International Health Regulations Compliance

Table 5: The seven dimensions of the Good Country Index Version 1.3
(Source: *The Good Country Index (2021)*: (<https://index.goodcountry.org/>, retrieved: 2 April 2021))

While the 2019 ranking of the good country index examined 153 countries, their number was only 149 for the year 2020 because of the amount of publicly available adequate data for the analysis. Based on the results, the nations in each category can be ranked here as well, and the absolute winner can also be announced. However, Anholt already emphasized in his 2014 TED presentation on this topic that the ranking is not about good, better and best countries but rather about good, gooder and goodest countries. More importantly, it is advisable to avoid the interpretation 'bad, worse, worst countries' as these countries are not bad, but rather selfish. They only pay attention to themselves and are not interested in the fate of the world. But which is the best (or more accurately: the goodest, that is, most unselfish) country based on the latest rankings of 2020? Well, it is none other than Sweden, which finished in the first place in the overall list without winning any of the categories, but performing well in general. It is in the top 10 of 149 countries in 5 categories, and if we look at its statistics, it is essentially a net creditor of humanity in all of the seven dimensions listed, that is, it does more good for the planet than bad. It is also striking is that the top 10 countries of the overall ranking are all but one European. Sweden, Denmark, Germany, Canada, the Netherlands, Finland, France, the United Kingdom, Spain and Norway were ranked in the top 10. According to Anholt, this is because these countries are really doing a lot (of good) for other countries, especially within Europe of course, and (if they are members) within the European Union as well. As Anholt points out in all his speeches, one of the most fantastic things to create a better world is in fact the European Union itself. But what is the situation if we examine the top 3 countries in each category? Looking at the table, we can immediately see some interesting findings. One of these is that the country doing the most positive things for world order (at least according to UN data and this ranking) is the country that broke out World War II many decades ago. Moreover, Germany is at the forefront in another dimension, health and wellbeing. Even more interestingly, Georgia is on top in two categories: they do the most for the world in terms of international peace and security, and prosperity and equality – this result is easier to understand if we consider that data received are always weighted by the country's GDP, which is not very high in the case of Georgia. However, the most interesting category for us Hungarians is probably science, where Hungary finished in 2nd place. All this is due to the fact that (again, in relation to GDP) we perform well in attracting foreign students, international publications and the number of Nobel laureates – and this ranking takes into account not only the country where the Nobel laureate lived and worked when receiving the award, but also where was the laureate born. If we look at Hungary's overall result in the Anholt Good Country Index, the country is ranked 30th among 149 countries, which is an improvement compared to the previous year. when we were 39th, albeit from 153 countries. It is less favourable that almost all European countries are ahead of Hungary, but let us focus on the good aspects of the ranking here, at the end of the study: we may see world powers such as the United States (38th), Russia (47th) or China (60th) behind Hungary.

Table following on the next page

Position	Overall ranking	Science & Technology	Culture	International Peace & Security	World Order	Planet & Climate	Prosperity & Equality	Health & Wellbeing
1	Sweden	Ukraine	Belgium	Georgia	Germany	Norway	Georgia	Germany
2	Denmark	Hungary	Netherlands	Ireland	Austria	Finland	Denmark	Norway
3	Germany	United Kingdom	Luxemburg	Mongolia	Netherlands	Switzerland	South Korea	Sweden
4	Canada	Czech Republic	Denmark	Kyrgyzstan	Australia	Sweden	Singapore	Denmark
5	Netherlands	Latvia	Sweden	Rwanda	Finland	Lithuania	Luxembourg	Netherlands
6	Finland	Austria	Austria	Uruguay	Norway	Croatia	United Arab Emirates	Switzerland
7	France	Denmark	France	Moldova	Denmark	Slovenia	Cyprus	United Kingdom
8	United Kingdom	Bosnia-Herzegovina	Slovenia	Bulgaria	Malta	Germany	Botswana	Canada
9	Spain	Netherlands	Estonia	Singapore	Sweden	Portugal	Sweden	United States of America
10	Norway	Finland	Malta	Malawi	Cyprus	Australia	Mauritius	United Arab Emirates

Table 6: The top 10 countries in the overall ranking and the 7 dimensions of the Good Country Index

(Source: The Good Country Index (2021): Results 1.4. (<https://index.goodcountry.org/>, retrieved: 2 April 2021))

5. COMPARING THE THREE COUNTRY BRAND RANKINGS AND THEIR RESULTS

As mentioned above, the three country brand measurement methodologies are quite different, even if it is true that Simon Anholt created two of them. The most similar characteristic of the rankings is the number of dimensions and the number of indicators associated with them. However, there is a big difference between the number of countries studied (50 – 75 – 149), not to mention the sample size – while 20,000 people are interviewed in the case of the Anholt Nation Brands Index, their number is 2,000 for The Future Brand Country Index, and public data from the UN is used for the Anholt Good Country Index instead of polling. This is shown in Table 7.

Point of comparison	Anholt Nation Brands Index	The Future Brand Country Index	Anholt Good Country Index
First year of publication	2005	2010	2014
Number of dimensions	6	6	7
Number of indicators	23	22	35
Number of countries evaluated	50	75 (based on World Bank Top 75 GDP)	149
Sample	A total of 20,000 people, but only from 20 countries, all of whom express their opinion about the 50 countries	A total of 2,000 experts and opinion leaders who travel frequently, each evaluating 7 countries that are close to them	It is not carried out through opinion polls, but on the basis of UN factual data, interpreted in relation to the countries' GDPs
Time of last data collection	Between 7 July and 30 August 2020 (the COVID pandemic had lasted for 4 months)	Between 2 and 11 September 2020 (the COVID pandemic had lasted for 6 months)	The availability of UN data is slower, data is always a few years old. (The COVID effect is not yet perceptible in this ranking.)

Table 7: A comparative analysis of the three country brand indexes

(Source: Own comparison based on the individual rankings)

Although there is a relatively large difference between each methodology, the difference is not so big in terms of their end results, especially when looking at the top10 countries. As Table 8 shows, Germany, Canada and Sweden are at the forefront of all three rankings.

Ranking	Anholt Nation Brands Index	The Future Brand Country Index	Anholt Good Country Index
1	Germany	Japan	Sweden
2	United Kingdom	Switzerland	Denmark
3	Canada	Norway	Germany
4	Japan	Germany	Canada
5	France	Canada	Hollandia
6	Italy	Denmark	Finland
7	Switzerland	Finland	France
8	Australia	Sweden	United Kingdom
9	Sweden	United Arab Emirates	Spain
10	United States of America	New Zealand	Norway

*Table 8: The top 10 countries of the three country brand indexes
(Source: Own edited version based on the individual rankings)*

Seven countries made it to the top 10 of two lists: Denmark, the United Kingdom, Finland, France, Japan, Norway and Switzerland. Of course, there are also countries that are only one ranked so high in one of the rankings: the United States, Australia, the Netherlands, Italy, Spain and New Zealand. In this respect, it is therefore reaffirmed that a good country brand is based on a good country.

6. "ONE THING IS IMPORTANT: TO BE GOOD NOW"

It may sound strange at first that the lyrics of Napoleon Boulevard, a Hungarian pop band, provide one of the most important pieces of advice in country branding, but the Good Country Index presented in this study proved that it is very much true. Moreover, if we examine the original version of the lyrics, we may discover another interesting connection. In fact, it is the music of the Italian film *State bouni se potete* ("Be good if you can"), which was released in 1984, although it was only presented in Hungary in 1989. In the film, one of the children (later an adult) is often tempted by the Devil as his patron, St. Philip Neri, tries to put him on the right track – as the saint did in reality with street children and criminals in the 16th century. In fact, the main message of St. Philip Neri is not only "Be good if you can", but also "Stay good if you can", another translation of the original Italian title, which is also suggested by the film itself. Well, this advice is much more important nowadays than ever, as we live in the period of the COVID-19 pandemic. On second thought, it is the first truly common matter since World War II, affecting our daily life across the planet. Of course, we could also mention climate change, but people do not have to wear masks or lock themselves away at home, not meeting anyone. At least not yet. This also means that the nearly eight billion people on Earth have one thing in common, which will hopefully become a memory soon: the coronavirus. This situation could even provide an opportunity for global cooperation, helping each other; but to be sincere, we can only see traces of this. Instead, politicians are primarily concerned with their own countries, focusing on their communication with their own citizens. Their main message is to protect their own country, instead of joining forces with other countries to defeat the virus together. The reintroduction or even reinforcement of border control also shows the closure of nations, with other countries marked in red, yellow or green at best.

There is also competition in vaccine development, not only between companies, but also between countries. Research takes place in several locations, but they only share information partially. Meanwhile, we also see that rich countries have concluded multiple contracts for millions or even tens of millions of vaccines, while poorer countries cannot afford them. There is even a special term for this: vaccine nationalism. True, there are examples of developed countries offering their help, but overall, the above actions tend to sharpen the differences. All this affects the solution of all other global challenges: according to Bill Gates, the pandemic returned the world back to the level where it was twenty-five years ago in terms of the eradication of deep poverty. (Business Insider 2020). However, this whole thing cannot be blamed on politicians alone. In most places, polls show that people are extremely receptive to this right now – according to them, good leaders are the ones who do the most for their own people and good countries are the ones that selfishly focus on themselves. This also means that Anholt and his team still have a lot of work to do to make the good country approach widely accepted.

ABSTRACT

In the last few decades technology has been dramatically reshaping the landscape of age-old financial services, institutions and industries such as payment, money landing, banking, asset management, personal finance, and financial markets. Financial technologies, or FinTech have received an immense attention of both scholars and practitioners worldwide. Contrary to the financial, insurance services have not been changing at the same pace in recent years. It seems that two portmanteaus 'fintech' and 'insurtech' have not been equally exploited terms. Hitherto, scholars have not reported on any bibliographic collections on insurance technologies and none of the studies have comprehensively analysed and listed insurtech-related articles throughout the decade-long practical development in the field. Filling the gap in the present body of knowledge, this paper aims to report on an early development of the scholarly works related to insurtech emergence and development. This paper provides the summary statistics on journals covering the topic, authors, year of publication, size, methods, and applications of insurtech elaborated. The study is based on the bibliometric analysis of 561 papers extracted from the Scopus database.

Keywords: *Bibliometric analysis, Financial technologies, Insurance, Insurance technologies, Literature review*

1. INTRODUCTION

In the last few decades technology has been dramatically reshaping the landscape of age-old financial services, institutions and industries such as payment, money landing, banking, asset management, personal finance, and financial markets (Nicoletti, Nicoletti and Weis, 2017; Mention, 2020). Financial technologies, or FinTech have received an immense attention of both scholars and practitioners worldwide. Contrary to the financial, insurance services have not been changing at the same pace in recent years. It seems that two portmanteaus 'fintech' and 'insurtech' have not been equally exploited terms (Milanovic et al, 2020). The banking sector has been mostly propounded in the extant literature most probably due to the extent of interaction with costumers, whereas sectors such as insurance were slow adopters of new technologies. A common sense is sufficient for the rationale behind the aforementioned slow adoption. First, insurance industry is large by both the asset size and profitability, on one side, and multimillion workforce on the other. The insurance industry is currently the 15th largest industry in the world (Varghese and Haresh, 2018). The gigantism slows down the process of technology transformation. Complexity of the insurance service also decelerates the progress. For instance, cyber risks have been known for years now, but it was only recently that insurance companies accepted to insure against these risks (Kaigorodova et al, 2020). The industry is pretty aged.

The emergence of the modern insurance can be traced back to the late 17th century (Pearson, 1997). Last but not the least, the insurance industry is heavily bureaucratic by the nature. It appears to be one of the most stringently regulated industry branches in the world (Marano, 2017; Liu et al., 2019), and the regulation has been empowered for more than two centuries (Pearson, 2002). Accordingly, saturated and rigid might be the terms easily attributed to the insurance industry. Insurance is certainly not a novel topic, but modern technologies that disrupt the industry are at the forefront of both practice and academia. Practice-based overviews on insurtech are overwhelming public browsers, as practitioners are usually considered to be the trailblazers when it comes to the delineation of the use of novel technologies (Milosavljevic, Joksimovic and Milanovic, 2019). Hitherto, scholars have not reported on any bibliographic collections on insurance technologies and none of the studies have comprehensively analyzed and listed insurtech-related articles throughout the decade-long practical development in the field. Filling the lacuna in the present body of knowledge, this paper aims to report on an early development of the scholarly works related to insurtech emergence and development. Particular goals of the study are to statistically analyze all the publications from renowned scholarly databases by different criteria, such as the type of technology used, year of publication, type of documents, subject area, and country/region covered in the study. This study is motivated by the need to organize an ever-growing number of publications on insurance technologies. The authors believe that this study might be helpful to all the interested parties in this field when exploring the new frontiers in insurance technologies. Having in mind that bibliometric studies “do not deal with theories, methods and constructs as much as they do with authors, affiliations, countries, citations etc.” (Paul and Criado, 2020), this study firstly draws on insurance value chain and the technology use-cases within and amidst different components of insurance value chain. Only then, we conduct bibliometric analysis following the best methodological practices (Emrouznejad and Yang, 2018). The remainder of the paper is organized in the following order. Section 2 reviews related works and dissects the novel technologies used in the insurance industry. Section 3 elaborates on the bibliometric methodology. Section 4 presents the results of the study. Final section is reserved for the concluding remarks.

2. RELATED WORKS

The rise in competition at the insurance market and consequent decline in profit margins (Borel-Mathurin et al, 2018) has positioned technological change as a paramount strategic factor for all insurance companies worldwide. Practitioners, however, are not unequivocal on whether this transformation is a piecemeal and uncoordinated by nature, or the part of the large-scale disruptive transformation process. On one side, voices are raised on the slow transformation capacities of insurers, positing that “regulation, product complexity and insurers’ large balance sheets” keep digital attacks away (Catlin and Lorenz, 2017). Accordingly, the broad digital transformation in the insurance industry has come rather too late (Müller et al, 2016). On the other side, a number of industry reports are not questioning “ifs”, but “hows and whens” of broad digitalization (McKinsey, 2018). Among others, the cacophony in the aforementioned practice and industry-related reports has affected scholarly contributions in the digitalization of insurance. Simple browsing through the main article collections leaves a relative paucity of evidence on insurance-wide technology changes. This is to some extent expected, as the phenomenon of insurtech is evidently multifaceted. Not only that this phenomenon covers actuarial and technological aspect, but spread across economics, strategy, marketing, regulation, implementation in various field (in both life and non-life insurance). Although scarce, concurrent research offers some evidence on the use of modern technologies in insurance business. There is a noticeable intensification of the use of digital platforms and mobile applications in creating and providing new, personalized solutions and services (Stoekli, Dremel and Uebernickel, 2018) and innovating customer relationship management

(Bazini and Madani, 2015). In technological advances in big data and complex data analytics, insurance companies have recognized the opportunity for better revenue forecasting (Fang, Jiang and Song, 2016), innovating their business models in terms of more efficient identification and risk reduction, more accurate market segmentation and fraud prevention. The data collection and processing has been substantially changed with IoT based solution and social networks which opens an avenue for more precise and diligent setup of premiums and risk mitigation (Rumson and Hallett, 2019). These advanced sources of digital data enrich the insight into customers' behavior, allowing insurers to develop tailor-made approach to risk assessment and to personalize insurance products. The emergence of big data technology can significantly contribute to automation of insurance processes, but also rises ever-growing concerns regarding privacy and data protection (Keller, Eling and Schmeiser, 2018). Another disruption in insurance industry has been made with blockchain technology. This distributed-ledger technology has made significant changes in other industries (international payments, transportation and supply chains, and digital identification) and slowly but steadily has been infiltrating in insurance operations – such as health insurance (Zhou, Wang and Sun, 2018) or cyber-insurance (Lepoint, Ciocarlie and Eldefrawy, 2018). The most prominent advancement in blockchain use in insurance is related to “smart contracts” in the automation of procedures for resolving claims and the entire process of insurance policy administration. Following the wave of tech-based disruptive innovations in other industries, traditional insurance companies strive to integrate machine learning, deep learning, chatbots, robo-advisors and other solutions based on artificial intelligence across the whole value chain. Perhaps the most illustrative description of disruptive potential of AI-based solutions (i.e. machine learning, deep learning, chatbots and robo-advisors) in insurance industry can be found in McKinsey study “Insurance 2030 – The impact of AI on the future of insurance”. The authors strongly states that artificial intelligence will “shift insurance from its current state of “detect and repair” to “predict and prevent,” transforming every aspect of the industry in the process (McKinsey, 2018).

3. METHODS

Bibliometric studies are based on the application of quantitative analysis to books and other media (Hood and Wilson, 2001). These studies are an important tool in examining and structuring knowledge on a particular novel streams of research (Liang and Liu, 2018). This method is especially important today as it “can be used to understand the past and even potentially to forecast the future” of new technology use (Daim et al, 2006). The bibliometric analysis allows us to answer to the following questions: RQ1. How does insurtech evolve in terms of the academic output? RQ2. Are the cutting-edge publications in this field reserved for conferences or journals? RQ3. What discipline propels the research? Is more appropriate term “insurtech” or “techinsure”? RQ4. Which country, institution and funding association have the largest impact in the field of insurtech? For the presentation and analysis of the findings, the study follows the recommendations of Hicks et al (2015). We based our study on Elsevier's Scopus as one of the main sources for identifying scientific output (Vera-Baceta, Thelwall and Kousha, 2019). The Scopus has been selected as the primary database for bibliometric analysis in the field of computer science, management, business administration and finance (see Falagas et al., 2007). Due to relative novelty of insurtech as research field, our study examines articles, books, conference papers and reviews that have been published from 2000 to 2020. Since there are multiple ways to address the term insurtech, we consulted several publications to find proper synonyms and closely related terms. The initial research was focused to publications whose title contained the following Boolean phrases: “insurance” or “insurance technology” or “insurtech”. The first search string identified over 38.000 publications. For the purposes of the sample downsizing, additional search criteria had been applied.

Therefore, search expression was refined to identify studies that investigate the use of specific modern technologies in insurance domain. Although the list of these modern technologies is certainly more comprehensive, our study singled out the following technologies: mobile technology, big data, internet of things, blockchain, cloud computing, and artificial intelligence. Out of initially identified 38.000 papers, total 561 papers remained as starting point for analysis. The whole process of identifying and selecting the sample for our study is presented in Table 1.

Description	Results
Database	Scopus
Search period	2000 - 2020
Publication type	Article, Book, Conference Paper, Review

Search results	561

Table 1: Bibliometric analysis framework

4. RESULTS

The seeking for adequate answers to proposed research questions is explained in the following sections.

4.1. RQ1: How does insurtech evolve in terms of the academic output?

Our sample covers the period between 2000 to 2020 and includes 561 scientific papers. The distribution over these years clearly reveals the increased interest of researchers in the subject of insurance technology. Over 55% of studies were published in the last three years of the period covered in our bibliometric analysis. The peak of publishing activity was reached in 2019. However, it is still an open question will the current pandemics severely affect scholarly works on insurtech. The distribution of academic output over the years is presented in Fig. 1.

Figure following on the next page

Figure 1: Distribution of insurtech publications since 2000.

4.2. RQ2: Are the cutting-edge publications in this field reserved for conferences or journals?

The dominant type of insurtech related papers from our sample comes from conference proceedings (n=50.62%). Journal articles make 42.42% of the sample. Given that majority of universities see only articles as an instrument “(Lee and Lee, 2013) in elevating a university’s status as a reputable centre of knowledge production”, we can argue that the share of journal articles will increase over time, as the technologies saturate. Other document types (reviews, book chapters and editorials) make approximately 7% of our sample. Other results for the document type split are given in Fig. 2.

Figure 2: Insurtech publications document type split

As an amorphous field of scholarly interest, this is an expected outcome. Majority of novel technologies are firstly presented at conferences, and only after the academia accepts the influx of novel technology, they receive wider presentation audience through journals.

4.3. RQ3: What discipline propels the research?

As for the subject area, from 561 publications the total of 1.038 reports for subject area in 25 different fields were reported (Mean=41.52; SD=70.93). This makes insurtech highly multidisciplinary field of research (for the distribution per subject area see Fig. 3).

Figure 3: Insurtech publications by subject area

The dominant subject area is Computer Science reported in 333 cases, and followed by Engineering (149) and Decision Sciences (94). The first three subject areas make 55.5% of the sample. As such, the emergence of insurtech could be described as tech-, rather than business-driven field of interest.

4.4. RQ4: Which country, institution and funding association have the largest impact in the field of insurtech?

The insurtech publications are widely spread around the globe, excluding Africa and a large portion of Latin America and Central Asia. A majority of the publications comes from China (100), followed by the United States (83), Germany (46), India (44) and United Kingdom (30). The map of countries with the intensity of publications is given in Fig. 4.

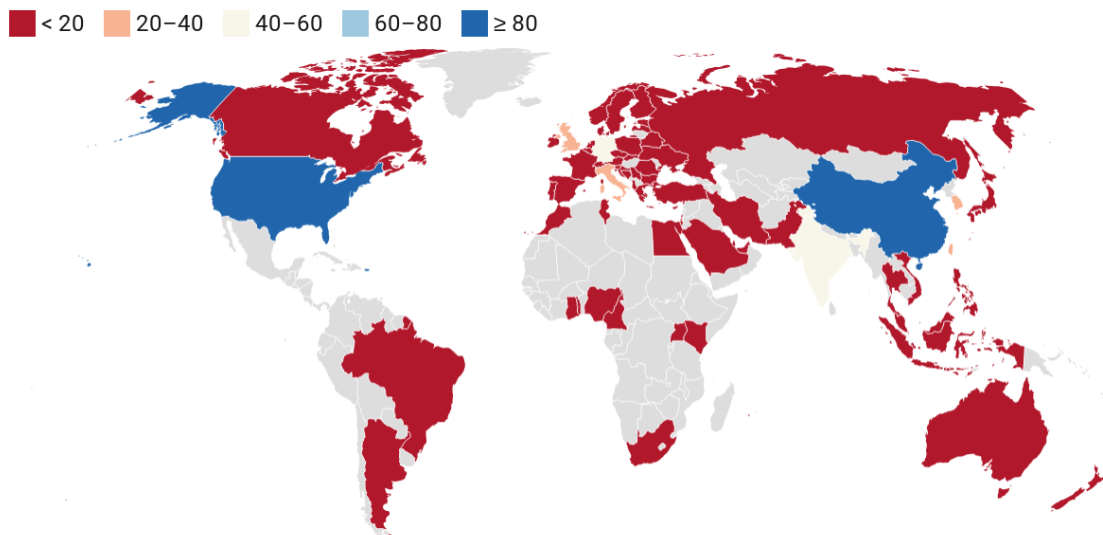

Figure 4: Map of countries/regions covered in insurtech publications

4.5. Most productive institutes and funding schemes

From the total of our sample, 379 author's affiliations were reported with 160 unique cases. This makes 2.37 affiliations per publication. We can firmly state that the research affiliations are heavily diluted and a number of institutions pretend to have lead position in this promising research field. In Table , we report on the affiliations with three plus unique appearances.

Rank	Affiliation	Country	Unique cases
1	Nanyang Technological University	China	15
2	School of Computer Science and Engineering	Singapore	11
3	Universitas Indonesia	Indonesia	10
4	Universitat de Barcelona	Spain	8
5	The Royal Institute of Technology KTH	Netherlands	8
6	Friedrich-Alexander-Universität Erlangen-Nürnberg	Germany	6
7	University of South Africa	South Africa	5
8	Università degli Studi di Roma Tor Vergata	Italia	5
9	University of Cape Town	South Africa	4
10	Seoul National University College of Medicine	South Korea	4

Table 2: The most productive affiliations in insurtech research

Having in mind the budgetary constraints for research grants around the globe, the information on funding source for scholarly publications in general attracts considerable attention nowadays (Liu, Tang and Hu, 2020). In our sample, from a total number of publications (561), 73.62% (n=413) have reported funding organization. The list of top funding institutions (where each institution supported at least four or more publications) is presented in **Error! Reference source not found.**

Rank	Foundation	Country	No of studies
1	National Natural Science Foundation of China	China	20
2	National Science Foundation	USA	8
3	Universitas Indonesia	Indonesia	7
4	Horizon 2020 Framework Programme	EU	7
5	European Regional Development Fund	EU	5
6	Institució Catalana de Recerca i Estudis Avançats	Spain	5
7	Ministry of Science and Technology, Taiwan	Taiwan	4
8	Natural Sciences and Engineering Research Council of Canada	Canada	4
9	European Commission	EU	3
10	Fundamental Research Funds for the Central Universities	China	3
11	Ministerio de Economía y Competitividad	Spain	3
12	National Research Foundation of Korea	S. Korea	3

Table 3: Leading funding institutions for insurtech research

Four dominant funding institutions in the field of insurtech are National Natural Science Foundation of China, National Science Foundation (USA), Universitas Indonesia and EU Framework Programme “Horizon 2020”. As for the National Natural Science Foundation of China (NSFC), the result is to some extent expected as this foundation has a gigantic basic research fund (Feng, 2020). Also, the anecdotal evidence is sufficient for the China’s largest funder of basic science – NSFC is even piloting an artificial intelligence tool that selects reviewers for research grants (Cyranski, 2019). The National Science Foundation is the second largest supporter of insurtech studies which is by no means odd as this institution heavily funds future technology architectures (see Ambrosin et al, 2018). Universitas Indonesia holds the third place with funding seven studies in total. Surprisingly or not, this institution is a focal

research point of Indonesia and puts a major effort into cutting edge research (Panjaitan, Surjandari and Rosyidah, 2017).

The same number of publications was funded through EU Framework Programme “Horizon 2020”. Accordingly, since its foundation, the programme profoundly stimulates research and innovation projects for integration of digital technologies in value chains across the whole economy (European Commission, 2017).

5. CONCLUSION

The realm of insurtech science has been steadily growing in the last few decades. Nonetheless, a number of interrogatives still remain unanswered. In this section, we provide a discussion for future research directions facilitated by bibliometric by study results. The most important theoretical and practical finding is that the field of insurance technology is in an infantile phase in scholarly terms, in comparison with other financial services (i.e. banking, investments, lending, payments etc.). By searching through the Scopus database, we identified 561 publications that attentively elaborate on the topic. Nevertheless, the body of knowledge is steadily growing in the last seven years. As the authors advocate for the novel technologies in insurance, there is a lack of evidence of mutual coexistence of ‘traditional’ and ‘novel’ insurance services. As the results of the bibliometric analysis indicate, research interests are focused at the fields of disruptive potentials of mobile technology, IoT, big data, artificial intelligence, blockchain and cloud computing in insurance domain. The publications analyzed in this study deals with several different research fields. Not suprisingly, the dominant subject area is computer science. As the results indicate, insurance technology, or insurtech, is currently tech-, rather than business-driven field of interest. The study has inevitable flaws deriving from research design, especially related to the sample construction, publication period covered, and selection of scholarly database. Moreover, the design of search strings and inclusion criteria may have narrowed the sample. However, a broad issue in the lucrateness of insurance technology investment is an open question. An avenue for future studies could be a detailed cost-benefit analysis of the deployment of financial, human and other resources into the advances of technology. For instance, is blockchain as a technology merely a ‘hype’ or its use can materially contribute to the development of insurance?

THE EUROPEAN ORDER FOR PAYMENT PROCEDURE

Dinka Sago

*Associate professor at Faculty of Law, University of Split,
Domovinskog rata 8, Split, Croatia

ABSTRACT

The European Order for Payment Procedure (EOP) is based on Regulation (EC) No. 1896/2006 of the European Parliament and of the Council (hereinafter: EPO). It entered into force on 12 December 2008. This paper analyze basic principles of the Regulation. The EOP is not a compulsory proceeding for the plaintiff but an option, he can choose between this proceeding and any other proceeding provided by the law and it applies only to overdue, uncontested monetary cross-border claims. The procedure is not available in all kinds of disputes, but there are no limitations on its application to uncontested, overdue consumer complaints. There are several reasons for the regulation of the EOP on an optional basis but the most outstanding one is that in those Member States where an order for payment procedure does not exist, the claimant could be deprived of the possibility to use this kind of proceeding. A EOP is enforceable in all Member States except Denmark, and does not need to be separately declared enforceable. It must be sent to the enforcement authorities in the Member State in which it is to be enforced. The main purpose of the Regulation is to make the order for payment procedure in a cross-border context simple, effective and swift manner in another Member State through direct contact with judicial authorities of the latter. The procedure simplifies, speeds up and reduces the costs of litigation in cross-border cases concerning uncontested pecuniary claims.

Keywords: *civil and commercial matters, cross border cases, European Union, Member State, order for payment procedure*

1. INTRODUCTION

The Civil procedure Act (Official Gazette 53/91, 91/92, 112/99, 88/01, 117/03; 88/05, 02/07, 96/08, 84/08, 123/08, 57/11, 148/11, 25/13, 89/14, 70/19, hereinafter: CPA) is the main legal source regulating litigation in the Republic of Croatia. The latest modifications in the CPA are aimed at promoting the efficiency and effectiveness of the litigation procedure, ensuring an additional harmonization of the national legislation in compliance with the recommendations of the Council of Europe and building certain EU directives into the national legal system (Sikirić, 2008., p. 101 – 128.). In the Part IV of the Croatian CPA titled European Civil Procedures are located provisions about implementation of Regulations regarding: service of judicial and extrajudicial documents in civil or commercial matters (Art 507. a – 507. č); taking of evidence (Art 507. d - 507. h); order for payment procedure (Art 507. i – 507. nj) and procedure in small claims disputes (Art 507. o – 507. ž) (Šago, 2013, p. 116.). In the draft of the Regulation (EC) 1896/2006 of the European Parliament and of the Council of 12 December 2006 creating a European order for payment procedure (OJ 30.12.2006, L399/1) (hereinafter Regulation [EC] 1896/2006) the influence of the Green Paper on a European order for payment procedure and on measures to simplify and speed up small claims litigation, dated 20 December 2002 is notorious. The Green Paper was adopted after a period of consultations; thus, the experience of the payment for order procedures existing in some of the EU countries was the basis for the features and the ruling of the proceeding of the European order for payment, since most of the suggestions of the Green Paper were finally included in the Regulation. National law is applicable, on a subsidiary basis, to questions which are not regulated in the EPO Regulation.

Regulation (EC) No 1896/2006 of the European Parliament and of the Council of 12 December 2006 establishes a European procedure for orders for payment (EPO). The main purpose of the Regulation is to simplify, accelerate and reduce the costs of proceedings in the cases concerning the cross-border uncontested pecuniary claims by creating a European procedure of payment and ensuring the free circulation of the payment order in all the European Member States in terms of establishing those minimum standards to eliminate the obligations of the intermediate proceedings in the State of enforcement (Lăzărescu, Lăzărescu, Dumitra, Bărzan, 2010., p. 3.).

2. NATIONAL AND EU ORDER FOR PAYMENT PROCEDURE

Croatian provisions regarding implementation of EPO are in the Articles 507.i - 507.nj CPA. Only the Commercial Court in Zagreb shall have exclusive competence to decide on applications for issuing and review the EPO and for issuing a declaration of its enforceability (Art. 507.i CPA). The Croatian CPA doesn't determine, which court will be competent for litigation in the case of an objection against the EPO and a transfer to ordinary civil proceedings. The scope of the application of the EPO is much more narrow than the scope of the application of the Croatian order for payment (Garašić, 2012., p. 17.). The EPO can be applied only in cross - border cases, but the CPA can be applied in cross - border cases and in non cross border cases (Šago, 2013., p. 123.). There are different rules on determination of jurisdiction for the European order for payment (Art. 6 EPO) and the Croatian order for payment (Garašić, 2012., p. 18.). In contrast to the EPO, the claimant in CPA procedure may not indicate to the court that he opposes a transfer to ordinary civil proceedings. Unlike the EPO procedure, Croatia has no special application forms in national order for payment procedure. In the CPA procedure there are no so many possibilities for completion and rectification of the application for issue of an order for payment as they exist in the EPO procedure. In the CPA procedure the court has no time limit for issue of the order for payment, as it exist in the EPO procedure. Croatia has no special form for an objection against the order for payment (Garašić, 2012., p. 18.). In the EOP the exequatur is abolish (Art. 19 EPO), what's not the case in the Croatian order for payment procedure. In the EOP exist the possibility for review of the order for payment (Art. 20 EPO). It's not possible in the Croatian order for payment procedure. The rules of enforcement, refusal of enforcement and stay or limitation of enforcement in the EOP (Arts 21-23) are very different from those rules in the Croatian order for payment procedure (Garašić, 2012., p. 18.). Time limits for an objection against the order for payment are different: 30 days for EPO (Art. 16(2) and 8 respectively 3 days for CPA (Art. 448 (2) CPA) (Triva, Dika, 2004, p. 812 – 818.). In EPO procedure the court of origin declare the enforceability of the order for payment ex officio, what is not the case in the CPA procedure. Also, in the EPO procedure the exequatur is abolish, what's not the case in the CPA procedure. In the EPO procedure exist the possibility for review of the order for payment (Art. 20 EPO) what's not possible in the CPA procedure (Šago, 2013., p. 123.).

3. PURPOSE AND SCOPE OF THE REGULATION

This Regulation shall apply to civil and commercial matters in cross-border cases, whatever the nature of the court or tribunal. It shall not extend to revenue, customs or administrative matters or the liability of the State for acts and omissions in the exercise of State authority (*'acta iure imperii'*).

This Regulation shall not apply to:

- a) rights in property arising out of a matrimonial relationship, wills and succession;
- b) bankruptcy, proceedings relating to the winding-up of insolvent companies or other legal persons, judicial arrangements, compositions and analogous proceedings;
- c) social security;

- d) claims arising from non-contractual obligations, unless:
- 1) they have been the subject of an agreement between the parties or there has been an admission of debtor
 - 2) they relate to liquidated debts arising from joint ownership of property.

A cross-border case is one in which at least one of the parties is domiciled or habitually resident in a Member State other than the Member State of the court seised. Domicile shall be determined in accordance with Articles 59 and 60 of Council Regulation (EC) No 44/2001 of the European Parliament and of the Council of 22 December 2000 on jurisdiction and the recognition and enforcement of judgments in civil and commercial matters (OJ L 12, 16.1.2001, p. 1). 2004 - OJ L 381, 28.12.2004, p. 10). The relevant moment for determining whether there is a cross-border case shall be the time when the application for a EPO is submitted in accordance with this Regulation (Article 3.).

4. JURISDICTION

The request for the issuance of an EPO is submitted to the competent authority in the "Member State of origin", which is the Member State in which the payment order can be issued (Čuveljak, 2014, p. 2.). The most obvious rule of determination of the competence is to entrust the order for payment procedure to the court of the defendant's domicile, this rule of competence could be helpful to search assets of the defendant during the enforcement and the notification to the defendant and his defence could be easier (Garcimartín Montero, 2016, p. 108.). The jurisdiction of the EPO authority is determined by Council Regulation (EC) No 44/2001 of 22 December 2000. on jurisdiction, recognition and enforcement of decisions in civil and commercial matters (hereinafter: Brussels I Regulation). It can be pointed out that the jurisdiction of the court of the Republic of Croatia exists if the defendant has domicile in the Republic of Croatia, then if the contracted court is in the Republic of Croatia, and if the defendants are consumers. It is additionally stipulated that a company, other legal entity or associations of natural or legal persons, have their permanent residence in the place where they have their registered office, or the main administration, or the main place of business. The basic rule of international jurisdiction is that a person is sued where he or she is domiciled, regardless of their nationality. However, there are special rules that state that in a dispute related to contracts, it is important that the parties have agreed, and if there is no contract then the place of execution of the contract (purchase - place of delivery of goods, for services - place of performance of services, etc.), if the dispute arising from the activities of a branch, agency or other business unit, before a court in the place where the branch, agency or other business unit is located (Čuveljak, 2014, p. 2.).

A person domiciled in a Member State may be sued:

- if she is one of several defendants, and before a court in a place where any of the defendants is domiciled, provided that the actions are so closely linked that it is better to deal with them together to avoid the risk of irreconcilable court decisions in separate proceedings
- as a third party in proceedings for security or in any proceedings against a third party, before the court in which the original proceedings were instituted, unless the proceedings were instituted solely for the purpose of excluding that person from the jurisdiction of the court which would have jurisdiction in his case
- in the case of a counter claim arising from the same contract or factual situation as the original action, before the court in which the original proceedings are pending
- in matters relating to a contract, if the action may be linked to an action against the same defendant in matters relating to real rights in immovable property, before a court of the Member State in which the immovable property is situated (Čuveljak, 2014, p. 2.).

5. THE PROCEEDING

5.1. Application for EPO

An application for a European order for payment shall be made using standard form A as set out in Annex I.2 (Šago, 2013., p. 123.). The application shall state (Article 7.):

- a) the names and addresses of the parties, and, where applicable, their representatives, and of the court to which the application is made;
- b) the amount of the claim, including the principal and, where applicable, interest, contractual penalties and costs;
- c) if interest on the claim is demanded, the interest rate and the period of time for which that interest is demanded unless statutory interest is automatically added to the principal under the law of the Member State of origin;
- d) the cause of the action, including a description of the circumstances invoked as the basis of the claim and, where applicable, of the interest demanded;
- e) a description of evidence supporting the claim;
- f) the grounds for jurisdiction and
- g) the cross-border nature of the case within the meaning of Article 3.

The form A of the Annexes (needed for the application) includes some predetermined contents such as sales contracts, rental agreement, loan, insurance contract, etc. it includes also the possibility to specify if the claim is based on non-payment or delivery, delivery of defective goods or services, etc. Although these items include the most frequent claims, there is always the possibility to add any other information not already included in the form (Garcimartín Montero, 2016, p. 113.). In the application, the claimant shall declare that the information provided is true to the best of his knowledge and belief and shall acknowledge that any deliberate false statement could lead to appropriate penalties under the law of the Member State of origin. In an Appendix to the application the claimant may indicate to the court that he opposes a transfer to ordinary civil proceedings within the meaning of Article 17 in the event of opposition by the defendant. This does not prevent the claimant from informing the court thereof subsequently, but in any event before the order is issued. The submission of the application is, of course, admitted in paper form, or by any other means of communication, including electronic, accepted by the Member State of origin and available to the court of origin. The application shall be signed by the claimant or, where applicable, by his representative. Where the application is submitted in electronic form in accordance with paragraph 5, it shall be signed in accordance with Article 2(2) of Directive 999/93/EC of the European Parliament and of the Council of 13 December 1999. on a Community framework for electronic signatures. Some articles of the Regulation (EC) 1896/2006 refer to the use of electronic media: art. 7 of allows the use of electronic media in the submission of the application; the same article recognises that the use of electronic signature is enabled and that this signature cannot be challenged if it is according with the EU regulation, art. 13 allows the use of electronic means for the service of the application and art. 15 regulates electronic media when they are used for the statement of opposition (Garcimartín Montero, 2016, p. 110.). The signature shall be recognised in the Member State of origin and may not be made subject to additional requirements. Such electronic signature shall not be required if and to the extent that an alternative electronic communications system exists in the courts of the Member State of origin which is available to a certain group of pre-registered authenticated users and which permits the identification of those users in a secure manner. Member States shall inform the Commission of such communications systems (Article 7. par. 6.). If a EPO is to be served in the Republic of Croatia, service shall be effected pursuant to the provisions of Croatian CPA on service ex officio (Arts 133 -150, 492b - 492c), but if a EPO is to be served in another Member State of the EU, service shall be effected pursuant to Regulation No 1393/2007

(Garašić, 2012., p. 1.). An application for a EPO and opposition against such order is made using a standard form (Crifo, 2009, p. 103-143.). The claimant in principle applies for an EPO before a competent court. There are no special rules on admissible language of the application. Parties and other participants in the proceedings shall file their complaints, appeals and other submissions with the court in the Croatian language and the Latin script. An application requires a description of the available evidence. After examination of the application the court will either issue the EPO or reject the application (McEleavy, 2008, p. 456.). CPA doesn't have a special rule who issues the EPO within the court. Judges issue court decisions. Also judicial advisors are authorized in civil proceedings to conduct proceedings and propose a decision to the judge if the value of the subject of the dispute does not exceed 100,000.00 HRK, or in commercial disputes if the value of the subject of the dispute does not exceed 500,000.00 HRK (Art. 13 CPA) (Šago, 2013., p. 124.). The court seised of an application for a European order for payment shall examine, as soon as possible and on the basis of the application form, whether the requirements set out in Articles 2, 3, 4, 6 and 7 are met and whether the claim appears to be founded. This examination may take the form of an automated procedure. If the requirements set out in Article 7 are not met and unless the claim is clearly unfounded or the application is inadmissible, the court shall give the claimant the opportunity to complete or rectify the application. The court shall use standard form B as set out in Annex II. Where the court requests the claimant to complete or rectify the application, it shall specify a time limit it deems appropriate in the circumstances. The court may at its discretion extend that time limit.

5.2. Rejection of the application

If the court finds that the request is unfounded, it will reject it using Form D (Čuveljak, 2014, p. 4.). The court will reject the request if the claim is obviously unfounded, then if the plaintiff does not return the proposal sent for correction or amendment, and if the conditions from Art. 2 (Scope), 3. (cross-border case), 4. (due monetary claim), 6. (competent court), and 7. (duly completed application). In that case, the column on the reasons for rejection is filled in on form D, and the applicant has no right to appeal. However, the rejection of the application shall not prevent the claimant from pursuing the claim through a new application for EPO or any other procedure available under the law of a Member State (Article 11.).

5.3. Issue of a European order for payment

Within 30 days from the day of submitting the request, the court should decide on it, and if it did not reject it, the EPO is issued using form E. The form is delivered to the defendant together with a copy of the claim form and the complaint form. This form contains information about the court, the parties and their representatives, information about the claim and important information for the defendant - that he can pay that amount or challenge it with an objection that must be sent within 30 days of delivery of the order to the defendant. The Report from the Commission on the application of Regulation (EC) 1896/2006 is highly critical with the long terms for the issuing of the European order for payment in some countries. It takes between 2 and 9 months to take their decision to the courts of at least 11 Member States; the Report considers absolutely necessary a reduction of this length that implies a clear infringement of the Regulation (Garcimartín Montero, 2016, p. 115.). The EPO informs the defendant that the order was issued solely on the basis of information provided by the plaintiff and which was not confirmed by the court, then that the order will become executed if no objection is lodged origin in accordance with the rules of ordinary civil proceedings, unless the plaintiff requests that the proceedings be terminated in that case. Delivery is made in accordance with national law and in a way that meets the minimum standards (recommended with a return receipt), and if it needs to be delivered in the Republic of Croatia, then delivery follows the rules of the CPA on ex officio delivery.

However, if the EPO is to be delivered in another EU Member State, then the delivery is made on the basis of Regulation (EC) No 1393/2007 of the European Parliament and of the Council of 13 November 2007 on the service in the Member States of judicial and extrajudicial documents in civil and commercial matters ("service of documents") and repealing Council Regulation (EC) No 1348/2000 with the appropriate application of the provisions of Articles 503 to 503d of the CPA (507 d. - h.). The complaint is submitted using form F, but can also be submitted without a form, provided that it does not have to be substantiated (in the Official Journal of the EU, this form has been partially mistranslated). The form itself contains information about the court, the parties and a statement of objection against EPO issued on a certain date and the signature of the defendant. In the Republic of Croatia, it was pointed out that after the complaint, further proceedings will be conducted in accordance with the provisions of the CPA regarding the complaint against the payment order (Articles 445a, 451 to 456), unless the plaintiff requested that the proceedings be terminated. If the claimant enforces the claim through the EPO procedure, nothing under national law calls into question his position in subsequent ordinary civil proceedings. Upon the objection, the court informs the plaintiff whether the defendant has lodged an objection as well as any transfer to ordinary civil proceedings. If the defendant has not lodged an objection (in the Republic of Croatia it is not allowed to seek reinstatement due to missing the deadline for lodging an objection against EPO), the court of origin (the court that issued the EPO) declares the enforceability of the European order for payment without delay delivery date. Formal enforceability requirements are governed by the law of the Member State of origin, and the court sends an enforceable European order for payment to the claimant. An EPO which has become enforceable in the Member State of origin shall be recognized and enforced in another Member State without the need for a declaration of enforceability and without any possibility of challenging the recognition. Thus, an EPO issued in one Member State is an enforcement document in all other Member States and enforcement is carried out on the rules for the enforcement of either European orders or enforcement titles in accordance with national law. For enforcement in another Member State, the claimant shall provide the competent enforcement authorities of that Member State with a copy of the European order for payment declared enforceable by the court of origin, which satisfies the necessary conditions for its authenticity and, where appropriate (Garcimartín Montero, 2016, p. 115.).

5.4. Refusal of execution

Once issued and executed, an EPO may be reviewed only before a court of the Member State which issued that EPO. In exceptional circumstances, the defendant may file a request for review of the executive EPO. This request shall be made without delay before the court of the State of origin if there has been no proper service or if the defendant has been prevented from raising an objection through no fault of his own due to force majeure or extraordinary circumstances. In addition, after the execution of the EPO, the defendant also has the right to request verification of the EPO before the competent court in the home Member State where the payment order was manifestly incorrectly issued, taking into account the issuance requirements prescribed by the Regulation or due to exceptional circumstances (Čuveljak, 2014, p. 4.). After receiving the defendant's request, the court reviews it and if it finds that the review is justified on the reasons given by the defendant, then the EPO is null and void. The court in the Republic of Croatia decides on the request for review of the EPO by a decision, against which no appeal is allowed, but the defendant is obliged to make probable the facts on which his proposal to repeal the EPO is based. If the court finds that the EPO is null and void, it will suspend the proceedings under Regulation no. 1896/2006, while further proceedings will be conducted in accordance with the provisions of the CPA. The enforcement of the EPO itself is governed by the law of the Member State of enforcement and is enforced in the same way as

domestic decisions and no security or deposit can be claimed from the plaintiff. However, if it is enforced in a country where the EPO has not been issued, the plaintiff should provide the competent authorities with a copy of the EPO declared enforceable by the court of origin and, if necessary, a translation of the EPO. It was also pointed out that the enforcement EPO issued by a court in the Republic of Croatia is an enforcement document on the basis of which enforcement can be requested in the Republic of Croatia as on the basis of an enforcement decision of a Croatian court (Čuveljak, 2014, p. 4.). If the creditor is required to attach a translation of a European order for payment, that translation should be in Croatian and certified by a person authorized to do so in one of the Member States. The competent court in the executing Member State may, at the defendant's request, refuse to execute the EPO if the payment order in question is contrary to an earlier decision or order previously issued in any executing Member State or third country, provided that the earlier decision or earlier order included the same basis for instituting proceedings between the same parties if the earlier decision or earlier order fulfills the conditions necessary for recognition in the Member State of enforcement and if the contradiction could not be used as an objection in court proceedings in the Member State of origin (Čuveljak, 2014, p. 4.). In addition, it was pointed out that enforceability, after filing the application, would also be denied if and to the extent that the defendant had paid the amount awarded in the European order for payment. In order to avoid misunderstandings, it was also pointed out that the EPO cannot be reviewed under any circumstances to the content in the Member State of enforcement. Where the defendant has lodged a request for review of the EPO, the court in the Member State of enforcement may limit the enforcement of the proceedings to protective measures or condition the enforcement under conditions of security determined by him or in exceptional circumstances, suspend the enforcement proceedings. If a review of the EPO issued in the Republic of Croatia is requested, the court deciding on the request may postpone enforcement with appropriate application of the provisions of the Enforcement Act on postponement of enforcement at the request of the debtor, and an appeal against the enforcement decision is allowed. only if those reasons arose after the delivery of that order and if they could no longer be raised in the objection. The request for denial of enforcement is decided by a decision of the municipal court as the enforcement court, and the territorial jurisdiction of the court is determined according to the rules on the territorial jurisdiction of the court in enforcement proceedings. The court decides on the suspension of enforcement and the revocation of enforcement actions with the appropriate application of the provisions on enforcement proceedings, and the court decides on the postponement or restriction of enforcement by a decision against which a special appeal is not allowed. The decision shall remain in force until the end of the proceedings initiated by the party on the request for suspension or postponement, or until a different court decision made in connection with the proposal of either party (Čuveljak, 2014, p. 5.).

5.5. Opposition to the EPO and absence of timely opposition

General rules of Croatian CPA on the form shall apply for opposition to the EPO (Triva, Dika, 2004, p. 812 – 818.). Submission given outside of trial shall be filed in writing. An application for opposition against an EPO may be submitted only in a machine readable format. If the defendant lodges a statement of opposition to the EPO within the meaning of Article 16 of Regulation 1896/2006, further procedure shall be conducted pursuant to the provisions of Croatian CPA on the procedure in case of an objection to the payment order while taking into account the provisions of Art. 17. EPO (Art. 507.1 CPA). It means that the same rules that apply in the case of an objection against a CPO shall apply in the case of an objection against a EPO. There is no special rule on legal remedies against the court decision on statement of opposition that was filed against EPO. A statement of opposition against a EPO that is untimely, incomplete or not allowed shall be dismissed by a competent court for litigation.

Such a ruling issued by a court of first instance may be challenged by an appeal. If a statement of opposition against a EPO is timely, complete and allowed, and the defendant states there are some hindrance to the further course of the proceedings, the court shall first decide on this objection. If it establishes that this objection is well - founded, it shall annul the payment order by a ruling. Such a ruling may be challenged by an appeal (Art. 378(1) CPA and also a ruling on review of an EPO may be challenged by an appeal (Šago, 2013., p. 124.). The certificate of enforceability of a EPO shall be issued by Commercial court in Zagreb. In contrast to a domestic order for payment the claimant does not have to apply for it. The certificate shall be given ex officio. The certificate procedure according to Art. 18. EPO shall be followed. Regarding requirements for enforceability Art. 23 of Croatian Execution Act shall apply. A court decision instructing the fulfilment of a claim on payment or performance is enforceable if it has become legally effective and if the term for voluntary fulfilment has expired. That term runs from the date of delivery of the decision to the execution debtor, unless provided otherwise by law. In the absence of timely opposition a CPA and EPO becomes final and not only enforceable (Šago, 2013., p. 124.).

5.6. Enforcement in the Member State of enforcement

According to Croatian Execution Act (Official Gazette, no. 112/12, 25/13, 93/14, 55/16, 73/17, 131/20) any certificate of enforceability that was issued, although the conditions laid down by law for its issuance were not fulfilled shall be repealed by the court or body that issued it, and that in a ruling, further to a motion or in the line of duty (Šago, 2013., p. 125.). The procedures of the EPO should be governed by the national legislation without any prejudice to the provisions of the Regulation, particularly those relating to the minimum standards in Art. 22, Paragraph (A) and (2) and Art. 23. The regulation of art. 22 of Regulation (EC) 1896/2006 that establish that the enforcement may be refused if there is a previous order and also the *res iudicata* effect is generally accepted in the national order for payment proceedings (Garcimartín Montero, 2016, p. 119.). The defendant has one month from the date of service to submit a statement of defence, otherwise the court of origin will declare its payment order enforceable. The defendant can in exceptional circumstances apply for review of the order after the expiry of the time limit if it has been served on him without proof of receipt, and service was not effected in time for him to arrange a defence or he was prevented from objecting by reason of force majeure. Review is possible if the order was clearly wrongly issued. If such an application for review is lodged it is without prejudice to the enforceability of the order per se, but the court in the Member State of enforcement may upon application „limit enforcement to protective measures, make enforcement conditional upon provision of security, or stay enforcement. If the review is found by the court to be justified the order for payment shall be null and void (Storskrubb, 2008, p. 21.). Further procedure shall be conducted pursuant to the provisions of Croatian CPA (Art. 507lj (3) CPA). It is not permitted to apply for reinstatement under the provisions of CPA on account of failure to observe the time limit for the statement of opposition to the EPO referred to Art. 16(2) EPO (Medić Musa, 2007, p. 111 – 134.). Courts have competence with respect to enforcement of the EPO according to rules of the Croatian Execution Act that applies to enforcement of any other enforcement title documents (Uzelac, 2010, p. 221 – 229.). If the debtor has neither opposed within the time limit nor paid, the EPO will become enforceable in accordance with Article 18. A defendant who has failed to oppose in time will be able to apply for review of the EPO in the Member State of origin. According to the Article 22 the defendant may, in specific cases of irreconcilability of the EPO with an earlier decision, apply for refusal of enforcement in the Member State of enforcement. If an application for review of the EPO issued in Croatia is submitted, the court deciding on such application may suspend the enforcement and apply the provisions of Art. 61 of the Enforcement Act.

An appeal against an enforcement order due to reasons relating to a claim established in the EPO shall be admissible only if such reasons occurred after the service of the order and if it was no more possible to present them in the statement of opposition pursuant to Art. 16 EPO. A municipal court as enforcement court shall decide on applications for refusal of enforcement pursuant to the provision of Art. 22 (1) EPO in a ruling (Šago, 2013., p. 125.).

6. CONCLUSION

Efficient collection of debts without legal disputes is crucial for economic operators in the European Union, as late payments are the main reason for illiquidity that threatens the survival of businesses, especially small and medium-sized enterprises, resulting in the loss of many jobs. The main goal of European Civil Procedure is improving and facilitating judicial cooperation in civil and commercial matters between the Member States in all fields; improving the effective and practical application of Union instruments and conventions in force between two or more Member States; and promoting effective access to justice for the general public. All Regulations represents a true advancement in the integration process, have signalled the beginning of the creation of a European uniform civil procedure (Hodges, 2007., p. 96 – 13.). The goals of which are to simplify, speed up, reduce the costs of cross-border litigation and reduce language obstacles because in cross-border litigation, language differences are one of the main obstacles preventing parties from taking action and defending their rights (Stadler, 2012, p. 151 - 168.). Shortly after the EPO Regulation, another Regulation creating a European civil procedure was adopted, namely the Regulation establishing a European Small Claims procedure. These three Regulations put into practice the principle of mutual recognition of judgments in civil matters. Their main aim is to simplify and speed up the cross-border recognition and enforcement of creditors' rights in the European Union. In this respect they contribute both to building a genuine area of justice in the European Union, and to implementing the Single Market. As the EPO is a special procedure applied in almost all European countries, the issue of legal representation is regulated and it is pointed out that representation by lawyers or other legal professionals is not mandatory for both the plaintiff in connection with the request for a European order for payment and the defendant in in connection with the objection to the European order for payment. With regard to court fees, it was pointed out that the total amount of court fees for EPO and ordinary civil proceedings that follow in case of an objection to EPO in a Member State may not exceed court fees for ordinary civil proceedings not preceded by a European order for payment procedure in that Member State. Court fees include both fees and charges that must be paid to the court, the amount of which is determined by national law. With regard to other procedural issues not resolved by that Regulation, it was decided to apply national law, and Regulation (EC) No 1896/2006 does not affect the application of delivery regulations, judicial and extrajudicial documents in civil or commercial matters in the Member States.

THE INFORMATION SOCIETY IN THE COVID-19 ERA

Anna Janiga-Cmiel

*University of Economics in Katowice,
1 Maja 50, 40-287 Katowice, Poland
anna.janiga-cmiel@ue.katowice.pl*

ABSTRACT

The study analyses factors which significantly contribute to the development of the information society in selected EU member states (also added in the analysis: Norway, Iceland, Turkey). It covers the time before and during the COVID-19 pandemic. Its aim is to identify groups of countries bearing similarity in the phenomenon under study by means of a taxonomic method - Czekanowski's diagram. The paper presents an analysis of a particular set of diagnostic features. The variables, whose relevance and statistical accuracy were first verified, formed a basis for the classification of the selected countries. The data comes from the statistical yearbooks published by the Central Statistical Office and from the Eurostat websites (it covers the years 2020, 2019 and 2012).

Keywords: *Czekanowski's diagram, Information Society, Taxonomic analysis, COVID-19*

1. INTRODUCTION

In recent times, the way we live has been closely linked to modern technologies and their development as well as to Internet access. The progressing information and communications technologies, which have already established a foothold in society, are entering new areas of our life, thus contributing to further development of the information society. We have become an information society that strives for continuous access to the Internet in order to enable people and organizations to liaise and exchange information despite economic boundaries. The COVID-19 pandemic has significantly contributed to the acceleration of digitization processes and the introduction of various new technological solutions. The coronavirus pandemic and the lockdown have led to changes in the ways of working existing in many companies and institutions as they were forced to digitize their services in a short period of time. Offices, hospitals, enterprises and all kinds of institutions have significantly expanded their e-services and launched websites presenting and promoting their offerings. In the public administration, the portfolio of e-services has been extended, which enables each user to handle a variety of administrative matters. However, the rise in the number of people using e-services provided by public administrations, digital platforms, etc. is accompanied by an increase in the number of cyber attacks and cyber security breaches. Most companies and institutions have adopted online customer service and embarked on online marketing activities. It has become a common practice to access news online and read online newspapers. Due to the outbreak of COVID-19, people have turned to the internet to buy groceries. The current situation has resulted in increased usage of the Internet and higher demand for Internet access by households. Remote working, remote teaching, online meetings and training have been introduced. The pandemic and temporary lockdown restrictions have transformed our daily life, making the internet its indispensable component. Unfortunately, lack of internet access can both cause and worsen digital exclusion, which affects mainly senior citizens, people with disabilities and other vulnerable groups. Another group experiencing difficulties are schoolchildren, high school and university students as well as employees working from home. The problems include not only the lack of internet access or efficient broadband connection but also lack of a home environment that allows remote learning and remote work. The aim of the study is to analyze the development of the information society in selected countries in the context of the COVID-19 problem.

2. CZEKANOWSKI'S DIAGRAM

In Czekanowski's method, the first step involves creating a matrix of distances between objects D, which can be defined by means of any metric. The distance measures in matrix D are divided into classes of object similarity. Each class is assigned a graphic symbol and thus Czekanowski's unordered diagram is created. Next, it is necessary to reorder the diagram and arrange the graphic symbols in such a way that the symbols corresponding to the shortest distances are located along the matrix diagonal, while those which represent longer distances are further away. (Pociecha J., Podolec B., Sokołowski A., and Zając K., 1988), (Grabiński T., Wydymus A., and Zeliaś A., 1989), (Panek T., 2009), (Młodak, A., 2006).

3. EMPIRICAL ANALYSIS

The first stage of the study focused on the selected countries in the year 2020, and next in the year 2019, 2011. The set of the diagnostic variables, which was established based on the descriptive and formal analysis of these variables, included (Janiga-Ćmiel, 2017), (Janiga-Ćmiel, 2018), (Janiga-Ćmiel, 2020):

- X₁ - Percentage of individuals - Individuals used a laptop, notebook, netbook or tablet computer to access the internet away from home or work,
- X₂ - Percentage of individuals - Internet use: never,
- X₃ - Percentage of total employment - Persons employed using computers with access to World Wide Web,
- X₄ - Percentage of individuals - Internet use: Internet banking. E-banking and e-commerce,
- X₅ - Percentage - Upper secondary, post-secondary non-tertiary and tertiary education.
- X₆ - Percentage of enterprises - Enterprise recruited/tried to recruit personnel for jobs requiring ICT specialist skills

The data comes from the statistical yearbooks published by the Central Statistical Office and from the Eurostat websites (it covers the years 2020, 2019, 2012). In the first step of the analysis, the dataset was used to standardise variables and calculate taxonomic distances.

$$z_{ij} = \frac{x_{ij} - \bar{x}_j}{s_j}; \quad (1)$$

where (Panek T., 2009):

z_{ij} – standardized variable x_j for the i -th object,

x_{ij} – variable x_j for the i – th object,

\bar{x}_j – arithmetic mean of the variable x_j ,

s_j - standard deviation of the variable x_j .

Next, the partition boundaries for the values of taxonomic distances were specified based on the calculated empirical area of variability (the Euclidean metric). Finally, Czekanowski's unordered and ordered diagrams were constructed. All calculations were performed and the diagram created by means of MaCzek program: [<http://www.antropologia.uw.edu.pl/MaCzek/maczek.html>,02.06.2021]. The countries were grouped by selecting objects that show the strongest mutual similarity. The results are presented in Figure 1, Figure 2 and Figure 3.

Figure following on the next page

Figure 1: An orderly Czekanowski's diagram for countries characterized by a similar level of the phenomian - 2020

(Source: based on own research by means of MaCzek program)

The analysis of the data for the year 2020 by means of the method discussed above resulted in separating groups of countries characterized by a similar level of the phenomian. Eight groups emerged:

- G1: Malta, Hungary, Slovakia, Austria, France, Ireland, Estonia.
- G2: Lithuania, Croatia, Greece, Portugal, Poland, Slovenia.
- G3: Czechia, Litvia.
- G4: Italy, Turkey,
- G5: Bulgaria, Romania.
- G6: Luxemburg, Sweden, Iceland, Denmark, Norway, Netherlands, Finland.
- G7: Spain, Cypru.
- G8: Germany, United Kingdom.

The countries belonging to groups G6 and G8 were characterized by the highest values of all variables (except x_2). The countries belonging to the groups G2, G3, G4 and G5 achieved the highest values of the percentage of people who have never used the Internet. Groups G1 and G7 contain the countries with average values of the analyzed variables. The other countries do not form groups. However, it should be noted that in some cases the breakdown is not clear and some countries may be assigned to other groups.

Figure 2: An orderly Czekanowski's diagram for countries characterized by a similar level of the phenomian - 2019

(Source: based on own research by means of MaCzek program)

The same analysis was conducted for another year under study, i.e. 2019. This time, the following groups were formed:

- G1: France, Belgium, Luxemburg, United Kingdom, Denmark, Sweden, Germany.
- G2: Ireland, Norway.
- G3: Romania, Italy, Bulgaria.
- G4: Slovenia, Portugal, Netherlands, Iceland.
- G5: Poland, Austria, Slovakia, Latvia, Croatia, Greece, Lithuania.

The other countries do not form any groups. The countries characterized by the highest values of the analyzed variables formed the groups: G1 and G2. The countries belonging to the group G3 are characterized by the highest values of the percentage of people who have never used the Internet. Groups G4 and G5 contain the countries with average values of the analyzed variables.

Figure following on the next page

Figure 3: An orderly Czekanowski's diagram for countries characterized by a similar level of the phenomian - 2012
(Source: based on own research by means of MaCzek program)

Similarly, for the last period, i.e. the year 2012, groups emerged:

- G1: Belgium, France, Austria, Germany, Luxemburg, United Kingdom.
- G2: Finland, Sweden, Netherlands, Denmark, Norway.
- G3: Czechia, Slovakia, Lithuania, Latvia, Estonia, Ireland, Hungary, Cyprus.
- G4: Croatia, Poland, Slovenia.
- G5: Bulgaria, Grece, Italy.
- G6: Portugal, Spain, Malta.

The countries with the highest values of the variables form the G1 and G2 groups. The groups G1 and G2 are characterized by the highest values of percentage of individuals, who used a laptop, notebook, netbook or tablet computer to access the internet away from home or work. The countries belonging to the groups G3, G4, G5 and G6 achieved the highest values of the percentage of people who have never used the Internet. The countries belonging to group G4 are characterized by the highest values of the percentage - Upper secondary, post-secondary non-tertiary and tertiary education.

4.CONCLUSION

The results of the grouping indicate that the groups are made up of countries whose residents have a similar standard of living. It is especially true for the year 2020. Richer countries provide their societies with wider access to healthcare services, access to the internet, new technologies and better education; they support the development of rural areas and take measures to curb unemployment.

They can afford to allocate considerable resources, including financial resources, to combat the COVID-19 pandemic and its multiple effects, which is more difficult for poorer countries. The less economically developed countries will be the first to experience the negative consequences of the coronavirus pandemic. In addition, the pandemic has drawn our attention to a number of serious problems, e.g. inequality in the standard of living between various societies. Summing up, we can say that the development of the information society is related to the economic development.

COMPARISON OF FINANCIAL INDICATORS AND THE TREND OF THE NUMBER OF USERS OF THE OLD AND NEW MEDIA INDUSTRY DURING THE COVID 19 PANDEMIC

Josko Lozic

University North, Croatia

jlozic@unin.com

ABSTRACT

The aim of this paper is to compare the business results of corporations within the media industry. The analysis included two corporations from the "old" and two corporations from the "new" media industry. The corporations in the "old" media industry are Comcast Corporation and the New York Times, and the corporations in the "new" media industry are Netflix and Spotify. We determine the "old" media industry according to the organizational design of vertical integration. The "new" media industry uses a streaming platform model. Financial analysis includes selected items from the corporate income statement to compare the business results of corporations. By analysing the trend in the number of users, a new model of user behaviour was determined. The "old" media industry is undergoing a process of transformation and generating revenues from several different models of commodification. The "new" media industry is taking advantage of the technological advantage of this new user habit. The analysis and comparison of the results of these two models indicates the directions of development of the global media industry.

Keywords: *media industry, platform economy, streaming platform, vertical integration, zero marginal cost*

1. INTRODUCTION

The digitalization of production systems has brought changes in management models in all types of industries. The media industry was among the first to enter the processes of transformation. The content production and distribution system based on digital technologies has enabled the convergence of the system within the entire media industry. Parts of the old media industry have transformed technology and management according to the requirements of the environment. The new media industry has started business based on new technologies.

Table 1: Differences between old and new media industry

	Old media industry	New media industry
	Comcast Corp. New York Times	Netflix Spotify
Organizational design	Vertical integration	Platform economy
Monetization	Hybrid model	Subscribe
Distribution	Hybrid model	Streaming
Media industry	Transformation	New media industry
Cost model	Economies of scale; zero marginal cost	Zero marginal cost
Media model	Mass media; platform media	Platform media
Technology model	Broadcasting, "factory floor"; Internet	Internet

Source: Own illustration

The "old" media industry emerged on the foundations of production capitalism and vertical integration. She used a model of selling in "brick-and-mortar" stores and cable subscriptions. Vertically integrated corporations benefited from economies of scale, relying on mass media, mass advertising, and mass markets.

The business paradigm was based on the "factory floor" production model. The new media industry has grown on the development of technology, the digitalization of the production process, and the convergence of content production and distribution systems. It is based on platform economics and streaming content distribution (Parker et.al. 2016; Moazed, Johnson 2016). Instead of selling physical media, revenue is generated from subscribing to a streaming platform. The platform economy model implies abandoning the classic cost model and uses the "zero marginal cost" model (Rifkin 2015; Lozić 2019). Platform economics and content distribution in the streaming platform model are leaving the cable model and are based entirely on Internet technology. The basic differences between the old and new media industry are shown in Table 1. The old media industry has entered a process of transformation, which has mostly affected the models of monetization and distribution of content. Revenue from copyright, streaming and subscription replaces classic revenue. The new media industry produces new media content, but also buys copyrights from the old media industry. The transformation of the entire media industry is very dynamic and requires a very detailed analysis. This paper focuses on financial indicators to compare the business results of corporations from the old and new media industries. Corporations are sorted by gross profit due to the difference in cost formation of revenue. The old media industry is building completely new content and we can assume that it has higher cost of revenue costs than the new media industry. In addition to gross profit, operating income and net profit will be compared to analyse the business results of the old and new media industries. The analysis of selected financial items will be compared with the trend in the number of users in the selected time period. 1.

2. LITERTURE REVIEW

The transformation of the media industry has come about under the influence of two fundamental factors. On the one hand, the development of technology has created new opportunities for the production and distribution of media content, and on the other hand, the new technology has laid the foundations for a significant change in the habits of media content users. The old media industry, in the context of the research topic of this paper, was based on broadcasting and the television screen. In the centre of the living room was a coaxial cable outlet. Jenkins (2006) first warns of the excessive impact of broadcasting. The media industry developed with the production capitalism of the 20th century and with the advent of leisure. Leisure time is a realm outside working hours in which the individual can distance himself from the responsibilities in real life. In this realm, the individuals attempt to provide harmony and peace in his inner world and ensure integration with society (Ismayilov, Sunal 2014). The end of the twentieth century was marked by the digitization and distribution of music content in a new form. The transformation took place in several different but related phases: gramophone records were replaced by CDs; CD audio carriers were slowly replaced by MP3 digital tracks, and after that streaming platforms took over the dominance in the distribution and consumption of music content (Simon 2019; Fuentes et al. 2019). The beginning of the 21st century marked a turning point in the use of electronic platforms for listening to music. The desktop computer has been somewhat neglected, and the focus of interest is mobile digital playback devices such as the Apple iPod, and this way of consuming music is beginning to prevail (Hesmondhalgh, Meier 2018). Rapid change in technology has occurred, which have affected the nature of leisure activities. Leisure has itself become high organized and commercialized business (Browne 364). The fact is that leisure time has become consumption-orientated and entered into the service of consumption economy is, without doubt, likely to neutralize the efforts of optimistic leisure policymaker who wish to deploy leisure time as the rehabilitation base of individual and social pathologies (Ismayilov, Sunal 2014). The beginning of the 21st century marked a turning point in the use of electronic platforms for listening to music.

The desktop computer has been somewhat neglected, and the focus of interest is mobile digital playback devices such as the Apple iPod, and this way of consuming music is beginning to prevail (Hesmondhalgh, Meier 2018). The transition to mobile digital devices and a completely new way of consuming music and other media content marked the end of the old media industries. What is meant by “new media” varies somewhat, but mainly includes the Internet, video and computer games, and mobile devices, including iPods, PDAs, and telephones (Marshall 2009: 81). Technology has become the word most associated with new media (Hendricks 2010: 5). The streaming service provides users with the possibility of creating their own music lists ("lists") or using already compiled music lists, created by music editors according to the preferences of individual user groups (Webster 2019). Building your own lists on the Spotify platform changes the way you interpret the classic value chain because in the "peer-to-peer" model of exchange, music lists are created by users themselves, not music content editors (Kask, Oberg 2019). With the development of postmodern societies, a strong habit of subscribing to steaming services instead of owning physical sound carriers has developed (Hagen 2015). The streaming platform services have made it possible to listen to music numbers that have long been neglected in various music niches (Webster 2019). In 2013, Netflix will begin broadcasting the globally popular House of Cards series, which will definitely strengthen the platform's leadership position within the streaming platform family. From the very beginning, Netflix has been placed in the context of "Spotify for movies". After the success of the series, Netflix comes out of that context and will become equal to the "older brother" (Fleischer 2020). Sun (2019) called Spotify the "celestial jukebox" that users have always been looking for. The same could be applied to Netflix for the film industry. Jenner (2014) studies the way Netflix designs its own television program and emphasizes that the broadcasting model, i.e. the managerial model, is completely different from cable and traditional television. The history of television can be divided into three basic periods: a) the “network-era”; b) "multichannel" transition; and c) the “post-network era” (Lotz 2007). The period of the network era stretches from the 1950s to the 1980s, and is known for the dominance of the three American television companies’ ABC, NBS and CBS. These corporations were vertically integrated media corporations that directly influenced the global media industry. In the context of technological development, there were terrestrial televisions that broadcast radio and television programs (Lozić 2021). The post-network era is connected with the development of Internet television and the distribution of media content without any form of the "old media" industry remaining a mediator in the process. "New" media content is distributed and broadcast on digital platforms that use screens, but the distribution and monetization model is completely different from the models that were present in the network-era and multichannel-era. Pearsons (2011) points out that the post-network era period begins after the 1990s. In the context of the transition from the multichannel era to the post-network era, Braun (2013) emphasizes the importance of technology development, and the focus of the activity shifts from production to distribution. Digital technology has enabled completely new forms of distribution and consumption of media content. Generation Z and the development of technology in the form of streaming platforms began with the deconstruction of this form of technological presence in everyday life. The cancellation of the cable television subscription is symbolically called "cord-cutters", ie those who "cut" the cable. A situation that was even more dramatic for classic television corporations is marked by the term "cord-nevers", i.e. those who will never subscribe to cable television. This group primarily includes members of Generation Z (Seemiller, Grace 2019). Waldfoegel (2019) from the title "all-you-can-eat" generation. As early as 2014, Jenner studied the way in which Netflix designed its own television program and emphasized that the broadcasting model, i.e. the managerial model, is completely different from cable and classic television. Along with technological development, changing user habits is another of the fundamental pillars of change in the media industry.

Hagen (2015) refers to Walter Benjamin who recognizes the three basic rituals that a book collector goes through: a) ordering - collecting books that are connected into a meaningful whole; b) possession - pure possession loses its meaning in itself as well as the owner of the collection and; c) the restoration of the old world - the strongest desire of the collector that forces him to re-collect new books. The consumption of music in the 21st century has almost completely abandoned the fundamental characteristic of this division, and that is possession. The change in the way music content is consumed and the difference in use between the old and new music industry, but also the media industry as a whole, was determined by Jean Baudrillard. It points to the difference between creating a collection of music content and using music content. Music content can be used or can be owned (Hagen 2015). Mason (2015) emphasizes the crucial importance of the changes brought by postmodern and post-industrial society to change the behaviour of media industry users

3. METHODOLOGY AND RESEARCH QUESTIONS

The survey will use financial data from Annual Reports of selected corporations. The financial analysis focuses on four basic indicators: revenue, cost of revenue, operating income and net income. The results of the financial analysis will be compared with the results of the trend analysis of the number of users. The research starts from the assumption that the new media industry has a higher gross profit than the old media industry due to lower operating costs in the streaming platform model, and that the number of users of the old media industry decreases while the number of new media industry users grows. The research is structured and focuses on the following issues:

- Q1 -What is the revenue trend of the old and new media industry before and during the Covid 19 pandemic?
- Q2 - What is the trend of gross profit and net profit in the old and new media industry
- Q3 - Is there a difference in the trend in the number of users between the old and new media industry.

The analysed financial items were processed for a period of 6 years, from 2015 to 2020. The analysis of the trend in the number of users covers the same period in order to be able to compare the results. The results of the analysis are presented in the chapter Discussion and conclusion.

4. DATA ANALYSIS

The research and analysis is divided into two parts. In the first part, selected financial items are analysed, and in the second part, the trend in the number of users is analysed. In research and analysis, corporations are ranked according to gross profit.

4.1. Selected financial item analysis

Four corporations were included in the analysis. Comcast and the New York Times belong to the old media industry, and Netflix and Spotify belong to the new one. Comcast is the largest media corporation in the world in terms of revenue and has the largest net profit from the analysed corporations. Comcast is a vertically integrated corporation that is transforming itself towards new models of content production and distribution. The New York Times is a newspaper publisher that is rapidly transforming into new content distribution models and moving to a digital distribution model with a subscription to the platform. Netflix and Spotify are part of the platform economy and generate most of the revenue from subscribing to the streaming platform. Selected financial items from the Annual Report are shown in Tables 2 to 5.

Table 2: Selected financial items - Comcast (\$; millions)

	2015	2016	2017	2018	2019	2020
Revenue	74.510	80.403	85.029	94.507	108.942	103.564
Cost of revenue	22.550	24.463	25.355	29.692	34.440	33.121
Gross profit	51.960	55.940	59.674	64.815	74.502	70.443
Operating income	15.998	16.859	18.018	19.009	21.125	17.493
Net income	8.413	9.045	22.922	11.862	13.323	10.701

Table 4: Selected financial items – Netflix (\$; 000)

	2015	2016	2017	2018	2019	2020
Revenues	6.779.511	8.830.669	11.692.713	15.794.341	20.156.447	24.996.056
Cost of revenues	4.591.476	6.029.901	8.033.000	9.967.538	12.440.213	15.276.319
Gross profit	2.188.035	2.800.768	3.659.713	5.826.803	7.716.234	9.719.737
Operating income	305.826	379.793	838.679	1.605.226	2.604.254	4.585.289
Net income	122.641	186.679	558.929	1.211.242	1.866.916	2.761.395

Source: Own illustration (Netflix Annual Report)

Table 5: Selected financial items – Spotify (Eur; millions)

	2015	2016	2017	2018	2019	2020
Revenue	1.940	2.952	4.090	5.259	6.764	7.880
Cost of revenue	1.714	2.551	3.241	3.906	5.042	5.865
Gross profit	226	401	849	1.353	1.722	2.015
Operative loss	-235	-349	-378	-43	-73	-293
Net loss	-230	-539	-1.235	-78	-186	-581

Source: Own illustration (Spotify Annual Report)

The analysis of revenues and net profit of the old and new media industry indicates the first difference between them. Comcast and NYT generated lower revenue and lower net profit in 2020 compared to the previous period. Comcast's total revenue fell 4.9% and net profit fell 19.7%. The NYT generated 1.6% less revenue in 2020 compared to the previous period and 28% lower revenue. Comcast and NYT are in the process of transformation and are generating more and more revenue from subscribing to digital content, which should directly affect the cost of revenue. Still, Comcast has a 5.4% lower gross profit in 2020 compared to the previous period. The NYT is rapidly transforming and has almost equal gross profits in the last two periods.

Table following on the next page

Table 6: Gross profit margin (2015-2020)

	2015	2016	2017	2018	2019	2020
Comcast	69,7%	69,6%	70,2%	68,6%	68,4%	68,0%
New York Times	60,9%	59,6%	63,3%	45,8%	45,4%	46,2%
Netflix	32,3%	31,7%	31,3%	36,9%	38,3%	38,9%
Spotify	11,6%	13,6%	20,8%	25,7%	25,5%	25,6%

Source: Own illustration

Netflix and Spotify achieved continuous revenue growth. Netflix revenue was up 24% in 2020 from a year earlier. Spotify revenue was up 16.5% in 2020 from the previous period. Net profit Netflix grew in 2020 by 47.9% over the previous year. Spotify had a negative net profit in all analysed periods. The results of the research clearly show that it cannot be argued that the new media industry is more financially efficient than the old media industry. Spotify's business model shows shortcomings in revenue and gross profit, which Comcast compensates for with revenue.

Table 7: Operating income margin (2015-2020)

	2015	2016	2017	2018	2019	2020
Comcast	21,5%	21,0%	21,2%	20,1%	19,4%	16,9%
New York Times	11,7%	7,2%	10,5%	10,9%	9,7%	9,9%
Netflix	4,5%	4,3%	7,2%	10,2%	12,9%	18,3%
Spotify	-	-	-	-	-	-

Source: Own illustration

The new media industry uses a platform economy model that allows it to significantly reduce the cost of producing and distributing content. The assumption is that it makes higher gross profit margins than the old media industry. The results of the research showed exactly the opposite results. The largest gross profit margin is realized by Comcast, followed by the NYT. The amount and diversification of revenue allows Comcast to maintain a high gross profit margin. The NYT is transforming into a platform economy model and has stopped the decline in gross profit margin. Netflix and Spotify are increasing gross profit margins year after year, but they are still lagging behind the old media industry. The analysis shows a fundamental trend difference. The gross profit margin of the old media industry is continuously declining, while the gross profit margin of the new media industry is continuously growing. The results of the research are shown in Table 6.

Table 8: Net profit margin (2015-2020)

	2015	2016	2017	2018	2019	2020
Comcast	11,3%	11,2%	27,0%	12,6%	12,2%	10,3%
New York Times	4,0%	1,9%	0,3%	7,2%	7,7%	5,7%
Netflix	1,8%	2,1%	4,8%	7,7%	9,3%	11,0%
Spotify	-	-	-	-	-	-

Source: Own illustration

Analysis of operating income margin results indicates changes that are happening in the media industry. Netflix has the largest operating income margin. Operating income margin Netflix is continuously growing, while Comcast has a continuous decline in this financial item. Netflix's growing operating margin growth trend explains the higher capitalization than Comcast. The operating margin analysis indicates the diversity of financial stability within all segments of the

media industry. Netflix has strong financial stability, while Spotify has negative operating income margins. The results of the research are shown in Table 7. The results of the net profit margin analysis are very similar to the results of the operating income margin analysis. The amount and order of selected financial items is the same as for operating income margin.

Table 9: Regression analysis (2015-2020)

s; $R^2 > 0,8$	Revenue	Cost of revenue	Operating income	Net profit
Comcast	7,53%	8,81%	3,41%	-
New York Times	3,15%	11,27%	2,73%	-
Netflix	30,43%	20,71%	56,96%	69,18%
Spotify	25,10%	22,19%	-	-

Source: Own illustration

Regression analysis of the trend indicates differences in the financial performance of selected corporations. Netflix is the most successful corporation with the highest average annual growth rate ($s=30.43$) and the highest average growth rate of operating income ($s=56.96$). The average annual net profit growth is 69.18%. Comcast and NYT have an average operating income growth rate of 3.41% and 2.73%. The average net profit growth rate for Comcast and NYT cannot be determined precisely because the coefficient of determination is less than 0.8 ($R^2 < 0.8$). The low growth rate of operating income and the oscillation of the net profit trend indicate changes that have affected the old media industry. Spotify belongs to the new media industries, but did not achieve positive operating income and net profit in the entire analysed period. The results of the analysis indicate significant differences in the financial performance of each of the analysed corporations, regardless of which category they are classified. The results of the research are shown in Table 9.

4.2. User's trend analysis

Analysis of financial items reveals the complexity of the media industry. Netflix has the largest capitalization although it has less revenue than Comcast. Research and trend analysis of the number of users additionally reveals the complexity of the business paradigm of the media industry. The analysis of the number of users is based on the total number of subscribers at the end of 2020. The largest in terms of subscribers is Spotify with 345 million subscribers. Spotify has the worst financial data in the context of gross margin to net profit margin, and also has the largest number of subscribers. The NYT has the lowest revenue, and with 4.39 million digital subscribers, is the smallest of the selected corporations. The transformation of the NYT business enabled the largest increase in the number of users. A comparison of the analysed data from Spotify and NYT indicates the complexity of the research task in the media industry. Netflix has 203.67 million subscribers and, in the last 10 years, has increased its subscriber base 10 times. Comcast has the highest revenue, and the number of users is 10 times smaller than the number of Netflix users, i.e. it has 19.85 million users. 8. One of the goals of the research is aimed at comparing the trend of the number of users with the results of the analysis of financial results. Comcast is facing a broadcast subscription cancellation and the trend regression curve has a negative direction coefficient. Spotify is the largest in terms of number of users. The average annual growth in the number of users is 25.2% with a coefficient of determination of $R^2 = 0.9732$. Netflix is the most valuable corporation within the media industry by capitalization on the NYSE, has the highest average net profit growth rate of 69.18%, and an average annual growth in subscribers of 20.4%, with a coefficient of determination of $R^2 = 0.9866$. Netflix and Spotify have a linear growth trend and the number of users is growing digressively (Lozić 2020).

Figure 1: Monthly subscribers trend (2015-2020)

Source: Own illustration

The NYT is the lowest in terms of revenue, and with 4.39 million digital subscribers, it is also the lowest in terms of that item. However, with the transformation of the business into a platform model, the only one has an exponential growth in the number of subscribers. The annual growth in the number of subscribers is the largest and amounts to 34.3% with a coefficient of determination of $R^2 = 0.9808$. The results of the research are shown in Figure 1.

5. DISCUSSION AND CONCLUSION

The results of research and analysis of financial results and trends in the number of users clearly indicate the complexity of research trends in the media industry. The transformation of the content management and monetization model has already significantly affected all participants in the media industry, so it is not possible to talk about a precise division into entities from the old and new media industry. Comcast has the highest revenue and the largest gross profit margin, but the number of subscribers is steadily declining from year to year. In contrast, Spotify has the largest number of subscribers and the number of subscribers is continuously growing from year to year, but it has the lowest gross profit and has a negative net profit. Seven basic points were singled out from the research results:

- The revenue trend of the old and new media industries indicates one of the fundamental differences. The old media industries had reduced revenues in 2020, during the pandemic, i.e. they are less resistant to environmental crises.
- NYT is nearing the end of the transformation of the production and sales model, as indicated by unchanged gross profit at the time of the pandemic
- Spotify generates insufficient revenue and has a low gross profit that does not leave enough room for other costs. Therefore, it cannot be argued that the new media industry is more efficient in all segments than the old media industry.
- Gross profit margin of the old media industry is continuously declining, while gross profit margin of the new media industry is growing from year to year
- Netflix has the highest growth rates of operating income and net profit making it the corporation with the largest capitalization.

- Spotify has the worst financial data, and the largest number of users, which proves that technological superiority and the number of users is not enough to succeed without other management tools-
- The transformation of the NYT business made it possible to stop the decline in gross profit and the exponential growth in the number of subscribers. The NYT business model points to the development of the media industry towards a platform economy.

The seven selected points of discussion clearly indicate the directions for further research into the development of the media industry. In the context of the research questions asked, the research conducted in the paper showed the following results. In the context of the first research question, it can be concluded that at the time of the pandemic, revenues fell to corporations from the old media industry. Netflix and Spotify revenue continued to grow in the pandemic as well. In the context of another research question, the assumption that gross profit will be higher in the new media industry has not proved correct. The old media industry had a higher gross profit margin, but they decreased in the analysed period, in contrast to the gross profit margin of the new media industry, which is continuously growing. In the context of the third research question, the rule that each media subject must be analysed separately is reaffirmed. The number of Comcast users is steadily declining, but the number of NYT digital users is growing exponentially. The number of Netflix and Spotify users is growing linearly, but that growth is declining. The results of the research confirm the claims about the transformation of the media industry, and confirm the wide range of possibilities for further research.

ABSTRACT

This study examines the impact of Covid-19 on consumers' buying behaviors during and after lockdown. Consumers' experienced one of the most dangerous pandemics in the 21st century. The repercussions of this virus impact the way consumers shop. Being subject to unplanned changes will eventually shake up the lifestyle of individuals. In order to bring an answer to different questioning about the change of consumers' buying behaviors, the paper contains a literature review to explain different variables affecting consumers' behaviors in such epidemic situation, which allows deducting three hypotheses. To check them out, a survey was conducted using a quantitative research methodology. The questionnaire was carried out to answer the research problem sought. The collected data demonstrate that the experience of lockdown and health measures developed an emotion of fear among Moroccan consumers, which influenced buying behaviors and habits. Therefore, the generalization of the vaccination campaign can be an opportunity to return to old shopping habits.

Keywords: *Consumer Behavior, Buying Behavior, Covid-19, Morocco*

1. INTRODUCTION

Since December 2019, the world has witnessed new respiratory disease (Faour-Klingbeil *et al.*, 2021), which has not only a social and economic impact but also a psychological impact among citizens. Amid this Covid-19 pandemic (also called coronavirus), people have been faced many changes in terms of lifestyles, habits, and consumption due to health measures taken by authorities. The ubiquity of Covid-19, and its impact on buying habits, led us to believe that the consumer is undergoing an unexpected change in his life. This change, accompanied by uncertainty about the future, will undoubtedly have an impact. This research paper aims to study the impact of Covid-19 on consumer buying behavior among in Morocco. This study deal with two main periods: the lockdown period (from March to June 2020) and the after lockdown period, which is the beginning of the post-Covid-19. Since that time, many measures were taken such as emergency state, the opening and closing of boards, the cessation and the resumption of flights, and the control of the continuity of certain business activities according to the pandemic situation. Those unexpected procedures lead to several questions concerning consumers' buying behaviors: Are health measures and lockdown a reason to influence consumers' buying behaviors? Can fear and panic developed due to the pandemic explain the change in consumers' purchase behaviors?

Will vaccination be the key to return to old buying habits? Through a survey, an answer to the previous questions will be demonstrated. This work is based on an analysis of data collected from Moroccan consumers to reject or accept the research hypotheses developed.

2. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

2.1. Developing new purchase behavior due to Covid-19 pandemic lockdown

On March 02nd, 2020, the first case of Corona virus was registered in Morocco. The authorities have decided to adopt large-scale drastic measures in accordance with the directives of his majesty King Mohammed VI and under his direct supervision in order to preserve the country (Hadrya, Soulaymani, and Hattimy, 2020) from the spreading of the virus. During the same month, several measures were taken, including suspension of air flights and maritime links to and from countries, the mandatory of wearing a mask for the whole country (Layelmam *et al.*, 2020), and on March 20th, 2020, the lockdown followed (Khomsi *et al.*, 2020). This last decision was new inside the society. Morocco allowed the opening of essential retailers with the respect of social distancing with a limited number of customers, hand sanitizers available for clients, and the usage of masks by clients. Moreover, except for people still working in the office, one member of each family is allowed to go out from the home to do groceries with a unique authorization paper from the government. Consumers were falling into new routines for eating, working, home-schooling, socializing, exercising, and shopping (Brunt, 2020). People behave differently when faced with threats (Szymkowiak *et al.*, 2020), such as fear. This new lifestyle conduct by emotions has emerged a panic buying behavior (Islam *et al.*, 2021) and stockpiling of food and daily supplies (Cecchetto *et al.*, 2021) since people couldn't expect or anticipate the duration of the pandemic outbreak. The measures taken to limit the spreading of the covid-19 virus has generated significant disruptions and social anxiety on consumer behavior. All consumption is time-bound and location-bound (Sheth, 2020). This change among consumers' behaviors is explained by the role of emotions in buying decisions, post-purchase attitudes. Indeed, the confinement and staying at home, people in Morocco, and many other countries, were facing new characteristic attitudes and behaviors among society. A person unconsciously is deeply into this indoors staying and shopping culture. Inside this context, consumer thoughts, feelings, and behaviors vary considerably (Stephens, 2017). Covid-19 has changed the nature of businesses around the world (Bhatti *et al.*, 2020), consumers during lockdown were limited to buying essential products, their experience has changed both in-store and online shopping. A research conducted in South Korea shows that consumers visit more neighborhood stores where they have little interaction with other consumers unlike visiting hypermarkets and large supermarkets (NielsenIQ, 2020). Consumers think more before acting, their fear increases when they think about what this crisis means to them and what it means to their family, friends, and society in general. They try to adapt to the new normal life which no future projection is clear. As well as consumers, businesses worked hard to adapt to the new market requirement. Grocery retailers have implemented new solutions such as e-commerce and deliveries (Pantano *et al.*, 2020). In Morocco, a huge growth has been known in the e-commerce field. According to Interbank Electronic Banking Center (CMI), online transactions up 43% in 2020 (MapNews, 2020), this number shows the impact of the health crisis on shopping behavior. Consumers are ready to experience a new way of purchasing with the intention of protecting themselves from the virus.

2.2. Consumer purchase behavior after the lockdown

After few months of lockdown, authorities try to maintain the spread of the virus through the sanitary state of emergency that varies from one country to another and sometimes even from one region to another. So, several countries decided to revive the economy by reopening businesses, which is also the case of Morocco.

Developing new habits of shopping behavior during lockdown has played a crucial role in the way how consumers buy after the lockdown. Studies about consumer behavior after lockdown are still limited because the situation changes continually and rapidly depending on the pandemic situation. The year 2021 is marked by the Covid-19 vaccination campaign, so as to achieve an end to isolation and social distancing, countries around the world are rushing to vaccinate the maximum possible number of citizens. Moreover, consumers are considering the way their life will be when a majority of people will be vaccinated (Cheung, Peterson, and Zaharchuk, 2021). Two different research conducted by Numerator Intelligence and Shopkick considered that many behaviors are likely to stick in post-Covid (Numerator, 2021) and conclude that U.S consumers do not intend to change their shopping habits or renounce safety precautions (Redman, 2021). Despite that, a report by IBM concludes that U.S consumers want to see the rate of vaccination excess 70% to feel more comfortable and prepare themselves to return to their old habits before the pandemic, the pre-Covid era (Danziger, 2021). All those observations push to reflect on consumers' confusion about their behaviors and future. Indeed, this uncertainty could be explained by all those flexible and changeable events lived from late 2019 till 2021 that make it hard for consumers to know themselves and for researchers to study their buying behavior.

2.3. Hypothesis development

Based on the previous literature review, and the problem research and objectives, the following null and alternative research hypotheses were formed:

2.3.1. First hypothesis

Experiencing for the first time such new life due to a pandemic can influence the consumers' shopping behaviors. Consumers are obliged to respect all the health measures and the lockdown made by authorities.

- *HO₁: There is no dependence between experiencing a new lifestyle (lockdown and health measure) and consumers' buying habits behaviors.*
- *H1: There is a dependence between experiencing a new lifestyle (lockdown and health measure) and consumers' buying habits behaviors.*

2.3.2. Second hypothesis

Related to the previous hypothesis, experiencing an unexpected situation without having visibility into the future can develop fear and panic emotions, which can explain the consumers' purchase behaviors.

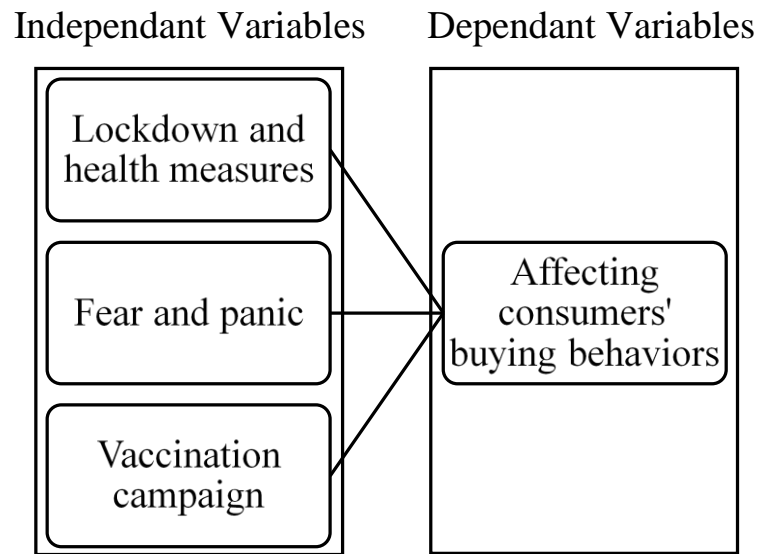

- *HO₂: There is no relationship between fear and panic and consumers' buying habits behaviors*
- *H2: There is a relationship between fear and panic and consumers' buying habits behaviors*

2.3.3. Third and last hypothesis

Authorities around the world work hard to fight the pandemic of Covid-19. Vaccination campaigns begin in many countries and Morocco too. The generalization of vaccination can be the only way to give up many measures taken to face the propagation of the virus. Consumers' can be ready to return to their old buying habits thanks to the vaccine.

- *HO₃: There is no dependence between vaccination campaign and consumers' buying habits behaviors*

- *H3: There is a dependence between vaccination campaign and consumers' buying habits behaviors*

*Figure 1: Research Model
(Source: Authors' own elaboration)*

The previous research model explains the previous hypothesis, which is developed to be empirically tested.

3. RESEARCH METHODOLOGY AND DATA COLLECTION

To make sure to get an answer to the research problem and to verify the hypotheses, a survey was conducted to collect the necessary data from Moroccan consumers. The questionnaire design is organized into three (3) parts in a total of fifteen (15) questions. The first part examines consumers' behaviors during the lockdown, the second deals with the after lockdown period, and the last part is dedicated to sociodemographic variables to know more about the sample characteristics. The survey was conducted online using social media (mainly Facebook and WhatsApp) to collect data. The formula used to calculate the sample size is that developed by Cochran (1977).

$$N = \frac{Z^2 p(p-1)}{e^2}$$

With:

N = Population size (36 690 000 habitants in Morocco)

Z = Sampling confidence level (95% confidence level)

p = Estimated proportion of the population that represents the characteristic (p = 0.5)

e = Margin of error chosen (5% which means e = 0.05)

Its numerical application gives a result of 384,159, which means a minimum of 385 responses is needed. A total of 413 were collected in a week (from 29th April to 6th May 2021), the questionnaire was distributed in French and Arabic as the most spoken languages in Morocco using Google Form to make the diffusion easy through a link. Table 1 below shows the respondents' sociodemographic characteristics.

		Fréquence	%	Valid %	Cumulative %
Gender	Female	269	65,1	65,1	65,1
	Male	144	34,9	34,9	100,0
Age	<i>between 18 and 24 YO</i>	240	58,1	58,1	58,1
	<i>between 25 and 39 YO</i>	136	32,9	32,9	91,0
	<i>between 40 and 60 YO</i>	35	8,5	8,5	99,5
	<i>more than 60 YO</i>	2	,5	,5	100,0
Occupation	Student	205	49,6	49,6	49,6
	Civil servant or Employee	133	32,2	32,2	81,8
	Liberal profession	22	5,3	5,3	87,2
	Retraité(e)	1	,2	,2	87,4
	Looking for a job	14	3,4	3,4	90,8
	Freelancer	12	2,9	2,9	93,7
	Housekeeper	12	2,9	2,9	96,6
	Other	14	3,4	3,4	100,0
Monthly Income	<i>Less than 3000 DH</i>	223	54,0	54,0	54,0
	<i>3001 - 6000 DH</i>	67	16,2	16,2	70,2
	<i>6001 - 9000 DH</i>	43	10,4	10,4	80,6
	<i>9001 - 12000 DH</i>	36	8,7	8,7	89,3
	<i>More than 12000 DH</i>	44	10,7	10,7	100,0
Total of respondents		413	100,0	100,0	

*Table 1: Sociodemographic variables of respondents
(Source: Authors' own elaboration using SPSS and EXCEL)*

4. DATA ANALYSIS AND RESULTS

The software SPSS Statistics 25 is used to analyze the data collection. The reliability measured from the collected data according to the Cronbach's Alpha coefficient is 0,697, which is acceptable in exploratory research.

Cronbach's Alpha	Number of Items
0,697	12

*Table 2: Reliability statistics
(Source: Authors' own elaboration using SPSS)*

The main objective is to test the hypotheses of the research. In order to realize that, the statistical test used is chi-square to demonstrate if the research hypothesis will be rejected or not.

4.1. Testing H1

*Figure 2: Cross analyze of health measures relationship and buying habits during the lockdown and after the lockdown
(Source: Authors' own elaboration using SPSS)*

The bar graph below explains that the majority of respondents, 78,70%, believe in the influence of health measures on buying behavior. In this category, 58,77% think that their purchasing habits change minimally, and 20,93 % experienced a significant change than the rest (20,30%) believe that there is no change.

	Value	ddl	Asymptotic (bilateral)	significance
<i>Pearson chi-square</i>	29,664 ^a	2		,000
<i>Likelihood ratio</i>	27,565	2		,000
<i>Linear-by-Linear association</i>	23,952	1		,000
<i>N of Valid cases</i>	413			

a. 0 cells (0,0%) have expected to count less than 5. The minimum expected count is 16,41.

*Table 3: Chi-square test for H1
(Source: Authors' own elaboration using SPSS)*

The result above demonstrates that the significance is lower than 0,05 which means that the variables studied are dependent. The health measure explains the change in consumers' buying behavior. So, H1 is accepted.

Acceptance of H1: There is a dependence between experiencing a new lifestyle (lockdown and health measure) and consumers' buying habits behaviors.

Accepting H1 means that the change of consumers' buying behaviors depend on the lockdown. There is a relationship between what consumers' lived during this period and their shopping habits.

4.2. Testing H2

		I don't know yet when I will restart this activity				Total
		Within few days	In few weeks	In a few months	I don't know yet when I will restart this activity	
If you disinfect your merchandise, why do you do it?	Because of fear of being infected	76	52	73	35	236
	Because it's a trend (everybody does it)	5	8	6	0	19
	Out of habit (It's a habit before Covid-19 appears)	16	15	15	19	65
	<i>Total</i>	<i>43</i>	<i>72</i>	<i>87</i>	<i>118</i>	<i>320</i>

*Table 4: Cross-tabulation analyzing the relationship between disinfecting products and consumers' buying habits during the lockdown and after the lockdown
(Source: Authors' own elaboration using SPSS)*

The table 4 above analyze the reason behind disinfecting merchandise after purchase and the time needed to restart doing some activities like going to beauty salon, visiting crowded spaces (souks), using public transportation (buses and grand taxi) ... The result shows that 73,75% of respondents assume that they disinfect products because they are afraid of getting the virus. In this category of respondents, 32,63% restart some activities in few days and 27,12% in few months, and 21,61% still do not know when to restart some activities then 18,64% return to do some activities in few weeks.

	Value	Ddl	Asymptotic (bilateral)	significance
<i>Pearson chi-square</i>	19,489 ^a	6		,003
<i>Likelihood ratio</i>	27,565	6		,002
<i>Linear-by-Linear association</i>	1,948	1		,163
<i>N of Valid cases</i>	320			

a. 2 cells (16,7%) have expected count less than 5. The minimum expected count is 2,55.

*Table 5: Chi-square test for H2
(Source: Authors' own elaboration using SPSS)*

The result above demonstrates that the significance is lower than 0,05 which means that the variables studied are dependent. The fear caused by health measure explains the change in consumers' buying behavior change. So, H2 is accepted.

Acceptance of H2: There is a relationship between fear and panic and consumers' buying habits behaviors

Accepting H2 means that the change of consumers' buying behaviors depend on the emotion of fear. There is a relationship between what consumers' felt due health measures and their purchase habits.

4.3. Testing H3

Figure 3: Cross analyzing the relationship between the change of purchasing habits and generalizing vaccination with buying habits during the lockdown and after the lockdown (Source: Authors' own elaboration using SPSS)

The bar graph explains the relation between the generalization of the vaccination campaign and the return to old habits. This result shows that 54,96% of respondents think that their purchasing habits have changed minimally since the lifting of the lockdown, including 23,97% do not have an idea if the generalization of vaccination campaign will make things as before the appearance of corona virus. It shows that those respondents are still confused about the future. On the other hand, 23,48% are positive about the future and believe that vaccination could be the key to the return to old habits. Only 7% of respondents who feel the minimal change think that the vaccination will not change anything.

	Value	Ddl	Asymptotic significance (bilateral)
<i>Pearson chi-square</i>	20,742 ^a	4	,000
<i>Likelihood ratio</i>	21,950	4	,000
<i>Linear-by-Linear association</i>	14,736	1	,000
<i>N of Valid cases</i>	320		

a. 0 cells (0,0%) have expected to count less than 5. The minimum expected count is 13,61.

*Table 6: Chi-square test for H3
(Source: Authors' own elaboration using SPSS)*

The result above demonstrates that the significance is lower than 0,05 which means that the variables studied are dependent. The health measure explains the change in consumers' buying behavior change. So, H3 is accepted.

Acceptance of H3: There is a dependence between vaccination campaign and consumers' buying habits behaviors

Accepting H3 means that consumers hope that vaccination will be a solution to get back to their old buying behaviors.

5. DISCUSSION, LIMITATION & FUTURE RESEARCH AVENUE

The results show that the research model used is an answer to the general question of the research. Indeed, the change of buying habits is explained by the health measures and lockdown then fear or panic. In marketing, emotions are powerful because they affect consumers' motivation and then buying behavior. This new living condition is an environmental factor caused by the propagation of corona virus. So, groups of people share common rituals and behaviors, which can explain the change in consumers' buying behaviors. The fact that the majority of respondents believe that the generalization of vaccination will allow a return to old purchasing habits can be explained by the hope of overcoming this emotion and feeling of fear and panic. This feeling can be a motivation to return to normal life and therefore to the purchasing habits of before. This research is limited. No one can deny that the research methodology has many weaknesses such as issues with sample and selection. The questionnaire was distributed on social media, and the users are not representative of the population of Morocco. Digital users are still limited in the country. The majority of respondents are part of the researchers' relational network. Additionally, the urban and rural aspects were neglected as well as the geographic aspect. From the socio-demographic variables, it obvious that the majority of respondents are students so the results of the sample cannot be judged as representative. When it comes to avenues for future researches, it is recommended to launch studies about the implication of motivation in consumers' choices and buying decisions in a post-Covid-19 era (after the generalization of the vaccination), consumers will get back their old buying habits or this period of Covid-19 will be more powerful and will change completely consumers' shopping behaviors.

ABSTRACT

Under the broader geographic, economic and social scope, cluster leadership gives the best possible answer to uneven regional growth and development conditions for collaboration among different organisations. In practice, it means that cluster organisations connect multivarious industry stakeholders with different value-added component. They often investigate or replicate the scalable processes while monetising industrial knowledge. Moreover, they are reassessing network opportunities relevant to their daily business activities. Having all mentioned in mind, the authors are explaining the contribution of qualitative research strategies in management science while encouraging financial markets to find value creation initiators in the cluster life cycle. In addition to that, the authors review current cluster knowledge and expand beneficiary outcomes in the existing mixed methodology analysis. For that purpose, the authors screen industrial potentials and the financial impact of the cluster life cycle in the last twelve years from the Mendeley database. In the discussion part of the paper, the authors connect correlation in futures outcomes of mixed methodology in research to several areas of interest. These areas of interest stand for digitalisation of public administration, clean technology and renewables, sustainable transport and charging stations, data cloud capacities, buildings' energy efficiency and training support for digital skills. In the conclusion part, the authors shall summarise all valuable findings related to the potential of cluster organisations on financial markets as a part of interest and studies in science and business.

Keywords: *cluster organisations, cluster life cycle, value creation, leadership, financial markets*

1. BACKGROUND OF THE CLUSTER ECOSYSTEM

Industrial clusters are dynamic and complex concepts formed by the multivarious industry stakeholders with different value-added component (Rocha, 2004). Their interactions result from informative collaborations that raise interest for digitalisation of public administration, clean technology and renewables, sustainable transport, charging stations, improving data cloud capacities, improving energy efficiency and training support for digital skills. The majority of prior research in the field has applied to support the strengthening of collaboration of social cohesion and proposing new orientations in the collective learning process (Patias et al., 2016). To rectify the problem of cluster leadership in the life cycle, future directions of developing the concept of clustering (Gagnidze, 2015) is crucial in delivering a sustainable and efficient ecosystem.

While taking three lenses into account, the background of the cluster ecosystem aims to carry out a triple helix mechanism (Ivarsson, 2013). Because of that, the authors deliver only relevant information about innovation support providers by providing proactive guidelines in the sustainability sphere of cluster organisations (Demir, 2016). Also, the authors hope that outcomes from this paper will lead to stimulation of innovation activities with the adoption of goals and value for new growth opportunities (Yang & Černevičiūtė, 2017). This allows the conclusion that the intermediation mechanism in the cluster life cycle will be fluent and transparent if an appropriate financial benchmark as XBRL standard will become a trademark for economic digitalisation and transparency (Gostimir, 2015) in the triplet helix model (Ivarsson, 2013). When applying these findings to industrial clusters in Croatia, complex methods require complicated calculations of proper corporate governance. The majority of prior research has applied key roles and functions of the domestic and international cluster life cycle. Results provide a basis for authors motivation to connect correlation in future outcomes of mixed methodology research to several areas of interest. Nevertheless, authors establish stronghold position and reflections through cluster organisation opportunities with the literature review in section two. In section three, they validate how cluster organisations and sub-organisations achieve technological transfer across organisational boundaries. Section four proposes directly contributing to cluster organisations in practice. Section five refers to the conclusion, while section six lists the relevant bibliography.

2. LITERATURE REVIEW OF CLUSTER ECOSYSTEM

More than ever before, from today's perspective, the cluster life cycle is defined as a value proposition concept with a geographical, social, economic, and political dimension. A well-known issue with cluster organisation is that they don't consider the intrinsic motivation and quality of highly qualified management knowledge during the cluster life cycle. A pretty good example of this case has been given by conducted research in Spain on innovation performance of small and medium-sized enterprises by Valdez-Juárez, de Lema and Maldonado-Guzmán (2016). Their results show positively correlated efforts on innovation performance in local small and medium-sized enterprises. Broadly translated our findings comes from the fact that exact relationship as a correlation of knowledge management has been proved in mobile telecommunication companies in Jordan (Hajir, Obeidat, Al-dalahmeh, & Masa'deh, 2015), the Brazilian information technology industry (Junges, Gonçalo, Garrido, & Fiates, 2015), Iranian manufacturing factories (Ebrahimi Mehrabani, & Shajari, 2012) and Nigerian hotel industry (Lasisi & Dabiri, 2015). Despite the limitations, these findings are valuable in light of emphasised consistency from the perspective of time lag investors. Overall, results demonstrate a strong effect of clear guidance for the application of empirical studies in the research fields such as information systems (Wynn & Williams, 2012), SMEs and environment (Jeppesen, 2005), critical management studies (Junor, 2001; Fleetwood, 2005; Marobela, 2006; Rasmussen, 2011), industrial marketing (Easton, 2010), migration (Peter & Park, 2018), labour process theory/employment relations (Mearns, 2011), performance measurement (Armstrong, 2019), organisational case studies (Vincent & Wapshott, 2014), entrepreneurship (Hu, 2018), social sciences (Fletcher, 2017; Price & Martin, 2018), and socio-technical transition (Sorrell, 2018). Future research on cluster organisations might extend the explanations of constant interaction of theoretical considerations from cluster leadership as a foundation for the case study for various reasons. Many of the currently retrieved articles from Mendeley's database demonstrate the authors interest in the cluster life cycle and determination toward its success. In practice, future research could examine these cooperations in cluster model organisations to identify such endeavour outside of traditional corporate boundaries. In that way, undertaken conditions could maintain pipelines for the growth perspectives on the new markets (Ivarsson, 2013).

Based on these facts, a relatively new and complicated management challenge could offer more likelihood of long-term success of artificial intelligence in capital intensive industries (Johnson, Buehring, Cassell & Symon, 2006). In connotation of international interoperability, new cluster models create unique purpose entities and role models for the start-up's industry in the financial ecosystem. The IVC Research centre report displays these findings in Figure 1, which drives capital raising and funding opportunities as natural intermediaries for economic agents, social community, and financial markets in the example of Israel leading tech cluster formation.

Figure 1: Capital raised and funding of leading tech clusters in Israel from 2015 to 2020 (in million US dollars)

(Source: IVC Research Center)

This data suggests that characteristics, competencies, and styles are created on collaboration trust and skillset innovation. Another promising finding from International Institute for Management Development (IMD) was that allocation of shown that the Israel tech clusters have shown progressive growth in productivity and employment of intellectual property (Turetsky, 2016). However, when pointing to Croatia, industrial clusters are mostly connected on a horizontal level, meaning that the companies don't cooperate to produce a standard product. According to the Croatian Chamber of Commerce, there are currently forty clusters. Most of them participate in joint projects or joint performance on the market with a mission to bridge financial, organisational and legal acts (Dragičević & Obadić, 2014). In that way, only top domestic cluster organisation facilitate goals and expectations among all parties. This result highlights that little is known about the predictive validity of cluster models. However, the question is how successful they are and which stage of the cluster life cycle they perform.

3. TECHNOLOGICAL TRANSFER ACROSS ORGANISATIONAL BOUNDARIES

Until recently, there were no methods for business model innovation that ensure strong networking opportunities for knowledge sharing, service development, and technology transfer. Nowadays, it is an argument that lurks short term opportunities that could be spurred by the enrichment of the cluster life cycle.

Therefore, the future orientations of developing the concept of clustering (Gagnidze, 2015) with the foremost bearers of knowledge (Ranga & Etzkowitz, 2013) will be crucial to complement the offer of quality services, the quantity of capacity while developing sustainable and efficient system. Due to the full uncertainty effect of the coronavirus pandemic, it is still unknown who and how needs to adapt organisational units across organisational boundaries. Together, the present findings confirm that the technology ecosystem should test and explore an agile, robust and well-prepared system for future outcomes. For instance, cluster organisations active in deep-tech sectors search for a business pipeline in scientific advancements and new patents. From the view of professional management of the cluster, organisations search for new outcomes in the production of advanced materials, robotics, semiconductors services, progressive vision, sensors, quantum, and next-generation healthcare. Planned comparisons revealed that growing segments in new technology and scarce resources combine know-how with emerging technologies in cluster organisations. While having this in mind, the authors present a promising external project via the Devpost platform – CommedicAI. The results from the external project confirm that Commedic(AI) stand for a pre-clinical simulator that facilitates the augmentation of skills in healthcare by using artificial intelligence to teach clinicians while interacting with data results in diagnostics and predictive medicine (Devpost, 2021). This result highlights that little is known about the practical implication on the vital suits sectors in cluster organisations while innovating artificial intelligence application and life sciences processes, as in Table 1.

Artificial intelligence application	Life science process	New outcomes
Preoperative planning - visual data mitigation with multi-modal inputs. Less informative diagnostics data help us to create specific virtual reality	Supervised learning - accuracy, speed and privacy	Improving process of visual odometry, enhancing simultaneous localisation of visual mapping, improving surgical instruments
Intraoperative guidance - in short, period, detect environmental variance as guidance for endoscopic navigation and augmented reality	Semi-supervised learning - real-time precision, adaptation to precision and high resolution	Improving dynamics modelling and kinematics, deterioration toward data management and simulations, improving Da Vinci surgical robot
Surgical robotics - developing new models and knowledge based on localisation and mapping	Reinforcement learning - safety, robustness and complete precision	Additional segmentation and medical devices tracking, proposition for 3D issues tracking and reconstruction, improving continuum and nanorobots

Table 1: Optical tracking simulators as CommedicAI pre-clinical simulator facilitates the augmentation of skills in healthcare by using AI to teach clinicians to interact with the data results in diagnostic and predictive medicine

(Source: Author's project from Devpost, April/May 2021.)

The dataset is reachable via repo in GitHub, and it is collected from two sources on the reliability and usability of the data sources. Tracking each category in models is supervised by ISO 13485 on the ladder of technological change across organisational boundaries. The applicability of these results represents 150 data-image through the simulator's output model. They enable the communication between artificial intelligence in the pre-clinical learning environment. Also, new model outcomes represent a practice-oriented environment from the static image of organs toward dynamic organ function. From these results, it is clear that the simulator has built an image classification model while using the Inception V3 model as a base with a couple of CNN Layers as tops. It transfers the learning process with unfrozen weights of underlining Inception layers for re-training and re-valuation. In addition, the model has shown that the GRAD-CAM heatmap demonstrates and improve model explainability of collected data

sets. When comparing these results to those of older studies, it must be pointed out that the pseudonymisation scenario could make the process more transparent and agile. As stated above, the pseudonymisation scenario in Table 2 is covered and responded to by ISO 13485 for medical devices. This scenario model applies a solution to new EU IVD regulation based on the current knowledge.

Pseudonymisation step	Pseudonymisation scenario
First	Data subjects are linked to the data controller and pseudonymisation entity
Second	Data subjects interact with data processor which provides services for data controller and pseudonymisation entity.
Third	Data subjects are selecting crucial information from data controller known as identifier and its pseudonym
Fourth	Data controller and pseudonymisation entity reevaluate data and do reverse
Fifth	Data subjects are involving a trusted third party and pseudonymisation entity in the scenario model.
Sixth	Pseudonymisation secret initiates and develops new activities for data subjects.

Table 2: Pseudonymisation scenario for data manipulation in CommedicAI (Source: Author's project from Devpost, April/May 2021.)

Besides, this regulation will be mandatory in 2022, and it represents a quality management system explicitly used for medicals devices. In addition to the above mentioned, the result ties nicely with previous studies wherein disruptive innovation in the clinical learning approach provide incredible benefits for doctors and patients while receiving a more precise diagnosis from simulation and training, as it is in Figure 2.

Figure 2: Highlighted infected region for Covid-19 infection and normal patient lungs (Source: Author's project from Devpost, April/May 2021.)

Overall it helps in: surgical training and teaching, remote cooperation between multidisciplinary teams, protection in privacy data, reducing cybercrime, early detection of diagnosis based on audio and visual information and developing professional ethics in artificial intelligence. Finally, it is worth discussing these promising facts revealed by technology transfer results via technology cluster such as European Medtech hubs. In line with previous opportunities in cluster interest, this maintains significant scale cooperation as a rich supply of start-up companies within companies, research institutes, and clinics (Klein, 2015). At this stage of understanding, authors believe in an excellent supplier backbone opportunity and first-rate access to research facilities with easy access to funding. To test whether this is equivalent across different cluster organisations and life cycles, authors present a design between technology and humans to release an impressive potential and continuum passing of technology and knowledge. The main conclusion that can be drawn from the chapter delivers incredible results in process innovation in Medtech cluster organisation. At the same time, business formation in the cluster is at the pole position. Also, this may constitute the object of future studies in the sphere of financial markets and open the path in healthcare-related industries. In the next section, the authors implement cognitions that contribute to cluster organisations' in practice.

4. OPPORTUNITIES FOR CLUSTER ORGANISATIONS' IN PRACTICE

The innovation process in cluster organisations creates a positive spillover effect when stakeholders collaborate and co-localise in spatial proximity. In that case, the outcome is greater than the sum of development, diffusion, and innovation as individual parts. However, as far as the authors know, no previous research has investigated a pre-clinical simulator that facilitates the augmentation of skills in healthcare by using artificial intelligence (Dossierplus et al., 2019). A further novel finding is that factors that create knowledge inputs to the innovation process must be structured in compilation, storage and use of business data. That's the reason why the labour force used innovation in research and development activities in demands side factors (Ivarsson, 2013). Opportunities for cluster organisations attract strong innovation dynamics that foster investor and venture capital-friendly environments with a substantial influx of international markets. On these insights, authors are proactively searching for the financing of innovation processes that facilitate both commercialisation and academic knowledge. One of the best options as a regulatory standard is XML-based applications, as XBRL could help define, control, and examine data manipulation at a drastically reduced level (Gostimir, 2015). Furthermore, the XBRL standard as a trademark will encourage organisations to swap their corporate, economic, financial, tax and accounting data as a global standard (Bergeron, 2003). Thus, it will help the financial sector meet great expectations in financial discipline. Beyond that, it will affect different cluster stakeholders and organisations on the international level. The speed at which data is prepared and compiled for XBRL will also help to professionalise reporting standards and procedures while searching for venture capital investors. In that case, venture capital investors could support developing programmes on the financial markets (Dossierplus et al., 2019) relevant to innovation processes (Patias et al., 2016), such as digital health, cybersecurity, fintech, legal advice and commercial information technology transfer (Yang & Černevičiūtė, 2017). In conclusion, the authors summarise the relevancy of commercial aspects in the cluster life cycle and academia presence in cluster organisations.

5. CONCLUSION

Private and public initiatives determine the success of cluster organisations. The main factors that generate both poles' initiatives are linked to the quality of capital markets, commercial aspect of infrastructure, education system and research and development capacities. Like in the case of Israel, military service imposes a significant impact on entrepreneurial mindset and

diversity of solutions in the technological sector. Based on their experience, the high degree of presence on international markets helps interested parties to develop a creative environment where the innovation system will bridge all systematic risks and challenges in the cluster ecosystem. In the final step, all stakeholders must be involved in the innovation process. With that mission and vision, they deliver more credible results, extending the cluster life cycle in which they operate.

ABSTRACT

During the crisis caused by the COVID 19 virus, tourism as the fastest growing industry had the biggest losses. With a proactive approach, on the first day of easing measures on June 15th, 2020. Međimurje County, a territorial-political regional unit in Croatia, its tourist board, launched a media campaign to reduce losses in tourism. Exploring the example of the promotional campaign of the Tourist Board of Međimurje County “Međimurje gives more”, the paper discusses digital campaign as a tool for promoting destinations in times of crisis caused by the COVID 19 virus. The paper analyses a media campaign that was primarily aimed to potential domestic tourists. The achievements of the digital campaign were also analyzed using the case study method. Hypothesis H1 was set as follows: a well-designed and well-run digital campaign can contribute to an increase in the number of arrivals and overnight stays regardless of the crisis caused by the COVID 19 virus. The primary aim of this paper is to research whether, regardless of the corona crisis, a digital campaign can affect the positive results in tourism.

Keywords: *digital campaign, tourism, Međimurje, COVID 19, information and communication technologies (ICT)*

1. INTRODUCTION

Until the outbreak of the COVID 19 crisis, tourism¹ was the fastest growing industry and the sector whose successful advertising was most influenced by the development of information and communication technologies. The Internet, its wide application in the personal, social and business life of people, has also set new standards, but also made advertising easier and cheaper when it comes to tourist media campaigns. “If the consumer / tourist has not visited the destination, then the role of the media is important because personal experience is an important criterion influencing the choice of destination image, and without personal experience images are formed from different types of media and advertising (Molina & Esteban, 2006: 1039; Biel, 1997). At the beginning of 2020, the whole world was trapped by the crisis caused by the COVID-19 virus and for the first time in history was completely closed, which consequently meant great losses in the economy, but also a great deal of uncertainty when it comes to economic recovery. No one could have predicted the end of the crisis.

¹ UNWTO (2014) defines tourism as “a social, cultural and economic phenomenon that involves the movement of people to countries or places outside their usual environment for personal or business / professional purposes”.

The tourism sector was most affected due to the partial and / or suspension of travelling. New information and communication technologies (ICT) found their first application more than sixty years ago through the development of distribution systems in tourism. Interdependence is evident since the trends, increasing competition, innovative requirements that the tourism sector has require precisely ICT solutions to meet all the requirements of the individual and the market as a whole. This is especially pronounced today, at a time of global corona crisis that has hit the tourism sector the hardest. "For Passenger 2020, IPK's World Travel Monitor® found a global drop in international travel of 70 percent. Trends across continents vary: In Asia, which was hit first by the pandemic, outbound passengers fell the most, by almost 80 percent, while outbound Europeans recorded the least losses with minus 66 percent. Latin American outbound travel fell 70 percent from the world average. North America recorded a minus of 69 percent. The corona virus has led to changes in travel. The segments most affected by the global decline in outbound travel are private travel (minus 71 percent). Business travel recorded minus 67 percent. In the holiday market, cruises and city trips suffered above-average losses (minus 75 percent), while beach vacations and outdoor vacations (minus 53 percent) overcame the crisis much better. As expected, the pandemic particularly hit air travel, where there was a 74 percent drop in overseas travel. By comparison, international car travel (minus 58 percent) went much better. The decline in accommodation is above average in the hotel industry (minus 73 percent), while other types of accommodation - including private - are less affected" (Turizmoteka / ITB Berlin). Everyone, from large and well-known destinations to the smallest ones, had to look for new ways, think about transforming the tourist offer into a new more inclusive and sustainable model, and at the same time, more importantly and demanding in these new, in every sense uncertain condition, design a promotional campaign. Which will attract tourists to decide to travel at all and to choose their destination? Due to the crisis, there is little or no money for promotional activities, and cheaper information and communication channels are being sought, primarily social media. Popular tourist destinations use social media as a promotional tool for interactive marketing purposes. There has been an increase in visitors using online social media as one form of new challenge in all industries (Schmallegger and Carson, 2008). Međimurje is the first destination in the Republic of Croatia which at early beginning of the corona crisis developed promotional campaign and adapted to new circumstances regardless of the tremendous results that Međimurje tourism recorded the last ten years, as evidenced by the continuous increase in the number of arrivals and overnight stays as well as many prizes at the Croatian and international level.² The campaign "Međimurje gives more" was designed primarily aimed at domestic potential tourists, which instead of the usual method in crisis situations - lowering prices, offers an additional bonus in the form of coupons.³ Promotional activities were the responsibility of the Međimurje County Tourist Board in local and national media. For the purposes of this paper, the digital campaign from June 15 to September 15, 2020 were analyzed. The costs of production and distribution of promotional materials, web design and advertising were borne by the Tourist Board of Međimurje County with the co-financing of Toplice Sveti Martin. This is an excellent example of a strategic partnership, which includes co branding and co marketing activities, and in the tourism, represents a modern way of creating new values and identification, interconnecting values and reputation. The Tourist Board of Međimurje County is one of the most successful and most awarded tourist boards, and

² Međimurje is the only destination in Europe winner of three European Destination of Excellence awards (2007, 2016, 2019, Golden Flower of Europe with a silver sign 2010, The Swiss Tourism Award 2016, Golden INTERSTAS 2017, Best Continental Tourism Destination 2019 (source TZMŽ)

³ The bonus is designed in such a way that each guest receives from the accommodation, catering or other tourist commercial service provider, for every consumption of HRK 250 coupon. The partner with whom the service was provided is handed a coupon upon realization of the service, i.e. upon arrival at the accommodation facility, and with catering services after payment of the bill. With the coupon received from the partner, the guest can visit one of the public tourist facilities / sites free of charge or use one of the tourist services donated by public or commercial partners in the project.

Toplice sv. Martin is a leader in wellness tourism, which indirectly gives a potential tourist a guarantee of reliability and quality of destination and service. The digital campaign, which is the subject of the research, started with a press conference at which the settings of the campaign itself, messages, slogan and visuals were presented. Hypothesis H1 has been set: a well-designed and well-run digital campaign can contribute to an increase in the number of arrivals and overnight stays regardless of the crisis caused by the COVID 19 virus. The main goal of this paper is to research whether, regardless of the corona crisis, the digital campaign can affect the positive results in tourism.

2. METHODOLOGY

For the analysis, the data of the e Visitor system on the number of arrivals and overnight stays and the data of the Tourist Board of Međimurje County were used as primary data, as well as secondary data of the book, scientific and professional articles and Internet sources. By descriptive methods of synthesis and analysis, comparisons, the collected data were systematized and compared. The paper uses descriptive and developmental research, and the data are quantitatively and qualitatively analyzed with the help of Microsoft Office Excel, and are presented in tables and graphs. The case study method was also used in the paper. According to Yin, “a case study is an empirical study that studies a contemporary phenomenon within its real-life context, especially when the boundaries between the phenomenon and the context are not obvious” (Yin, 2007: 24). The case study was applied to the analysis of the media campaign "Međimurje gives more" to answer the research question - whether, regardless of the popularity of social networks in modern advertising, traditional advertising channels should be neglected, such as the media campaign on television.

3. SETTINGS OF THE CAMPAIGN "MEĐIMURJE GIVES MORE"

The very thoughtful approach of the Tourist Board of Međimurje County to the design of the campaign itself, but also to the media planning of the campaign with regard to the circumstances and limited resources, is evident. Aware that only “the Internet enables one-on-one-on-one and one-on-one communication” (Siomkos and Tsiamis, 2004: 206) the campaign is based on e-promotion. In times of crisis and complete lock-down, almost all communication took place in the virtual world, since there is a social need for a person to communicate and communicate with others. Also, in terms of communication, all the advantages of modern information and communication technology have come to the fore.

Traditionally, TV advertising is the most expensive way of advertising, due to the price of renting media space, but also making videos that need to be broadcast. Since the target market is the Republic of Croatia and the Republic of Slovenia, television was an indispensable medium.

Table 2: Media plan billboards / mega boards

Media	Market	Contain	Format (billboard, city light, digital city light...)	Size	Number of positions	Location	Start date	The end date	Duration days

On-line advertising was conducted in the territory of the Republic of Croatia and the Republic of Slovenia, and given the planned reach, it is clear how important modern information and communication technologies are in tourist offer advertising. The Tourist Board of Međimurje County started the campaign on June 15, 2020 with a press conference at which the tourist campaign "Međimurje gives more" was presented, i.e. its settings, slogan and visuals. "Promotional texts, such as tourism texts, are an example of variability (represented by promoted destinations) pre-systematized by the tourism industry and, within this framework, as pre-packaged displays, are transformed into objects of tourism consumption" (Francesconi 2007: 6).

Photo 1: Tourist Board

Source: Međimurje County Tourist Board

The use of persuasive elements in the promotional campaign is evident, which is an important factor given the situation caused by the COVID 19 virus, as it was necessary to find a way to "convince" a potential tourist to decide to travel and choose a destination for their trip. According to Katz, "attitudes can be broken down into three parts: the emotional component, the cognitive component, and the behavioral component. Although each position consists of these three components, they are not equally represented, and individual positions are more often based on one primary component. Accordingly, persuasion can be directed at one of the components of the attitude, assuming that by changing one component there will be a shift in the other component" (Katz, 1960: 163). Also, analyzing the visual itself and the message sent (Međimurje gives more), it is clear that the visual and verbal components are connected, which is extremely important when it comes to tourist promotion. The visual of the campaign itself is a kind of culmination of "story telling" - a story about Međimurje that the Međimurje County Tourist Board has been telling very successfully since 2013. The websites of the Međimurje County Tourist Board and the "Međimurje Gives More" campaign are connected, which are very clear, simple navigation, informative, "one stop shop" for potential tourists and a well-designed tool for running and monitoring the campaign. In conclusion, the way, time, messages and visuals of the campaign "Međimurje gives more" are a good example of how to effectively increase the effectiveness of the promotional campaign by aligning digital content with the expectations of potential tourists as well as an example of raising the level of digital campaign management. Međimurje provides more "as a central place of user inspiration in the travel decision-making phase, positioning the website as an informative guide for users who have decided to travel or are already in the destination, positioning the website as a central place to transfer the experience of satisfaction with the destination. Also, the content of both websites arouses feelings, attracts visitors through the so-called. Storytelling telling stories about rest, recreation, escape, health.... through visually appealing elements.

4. RESULTS

The campaign "Međimurje gives more" resulted in 63 online publications / news in all national and local media. The news was also transmitted on the websites of the Ministry of Tourism and Sports and the Croatian National Tourist Board. All announcements were extremely positive and praiseworthy. The best results were achieved with the Face book campaign. There were 528,161 views, 223,216 unique views and 8,256 unique clicks. Web campaign from 15th June – 15th July recorded a total of 11 203 visits, 10 951 unique visits, 23 075 page views, and visits are recorded from 45 countries (from Croatia 10,494, Germany 187, Slovenia 96, Austria 81, USA 8) with the duration of the visit, on average between 0.30 - 4.30 min. One mega board and one billboard were at the border crossings at the entrance to Croatia from the direction of Slovenia and Hungary (Lendava and Goričan). There was also a TV campaign on N1 and RTL television, a 7-second video, and according to data obtained from the Međimurje County Tourist Board; the reach was more than a million viewers. In conclusion, the campaign aroused great interest and resulted in positive comments from the profession and the citizens themselves. It remains to be seen whether the digital campaign conducted from 16 June to 15 September 2020 also resulted in positive tourism results in the number of tourist arrivals and overnight stays. The data of the Tourist Board of Međimurje County and the e Visitor system for 2019 and 2020 were compared.

Table 5: Arrivals of domestic and foreign guests in 2019 and 2020.

TOURISTS	2019	2020	%2019	% 2020
Domestic	8.715	9.567	32,71	52,04
Foreign	18.085	8.805	67,29	47,96
Total	26.800	18.327	100,00	100,00

Table 6: Tourists stays in days

Duration of tourist stay (days)	2019	2020
Domestic	2,40	2,44
Foreign	3,03	3,30

Source: Međimurje County Tourist Board/eVisitor

Since the campaign was aimed at potential domestic tourists, the data show how the goal of the campaign was achieved. There was a higher number of arrivals, overnight stays and lengths of stay of domestic tourists compared to 2019, and it is possible to confirm hypothesis H1: a well-designed and well-run digital campaign can contribute to an increase in arrivals and overnight stays. There was also a decline in the number of arrivals of foreign tourists, which was expected given the limited / suspended travel in the countries of the European Union, but on the other hand, their stay in the destination was extended. Međimurje, as a destination, but also as a tourist brand, has been continuously developing in the last ten years and is continuously recording better tourist results. The COVID 19 crisis, with all the negativities it brought, showed all the advantages of digital communication at all levels, and on the example of the researched campaign "Međimurje gives more" and all the potential it offers in tourism promotion. The strategy of using the digital campaign as the primary promotional tool in Međimurje has resulted in an increase in the number of tourists despite the corona crisis, but at the same time given the large reach of the digital campaign in and outside the country.

5. CONCLUSION

After the end of the crisis, tourism will surely become the fastest growing branch of the economy again. We live, work, function in the era of the Internet and digital information and communication technologies, and it is to be expected that tourist promotion will use them more and more, as they offer a range of modern technical possibilities for message placement – from text, audio-video message formats, everything to advanced forms of presentation such as virtual reality, 3D technology or even holograms. Social and digital media are indispensable in modern tourism promotion and, as this research has shown, significantly affect business and the tourism sector in general, because the development of information and communication technologies for most tourists have become a key tool for finding a suitable holiday destination. The very concept of tourism is related to entertainment, relaxation, positive memories... Symbolic or intangible components of the external nature of the product are associated with emotional values and feelings as a key attribute of the brand (Aaker in Balakrishnan et al., 2011). Promotional campaigns, which with modern technological solutions can be even more successfully approached by a potential tourist and certainly help in his decision to choose a destination. On the other hand, when it comes to choosing a destination, scientists claim that one of the success factors in digital advertising is “data quality, ease of use, responsiveness, security / privacy, visual appearance, trust, interactivity, personalization and fulfillment” (Chen and Wells, 1999 : 28). Also, from the side of service providers, thanks to modern information and communication technologies, it is possible to share information, monitor tourist satisfaction with the aim of improving the service and strengthen the brand, image and ultimately the popularity of the destination. Given the continuous development, strategic thinking, it is to be expected that Međimurje County, as an already well-known continental tourist destination, will become a leader in e-branding in the next period with the help of modern digital information and communication tools. The destination is recognizable, has an effective communication strategy and promotion at the domestic and international level, and it is not questionable whether it will only use all the potentials of digital advertising in the future.

COVID-19 TAX MEASURES FOR SUPPORTING BUSINESSES AND INDIVIDUALS IN THE EUROPEAN UNION MEMBER STATES

Maja Grdinic

*Assistant Professor at University of Rijeka,
Faculty of Economics and Business, Croatia
maja.grdinic@efri.hr*

ABSTRACT

Since the beginning of 2020 and the appearance of the coronavirus in the European Union member states, and especially since the spring of 2020, when all countries have in some way locked their economies, when in most activities normal business operations were completely or to a large extent hindered, and when it became obvious that such a so-called lockdown will have unforeseeable negative consequences for the economy, countries around the world and also the European Union member states have begun to introduce various reliefs and incentives within the framework of economic and fiscal policy. Such government interventions in the economy and society are among the most significant in modern history. Intervention measures also included various tax measures mainly in the areas of personal income tax (PIT), corporate income tax (CIT), value added tax (VAT) and social security contributions (SSC). The primary objective of such intervention measures was to assist employers and employees during the Covid - 19 pandemic and to try to minimize the negative impact of the Covid - 19 pandemic on GDP. The aim of this paper is to present, analyze and compare the tax measures that have been implemented and are still in place in the European Union member states in the context of supporting businesses and individuals and minimizing the negative impact of the Covid - 19 pandemic. The results of the research show that all European Union member states have adopted at least one tax measure as a result of the Covid - 19 pandemic.

Keywords: Covid-19, European Union, governmental interventions, tax measures

1. INTRODUCTION

The Covid- 19 pandemic is an unprecedented economic and health crisis affecting the operations of all businesses (from micro-enterprises to multinationals), as well as the self-employed and the livelihoods of workers. Against this backdrop, all businesses are compelled to take immediate action to minimize the economic impact of the pandemic and protect the future functioning of the global economy. The impact of the Covid- 19 pandemic has led to a sharp decline in economic activity in all countries of the world. As a result, all countries have begun to approve and implement various incentives within economic and fiscal policies, including urgent tax measures to support the pandemic economy. The role of tax policy in mitigating the negative effects of the Covid-19 crisis and the lockdown of the economy has proved to be more than significant. Also, given the fact that the pandemic is still ongoing and most economies are still more or less locked in, the overall impact of the various tax measures will only become apparent once the economies begin to recover. Indeed, the periods of this crisis, and hence the role of tax policy in sustaining economies, can be divided into three groups. The first period is characterized by the aforementioned lockdown of economies, in which the primary objective of tax measures is to mitigate the effects of the crisis by granting additional budgetary resources to firms and households in order to avoid a complete collapse of the economies. In the second period, which comes after the lockdown period, firms and households will need similar measures and subsidies, but on a smaller scale, as most of them will continue to work. In the long run, there will be a third period in which tax policy will return to its basic objective of raising revenue. Thus, the main goal of the research is to provide an overview of various tax measures that the member states of European Union have introduced to help and

minimize the impact of the Covid- 19 pandemic on economic activity. The results of this research show that all European Union member states have started reforming their tax systems to a greater or lesser extent in order to introduce and approve tax incentives and reliefs to combat the negative impact of the pandemic on economic activity. The remainder of the paper is organized as follows: Section 2 provides an overview of different forms of tax instruments that can be used in response to the Covid- 19 crises and their potential impact on economies, Section 3 presents an analysis and comparison of specific tax measures to mitigate the negative effects of a pandemic. Section 4 concludes

2. TAX POLICY IN RESPONSE TO THE COVID-19 CRISIS

Considering that the Covid-19 pandemic started only a year ago and its impact on economies cannot yet be accurately assessed, there is not yet too much academic research on the subject. However, the following is an overview of some recent studies. Devereux et al. (2020) have analyzed, first, direct adjustments of taxes granted to firms and, second, the granting of various forms of subsidies to firms. They have analyzed two groups of measures. One is the measures that target behavioral changes of firms and workers and the other is the measures that provide a lump sum cash subsidy. The entire study is based on an analysis of the three stages that all economies go through during the Covid- 19 pandemic. According to the authors, the first phase was characterised by great constraints on both individuals and businesses, i.e. either the complete closure of businesses or great restrictions on activities due to reduced supply and demand. The second phase was characterised by great uncertainty related to future economic conditions and restrictions on movement. Also as a result of the first phase, where many businesses had a large drop in sales and some even had zero sales, the availability of both internal and external sources of financing is very limited. Also, despite significant government intervention in all countries, it is certain that many companies will not survive the first phase. The third phase will be characterised by much weaker public finances than they were before the pandemic. In the context of justifying significant government intervention during the pandemic, the paper of Guerrieri et al. (2020) stands out. They set up a model in which the shock in the supply of one sector has a negative impact on other sectors, and it is this model that advocates the use of fiscal policy instruments to stabilize income and employment. The main objective of all the measures taken by the states during the pandemic is to preserve jobs, not only in the sectors directly affected and whose supply is cut off, but also in other companies indirectly affected by this crisis. Guerrieri et al. (2020) list some fiscal policies that can be useful to promote the reactivation of economies, such as reducing the cost of reemployment of workers (reducing the SSC paid by employers). In their paper, Utz et al. (2020) analyze the macro-financial impact of the Covid- 19 pandemic and provide concrete suggestions for various macroeconomic policies to mitigate the negative impact of the pandemic in the short, medium and long run. The macro-financial impacts are also systematized as a function of the stages (similar to the work of Devereux et al. (2020)) that all economies face under the impact of a pandemic and lockdown of the economy. In the context of this article, it is important to highlight some of the conclusions in the area of fiscal policy by Utz et al. (2020). They point out that the slowdown in economies due to the Covid- 19 pandemic will lead to a significant decline in tax revenues and increased public spending as countries use automatic stabilization measures and various other fiscal policies to mitigate the negative effects of the pandemic. The authors expect the rate of decline in government revenues to be higher than the rate of decline in GDP, mainly due to (Utz et al., 2020: 21):

- 1) the tendency of some tax bases to fall faster than GDP during an economic downturn (profits, capital gains, excise taxes, and imports tend to fall faster than GDP during a recession);
- 2) a decline in commodity prices and related revenues;

- 3) possible discretionary changes in tax policy in response to the crisis, such as lowering tax rates or expanding rising tax allowances.

The authors also highlight the problem of fiscal sustainability of public finances in the medium and long run, which is a consequence of the approval of various incentives and reliefs such as tax deferral. Moreover, in the long run, it will be necessary to determine the transition and the right time to move from expansionary monetary and fiscal policies to fiscal consolidation in order to avoid further stalling of economic activity. The process of fiscal consolidation will lead to problems in sharing the burden of consolidation.

3. OVERVIEW OF THE TAX MEASURES IN THE EUROPEAN UNION MEMBER STATES

In their paper, Devereux et al. (2020) identify three possible groups of measures that occur at different stages of a pandemic as a form of government intervention to minimize the negative impact on national economies.

- Group 1: Employment subsidies, suggesting that a reduction in SSC paid by employers is more effective than a reduction in SSC paid by employees. The second form of intervention should be in the direction of reducing investment costs by providing higher tax reliefs.
- Group 2: Measures related to strengthening cash flow, such as measures to defer tax payments (VAT and CIT); measures to accelerate refunds of prepaid taxes from previous periods or to postpone the deadline for filing tax returns
- Group 3: Fiscal measures that directly target the health care system.

In their paper, Utz et al. (2020) provide a detailed list of fiscal, monetary, and financial sector policies that economic and monetary policymakers can use or have already used in the context of addressing the negative impact of the Covid- 19 pandemic on national economies. The measures are classified into different groups, such as expenditure-side measures, business support measures, monetary policy and liquidity measures, banking sector measures, financial market measures, payment systems and insolvency measures, and revenue-side measures. Only the latter measures are considered below in terms of their relevance in the context of this paper.

Table following on the next page

Revenue measures to protect businesses	Revenue measures to protect individuals
<u>Measures within Corporate income tax (CIT):</u> - Accelerated asset depreciation - Extend loss carry-forward for losses incurred during the crisis - Broaden tax deductibility of business expenses - Introduce tax credits i.e. the possibility of a direct reduction in the tax liability - Deferral of tax filing - Deferral of tax and/or interest payments - Tax rate reduction - Tax amnesty / incentives - Lower advance payment - Suspend debt collection activities - Suspend audit activities	<u>Measures within Personal income tax (PIT):</u> - Deferral of tax filing - Deferral of tax payments and/or interest payments - Tax rate reduction - Tax amnesty / incentives - Broaden tax deductibility (e.g., for contributions to health care) - Introduce tax credits
<u>Measures within Personal income tax (PIT) for self-employed:</u> - Deferral of tax filing - Tax rate reduction - Lower advance payment	<u>Measures within payroll taxes and social security contributions:</u> - Deferral of tax filing - Deferral of tax payments and/or interest payments - Tax rate reduction - Tax amnesty / incentives - Introduce tax credits
<u>Measures within Value added tax (VAT):</u> - Deferral of tax filing - Accelerating refunds	<u>Measures within property taxes:</u> - Deferral of tax filing - Deferral of tax payments and/or interest and payments - Tax rate reduction - Tax amnesty / incentives - Introduce tax credits
Revenue measures to promote availability of medical items	
Lower tax rates for medical items (import duties, VAT and other indirect taxes)	

Table 1: Covid-19 revenue measures

(Source: Adapted by author from: Utz, Robert; Feyen, Erik; Vazquez Ahued, Francisco; Nie, Owen; Moon, Jisung. 2020. Macro-Financial Implications of the COVID-19 Pandemic.

World Bank, Washington, DC. © World Bank.

<https://openknowledge.worldbank.org/handle/10986/33955> License: CC BY 3.0 IGO., p. 7.)

The OECD (2020) published a list of measures at the very beginning of the first lockdown period in March 2020 to limit the harmful effects on the productivity of the economy and to protect the most vulnerable groups. Possible measures include:

- Allowing higher amounts of welfare and income support to be paid temporarily to individuals and workers;
- Writing-off debt or deferring SSC payments for both employers and the self-employed;
- Granting tax relief to workers in health care and other sectors involved in emergency operations;
- Allowing deferral of payment of VAT, customs or excise duties on imports of goods;

- Expediting the refund of overpayments VAT and simplifying procedures for requesting VAT relief from bad debts;
- Allow for the adjustment of required prepayments for the next tax period based on the expected decline in business activity in the future;
- Defer, reduce, or even write off taxes not directly related to the current business cycle, such as periodic property taxes;
- Changing the rules for loss carryforwards.

The next part of the paper gives an overview of all tax measures introduced in the member countries from the beginning of the pandemic until today from European Union. The data for all countries were taken from the "IBFD's Tax Research Platform" and from the "OECD Tax policy responses to COVID -19".

3.1. Extended deadlines for tax filling/tax payments

This part of the paper will provide an overview of the measure related to the extension of deadlines for the submission of tax returns or the extension of deadlines for the payment of tax liabilities. Such a measure has been introduced in fifteen European Union member states.

- **Croatia**

CIT payers in Croatia are normally required to make monthly advance tax payments based on the previous year's tax return. With the occurrence of a pandemic and interruption of business activity, Croatia has approved a deferral of advance payments for 3 months and granted the possibility of further extension of this measure in the event that the taxpayer's income decreases by 20% or more. In addition, the deadline for submitting CIT returns has been extended by 2 months, i.e. until 30 June 2020.

- **Cyprus**

Cyprus has decided to postpone the deadline for filing PIT returns. The difference is that this measure applies to all income tax payers.

- **Denmark**

Due to the Covid- 19 pandemic, Denmark has decided to postpone the deadline for filing CIT returns. Also, since Denmark receives an advance payment on March 20 from CIT based on expected profits this year, Denmark has created the possibility of reducing the amount of tax due in March if the spread of the coronavirus affects the economy.

- **France**

Tax relief may be granted on a case-by-case basis to companies experiencing financial difficulties due to the Covid- 19 pandemic. Businesses may also apply for an extension of the monthly payment period in respect of advance payments of CIT and SSC. No interest or penalties will be due for late payments.

- **Ireland**

All taxpayers who pay their tax on a self-assessment basis are otherwise required to electronically file an income tax return and a capital gains tax return for the previous year by the end of October of the current year. Due to the Covid- 19 pandemic, the payment and filing deadlines have been extended to 10 December.

- **Hungary**
Postponement of the deadline for submitting annual tax returns (CIT, small business tax, local business tax, etc.) from May to September.
- **Latvia**
Latvia is special in that it has granted deferral of advance tax payments to individuals, under PIT. Such a measure applies to individuals who earn business income and otherwise have to make advance payments every three months PIT.
- **Lithuania**
Deferral of CIT payments without interest.
- **Luxembourg**
Businesses and self-employed persons, if faced with a liquidity problem due to the Covid-19 pandemic, could apply for a write-off of CIT advance payments for the first two quarters and request a four-month extension of the deadline for payment of CIT, utility taxes and net wealth tax, without interest on late payments. The authorities also allowed an extension of time for filing CIT and PIT tax return forms.
- **Netherlands**
The Netherlands has granted entrepreneurs who are subject to either CIT or PIT and who normally pay tax on the basis of provisional assessments and who expect that their taxable income will be reduced due to the impact of the Covid-19 pandemic on their business, the possibility to apply for a lower assessment of the tax liability. In addition, a deferral of taxes as well as pre-pandemic tax liabilities has been granted. For all tax debts incurred at the time of the pandemic, taxpayers will be granted an extended debt repayment period (36 months instead of 12 months), provided that debt repayment begins no later than July 1, 2021.
- **Portugal**
Portugal, like all the previously mentioned countries, has created the possibility to defer the payment of CIT and for the payment of PIT it is possible to pay in 3 or 6 monthly installments.
- **Romania**
As one of the responses to the Covid-19 pandemic, Romania granted its taxpayers who had outstanding tax debts as of 31 March 2020 an exemption from interest and penalties on these debts. The only condition was that they settle their principal tax debts and submit an application by March 31, 2021. In addition, taxpayers who normally pay CIT quarterly were allowed to calculate the quarterly tax debt in 2020 using the current quarter adjusted by the consumer price index (instead of calculating it based on the previous year's income tax debt).
- **Slovak Republic**
Tax returns can be automatically completed 3 months later (until 30.6.2020), with no penalties for late filing.
- **Slovenia**
The Republic of Slovenia has not allowed the extension of deadlines for filing a tax return at the time of the first lockdown period.

However, Slovenia does allow CIT payers to defer payment of their tax debt for a maximum of 24 months or pay in 24 installments due to the Covid- 19 pandemic. In addition, CIT payers were exempt from paying taxes during the first lockdown period.

- **Spain**

Due to the Covid- 19 pandemic, the Spanish government has allowed entrepreneurs to use the direct method of calculating tax liability instead of the objective method otherwise applicable when calculating advance payments of CIT. Also, from 2021 onwards, the use of the objective method is again allowed, but the days falling within the period of the pandemic-related state of emergency cannot be taken into account as working days by the entrepreneur. In addition, Spain grants a 6-month CIT deferral, but does not charge interest for the first 3 months. The measures apply to taxpayers whose turnover does not exceed EUR 6 million and the maximum amount of tax whose payment can be deferred is EUR 30,000.

3.2. Social security contributions

Considering the fact that in most European Union member states SSC represent a significant part of the tax wedge, i.e. labor costs, and as such have a major impact on the labor market and employment rates in the countries, reducing or delaying payments during a pandemic is one of the most important measures related to preserving jobs.

- **Belgium**

Self-employed workers affected by the Covid- 19 pandemic were granted a one-year deferral of SSC, and this measure was extended for the period of the first two quarters of 2021. In addition, employers were able to apply for a deferral of SSC, which they are obliged to do.

- **Estonia**

As one of the temporary measures to mitigate the negative effects of the Covid- 19 pandemic, Estonia created the possibility for employees not to pay 2% of their monthly income in the period between 1 July 2020 and 31 August 2021 (except for people born between 1942 and 1960). This 2% of income represents contributions to the mandatory pension scheme fund.

- **Greece**

The Greek government has approved a deferral of SSC for employers and self-employed persons that had to be paid during the first lockdown period (spring 2020) for the end of April 2021.

- **Hungary**

Sectors that were severely affected by the pandemic (e.g., tourism, restaurants, entertainment, sports, cultural services, transportation, agriculture) will be exempt from paying SSC, payroll tax, and small business tax (a simplified tax for SMEs levied on payroll and cash flow profit). Employees' SSC will be reduced to the level of the basic health insurance contribution payable. In addition, the SSC and the employers' payroll tax are not levied on companies in the aviation industry.

- **Luxembourg**

As a temporary tax measure due to the Covid- 19 pandemic from the beginning of April 2020, employers in Luxembourg will not be charged interest and penalties for late payment of SSC and this measure will also apply to debts existing on 14 March 2020.

- **Sweden**

In order to mitigate the negative financial impact of the Covid- 19 pandemic, SSCs were reduced in 2020 for both employers and employees and self-employed persons such that they were only required to pay pension insurance contributions at a rate of 10.21% and were not required to pay all other contributions (health insurance, unemployment insurance and other labor market measures, family pension insurance, parental insurance, work injury insurance and general payroll tax). The reduction in the payment of contributions was limited to an income level of SEK 100,000 for the year 2020. If income exceeds SEK 100,000, the usual SSC will be paid above this SEK 100,000.

3.3. Value added tax

This section provides an overview of countries that have changed rules and VAT rates due to the Covid- 19 pandemic. Most states have lowered rates or implemented a zero VAT rate on products (and services) directly related to health care and medical equipment procurement. In addition, some countries have reduced the VAT tax burden in sectors most affected by the pandemic, such as tourism, hospitality and air transport.

- **Belgium**

Due to the Covid- 19 pandemic, a reduced VAT rate of 6% applied from 4 May 2020 to 31 March 2021 on internal stocks, intra-Union acquisitions and imports of face masks and hydroalcoholic gels into Belgium. In addition, from 8 June 2020 to 31 December 2020, a reduced VAT rate of 6% applied to restaurants and catering services, excluding beer and other alcoholic products. This measure has not been extended. In addition, due to the pandemic, donations of medical supplies to hospitals and donations of computers to certain organizations and institutions (including schools and universities) are exempt from VAT. This measure has not been renewed.

- **Bulgaria**

Due to the pandemic, as a temporary measure for the period until 31 December 2021, the range of products and services subject to the reduced tax rate of 9% has been extended. These are:

- Sales of books other than publications wholly or mainly for promotional purposes;
- Supplies of restaurants and catering services consisting in the supply of prepared or unprepared food, wine and beer, but not spirits
- Baby food or infant food and baby diapers and similar products;
- use of sports facilities;
- general tourist services, including travel arrangements for tour operators and travel agencies with occasional bus service.

From 1 January 2021, the zero VAT rate will also apply to the supply of Covid-19 vaccines and directly related services, and the supply of in vitro diagnostic medical devices for the diagnosis of Covid-19 and directly related services.

- **Cyprus**

Due to the impact of the pandemic, the application of the reduced VAT rate of 5% was extended to hotel accommodation, catering, and local transport (taxi etc.). These taxation arrangements were in force from 1 July 2020 to 10 January 2021. In addition, under the VAT system, the tax authorities allowed certain categories of taxpayers to defer payment of VAT until 10 November 2020.
- **Finland**

Under the Covid-19 pandemic measures, supplies of goods used for the investigation, treatment or prevention of Covid-19 are taxed at the zero rate, provided that these goods are supplied to public health institutions, public social welfare institutions and other organizations approved by the customs authorities. This zero rate of VAT will apply until April 30, 2021.
- **France**

Reduce the rate VAT to 5.5% on protective masks and personal hygiene products until December 31, 2021.
- **Germany**

Unlike other countries that focused on reducing VAT rates mainly on medical devices and the most affected sectors, Germany reduced the standard VAT rate from 19% to 16% between 1 July 2020 and 31 December 2020. In addition, the reduced VAT rate was reduced from 7% to 5% during this period, while the application of the 5% rate for the supply of food will be extended until 30 June 2021.
- **Greece**

The Greek government has authorised a reduction in the VAT rate from 24% to 6% for products needed to protect against the coronavirus and prevent its transmission (hygiene masks and gloves, antiseptic solutions, soap and other personal hygiene products and ethyl alcohol, etc.). This measure will be in effect until April 31, 2021. In addition, a VAT rate of 0% will apply for the period from December 23, 2020 to December 31, 2022 for Covid-19 infectious vaccines and diagnostic equipment. The VAT rate on passenger transportation, coffee and restaurant services has been reduced from 24% to 13% for the period June 1, 2020 through April 30, 2021, and to 6% for movie tickets. In addition, VAT on sports tickets was temporarily reduced to 13% for the period from September 1, 2020 to June 30, 2021. Due to the pandemic, the exemption VAT with the right to deduct VAT was approved for the production of antiseptic items that companies carry out on behalf of the Ministry of Health. The exemption is valid until 31 April 2021. The supply of goods and services to the Greek state in the form of donations (e.g. hospital equipment) required in response to a pandemic are also exempt from VAT.
- **Lithuania**

Exemption from import duties and VAT exemption on imports of goods needed to combat the effects of Covid-19.
- **Malta**

As part of the measures to combat the Covid-19 pandemic, supplies of Covid-19 in vitro diagnostic devices, as well as specific services closely related to such devices, are classified as medical supplies subject to a reduced VAT rate of 5% until 31 December 2022.

In addition, supplies of services closely related to Covid-19 vaccines are considered exempt with credit until December 31, 2022.

- **Netherlands**

In the Netherlands, a 0% tax rate will temporarily apply to all face masks from May 25, 2020 to December 31, 2020 VAT. In addition, to mitigate the economic impact of the pandemic, certain VAT exemptions are mandated until 31 December 2020, such as the supply of medical equipment to caregivers and medical staff and the free supply of medical equipment to these facilities.

- **Portugal**

VAT exemption for donations in kind to the State and non-profit organizations to be distributed to health institutions or persons in need.

- **Slovenia**

Until 30 April 2021, medical equipment used to combat the Covid- 19 pandemic is exempt from VAT on importation.

- **Spain**

Due to the Covid- 19 pandemic, domestic stocks, intra-community stocks and imports of disposable surgical masks will be subject to a super reduced VAT rate of 4% between 19 November 2020 and 31 December 2021, unless the purchaser is a public body, a private charity or a clinic or hospital. The zero VAT rate applies between 23 April 2020 and 30 April 2021 to the supply, importation and procurement of medical equipment within the community for the treatment of Covid- 19 patients supplied to public, charitable or social institutions and healthcare facilities.

3.4. CIT incentives and allowances

Only two European Union member states have so far granted CIT incentives and relief while the coronavirus pandemic continues. In any case, it can be expected that in the future more and more countries will approach the approval and introduction of such measures in order to revive investment.

- **Italy**

Italy has introduced a number of new tax reliefs and incentives for entrepreneurs in an effort to revive the economy and mitigate the impact of the Covid 19 pandemic on affected businesses. The relief was introduced in the form of a tax credit:

- Tax credit equal to 65% of the costs incurred to renovate and improve the accessibility of hotels and other lodging establishments;
- Tax credit of 30% to 60% of the costs will be granted to businesses operating in the tourism sector and having costs incurred in renting property to carry on their business until 30 April 2021, depending on their income in 2019;
- Tax credit equal to 20% of the cash contribution in equity, up to a maximum of EUR 2 million, in the case of non-associated resident companies with consolidated revenues of the Group between EUR 5 million and EUR 50 million, which suffered a decrease in revenues of at least 33% in March and April 2020.

- **Romania**

Reduction of CIT, if taxpayers have paid their first quarterly tax by 25 April 2020 (5% reduction on quarterly tax for large corporations and 10% for SMEs).

3.5. Business and professional income

Denmark and the Netherlands are countries that granted incentives to business and professional income taxpayers after the Covid- 19 pandemic.

- **Denmark**

Denmark provides compensation for self-employed individuals who have a reduction in income due to a pandemic, and the condition for receiving the benefit is at least a 30% reduction in income. The business must have no more than 25 full-time employees and must have had an average turnover of at least DKK 10,000 per month in the previous period. In addition, a self-employed person who owns a business must have a share of at least 25% in the business and work in the business. The business owner's personal income must not exceed DKK 800,000 in the calendar year 2020. The benefit is a maximum of 90% (100% if the self-employed person was affected by the blocking period) of the expected loss of income compared to the average income in the previous financial years. However, the benefit may not exceed DKK 23,000 per month. The benefit must be refunded if the actual loss of income in 2020 is less than 30% or if the business owner's personal income in 2020 exceeds DKK 800,000.

- **Netherlands**

Self-employed taxpayers are entitled to use a fixed personal allowance depending on the number of hours the business owner has spent on his business. However, due to the Covid 19 pandemic, entrepreneurs may not be able to meet this criterion. To ensure that the self-employed could use these allowances during the pandemic, the tax administration assumed that entrepreneurs worked the same number of hours as they did in the year before the pandemic. In addition, entrepreneurs and companies that had a loss of at least €4,000 (due to the Covid 19 pandemic) for the period from 16 March 2020 to 15 June 2020 were entitled to a one-off non-taxable payment of €4,000.

3.6. PIT allowances and taxation of employment income

One of the measures is also a change in some parts of PIT, especially in the coverage of standard and non-standard reliefs. Several European Union member states have changed the rules of taxation of personal income, i.e. treated some payments as non-taxable due to the Covid- 19 crisis, increased the non-taxable (personal) deductions and changed the rules of tax treatment of non-standard reliefs, mainly related to travel or work expenses incurred as a result of working at home.

- **Austria**

In Austria, it is interesting to note that due to the Covid- 19 pandemic and during the period when the vast majority of taxpayers (employees) worked from home, it was determined that such a situation would not change the rules related to the deduction of travel expenses, i.e. that travel expenses remain tax deductible expenses.

- **Bulgaria**

In Bulgaria, due to the Covid- 19 pandemic, personal deductions for dependent minor children were increased as follows:

- from BGN 200 to BGN 4,500 for a minor child;
- from BGN 400 to BGN 9,000 for two minor children;
- from BGN 600 to BGN 13,500 for three or more minor children;
- from BGN 2,000 to BGN 9,000 for one minor child with recognized special health needs.

- **Germany**

In the German tax system, overtime pay is taxable at PIT. However, if employees received bonuses and awards in cash or in kind up to an amount of EUR 1,500 during the Covid - 19 pandemic in the period from 1 March 2020 to 31 December 2020, these types of awards are exempt from taxation, provided that these payments are granted as a reward for special efforts during the pandemic. For children residing in Germany, a monthly child benefit of EUR 204 is generally paid for the first and second child and EUR 210 for the third child. For the fourth and each additional child, the amount is EUR 235. To mitigate the economic impact of the Covid- 19 pandemic, a one-off child bonus of EUR 300 per child is granted. In addition, single parents have the option of increasing their personal allowance by EUR 1,908 per year per child, but in order to mitigate the negative impact of the pandemic, the deduction amount has been increased to EUR 2,100 for 2020 and 2021.

- **Ireland**

Employees who work at home full or part time can claim tax relief on any additional costs incurred as a result of working at home, including electricity, heating and internet costs. This applies to two basic situations:

- the employer pays the employee an allowance of EUR 3.20 per day: this allowance is exempt from all taxes;
- the employer does not pay any remuneration to the employee: the employee can then claim all costs incurred during the home work for tax purposes, i.e. he can claim 10% of the electricity costs and 30% of the internet costs.

It should also be noted that due to the pandemic, the Irish government has increased the amount of relief for the purchase or construction of the first property and the increased relief is valid until 31 December 2021.

- **Slovenia**

Payments made under the Covid- 19 pandemic measures to pensioners with low pensions, the unemployed and other vulnerable groups are fully exempt from tax. In addition, until 30 June 2021, the cost of Covid- 19 tests for an employee paid by the employer does not constitute taxable income of the employee.

3.7. Tax treatment of losses

Despite the fact that many countries' tax systems allow the carryback or carryforward of net operating losses as one of the incentive measures within the CIT under normal circumstances, only two European Union member states have revised these measures due to the Covid- 19 pandemic.

- **Czech Republic**

Loss carry forward is not allowed in the Czech Republic. However, in response to the Covid- 19 pandemic, taxpayers who record a tax loss in 2020 may claim a loss carryback and reduce their tax base for 2019 and 2018. This provision will apply to tax years ending on or after June 30, 2020.

- **Germany**

Generally, in Germany losses up to EUR 1 million (double in case of joint assessment) may be carried back to the previous year. In order to mitigate the economic impact of the Covid 19 pandemic, the maximum amount of losses that can be carried forward for the 2020 and 2021 tax years has been increased to EUR 5 million (double if jointly assessed).

From all this, it can be concluded that all member states of European Union have approached the adoption and implementation of various tax measures in order to mitigate the negative impact of the crisis resulting from the Covid- 19 pandemic. The implementation of the measures was particularly visible during the first lockdown period (spring 2020), although many measures have been extended and continue to this day. It should also be noted that in addition to the measures within the tax system, all European Union member states have introduced various other measures, such as cash transfers for households, wage subsidies to employers or employees, subsidies for the self-employed, extended or prolonged eligibility for unemployment benefits or for sickness benefits. However, the analysis of these non-tax measures is not the subject of this paper.

4. CONCLUSION

The Covid -19 crisis measures taken in the first phase of the pandemic certainly helped to a large extent in preserving jobs and consumption levels. However, given all the constraints in the economies and the significant decline in government revenues on the one hand due to the freezes and a significant increase in government expenditure on the other due to increased health care costs, the payment of various subsidies and grants to companies and individuals, it is obvious that all countries will have to deal with the consequences of this crisis for a very long time. In the third (recovery) phase, a good and quick adjustment of fiscal and monetary policies will be crucial, especially in the context of the partial or total removal of existing measures to combat the negative effects of the pandemic. This crisis will lead to even greater disparities in the level of development between countries, and special support will be needed for countries that already had lower economic growth rates, higher public debt and weaker health systems before the pandemic. Accordingly, international coordination and assistance will be needed, as well as European Union financial support for the less developed member states. In the third phase, it will be necessary to weigh and define which sectors are most affected by the crisis and which still need the most fiscal support. Moreover, tax revenues are likely to continue to fall in the coming years and it will be necessary to provide sufficient and long-term financial incentives to stimulate investment and private consumption. In addition, fiscal consolidation will have to be implemented, in which the adjustment of public revenues and the tax structure will play a key role. It also cannot be ruled out that countries will seek to develop and levy new forms of taxes and contributions

THEORETICAL AND PRACTICAL ASPECTS OF THE FORMATION OF COMPETITIVE PRICING STRATEGIES IN AZERBAIJANI ENTERPRISES

Fidan Safarova

Azerbaijan State University of Economics, Baku, Azerbaijan
ehmedovafidan@mail.ru

ABSTRACT

Azerbaijan cannot increase the share of ready products, especially food exports. The country has a raw material-oriented export model. Despite negotiations on the sale of non-renewable resources, the export of hydrocarbons remains the main source of foreign trade and leads to an increase in imports. At the same time, under the conditions of a limited domestic market, more and more enterprises are forced to shift to foreign economic activity. Records show that most Azerbaijani enterprises are not ready to actively compete. As a result, the industry is in such a difficult situation that there have been no serious innovations to strengthen the competitive position of enterprises. However, the way out of the difficult economic situation can only be to create competitive production focused on the needs of consumers. In this sense, competitiveness is an important condition for the well-being of local businesses. The problem of assessing and managing the competitiveness of Azerbaijani enterprises is the general decline in production, the high level of safety of competitive enterprises, the elimination of financial costs, and the problem of bankruptcy proceedings for many enterprises. In this context, it is necessary to increase the ability of the enterprise to analyze all the factors of competitiveness, on the other hand, to increase it to assess the competitiveness of the enterprise at a very high level, without which it is impossible to develop a future development strategy. In this regard, the formation of a competitive management system is the most important condition for the sustainable existence of enterprises. From this point of view, we believe that there is a need to analyze and research these systems and strategies in order to determine the level of implementation of competitive pricing strategies in the food sector of Azerbaijan. The research will reveal the competitive pricing strategies of companies operating in the food sector, the effectiveness of research in these areas, the problems encountered in implementing the strategies, and what is being done to prevent these problems. The current research reveals the behavior of companies operating in the food sector of Azerbaijan in the current competitive environment, the level of operations in practice in connection with new competitive pricing strategies, and what problems they face during research in this field.

Keywords: *enterprise, competition, pricing strategy, food sector*

1. INTRODUCTION

The competitiveness of the Azerbaijani economy is directly related to the development of the non-oil sector and some successful economic reforms in this direction are yielding results in achieving long-term and sustainable development, creating a competitive economy based on oil and gas revenues. As a result of the socio-economic processes intensification and sustainable development in the non-oil sector in recent years, the non-oil industry achieved an annual growth rate of 3.5 percent in 2019 [1, p.11]. However, the future development of the processing industry in the country depends to a large extent on raising the level of price competitiveness in the domestic market. In the market of goods and services, competition is one of the main requirements for self-regulation of prices and tariffs in accordance with supply and demand, as well as achieving a balance between the volume of demand and price. Because in a market environment where free competition is provided, raising the price of goods or services by any market entity forces consumers to look for other options.

Offering a homogeneous product at a lower price by alternative competing market entities forces this market entity to sell at a low price by adjusting prices to market demand. As a result of competition, the common price of similar products is formed and the market mechanism of price formation is activated. From this point of view and from the point of view of the measures outlined in the Strategic Roadmap, this article also considers the price mechanism of ensuring competitiveness in the field of food production and explores avenues to improve it.

2. ECONOMIC IMPORTANCE AND PRIMARY CONDITIONS FOR RAISING THE COMPETITIVENESS OF AZERBAIJANI ENTERPRISES

The adopted reforms model and the features of macroeconomic policy in Azerbaijan define completely new proportions of the real, trade, intermediary and financial sectors of the economy. Today, fierce competition for public resources and revenues between market sectors is leading to a reduction in production capital from financial capital and capital inflows to trade services. Liberalization of prices and foreign trade in the real cash sector, harmonization of domestic and world prices, and the separation of domestic producers from the raw material base in the context of tight monetary policy have created more favorable competitive positions in the raw materials sector. The internal macroeconomic conditions in which Azerbaijani producers, and especially the food industry, operate, undermine the position of local enterprises in the country's domestic markets due to strong pressure from foreign exporters on foreign markets. The basis for building a competitive economy is the widespread application of innovations and our country's participation in the international division of labor. Azerbaijan is actively involved in the development of a competitive economy. The government of the republic is based on the competitiveness of the market economy by deepening reforms and implementing sustainable measures to form a socially oriented society. The successful future of the Azerbaijani economy is reflected in the innovative development of industry and its integration into the world economy. The Republic is active in multilateral international cooperation projects and carries out an effective innovation policy in the national economy. President of the Republic of Azerbaijan Ilham Aliyev considers these areas a priority in his final reports on socio-economic development in 2017-2019. The competitiveness of our economy must be based on efficient technologies that reduce energy costs. Azerbaijan must develop in accordance with global trends, choose everything new and progressive in the world. Azerbaijan must take an active part in multilateral international projects that ensure integration into the global economy, including based on our favorable economic geographical position and available natural resources. Important institutional agencies have been established to develop competitiveness. Adopted laws and normative acts, government decisions have created a legal basis for the development of competitiveness. They allowed to create a legal guarantee for the activities of investors. The procedure for establishing a joint venture, registering participants in foreign economic activities and licensing exported products has been significantly simplified. All this has had a positive effect on some improvements in the structure of exports and imports. However, the Republic is unable to increase the share of finished products, primarily food exports. A raw material-oriented export model has been created in Azerbaijan. Despite negotiations on the sale of non-renewable resources, the export of hydrocarbons remains the main source of foreign trade and leads to an increase in imports. At the same time, in the conditions of a limited domestic market, more and more enterprises are forced to move to foreign economic activity. Records show that the majority of Azerbaijani enterprises are not ready to actively compete. As a result, industrial enterprises are in such a difficult situation that there have been no serious innovations to strengthen their competitive position. However, the way out of the difficult economic situation can only be to create competitive production focused on the needs of consumers. In this sense, competitiveness is an important condition for the well-being of local businesses.

There is a need to improve national security for exporters and import-substituting production methods to ensure food security. One of the priorities of the country's foreign policy is the development of comprehensive relations with the member countries of the World Trade Organization.

3. EVALUATION OF OPERATIONS RELATED TO MARKETING ACTIVITIES AND COMPETITIVE PRICE STRATEGIES OF COMPANIES ON DIFFERENT ADAPTATIONS

The current research identified the marketing activities of companies operating in the food sector of Azerbaijan in three adaptations, their behavior in the current competitive environment, the level of operations in practice in connection with new competitive pricing strategies and the problems encountered during research in this field.

3.1. The First adaptation

According to the *first adaptation*, the launch of the company in a certain year brought new quality and new flavor to the local production, confectionery and food industry, and gained great prestige in various local and Central Asian, Russian and Georgian industries. The company pursues a development policy in accordance with the requirements of international standards to strengthen the dynamics of development and expand exports. Research shows that in the first years of production, the company was more sales-oriented, and the gradual increase in production and competition has introduced the concept of quality. In order to increase the quality and inform the consumer about the quality products produced, the company's marketing activities have become more valuable and a marketing department has been established here. Currently, the company is working on commercial marketing, creating sectors such as sales forecasting and analysis, market and consumer research. As for the competitive position of the company, today the company is facing intense competition. To compete, the company uses its own methods and strategies, conducts annual market research, and signs contracts with foreign companies to make its results more accurate and clear. Besides, the company evaluates the market more objectively with the information of sales representatives. In the face of strong competition, the company's sales representatives gain information about the sales of competitors in the market and often learn customers' opinions about the products in the market through surveys, observations and interviews. The company sees other brands that sell by weight in the market as competitors because it sells in the branch of chocolate candies sold by weight, while Roshen and Mars consider national brands to be the biggest competitors. The prices of the company's competitors are very flexible, because most of them are national companies and have many loyal customers, which are the most important values that affect the competitive position of the company. Annual analytical surveys provide specific findings about competitors, and these results are used to evaluate the company in a way that gives it an advantage over the competition. As for the company's pricing strategies, according to research, the most important 4P marketing component in the company's marketing activities is price. When determining the price of a product, the company tries to achieve it at the point of reaching the price. The company sets the price of the product in accordance with the cost-oriented pricing approach. When a company sells its product at a set price, conducts monitoring activities too. The price of goods in the market is always monitored, analyzed and sales ability is assessed. When problems are encountered, solutions are developed and presented to management after the causes are investigated. When setting the price, the company aims to determine the optimal price and sell in the real market. When a company implements a pricing strategy, it prioritizes the company's values and mission.

3.2. The second adaptation

In the second adaptation, the company has built a large retail network equipped with modern technology in a short time, delivering its products to the market and consumers in the manufacturing sector and the products of the companies it shares. The company has been cooperating with various companies around the world since its establishment. Over the years, it has treated every company it worked for with respect and has shown great skill in delivering products. For this reason, over the years, the company has been awarded various certificates and diplomas by the companies it operates due to its high quality and skillful business. The company has opened a branch in Georgia. In addition to research existing new markets for businesses, the branch conducts market research, prepares a package of proposals and makes presentations for enterprises operating in the Azerbaijani market on an order basis. The company carries out its marketing activities with employees of the marketing department and sales representatives outside the company. Offshore sales representatives provide the company with information about the market, the actions of competitors in the market and market leader give information about products. Which product is sold for how much, at what price, to which consumer? What are the reasons? At what prices do competitors sell in the market? What are the reasons why consumers prefer competitive products? The company's marketing department is doing everything to increase sales. At the end of each year, marketing plans and strategies for the next year are prepared and presented to management. When it comes to the company's competitive position, according to research, the company faces intense competition. It offers food products to the Azerbaijani market, and therefore competition is inevitable as it faces competing companies in the market. The company also puts forward competitor search in marketing research. The company's competitors are local and foreign food companies. Today, in the food sector, consumers' preference for local foods changes by type of food. These conditions sometimes give the company advantages and sometimes disadvantages in competition. The company implements and analyzes consumer campaigns, advertisements, promotional efforts, strategies and policies to compete with competitors. The company tries to get all kinds of information about its competitors. The company is aware of information and updates on competing products, price indices and sales figures, mainly through sales representatives and supervisors working outside the company. The company competes with its competitors in the current competitive environment and develops marketing activities in this direction in order to compete. When it comes to the company's pricing strategies, research shows that the price of manufactured products is the most important factor for sales at any level. When determining the price of the product it produces, the company first takes into account the cost of the product, then the prices of competitors and then the required price. In determining the price, the company also takes into account consumer expectations, income and the point of loss in the real market. When setting the price, the company's marketing team, after conducting the necessary research, prepares a package of proposals based on the results of this research and submits it to the general management, production management, and the final manager of the company approves the price. The optimal price for the company is a figure derived from the cost of the product, the prices of competing products and the required average price. When determining a pricing strategy, a company first analyzes its competitors, defines its strategic goals and implements short and medium-term strategies to achieve those goals. The company always monitors and checks its existing strategies. Successful strategies and a well-defined price are the desired results for a company.

3.3. The third adaptation

In the third adaptation, the company is a leader among enterprises engaged in wholesale and retail sale of dairy products and today has developed sales channels in all regions of Azerbaijan. The main goal of the company's marketing policy is to expand the sales market, distribution

network and keep the product at the maximum level for the consumer. As for the company's marketing activities, according to research, it is involved in a wide range of marketing activities. As a marketing activity, a company conducts market, consumer, competitor, and product research, defines marketing plans and goals, collects and uses the necessary information, and makes important marketing decisions. To make marketing decisions, the company always conducts internal and external assessments, business, key market, competitor, sales analysis. As for the competitive position of the company, it should be noted that the company is facing intense competition in the market. In order to compete with competitors, the company always conducts competitor analysis and tries to get all kinds of conclusions about competitors. Sometimes the company does guerrilla marketing for it. The company always monitors competitors' sales, price indices and marketing activities. Marketing decisions take into account the behavior of competitors. As for the company's pricing strategies, research shows that the company follows a financially oriented pricing approach when determining the price of a product, but in some cases the company also uses psychological pricing methods. When setting a price, a company takes into account some important factors related to the market, consumers, competitors and company values. Pricing figures are approved by the economic planning department, not the marketing department. The marketing department prepares proposals only on the basis of research. When determining the company's pricing strategies, the company's goals and values, subjective and objective reasons come to the forefront. Existing strategies are medium-term and they are presented for evaluation at the end of each year. Thus, today the presence of many companies in the food sector of Azerbaijan creates fierce competition. Every company engaged in production and sales in the food sector implements intensive marketing activities, competition and pricing strategies in order not to lag behind and keep up with their competitors. There is strong competition due to changing technology, new customers, new inventions, changing consumers, sustainability of food products, elasticity of demand. Companies are in fierce competition with each other. The analysis of the marketing system in the food sector of Azerbaijan and how the companies operating in this sector apply operations related to competitive pricing strategies, the contribution of this research to the company, what problems it faces, what solutions are being sought during this period. Adaptations 2 and 3 of the research was defined that companies conducted moderate marketing activities, that companies made more sales-oriented marketing efforts, applied competitor analysis, competitor sales figures, and made strategic and political decisions to keep up with their competitors. was identified. Adaptation 2 and 3 companies apply competition and pricing strategies to continue the existing competition with Adaptation 1 and to analyze the strategic decisions made as a result of these strategies before and after implementation. The success of the adopted decisions and the applied strategies is measured. In order to gain a competitive advantage, the company constantly conducts market research and constantly takes into account the products, services, campaigns and promotions of its competitors. The results of the search show that the companies in Adaptations 2 and 3 are aware of the competition with Adaptation 1 and apply competition and pricing strategies to comply with it. However, it may arise weaknesses, shortcomings and failures in these strategies. That is, for companies to compete effectively with competitors;

- it should be applied the right pricing strategies,
- when applying these strategies, the demand for the product they market should be taken into account.
- demand forecasts need to be clarified.
- sufficient research should be done on the product,
- product-based 4P should be applied,
- indexed prices for the product should be determined by the prices of competitors,
- customer representatives should be given the type of product they can adequately handle.

4. RESULTS OF THE EFFECT OF THE PRICE FACTOR ON ENSURING COMPETITIVENESS IN THE FOOD INDUSTRY OF AZERBAIJAN

As a result of improving the competitive environment in the country, creating a favorable environment for individual entrepreneurs, meat production (including chicken) increased by 1.8 times, butter production by 1.8 times, vegetable oil production by 1.4 times, cheese and cottage cheese production 1.6 times, margarine production 5.4 times, confectionery production 1.6 times, iodized salt production 28.7 times, egg production 2.7 times, pasta production 5.3 times, canned fruit and vegetable production increased 7.6 times, grape wine and beer production increased 1.9 and 3.8 times, respectively and soft drinks production increased 4.2 times in 2019 compared to 2003 [2]. The rapid growth dynamics of most food products during 2003-2019, characterized by the overall competitiveness of the production of these products, indicates the possibility of increasing the relevant production according to the needs of the domestic market, as well as export markets. At the same time, in order to meet the consumer demand in the domestic market, as well as the demand for raw materials in the processing industry, the import volume of some products was significantly higher than the volume of domestic production of these products. Thanks to targeted measures taken to strengthen the country's food security, the level of self-sufficiency in basic foodstuffs has increased in recent years. Thus, in 2019, the level of self-sufficiency in some food products will increase to 86.1 percent for beef, 97.6 percent for mutton, 74.6 percent for chicken, 101.8 percent for eggs, 86.3 percent for milk and dairy products, 87.8 percent for potatoes, 100.8 percent for melons, 123.1 percent for fruits and berries, 112 percent for vegetables, 126.7 percent for fruit and vegetable juices, 111.4 percent for salt, 75 percent for sugar, 33.6 percent for vegetable oils, 98.2 percent for margarine, 69.5 percent for butter - (Table).

Table 1: With the main types of industrially processed food products level of self-sufficiency, percent

	2010	2014	2015	2016	2017	2018	2019
Refined rice	13,0	8,3	9,6	10,1	23,8	19,4	18,5
Flour (all types)	95,1	94,8	95,1	96,1	96,0	95,9	95,6
Groats (all types)	11,3	18,2	17,9	17,6	29,0	26,2	24,7
Pasta	72,7	58,0	53,2	51,0	48,0	28,7	24,7
Vegetable oil	74,3	67,0	60,5	36,9	37,1	34,3	33,6
Margarine	108,2	99,3	292,2	105,7	101,5	98,8	98,2
Fruit and vegetable juices	140,3	112,4	114,1	110,0	149,4	117,9	126,7
Canned fruits and vegetables	91,8	91,4	87,6	92,9	92,5	90,4	90,4
Butter	50,0	51,9	69,2	75,6	71,0	71,3	69,5
All types of cheeses	85,7	80,4	84,2	88,3	89,8	87,9	87,7
Sugar	155,6	170,6	192,9	114,4	60,6	81,7	75,0
Tea	63,2	50,7	40,2	44,9	47,7	44,6	43,7
Salt	25,4	77,5	76,9	100,3	105,8	103,1	111,4

Source: Food balances of Azerbaijan. 2016. Baku, 2016, p. 76; Food balances of Azerbaijan. 2020. Baku, 2020, p. 77.

According to the ConEC of the Republic of Azerbaijan, in recent years there has been a certain increase in the volume of food production in the country, but there has been a decrease in fields of particular importance. Compared to some other sectors of the production sector in the country, we are witnessing a smaller decline.

The conditions that determine the decline in production include:

- shrinking consumer demand;
- shortage of current assets;
- limited opportunities of attracting credit resources;
- disappearance of price competitive advantages for individual food products.

The main problem in the dairy industry of Azerbaijan is that, in addition to the small number of dairy processing enterprises in the country, the volume of production of natural milk raw materials needed to meet industrial needs is insufficient. Therefore, it is necessary for the republic to import a large amount of dairy products. Therefore, the need to expand the scope and strengthen the activities of existing processing enterprises in the country, as well as to increase the production capacity of natural dairy raw materials, serves to realize opportunities to increase the production of quality and marketable dairy products. Statistics also show that we do not observe the necessary dynamics in the production of dairy products in 2016-2019. In some regions of the country, the profitability of dairy products at most dairy plants has significantly decreased at the level of 2-5%, and there is no necessary material and technical base for processing. Overall, 70% of the existing equipment in this area is obsolete (with a service time of more than 10 years). Besides, it is impossible to upgrade equipment, especially for small enterprises, so prices continue to rise. It is clear from the statistics and market analysis that further growth in the level of food self-sufficiency in some products is relevant, both in terms of current and future demand. Analysis of the country's net trade balance shows that there are vast opportunities to increase exports of sugar and sugar products, as well as products such as sunflower oil. Other fields in the Strategic Road Map where there are important potential opportunities in our country are: making alcohol from grape wine, production of hippophae oil, cold-pressed walnut oil, glycyrrhiza, saffron and etc. made from wild fruits and berries, production of margarine, tobacco, fruit juice, milk and milk products, meat and meat products and sericulture [3, p. 61]. Besides, the issue of strengthening, deepening of the goods and services production along the value chain, as a result, leads to an increase additional value. This is confirmed by the calculations made for some main goods produced in the country. As shown in the Strategic Roadmap, by developing tomato production according to the value chain, ketchup production creates about 4 times more value added than open field production. Production of chips from potato products is about 13 times more than open area production, canning in the area of cucumber production creates 5 times more value added [3, p. 64]. It is clear that the added value created by deepening the production of goods along the value chain can increase several times. That is why it is more expedient to approach the organization of agro-food production through the prism of three-dimensional space, which includes the trinity of region-product-value chain. The above-mentioned products are mainly considered to be more competitive in the country's agricultural sector, and they may have great potential for export to other markets in the region. The sixth goal of the Strategic Road Map identifies mechanisms for the implementation of these products in domestic markets and the organization of exports. In the coming years, it is also planned to conduct in-depth analyzes and develop separate programs, plans or strategies for priority product ranges to stimulate production in the value chain, taking into account changes in the social, economic and geopolitical environment at the global and regional levels. The development of the AIC covers the main fields of the modern industrialization program. The state pays great attention to solving the problems of AIC industrialization. Among the tasks of sector industrialization, which helps to increase the export potential of Azerbaijan's agricultural products, are the application of innovative technologies due to in-depth research and employment of human resources. The state supports the use of water-saving technologies, processing, selection and development of cooperation.

The Strategic Roadmap provides for the achievement of sufficiently enough high exports of priority products, including fresh fruits, hazelnuts and all kinds of vegetables, from 65 sectors and sub-sectors of the AIC, it is planned to ensure the export of sugar and sugar products, gherkins, tomatoes, fresh fruit (diospyros, apple, peach, pomegranate, cherry), sunflower oil and seeds, green tea leaves. Besides, it is also important to support areas such as the production of alcohol made from grape wine, production of margarine, fruit juice, hazelnuts, productions made from wild fruits and berries (hippophae oil, glycyrrhiza, saffron, cold-pressed walnut oil, etc.), production of grapes, tobacco, cotton, meat and meat products, milk and dairy production and sericulture. At the same time, in the near future to increase the volume of production in sericulture, including sericulture processing, by at least 1,000 times, to increase the production of meat and dairy products by 25 percent and i.a. It is intended to achieve such goals. There are about 650 enterprises in the agro-industrial complex, which employ about 24,000 people. In the near future, it is necessary to concern the main tasks of the agro-industrial complex include further increasing the role of "Agroleasing" OJSC in expanding the range and production of agricultural and agro-industrial products, the gradual expansion of the activities of the newly established organizations - "ABAD" public legal person and "Supply and delivery of food products" OJSC. [4, p. 30]. In recent years, agro-parks have been established in the relevant economic zones of the country to form the AIC's infrastructure and logistics base that meet modern standards. The main areas of activity in these parks are the organization of production of agricultural products on the basis of advanced technologies, as well as the most efficient implementation of the processes of transportation, storage and sale of finished products. The creation of logistics centers in accordance with international standards has begun in agricultural parks. Shamkir Agropark, which occupies an area of 543 hectares, has various infrastructure facilities, intensive economic entities, processing plants, factories, logistics centers, as well as various centers such as sales centers, refrigerated storages. At the current stage of economic development, the following are among the main strategic objectives of the AIC:

- to achieve the production of agro-food products in accordance with modern international standards;
- to meet the needs of the country for high quality food and food products;
- to ensure the export of products with export potential to international markets;
- to expand the export of highly competitive agro-industrial products "Made in Azerbaijan" and i.e.

5. CONCLUSION

- 1) Companies build their marketing strategies on more product complexes. Therefore, intensified product strategies should be identified and market research should be conducted in a more professional manner. Companies need to identify real competition and develop pricing for the target market in order to maintain their success and ensure effective competition.
- 2) The added value created by deepening the production of goods in the value chain increases several times. Therefore, it is advisable to approach the organization of agricultural production through the prism of a three-dimensional space, which covers the components of the regional-by-product chain. There are also comparative advantages in the production of tobacco and sericulture, and as a result, the production of these products has increased.
- 3) Along with some dairy processing enterprises in Azerbaijan, a large amount of dairy products is imported to our country due to insufficient production of natural milk raw materials for industrial needs. Along with expanding the volume and strengthening the activities of dairy processing enterprises in the country, it will be possible to increase the production of high quality and marketable dairy products by increasing the production capacity for the production of natural milk raw materials.

- 4) Mainly processed and canned meat products are exported from our republic. Considering that the existing processing enterprises in our country meet the necessary requirements in terms of innovative technologies and labor productivity, it is possible to achieve a sufficient increase in the production of meat products by expanding their coverage and strengthening their activities.
- 5) The share of processed products in the structure of agricultural products imported to our country is higher. Therefore, in our opinion, by establishing processing enterprises for agricultural products in our country, it is possible to reduce dependence on imports of many products, especially tobacco, flour and dairy products, and to eliminate the trade deficit.
